Bradford Historical and Antiquarian Society.—At the annual meeting and conversazione of the Members of this Society, which recently took place at the Midland Hotel, Bradford, the result of the election of officers of the Society was announced as follows:—President, Mr. J. Norton Dickons; vice-presidents, Mr. J. Lister, M.A., Mr. J. A. Clapham, and the Rev. Bryan Dale, M.A.; treasurer, Mr. William Glossop; editorial secretary, Mr. C. A. Federer; corresponding secretary, Mr. Thomas Howard; librarian, Mr. Thomas Scorah; members of the Council, Messrs. W. M. Brookes, John Clapham, Thomas Lord, Thomas Mitcheson, Richard Poole, Percival Ross, John J. Stead, Harry Speight, S. E. Wilson, and Butler Wood.—The President, in commencing an inaugural address of much interest, made fitting reference to the death of his predecessor, Mr. T. T. Empsall. He said that the popular conception of an antiquarian society was that of a number of somewhat harmless, bald-headed, and spectacled individuals poring over musty documents, and quarrelling among themselves as to the decipherment and meaning of them. His answer to the enquiry as to the use of a society like that was that it was intended to collect and preserve from destruction the decaying monuments of the past, and to explain customs, usages, and manners whose origin was often so hoary with age that their real meaning and use were in danger of being forgotten. Although Bradford itself could not be regarded as beautiful, yet within ten miles of it scenes of natural beauty not to be surpassed anywhere were to be found. Neither was the district wanting in traces of prehistoric remains, as witness the cup-and-ring marked rocks and stone circles of Rombalds Moor, and in no place in England could ecclesiastical Architecture and the modes of living of the monks of old be studied to greater advantage than in the ruined abbeys of Kirkstall and Bolton. The dales and valleys of the district abounded with examples of domestic Architecture, such as those of Oakwell and Shibden, and whose histories, if they could be recovered and retold, might supply stories of forgotten worthies exceeding in interest the creations of fiction. The President referred with some detail to the wealth of interest to be drawn from peculiarities in the styles of Architecture, as exemplified in the ruins of Rievaulx Abbey and Tanfield Church, and the monuments and stained glass contained in many Parish Churches, and the documentary evidence locked up in many a parish chest. He suggested that the radius of the Society's excursions might with profit be somewhat extended, very little of Yorkshire having as yet been visited.—The report and balance-sheet was adopted.

Liverpool Engineering Society.—At the opening meeting of this Society Mr. S. B. Cottrell, the resident engineer of the Liverpool Overhead Railway, delivered his presidential address. He dealt with the development of railways as a whole, and in particular the question of electricity as applied to traction. Mr. Cottrell pointed out that while not more 67 years had elapsed since the completion of the Liverpool and Manchester Railway, there were now open in various parts of the world upwards of 400,000 miles of railways. Comparing the British and American railway systems, he said—The enormous American system, with over 181,000 miles of line, represented an invested capital of £2,313,000,000, although handling twice the weight of freight of the British railways, carried fewer passengers by 402,000,000 a year.

Society of Engineers.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening last, Mr. S. H. Cox, President, in the Chair, a paper was read by Mr. D. B. Butler, Assoc. M. Inst., C.E., F.C.S., on "The effect of Admixtures of Kentish Ragstone, &c., upon Portland Cement." The author first referred to the geological and chemical nature of Kentish rag, which he defined as a sandy limestone of the Lower Greensand formation, consisting chiefly of carbonate of lime, but containing more or less sandy and clayey matter, its composition varying according to the strata in which it was found. He then proceeded to describe his first series of experiments, which consisted in ascertaining the effect of admixtures of various proportions of finely-ground ragstone, upon the tensile strength of four different Portland cements, both when tested neat, and with three parts of standard sand, the amount of ragstone added varying from 2 to 50 per cent, and the tests extending from seven days to twelve months. The results showed that, although in some instances the neat briquettes were slightly improved by the admixture, the three-to-one sand briquettes invariably showed a diminution in strength, the diminution ranging from 6 to 19 per cent., according to the amount of admixture used. It was further found that the weakening effect of the ragstone was greatly intensified when the briquettes were left entirely in air, and also when gauged with and placed in sea-water. The effect of an admixture of finely-ground sand was also tried in one instance, and the results suggested that further experiments with that substance would be of interest. A further series of experiments with three other cements corroborated the results obtained in the first series, viz.: that the three-to-one sand briquettes were invariably reduced in strength by the ragstone admixture; that an admixture of finely-ground sand with cement was practically of the same value as an admixture of ragstone; and that by leaving the briquettes entirely in air, and also when used with sea-water, the prejudicial effect of the ragstone was much more marked. Tabulated results of the whole of the experiments, which comprised some two thousand briquettes, in addition to chemical analyses and other tests, were given in the appendix. The conclusions the author deduced from them were, that inasmuch as the admixture of Kentish rag reduced the adhesive power or cementitious value of the cement, it was simply a diluent or adulterant; and, as a corollary of these experiments, he further expressed the opinion that any admixture which by itself was inert, unless it was readily soluble in water, or reduced to an absolutely impalpable powder, must diminish the value of the cement, *quâ* cement, and thereby prove a source of weakness. In the latter part of his paper, Mr. Butler discussed some of the methods by which the presence of Kentish rag and other admixtures could be most readily determined. Kentish rag, consisting chiefly of carbonate of lime, effervesced freely upon the addition of dilute hydrochloric acid, and if, therefore, a cement contained any appreciable quantity of ragstone, it would develop similar characteristics, according to the amount of admixture present. As, however, most cements absorb a certain amount of carbonic acid from the atmosphere, some care and experience was necessary to distinguish between the effervescence caused by such absorption and that due to ragstone. After giving some account of the principal chemical and physical peculiarities of cements containing slag and similar substances, the value of a microscopic examination in conjunction with other tests was demonstrated. Several typical examples of cements containing these substances, and also of pure cements, were given by means of micro-photographs and lantern illustrations, which demonstrated very clearly the marked difference, microscopically, between pure cements and those containing admixtures.

WE understand that the Keighley Town Council has abandoned the scheme for widening the main street from Coney Lane to Bridge Street.

AN interesting discovery has been made in the town of Boskoop, in South Holland. When the church tower was being taken down last spring, five little books were found walled in it, and Professor Acquoy, of Leyden, to whom they were sent, has now published an account of them. All of them are religious books, which were in secret use at the *hagepreeken*, or hedge-preachings, at the time of the Spanish persecution, and they must have lain concealed in the tower of Boskoop for over 300 years.

THE Academy is to change hands at the end of this month, and about the middle of November the first number of a new series will appear under the editorship of Mr. Lewis Hind, who was formerly editor of the Pall Mall Budget. The Academy has always been scholarly and decorous, and in these respects it will remain unchanged. But certain more popular features will be introduced; it will be illustrated and enlarged. "John Oliver Hobbes" will furnish contributions to the first and to several succeeding numbers.

The New President, Royal Academy.

IF the election of Mr. E. J. Poynter has not evoked great enthusiasm, it has been received by the Artistic public with a sense of relief. Had there been a candidate of pre-eminent claims, the election would have engaged less attention, and, in view of the possibilities, we may congratulate the Academy on its choice of a President who, if not an extraordinary genius, is at least the possessor of a rare conbination of useful and admirable qualities—a man of knowledge, culture, and good taste. He has not the curious eloquence, the cultured cosmopolitanism of Leighton, or the masterful vigour of Millais, but he is not lacking in distinction, and he may be trusted to maintain the dignity of the post. Ex-Slade Professor at University College, Visitor to the National Art Training School at South Kensington, Author of "Lectures on Art," which has been called "the most suggestive and interesting book of the kind," Director of the National Gallery, Mr. Poynter is a learned Painter. A student under Gleyre, in Paris, forty years ago, the new President was an accomplished figure draughtsman, while as yet fine draughtsmanship of the figure was rare in English Art. Archæological accuracy is a point of honour with him, and his first great popular success was achieved almost in spite of himself. He has never been accused of painting "Israel in Egypt" because the public knew the subject and would take it to their homes. He painted it, probably, to please himself and Egyptologists—by a lucky chance the other things were added unto him. "The Catapult" procured his Associateship, and he has had other successes — "Perseus and Andromeda," "Atalanta's Race," "The Meeting of Solomon and the Queen of Sheba"—a most learned effort—to mention the most conspicuous. In a word, Mr. Poynter, over a long series of years, has painted diligently, interestingly, and well. At an early stage in his career, Mr. Poynter showed considerable talent for decorative designing. He painted cartoons for the mosaic of St. George, in the Westminster Palace, designed the Architectural and tile decorations for the grill-room at South Kensington, and painted a fresco at St. Stephen's Church, Dulwich. He designed

GILBERTFIELD CASTLE.

the border to the Queen's letter, and some of his creations decorate the new coins. He has also filled, satisfactorily, several official posts, and proved his possession of a capacity in administration that should serve him well in face of the responsibilites and duties of his Presidency. For years he was Principal of the Art Training School, at Kensington, and in the Directorship of the Museum, his was the influential voice. In 1894, he succeeded Sir Frederick Burton, as Director of the National Gallery, and the signs of his presence, and of his individuality, are not lacking. The son of an Architect, Mr. Poynter may be expected to encourage a more generous sympathy than has hitherto been extended to Architecture. The Academy is called upon to answer for more sins than its own, but it may well be that the wise tolerance of Mr. Poynter will work improvement in the attitude of one branch of Art to the others.

Mr. Thomas Graham Jackson, R.A.

THE election of a new President of the Academy has overshadowed to some extent the raising of Mr. Thomas Graham Jackson — or, as he is familiarly known to most of us, "T. G. Jackson" — to the full degree of a Royal Academician ; but to Architects in general it is of more importance than even the fact of who is, or may become, President. That Architecture should be more fully represented in the Academy, has been the cry of many who do not go as far as some of the would-be revolutionists, and say that Architecture should have a separate Academy of its own. A better representative could not have been chosen, although, perhaps, some will think Sir Arthur Blomfield, being an older man, should perhaps have had the preference. It has been said that the Council had made it known that it hoped and expected that the members would return an Architect, in order to restore the Academic balance ; but this does not count for much, as painters, more than other men, are very clannish, and are not easy to persuade to vote for another profession than their own, especially when so popular an Artist as Mr. B. W. Leader has been kept waiting such a long time for his promotion

Others were also in the list, including Mr. Seymour Lucas, Prof. Aitchison, Mr. Brett, Mr. S. J. Solomon, and Sir Arthur Blomfield. That the election will be widely popular goes without saying. Mr. Jackson is not only an Architect of profound knowledge, but he is also—what in these days is all too rare—an Artist, his profession being to him less a Profession than an Art. He is not only an Artist, but an Artist of great individuality and pure taste, whose sympathy for the Arts and Crafts has often been very practically shown. An Oxford man, a Master of Arts, a Fellow of the Society of Antiquaries, and an Honorary Fellow of Wadham College, Mr. Jackson has stamped Oxford with his name. When it was decided to build new Examination Schools on the site of the old Angel Hotel, in High Street, his designs were unanimously accepted over all competitors, and the new buildings at Trinity College, which form so notable a feature in Broad Street, were also from his designs. That he possesses the entire confidence of the University authorities has been shown on many occasions, especially in reference to the repairs of St. Mary's. Mr. Jackson is fifty years of age, and his influence in the Academy will, we hope, for many years, be of great assistance in supporting the more modern views with respect to Architecture, which are at last being more generally recognised. Architecture is the mother of all Art, and yet how disdainfully is she treated by her children. It is to such men as Mr. Jackson that we look to raise her to that high pedestal which is her right.

ST. HELEN'S NEW TECHNICAL SCHOOLS AND LIBRARY.

THE new Technical Schools and Central Free Library, erected at a cost of nearly £30,000, and presented to the town by Colonel Gamble, C.B., have been opened. The new building has been erected at the corner of Corporation Street and Hardshaw Street, almost opposite to the Town Hall. The site has the advantage of three frontages, namely, to Corporation Street, Hardshaw Street, and Bickerstaffe Street. Externally the building is faced with red terra-cotta and red-pressed bricks upon a sub-base of fine granite to the level of the ground floor. The whole of the ground floor, with the exception of the offices provided for the use of the director of technical education, has been devoted to the Free Library. The hall, in which is placed the borrowers' counter, measures 55 ft. by 24 ft. A private room for the librarian is screened off in a corner of the department, and lavatory accommodation for the staff is also provided. The whole of the frontage of the building to Bickerstaffe Street is occupied by the general reading room, which is 114 ft. long and 32 ft. wide, and fitted with continuous newspaper stands round the end fronting Hardshaw Street, in addition to which are three double stands, each 16 ft. long. The remainder of the room is fitted with flat-topped reading tables and stuffed benches, finished in morocco leather. The reference reading room, 50 ft. by 32 ft., has a counter running round two sides exactly similar in design to that in the borrowers' department, and behind it are placed the racks for the reference books. This department is furnished with polished oak tables and leather-covered benches to match those in the reading room. A reading room for boys, 32 ft. by 21 ft., and a ladies' room, 32 ft. by 13 ft., with separate lavatory accommodation in the latter, are also provided. A spacious store-room has been made in the basement, with direct access from Bickerstaffe Street. The basement is devoted to engineering, plumbing, and other manual departments, including an engineering shop, 62 ft. by 32 ft., fitted with the most complete modern machinery, so that students may go through the whole course, from pattern-making to finishing and fitting. The metallurgical laboratory is also most complete in the matter of fittings of the most recently approved design. The rear of the basement is taken up with the engine and dynamo house in connection with the heating and ventilating apparatus, forming an adjunct to the engineering department. The remaining space of the basement is devoted to the plumbing and building class-rooms, teachers' store-rooms and lavatories, and a covered cartway from Bickerstaffe Street, through which all building materials, library, and other stores can be taken into the building. On the first floor of the building fronting Bickerstaffe Street is placed the physics laboratory, 56 ft. by 25 ft., with class-rooms, and a lecture theatre capable of accommodating 90 students. Immediately behind the physics preparation room, and entered from the laboratory, is a "dark" room for photographic and other purposes. The wing of the building in Corporation Street on this floor embraces a students' common room, two large class-rooms, and the geometrical drawing room, with cookery and laundry demonstration rooms at the end of the corridor. Teachers' rooms, ladies' cloak room and lavatory are placed on either side of the central staircase, and a striking feature of the first floor, as well as of the floor above, is a continuous arcade, within which it is intended to retain for exhibition the prize specimens of the students, and as a museum for other articles of interest relating to the work carried out in the institute. The second floor is entirely devoted to the chemical and Art departments. The Art department, including the modelling rooms, the advanced Art rooms and the Art-master's rooms, are placed in the wing fronting Corporation Street, the whole being exceptionally well lighted and adapted to the various branches of Art to be taught therein. The heating and ventilation of the building have been arranged by Messrs. Blackman, of London and Manchester. The whole of the work has been carried out from plans prepared by Messrs. Briggs and Wolstenholme, of Blackburn and Liverpool, by Messrs. Neill and Sons, of Manchester.

KEYSTONES.

THERE is a scheme on foot to furnish electric power to the City of Mexico from peat beds nine miles distant.

IT is stated that over 200 Architects are competing in design for the new College of Technical Education at Sunderland.

AT Broadcroft the new Corporation gasworks, just erected by Rothsay Town Council, have been formally opened. The works, which have cost £12,000, have been rendered necessary by the expansion of the town, the need for the erection of sulphate of ammonia plant, and for providing motive power for an installation of the electric light shortly to be gone on with.

A WORKMAN made a discovery of spade-ace guineas in the course of digging out the foundation of some houses at Muswell Hill, a few days ago. A large number of villa residences are being erected, and in digging in comparatively an open field almost adjoining the Alexandra Park Estate, an earthenware jar was found, which contained some 120 spade-ace guineas in an excellent state of preservation. The discovery was first kept a secret, but the "find" has by some means leaked out, with the result that the police authorities have obtained possession of the guineas pending inquiry in the matter.

DURING the recent vacation the hall of the Cordwainers' Company, in Cannon Street, has been re-decorated throughout. The former decoration had been in existence for many years, and the introduction of the electric light into the premises in the spring of this year necessarily defaced certain parts. The plaster decorations of the hall are of the "Adams" style, and an Anaglypta dado has now been fitted round the room, serving as a suitable base for the upper part. Two ornamental mirrors, designed strictly in the same style, have been fixed on the north wall, and give a pleasing effect when entering the hall from the staircase. The general colour of the walls is buff above the brown dado, and the ornamental plaster frieze is finished in a pleasing shade of green with the ornamentation picked out in white. The work has been executed by Messrs. Campbell, Smith, and Co., of Newman Street, Oxford Street, and the ornamental mirrors were supplied by Messrs. Jackson and Sons, of Rathbone Place. The decorations were designed by the company's surveyor, Mr. Howard Chatfeild Clarke, of Bishopsgate Street Within, and have been carried out under his personal superintendence.

TO-DAY,

from the Offices of the

THE BUILDERS' AND ARCHITECTURAL JOURNAL REVIEW

KENT AND SUSSEX COTTAGES AND ROOFS.

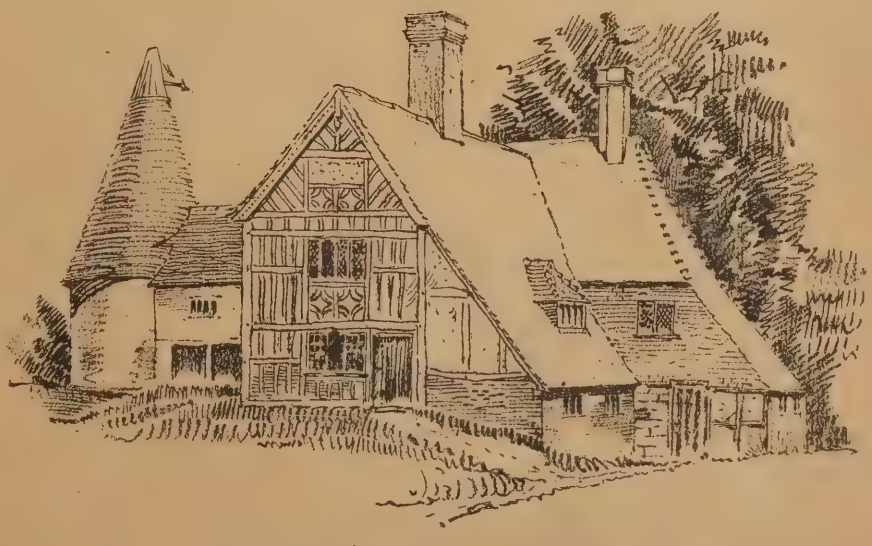
Written and illustrated by FRANK LISHMAN, A.R.I.B.A.

(*Concluded.*)

THERE is, over a cottage hard by the Church, in Cowden, a singularly happy piece of roofing, whereby a workshop adjoining is gathered under the same roof as the cottage itself; surely expressive of the influence of the home over labour and speaking better things than the living wage! When at Cowden it is but a few steps southward across the borders of Kent and into Sussex. A walk of three or four miles through wood and field all the way brings us into the village of Hartfield. Every house here, from the first with its long sloping roof, growing as it were almost out of the ground, to the last, is an excellent example of the perfect adaptation to site and surroundings.

The half-timbered house opposite the "De la Ware Arms," is a good instance of the exclusive use of vertical timbering; satisfactory as this is however, the long hips of main roof impart a heavy and flat appearance to the house as a whole, although the roofing over the brick oven and the fine stack from this latter do much to redeem it. The gable measures 15 ft. wide and about 14 ft. to the eaves. The oak studs average 6 in. wide and 8 in. apart. The plaster is finished with a pebble dash, which is a less common treatment than with a smooth face only. There is no barge board to gable, an ordinary roofing spar projecting 3 in. in front of studs, being substituted with the tiles overhanging 2 in. in front of spar. The Lych-gate (A.D. 1520) at Hartfield is worthy of notice. The gate, proper, is under a portion of the cottage shown in sketch, and is somewhat after the manner of the Penshurst Lych-gate. This cottage, as sketched from the south-east, shows so simple and effective a piece of roofing, that it might well be followed in modern cottage building. The surface of the plaster on the north side and in the gateway is scored in a rough diaper pattern, the indents being $\frac{1}{8}$ in. deep, the figures are irregularly and carelessly marked, but, from a little distance, they add to the texture of, and give an amount of interest to, the otherwise smooth plaster, quite out of proportion to the small amount of labour and skill expended upon it.

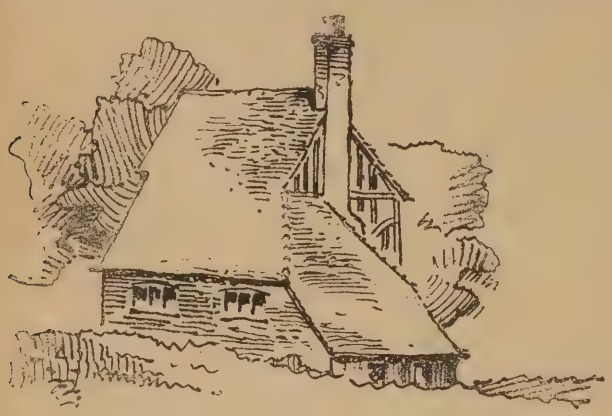
At Leigh Green, near the south entrance to Buckhurst Park, Withyham, is a more elaborate example of half-timber work than is usually found in Kent or Sussex, for not only is the curved diamond pattern used under the windows, as at the Middle House, Mayfield (though there to a greater extent), but the almost invariable treatment of the gable by vertical studs, and vertical studs only, is here departed from and diagonal studs introduced. The effect is satisfactory, but were the barge board continued on the one side down to the foot of the long slope of roof, and the diagonal studs repeated under it as in the upper part of the gable and two or three more quarterings inserted in the remaining oblong plaster panel, we should find a more satisfactory house end. The long line of roof would also "tell" better than under the existing arrangement. Whether the nearer chimney would then look too high for its position is doubtful, but it does so appear at present. The gable, proper, measures 16 ft. 6 in., the total across the house end being 27 ft. The manner in which the steep fall of the ground towards the back of the house is made to serve as a means of obtaining a good roof effect, is another of the many instances where the formation of the site influences the lines of the roof.



More attention has been devoted in this article to the roofs of the buildings that have come under our notice, as the principles involved are more applicable to present-day conditions of building, than is the case with other features. For instance, Parish Councils would be sure to object to living rooms measuring only 7 feet from floor to ceiling, yet this is a common enough height in these old cottages. Neither would the relative position of ceiling line and window head, in many instances, meet with their approval any more than it would appeal to the client's idea of comfort. In the upper floor of the "Castle Inn," at Chiddingstone, for instance, it is necessary to seat oneself in order that the window head may be brought to a level with the eye.

It appears to the author that, under ordinary circumstances, given a well-designed roof, the success of the whole is practically ensured. Let the exigencies of the site and its surroundings, therefore, be well considered—let us show our appreciation of a fine tree or a group of trees for instance—and let us take advantage of any rise or fall of the ground. Were these points attended to more by the Architect and the Estate Agent, it would not be resolved that the first essential in the "Development" of an "Eligible Suburban Building Estate" is the razing of fine avenues of chestnut or elm to the ground—nor would it be necessary for the local branch of this, that, or the other Banking Company to be open to receive subscriptions towards the £1,000 necessary to save the adjoining grove from the inroads of the jerry builder.

COTTAGE IN HARTFIELD, SUSSEX.



COTTAGE AND OAST-HOUSE, LEIGH GREEN, SUSSEX.

PROFESSOR AITCHISON AT THE INSTITUTE.

THE PRESIDENTIAL ADDRESS.

(*Concluded.*)

IF this ignorance of the value of Architectural monuments is not dispelled, and the greed of gold continues, those who live long may witness the conversion of St. Paul's Cathedral and Westminster Abbey into stations for railway junc-

LYCH-GATE HOUSE, HARTFIELD, SUSSEX.

tions. A genuine Architectural style is evolved in this way: from the shapes and sizes buildings take to suit the wants for which they are built; from the exigencies of the materials used; from the shape of the roofs, to protect the inside from rain, snow, or heat; from the size and grouping of the windows, according to the needs of the chambers and the intensity or dimness of the light; from the uses of the doors; from the external provisions for shade or shelter; from the original type from which the building was taken; from the constructive skill of the Architect; from the æsthetic sensibility of the nation, and the particular direction it takes; from the ability of the Architect to evoke the emotions proper to the building; and from the amount of excellence arrived at by the sculptors and painters; for it is obvious that if these Arts coexist in one building, each Art must be of equal excellence to make a consistent and effective whole. Architectural styles are not the creation of a day nor of a man, they are the alterations of the existing forms and arrangements to meet the new uses and the new tastes of the day; when the new generation is superior to the last, then Architecture improves, when it is inferior, Architecture degrades. The general taste of former people mostly persisted in the same line for centuries; we see this in Greek Architecture, that rapidly arrived at perfection after the successful overthrow of the Persians, and gradually declined till Athens fell under the sway of the barbarous Macedonians. Architecture is a

PROGRESSIVE ART,

but its progress is not always continuous, as nations unfortunately do not always improve, nor is their love constant to the same Fine Art. As long as Architecture is alive some change is of its very essence, as each generation has not exactly the same wants and tastes as the one immediately preceding it; hence we see the foolishness of substituting antiquarianism for Architecture, fixedness being substituted for natural motion, while a small knot of antiquarians settle what deceased Architecture is to be chosen as the model. Once it was Roman work, then Greek, and since it has been Gothic, as if the wants, the knowledge, the skill, and the taste of this end of the 19th century exactly resembled that of the Christian era, of 450 B.C., or that of the 13th century. Deceased Architecture is the Architect's lesson-book, as history is the statesman's, and poetry the poet's. Pleasant as it is to dwell on the glories and delights of deceased Architecture, one cannot confine oneself to it when speaking to an Institution like this, formed for the furtherance of the Art. It is doubtful if Architecture was ever in its present condition, for there has mostly been a tradition or a belief, and never before has a knowledge of many deceased styles been so complete. With two deceased styles at least, Renaissance and Gothic, a large proportion of our Architects are so familiar that they could build a paraphrase in either that might almost deceive a Gothic Architect of any period, or an Italian of the late Renaissance. This familiarity must to some extent tinge, if not modify, modern English work, and there is, as well, some superficial acquaintance with every style of importance that the world has known. Will a new style be developed by our successors as strikingly different from past styles as Saracenic is to Byzantine, or Gothic to Romanesque? We cannot help noticing that there are at present plenty of instances of the wildest originality, which have disregarded every Architectural canon and every dictate of common sense owing to a want of proper direction and training being given to the Architects; but this complete Architectural liberty, although it has drawbacks, has certainly given us some very charming work; and I think few would desire to go back to those dingy streets of brick, where each house was destitute of proportion, of mouldings, of features, or of any character, emotional or otherwise, but was a plain brick box with holes in it. Some Architects regret that

ARCHITECTURE IS NOT NOW A PURE FINE ART:

why, I cannot tell, for its aim is surely the highest of any of the Fine Arts—that of creating a perfect organism like one of Nature's, where every want is met, where the building tells us for what particular use it was made, and where the Sculptor, the Painter, and the ornamentalist have combined with the Architect to make the building tell its purpose most completely, and evoke the emotions proper to its use. Whatever other aims the Institute may have, the thing that is absolutely essential to its existence is the advancement of civil Architecture. Architecture comprises three main branches: convenient and æsthetic planning, sound and daring construction, and the investing of the whole structure with such forms as excite the proper emotions. The powers of mind necessary to fulfil these requirements with any approach to perfection, are seldom found to exist in the same person; hence the extreme rarity of great Architects. I hope that our glorious Art may in the future have still greater triumphs than it has had in the past; for, looking at our wider knowledge, our wonderful appliances, our new materials, our acquaintance with the powers of Nature, the greatness of our Empire and its position in the world, it may well be expected, if we and our successors retain our self-denying and single-eyed devotion to our Art. I hope that the nation will in the future take a deeper interest in Architecture, feel prouder of its triumphs, and understand what it does for the country; and that the Architects, casting aside archæology, except for study, may evolve a phase of Art which fulfils the tastes and aspirations of the nation as completely as the Greek temples or the Cathedrals of the Middle Ages once did.

At the conclusion of the President's address, Mr. F.C. Penrose, the late President, having proposed a short vote of thanks, Mr. D. Alex. Murray said that "The burning question of the day is:—What is to be the outcome of all our learning? For as the President pointed out, there has never been a period in the world's history when the Architect had such a rich store of accumulated knowledge at his command as he has at present, that our intimate acquaintance with Etrurian, Greek, Syrian, and Egyptian Architecture should lead to imitation, is obvious enough. The Saracens had abundant knowledge of the great things which had been done before their time, but this did not prevent them evolving a style of their own. The President further said that one of the earliest of the great Greek Architects had presumably travelled in Assyria and Persia, but this did not lead him to copy what he had seen when he arrived home again, any more than to introduce the Persian language in his country. The modern tendency to raze to the ground buildings that are dear to the friend of Art, as our President truly said, merely in order to erect 'shops in their stead, so as to obtain more rates and taxes,' is greatly to be deplored."

Colonel Lennox Prendergast also spoke.

Professor Aitchison, in proposing a resolution of condolence to the relatives of the late Secretary, Mr. White, said:—"It is my mournful duty to inform you that our late President, Mr. W. Henry White, expired on the 20th of last month. I may say that to this Institute his loss is well nigh irreparable. You will pardon me for saying irreparable, for, at the present moment, I could really name no one who could adequately replace him and who would exhibit such marked devotion to the Institute as our late Secretary has done. His post was to him not only his occupation, but to him it was, so to speak, his wife, his family and his home. He was so devoted to this Institute that I am very much afraid his untimely end was in a large measure brought about through overwork and the consequent want of exercise. His qualities for the office of Secretary were perhaps not unusual, but extremely uncommon. He was possessed of great sagacity, excellent judgment, great business ability, and one of his chief virtues was his extreme punctuality. Such a combination of valuable qualifications are not often found united in one and the same person. And when you realise all the duties which the Secretary has to perform you will find that he has his work well cut out for him, and that his duties necessitate that he must throw his whole capacity and whole energy into it. The amount of correspondence he had to get through from day to day was simply appalling. I may say that Mr. White brought a great many qualifications that were necessary to such an Institution as this. He was at one time a successful practising Architect in Paris, and afterwards in India, and was an able contributor to all the professional papers, and owing to his having been an Architect in practice in France he was not only a first-class French scholar, and read, wrote and spoke French almost like a Frenchman, but his admiration for the excellent methods of the French for teaching the young aspirants for the Architectural profession of the artistic feeling which is such a striking characteristic of the French temperament, was in every way heartfelt and sincere. I am sure that no one who knew him intimately in his professional capacity, could fail to share his admiration of the genius of the French in Architecture. His deep insight into the French system of teaching, and French life generally, gave him a peculiar power, which I hope we shall find in one of his successors, especially his knowledge of French, which must always be a tie between two nations, for nearly every other nation speaks French as well as its

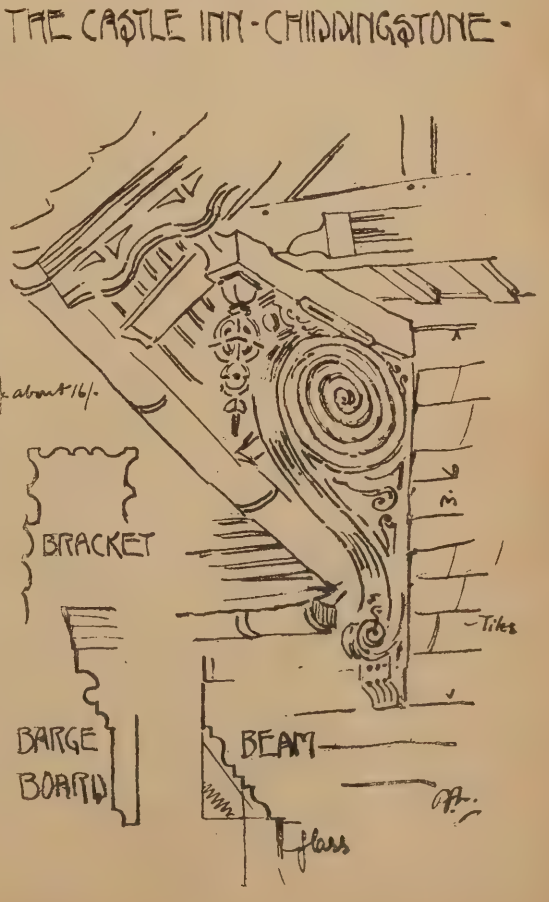
COTTAGE, NEAR W. PECKHAM, KENT.

own language, and his ability in this direction has endeared him to a great many Architects on the other side of the Channel. His devotion to the interests of the Institute knew no bounds, and he had the perfection of English Architecture dearly at heart, and he did all that was in his power to raise the status of the Architectural profession in this country. I need not say what a loss his death is to me alone, not only in his capacity as Secretary,

THE CASTLE INN, CHIDDINGSTONE.

but also as a personal friend. Many a time he has been standing in our midst, urging all the advantages he had seen in the French system, and, I hope, not without effect. I saw him not many days before his death, and then one of his principal thoughts was to recommend to the consideration of all the members of the Institute the excellent way in which all the people in the office had seconded his efforts. To show how much he had the welfare of the Institute at heart, he left his Architectural works and the whole of his drawings to the Institute. A letter of condolence has already been sent to his surviving relatives, and I now propose a vote of sympathy herewith to his relations for the great loss they have sustained." The Resolution was unanimously carried. Amongst those present were Mr. W. B. Richmond, R.A.; Prof. Robert Kerr, Prof. Tavenor Perry, T. Roger Smith, John Medland, (Manchester), James Cape, and J. Macvicar Anderson.

AT an adjourned inquiry at Crediton, respecting the claim of the silver coins found in Crediton Church on the 15th of October, the court found that it was Treasure Trove and that it belonged to the Crown. There were four claimants — the Lord of the Manor (General Sir Redvers Buller), the Church Governors, the person who found the coins, and the Treasury. The coins were produced and were all silver, in number over a thousand.



AT a recent meeting of the Salford Town Council, a long discussion followed the presentation of a report by the General Purposes Committee as to erecting a grain silo and warehouse on the banks of the Ship Canal, and which recommended the Council to adopt such a scheme, and obtain Parliamentary powers for that purpose. It was stated that the borrowing of such a sum would mean the payment of £6,000 or £7,000 a year interest by the Corporation, but against the expenditure the carrying out of the scheme would eventually bring great benefit to the borough.

LORD GRIMTHORPE ON OBSCURE MONUMENTS.

IN a letter to the Times, Lord Grimthorpe says: Your paragraph about the Queen's statue at the Royal Exchange, placed under a supply of rusty water, tempts me to say a word about some other ingenious dispositions of marble statues, if one may use the word for recumbent images. The two most recent instances that I have noticed are, first, Bishop Claughton's, in St. Albans Cathedral. The statue is thought by everybody very like in face, by Forsyth, but Sir A. Blomfield has thought fit to lay it on a bed so high that it would require a giant to look down on the face, or else a chair to stand on; and all for nothing, except to display a pedestal of coloured bits of marble, as incongruous as possible with the rude and massive Architecture of the surrounding oldest parts of that oldest of our great Churches. The other is worse, of a greater man in a still greater Church — viz., Archbishop Thomson's monument at York, of whose difficult face this, by Thornycroft, is the only representation by any Artist under the sun that I ever thought satisfactory, though there are sundry good ones by the sun. But the highest Architectural genius has been displayed in spoiling it. Not only is it set too high, worse than Bishop Claughton's, but close against a wall, and besides that obstructed at the top and bottom by a kind of stone framework, carrying a heavy and overdone canopy more conspicuous than the monument itself; so that it is impossible for any but the aforesaid giant, shoving his head in under the canopy, to see anything but a partial view of the archiepiscopal side-face, which was not his best. And though all that was possible has been sacrificed to those Architectural subsidiaries, the Architect never perceived in time that he was setting his frame against some of the ancient shafts which had been pushed out of upright ages ago by the thrust of the tower arches, as everybody knew, all over the transept sides. Consequently, there is an increasing gap all the way up, which there would not have been if the unnecessary upright frame or jambs had been omitted and the canopy—or a better one—made to come out of the wall, as they more generally did in old times. Another remark, which has probably been made a thousand times already by visitors, is that the inscriptions on all these tombs are illegible to everybody who is not up to the trick of reading things so written; and even to them they are made as obscure as possible, with the sole exception of "Tom Musgrave's," as we always called him at Cambridge, and whose common sense seems to have survived round his tomb in a good, square-cut, black inscription, which he who runs may read. The only really visible image of all those in the transepts is Dean Duncombe's, who lies low, and consequently with his face in sight of not only ordinary mortals, but of half-a-dozen marble dolls who stand or kneel at his head and feet worshipping him. As a specimen of the contrary kind, Bishop Selwyn's beautiful figure in alabaster, at Lichfield, lies under one of the old recessed arches, so that everybody can see and admire it—a striking contrast to that portentous abomination, done by I don't know whom, to perpetuate the memory of Samuel Wilberforce, at Winchester.

RESTORATION OF AN OLD NORMAN CHURCH.

ALTHOUGH 800 years have elapsed since Compton Greenfield Church had its origin, parts of the ancient Architecture remain, the principal feature being the fine Norman doorway from the south porch to the Church. The lines of decorative work bearing testimony to the skill of 12th-century sculptors are unusually effective, and the masonry has resisted well the ravages of time. The bold Norman carving had long been thickly covered by a creamy wash, and a year or two ago this was carefully removed and the surface of the stone laid bare. Similar treatment was found necessary on the interior of the Church in the recently completed scheme, and the masonry of several good arches has thus been made visible. The dark roof timbers have recently been oiled; the pews reduced in height, painted, and varnished; the old board floor taken away and replaced by wood blocks, on a concrete foundation. Pennant slabs have been used to pave the pathway up the nave; the chancel floor is of Pennant and Portland stones arranged in design, and in front of the communion table the paving is of black and white marble, fixed so as to form an agreeable pattern. A great improvement has been effected in the chancel by the removal of the two square, old-fashioned pews formerly standing there. In their place choir stalls and desks of carved oak have been placed on the south side, and on the north an organ chamber has been built out from the Church, with communication to the chancel by a large pointed arch. There the organ has been placed, and, in order to improve the communication of sound, the west wall of the chancel has been pierced by a small rounded arch. It may be added that the lower part of the old chancel arch is Norman, but the arch itself is of 14th-century design. The ivy-clad tower is also of the latter age, these ancient portions having been retained by those who rebuilt the Church in 1852. When the organ was removed from beneath the tower to its new chamber a small western doorway was discovered, the aperture being walled up. It has been restored to its original purpose, and an oak door placed in it. The ground floor of the tower has been formed into a vestry. Hot-water heating apparatus has been fitted for warming the Church, and lamps suspended. Mr. Ponting, the Diocesan Architect, had charge of the alterations, and they were carried out by Mr. J. Perkins, of Redland.

Sir Christopher Wren and his Work.

AN HISTORICAL AND CRITICAL SKETCH.

By ARTHUR STRATTON.

Read before the Liverpool Architectural Society, and published exclusively by the Builders' Journal.

PART I.—THE LIFE OF WREN.

THE early years of the life of Christopher Wren always seem enshrouded in a certain amount of mystery to an Architect, because they were devoted to a study apparently so opposite to that with which hi name is now universally associated. He was about twenty years of age when Inigo Jones, his great forerunner, died. Inigo Jones fell upon evil times; frustrated, it would seem, at every move, his masterly designs were for the most part but idle dreams, doomed to be known to posterity only as great possibilities. He played his part nevertheless, and was still playing his last act may be, when one appeared on the scene who was destined to carry on his work, and to carry it on with such brilliancy that all the world should shade their eyes, and yet be dazzled by the mere reflection which should suffice to keep his own name brightfor ever. It is consoling to think that Inigo Jones may have known some such thoughts, and have seen such a man in young Wren, whose hand, no doubt, he more than once grasped, and, perhaps, whose words of admiration for his few completed works were fondly remembered in his last unhappy hours.

We well might picture Wren in those days to have been an enthusiast, devoted solely to the study of Architecture; but, as a matter of fact, he was known rather as a young man possessing altogether exceptional powers of acquisition, interested in anything intellectual, but especially addicted, not to the Fine Arts at all, but to the higher branches of Science. Born in the quiet country vicarage of Knowle, in Wiltshire, on October 20th, 1632, he early exhibited great mental powers, apparently to the detriment of his physical strength, for we find that his father, Dean Wren, a man of high culture and understanding, deemed it advisable to supplement such attention as he could himself bestow upon his promising offspring by the services of a private tutor at home. However, in 1646, when in the fourteenth year of his age, he was at Wadham College, Oxford, astonishing everyone there with his bright intelligence and persistent study, having at that early age not only laid the foundation for a sound classical education, but also exhibited a strong bent for the experimental philosophy of the "New Learning."

His University career was distinguished by one succession of marked achievements, and he proceeded to the degree of M.A. in 1653, in which year he was also elected a Fellow of All Souls' College. At this time, and for some years subsequently, we know him to have been deep in scientific research, writing learned tracts on the "Theory and Hypothesis of Comets," and patenting inventions of all sorts, from diplographic pens and "Instruments of use in Gnomonicks to new designs tending to strength, convenience, and beauty in Building," whilst the discovery of mezzotint engraving should probably be attributed to him, rather than to Prince Rupert. Nothing seemed to dismay him, and before many years had passed away, "this miracle of a youth," as Evelyn called him in his Diary of 1654, was known in scientific circles all over Europe. At home the highest honour were conferred upon him; he was Savilian Professor of Astronomy at Gresham College in 1657, when only twenty-five years of age, and Professor of Astronomy in the University of Oxford in 1660. In 1673, owing to pressure of other work, he was compelled to resign his Professorship, but he long maintained his connection with the Royal Society, which had received its charter in 1662. His name as one of the originators occurs again and again in the proceedings of the Society, along with those of all the leading men of Science of the day, to say nothing of the names of King Charles himself, the Duke of York, and Prince Rupert.

In 1680, and again in 1681, he was elected to the Presidency, and we marvel that he found time to carry through his multifarious duties in that capacity to the satisfaction of all, and apparently not to the detriment of other occupations which were rapidly increasing around him. Having hastily followed him thus far, to the zenith of a scientific career, we must retrace our steps to glance at events which had been taking place outside the Universities, events which in course of time were to react upon him, and to alter the course of his whole life to such an extent that it might seem that so far he had missed his true calling in life, if such a master mind can be said to be restricted to any one sphere alone.

All through the earlier years of his college life the country had been convulsed by civil wars; on one occasion at least it is recorded that the disorder actually affected his own movements, and some time in 1658, the Professors of Gresham College were driven from their class-rooms and the place was garrisoned by the rebels. Amidst one long succession of tumultuous scenes and vicious uproar was his character firmly moulded. During these stirring times for the Church and State alike, his eyes must many a time have turned towards the Tower, where, for eighteen weary years, lay his uncle, Matthew Wren, Bishop of Ely, who was cast there for his supposed Popish tendencies; a victim along with Archbishop Laud in the wholesale demolition which was brought about by the temporary ascendency of Calvinistic principles in the land. The Church was no less corrupt than the State, and as an outward sign of its inward corruption, the erection of religious houses was not only stopped but those which already stood were subjected to every infamy of abuse and disuse. Little reverence was shown to the great Cathedral of St. Paul, which was already tottering, whilst the work of Inigo Jones, as being connected more or less with Laud, was undisguisedly hated by the Puritans. The peaceful Arts could hardly flourish at a time when bands of marauders scoured the country wishing to destroy anything that could in any way be construed into an embodiment of the Papish religion: no matter how beautiful its profanity was only enhanced thereby.

The Restoration alone could produce order, and the people, weary of self-rule, or no rule, and smarting under sores inflicted by themselves, gladly welcomed it. It was well for Art, that in Charles, at such a time, she found a patron. His long exile had not been spent in vain, and he came back alive to her claims and to the disgraces which had been inflicted upon the religious houses of his country. St. Paul's, as it then appeared, stung him to the quick, and one of his first acts was to appoint Wren, who was most likely well known as an amateur Architect, assistant to Sir John Denham, the Surveyor-General, a man whose name is now rather associated with poetry in words than with poetry in stone. Thus early, in 1661, was Wren connected which the Metropolitan Cathedral, partly no doubt owing to the influence of John Evelyn. Charles, who had received the fortress of Tangiers as part of the dower of Queen Catherine, wanted Wren, as one of the best geometricians of the day, to leave St. Paul's to Denham, and to go himself to Tangiers to superintend extensive works there to the Mole and harbour. Wren, however, excused himself, and we rejoice that he did not throw away some of the best years of his life and possibly his life itself, for a mere caprice of his whimsical King. The works were eventually abandoned, and a few years before the close of the King's reign the whole place was given over, and the garrison brought back to England.

In spite of his high position in the scientific world and the incessant demand upon his time which it occasioned, Wren now began seriously to turn his thoughts to matters Architectural. That he had always had an inclination that way, and that he was far from ignorant of its principles from his boyhood, no one will doubt. We are told that his father, the Dean of Windsor, was not only a good mathematician, but that his knowledge of the Art of Architecture was by no means inconsiderable. He produced many designs, but it is now very difficult to prove that any were ever executed. His son would naturally have seen them, and, whether good or bad, they most likely whetted his appetite. In 1661, when he probably had no idea of the future which was before him, he suggested "Designs in Architecture" as part of his contribution towards a royal entertainment on the occasion of the King's visit to Oxford. He was before long, however, to have an opportunity of shewing that his knowledge was not merely superficial. His uncle, the Bishop, who had been released from the Tower at the Restoration, bethought him to make some thank-offering, and to benefit his old College at the same time, by giving it a Chapel. He consulted his nephew and found him so ready to further the project, that the old man lived to worship in the Chapel of Pembroke Hall, Cambridge, and to know that he had paved the way for the young Architect's future career in giving him his first commission. The first stone was laid on May 13th, 1663, which was about four years prior to the death of his patron, and five years subsequent to the death of his father.

Further work at Oxford and Cambridge soon followed. It would be interesting to learn how his designs, strongly imbued with the Palladian spirit, as interpreted to him through Inigo Jones, were regarded by the people at large at these centres of learning. At Oxford, Gothic traditions which had lingered there, owing to Laud's influence, later than anywhere else in England, had produced the wonderful Christ Church Staircase as late as 1640, and may still have been persistent in Wren's college days; but in other parts, in the later years of the century, workmen were beginning to have a good knowledge of classic forms and details, and were speaking in stone the language of the time. In the course of his work at Trinity College, Cambridge, in 1665, Wren, in a letter sent with his small scale plans and general directions, seems to half apologize for venturing to suggest detail drawings such as now-a-days it would be simple madness to leave unsupplied; he says—"I suppose you had good masons; however, I would willingly take a further pains to give all the mouldings in great; we are scrupulous in small matters, and you must pardon us, the Architects are as great pedants as critics and heralds."

Charles had put the restoration of St. Paul's into Wren's hands since his refusal to go to Tangiers, for he was anxious to remove all evidence of the havoc wrought there by the Puritans during the long years of the Commonwealth. The central spire had long fallen, and the fabric was much defaced, but Wren had no idea of pulling it down; he wished rather to carry on the work of Inigo Jones, whose portico he greatly admired, by the substitution of Italian for Gothic forms, and more especially by the addition for a central cupola. He early laid great stress upon the desirability of a cupola, and we cannot doubt but that the possibilities of such a scheme were foreshadowed in his mind by the work of Alan de Walsingham at Ely, with which he was well acquainted. It was whilst this was engaging his attention, and whilst the buildings at Oxford and Cambridge were in progress, that he took his one foreign tour. Stimulated, very likely, by the prevalence of the Plague, which was then raging in London, he took advantage of the interval of peace between France and England before the war of the Netherlands to go to France. A glimpse of his doings there is afforded us by a letter to a friend in England; he met Bernini, who was busy on the Louvre, and was greatly impressed, not only with the magnitude of that work, but also with its excellence and with the large number of crafts represented, which, he said "make a School of Architecture the best probably at this day in Europe." We may feel sure that he was not lacking in enthusiasm from the following passage in his letter:—"Bernini's design of the Louvre I would have given my skin for, but the old reserved Italian gave me but a few minutes' view." He certainly made the most of his opportunities, and went wherever there was anything Architecturally grand in the neighbourhood. His sketch-book too must always have been in use. He says "that I might not lose the impressions of them I shall bring you almost all France on paper." This trip, undertaken for the study of Architecture, imbued him to a certain extent with the style of Louis XIV. It is worthy of note that he never reached Italy; whether he intended to extend this journey we cannot tell; certain it is that as events turned out he could never be spared from his native land again, and he had to content himself with the accounts which no doubt John Evelyn, and, in after years, his eldest son were able to give him. He turned back to England either at the end of February or early in March, 1660, so that any alteration in his plans cannot be attributed to the Fire.

On August 27th of that year he presented his design for the restoration of St. Paul's; it at once met with favour and was ordered to be put into

execution without delay, but a fate not so kind awaited the venerable pile. Within a week the Great Fire had laid the city low; London, which had boasted its hundred and twenty Churches and more, its stately mansions, and its picturesque streets, was but a smouldering ruin; the work of destruction was complete. Houseless and Churchless, scarcely recovered from the horrors of the Plague, it is difficult to conjecture even what must have been the dejection of the people as they awoke to their deplorable condition. But it is at such times, however, that the indomitable English courage comes to the fore; London was not to be deserted if human agency could set it up again. Never, perhaps, in the world's history have such calamities befallen a city, never had such an opportunity been afforded any master mind capable of the task of grappling with it. The last smoke had scarce blown away, the smouldering débris was not yet disturbed, when Christopher Wren busily engaged himself with a survey, in order to produce a plan for the rebuilding of the city. The opportunity came, and nothing daunted he realized the immensity of it. In due course he presented his plan, and we see what a model city he would have shown to the world, with its streets of uniform width, and "as near paral.el as possible, avoiding all acute angles," its groups of public buildings, and its well disposed Churches. Such a scheme was possible then, and only then, but already there were too many interests to be considered for it to be practicable, and in spite of Wren's efforts the city gradually rose once more on its old irregular lines.

With the return of quiet and order attention was once more centred upon the Great Cathedral, now, alas, a mere wreck of its former self. The design for the cupola, which was in the act of being carried out before the Fire, was now cast aside as being quite out of the question, and for two years everything that could be devised was done to restore the structure and to retain the work of Inigo Jones at the west end. The east end and choir were patched up and made fit for Divine Service, but in April, 1668, the Dean wrote—"What you whispered in my ear at your last coming hither, is now come to pass; our work at the west end of St. Paul's is fallen about our ears." The hopelessness of carrying on the work thus should by this time have been fully realised, but tentative efforts followed till the year 1670, when the necessity for either rebuilding altogether or leaving the whole to its fate became painfully apparent. We must ever be thankful that the former course was decided upon, and that Wren, who had been on the commission from the first, was appointed to make designs for a new structure. We can imagine with what eagerness he began to formulate his plans, full of hope and noble aspirations; but great trials and disappointments awaited him, and little seems to have been done till years after. For the more speedy procedure of the works the King issued his Letters Patents under the Great Seal in 1673, authorising Wren, who was then Surveyor-General of the Royal Works, to make a large model of one design which had met with special favour. This was Wren's favourite design, the one to which he would most willingly have set his name, but it survives only in the splendid model still to be seen at St. Paul's. The clearing of the site had actually progressed for its reception, but objections arose which put a stop to its fulfilment and outweighed any possibility of its ever being carried out. It will be seen from the plan that no aisles or separate chapels were provided, features always before associated in England with the plan of a Cathedral and the outcome of her ritual. The Court in their inner conscience looked forward to the day when this ritual might be recalled, and obviously such a Cathedral would be ill-fitting for the saying of mass and the ordering of processions. Could it not be possible to erect one which might answer all the purposes of the present by affording ample space for the gathering of congregations and the hearing of sermons, and yet if ever the time came, still be available for the change of ritual? The unfortunate Architect thus found himself confronted, and there was no course but to turn his attention to the accepted type of plan and to vest it as only he knew how. His acquaintance with Ely Cathedral served him again, we may feel sure, for henceforth certain resemblances are quite noticeable in the treatment of the plans about the crossing.

Designs were produced one after another, but no one met with the approval of all parties concerned. At last Wren, who knew that his critics were ignorant and worthless upstarts in matters Architectural, produced a design, which, to a cultured eye, is too fearful to be taken seriously. His critics, of course, fell into the trap thus skilfully laid. It was universally pronounced excellent, and the King, on the 14th May, 1675, granted his Royal Warrant for the execution of this "very artificial, proper, and useful design," as he called it. At the same time he gave permission for certain small deviations to be made from time to time as might be considered necessary. Wren no sooner saw himself thus in authority than, with admirable tact, he refused to publicly expose any further designs or models, and proceeded to carry out the work after his own bent. Supplies were not wanting, for, in addition to the tax on sea-coal levied in 1670, every chance had long been seized to raise funds, and plenty had accumulated to allow of a definite start. Throughout these early years after the Fire, when so much controversy was going on about St. Paul's, Wren had his hands full enough with designs of all sorts; they must indeed have been the busiest years in the life of one of the busiest men who ever lived. The life of such a man cannot be spoken of without passing reference to the labours which played so great a part in it, and it will be well to glance at a few of his more important undertakings, leaving any critical and technical remarks to the portion of my paper alloted to them.

Oxford had long been in need of a theatre for public ceremonies and functions; the "comitia" and "encænia" had always been held in St. Mary's Church, and the usual proceedings at such times ill became the sacred walls. At the munificence of a single donor, Archbishop Sheldon, the want was now liberally met. Sheldon had many a time met Wren in conference, and he now entrusted the carrying out of this great scheme to him. The building, still known as the Sheldonian Theatre, was ready for a grand opening ceremony on July 9th, 1669, and pleased everyone, not only for its design, which is said to be based upon that of the Theatre of Marcellus at Rome, but more especially for its construction. The roof over a span of 70 feet is accomplished without any intermediate supports, and unquestionably is a masterpiece of scientific carpentry.

Greenwich Hospital was always more or less on hand. Originally a Tudor palace, it was quite transformed by Inigo Jones and Webb, and although very far indeed from completion was at one time inhabited by Charles, who, early in his reign, placed it in Wren's hands. It was no ordinary problem which Wren set himself to solve, for he was most anxious not to disturb in any way the work of his predecessors, but so to adjust his new portions that the result might be one harmonious whole. This he eventually most skilfully accomplished, and at the same time he was instrumental in its conversion from a Royal Palace to the uses of a Seamen's Hospital. The imposing river front and the glitter of its two domes must ever keep in the minds of all who pass on that great highway of commerce the consummate talent and generous benevolence of the man who thus converted it to such good uses and gave those talents freely for the innate love of doing good.

(*To be continued.*)

THE Todmorden Urban Council has appointed Mr. C. R. Pease, of Batley, surveyor and engineer, at a commencing salary of £125, rising to £200; and resolved to apply to the Local Government Board for sanction to a loan of £45,900 for a sewerage scheme.

A LABOURER named Cox, with other men engaged in the erection of the building in connection with the new St. James Wharf, All-Saints' Street, Caledonian Road, was in the act of raising an iron stanchion, weighing 25 cwt., by means of a slip chain, when one of the links broke, and the stanchion fell, killing him on the spot.

AT a recent meeting of the General Works Committee of the Coventry Corporation, the question of the sewage scheme was discussed. A letter was read from Mr. Mansergh, the consulting engineer, on various points of objection raised by Lord Leigh's agents, but it is expected that the objections will be overcome.

ROOF-COVERINGS AND THEIR MATERIALS.*

By THOS. STIRLING, JUN., F. WALKER, and GEORGE EWART.

SLATING.—By THOS. STIRLING, JUN.

THE period of the formation of slate was a very early one, and belongs to the Cambrian and Silurian eras, that found in Wales being of an earlier date than the upheaval of the Alps. Slate is one of the primary rocks, and was originally composed of clay diffused amongst the ingredients of granite, forming what are known locally as veins. Slate has assumed its present form by volcanic action, the fine grain and closeness of the texture varying with the amount of pressure brought to bear on it, the nearer the heart of the mountain the better the slate. This action probably took place before the clay had hardened. In this country, these veins run in the same direction, usually from south-west to north-east; they are not found to exist anywhere north of the carboniferous line. The largest vein existing in this country is the one known as the Bangor and Carnarvon; this runs, with little interruption, from the Penrhyn Quarry, through Llanberis, to the Nantte valley, where most of the Carnarvon quarries are situated. Other sources of supply of regular-sized slates are widely apart, the largest regular one being Alsace. A large quantity of red, green, and blue are being sent over. The red slates are similar in colour to those found in the Bangor and Carnarvon veins, and are probably the best foreign slates at present obtained. The green is well known under several names:—Permanent, Sedan, German, Belgian, and Imperial, and is the cheapest green slate in the market. They cannot altogether be recommended for London use, as they contain a large number of specks of iron pyrites, which, after a time, oxidise and break up the surface of the slate. A fair number of dark blue slates are now sent from France; they are very thin, and not to be compared with Welsh slates of similar colour. I have no experience of their durability in London, or, in fact, in this country. America is the remaining source of supply, but, from what we hear, this is not likely to remain steady. They are now sending a large quantity, but this is only the surplus and old stocks which have accumulated for some time. At present they find a market readily, principally amongst small merchants and builders. Generally the larger merchants pin their faith to the Welsh slates, and, as long as they are supported by Wales, will not purchase these largely, if at all.

SLATES FROM CUMBERLAND AND WESTMORLAND

are, as a rule, obtained in random sizes, and vary much in colour, size, and thickness. Generally, the colours of best and seconds are similar, especially in Elterwater and Newtons, where only one colour is worked; but in some of the quarries where two or three shades are found, they are not very carefully sorted; the result is that a slightly speckled effect is produced when close to, but viewed from a distance this is not noticeable. One instance in which this effect has been purposely worked is the house erected for Mr. Beit, in Park Lane. Buttermere thirds were used here, and a mixture of light green, dark green, and deep olive green is seen. A few of the quarries supply slates cut to regular sizes, specially to order, and at a considerably increased price, which makes the work rather expensive. Westmorland slates used in this way lose much of their characteristic effect, and, in my opinion, do not look worth the extra cost above an ordinary green regular-size slate. The slates entitled to the term best Bangor are those produced at Penrhyn and Dinorwick Quarries. Unfortunately few of the best slates from either of these come to London.

FOR LONDON USE,

where appearance is a secondary object, I cannot suggest better slates than the best tons and best mottled. The best tons are capital slates for church roofs. They are laid in slightly diminishing courses, and show about 15 in. at the eaves, and reduce to about 9 in. at the ridge. They are

* Extracts from papers read at the Architectural Association on Friday night.

of a bluish-grey colour, with a tinge of green. The best mottled are so called from the splashes of green in them, and are similar in colour and quality to the best tons, but are somewhat thinner and are supplied in regular sizes. As a matter of experience, actual size has little to do with the quality of the work. If any preference is to be given, 16 in. by 10 in. is probably the best-sized slate of any. For very sharp-pitched roofs and curb work I recommend 16 in. by 8 in., or 16 in. by 9 in.; these slates are lighter and do not hang so heavily on the nails, and having more nailing in proportion to the larger sizes, lay firmer. For flatter pitches, the wider the slate, if of good quality, the better. In a slate 12 in. wide you have quite 4½ in. clear from the joint of the slate above to the nail hole; whereas in a 10 in. slate you only have 3½ in. For medium-pitched roofs, slates sized 16 in. by 12 in., 18 in. by 12 in., and 20 in. by 12 in., make good work. The neatest sized slate I know of is 18 in. by 9 in., and for a roof of 105 degrees this will make good and very neat work. A fact worth noting is that the rougher the slate the less chance of any leakage through rain blowing over the lap; this is accounted for by the greater quantity of air between rough slates than between smooth ones. In proof of this, try and separate slates that have been piled on top of one another after a day's rain. You will find that the moisture has worked in between the slates and excluded the air, and that considerable force is required to separate them. The same action takes place on a roof where the slates fit closely on top of each other; the moisture gathers and finally spreads over the lap or finds a vent through the nail hole. In the slates used largely in Devonshire and Cornwall this is very liable to occur. They are very smooth, and the rain there is more like mist, and quickly finds an inlet, so much so that in most cases the slates are bedded solid in putty. Formerly they were bedded in lime and hair, but that is worse than none at all. It simply acts as a sponge, soaks the damp in, and although it prevents leakage in any quantity, keeps the whole roof damp, and in course of time rots the woodwork. The action of the lime in time

DESTROYS THE SLATES.

The most effective way of dealing with this trouble by means of cement or compositions of that nature is torching; but this is not an entirely satisfactory job, as any vibration in the roof is liable to break the joint, which of necessity is a very fine one; torching can only be done on battened roofs where there is no boarding. The above remarks apply to nearly, if not all, slates of a smooth surface. The slates from the Westmorland and Cumberland districts are fairly representative of the various kinds, and make the most picturesque roof covering of any kind of slate, and this, combined with their extreme durability and the necessity of having men specially trained to use them, as a rule ensures good work. Slating is usually laid piece work, but in this particular class of work we do not make this arrangement, as much for our own benefit as that of our customers. The slater has more work in sorting, trimming, and holing the slates than in the actual laying, and it is necessary for him to set out the whole side of a roof on a rod in the various courses before he can lay a single slate. This frequently causes delay, especially where the builder has been late in giving the order. This is particularly the case where very deep slopes have to be covered, such as church roofs; nearly all the slates must be sorted before the slater can give the gauge, otherwise it is not possible to obtain regularly diminishing courses.

TO SORT THE SLATES PROPERLY

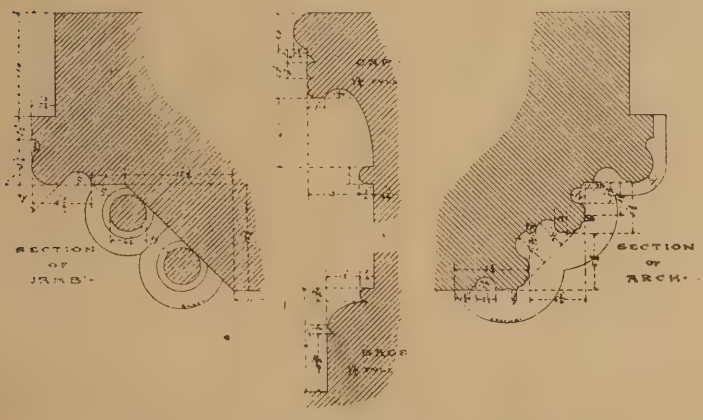
a good deal of space is required, and in large city jobs we are often in conflict with the builders over the space taken up. In using slates of random widths it is, of course, impossible to lay the slates with the joints lining vertically; if this were done much of the characteristic appearance would be taken away, and the effect little better than in ordinary cheap green slates, and the extra substance would be the only advantage. Nails used in this kind of slating are very much stronger than those required in ordinary slating; they should be of the following numbers to the lb.: 2 in., 90 = 1 lb.; 1¾ in., 100 = 1 lb.; and 1½ in., if any are used, 130 = 1 lb. I have sample lots of the nails I recommend for this class of work, and which we invariably use. I should mention that it is impossible to use these heavy nails with thin slates, the spall made in ordinary slates when holding is not large or deep enough to take the extra heavy heads, which, if they are not properly recessed into the slate, have a great tendency to break the slate laid over them, and, if it does not do that, prevents the slates from laying properly. We have had at various times considerable trouble in remote country places when using Westmorland slates; they seem to frighten the country slaters. Certainly they do not appear to advantage when roughly stacked up, and the inexperienced eye of the local slater, whose occupation is usually of a composite character, and who is probably a better authority on rough plastering, pan-tiling, painting, and bricklaying, cannot see how a sound job can be made. To such an extent does this feeling exist that they have, in most cases, succeeded in thoroughly upsetting the proprietor; it is, however, surprising to find how their mind alters during the progress of the job. I cannot recall a single instance where we have had to return to remedy any defect in Westmorland slating beyond the repairs inevitable before the various trades have finished. In places away from the sea, if the roofs are boarded, felted, and battened, I should suggest the addition of vertical battens if the situation is very exposed, say on the top of Hind Head. This course will be quite effective, as any moisture that may be blown over the lap will disperse, and quickly dry up before it has time to do any damage; whereas if the roofs are battened in the usual way there is a stoppage, the batten prevents the moisture dispersing, and the leakage will in course of time become serious. In addition, the current of air keeps the roof very cool during the summer months, and also preserves the slates, which, if cut off from ventilation, are subject in course of years to dry rot, which takes place particularly where slates have been laid in felt on boarding only, reducing the parts of the slates not exposed to the atmosphere to a powder. I am certainly of opinion that if Westmorland and other random-sized slates are used by competent men that a sounder, better, and more

DURABLE ROOF IS THE RESULT.

Unfortunately, the roof originally specified to be covered with good slates is the first thing to be cut down in cost, if circumstances demand a reduction. I note a growing demand for thicker slates, and shall do my best to foster it. Slates are, as a rule, much too thin, but I venture to think that some of the samples I have lately seen will fulfil all requirements, and I shall be only too pleased to give any further information about them. One point I should like to touch on is the covering of domes. We can make a good and effective job by using small slates, 8 in. long. On a small scale this has been done lately at the Royal Observatory, Greenwich, with good effect. I do not think it possible that ornamental work, except in variation of colour, could be worked, owing to the gradual tapering of the slates used as the summit is approached. For a good example of slating in a variety of colours I would refer you to the main building of the Oxford University Museum; the additions have been done since, but a great deal of trouble was taken by the Architect, Sir John Dean, to have his idea carried out, and each section was carried up to the ridge temporarily, and any alterations made that suggested themselves, till the effect desired was obtained. I fear I shall be going from my subject if I touch on slate slab roofs, and I will not do more than refer you to two or three instances:—Front of Camberwell Church covered with Delabole slabs and roll; Herbert Hospital, Woolwich Common, covered with blue Welsh slabs; Sun Fire Office, Threadneedle Street; Registry Office, Edinburgh, covered with Bangor slabs. I think we slaters have one grievance, or at all events something that remains an eyesore to those that take an interest in their work in after years, and that is the ugly stains made by the drainage of lead flats down green slates. This is very noticeable at the new Admiralty Buildings in St. James's Park, and has partly spoilt the effect of the green slates on the roof there.

TILES.—By F. WALKER.

In dealing with tiles as a roof covering, the first thing to be sure of is that you have selected a tile capable of excluding all dampness from your dwelling, and at the same time withstanding the disintegrating influence of the weather. The characteristics of a good roofing tile is density, combined with toughness and incipient vitrification, the last named quality producing, to some extent, that pleasing tint familiarly known as "bloom," one of the peculiarities of the Brosely tiles. Tiles of a bright red, or an earthy red, colour, should be looked on with suspicion, and avoided. They are invariably absorbent, and will not "weather" well. To ascertain the comparative merits of tiles, as to their weathering properties, there is no better test than the amount of water they will take in. Most roofing tiles are slightly absorbent, unless you get the highly fired brindled and blue tiles; and for this reason old tiles have, in a few isolated instances, attained to a higher market value than new tiles, as by age and atmospheric deposit they have acquired an artificial surface coating, and lost the property of absorption—at least on their outer exposed surfaces, though I am inclined to think that they have been desired more from an æsthetical point of view than otherwise, as in the case of Colonel Makin's house in the Exhibition Road, South Kensington, built some sixteen years ago, and roofed with old tiles. The old-fashioned tiles have no nibs or stubbs for hanging, and must therefore be kept *in situ* by means of two wooden pins or nails. In the old days the oak pins, by reason of their unyielding hardness, were a fruitful source of breakage when driving them through the sometimes badly-formed pin-holes at the ends of the tiles. Still, as far as absorption goes, the best kind of modern tiles are capable of excluding all dampness from your dwelling if they be laid with due regard to other conditions, with which I now propose to deal. Where tiles are bedded in lime-and-hair mortar the tops only should be bedded, the mortar extending say, not more than three inches below the head of the tile. If brought too low it may become a source of dampness in exposed situations, by reason of its capillary attraction. As a matter of personal opinion and experience, I would slightly gauge with Portland cement all lime and hair used in the bedding of roof tiles, the additional cost being very small. Where your roof is close boarded (and sometimes felted) there is no need for bedding, though, of course, a covering of bedded tiles is less liable to breakage in climbing about a roof than would be one of unbedded tiles. By gauging the lime-and-hair mortar you make it practically non-absorbent, and therefore less likely to attract and take up moisture.



SECRET GUTTERS

at dormer cheeks and elsewhere often become a source of dampness as a consequence of the tiler thoughtlessly beating down the plumber's lead welt or turn over, purposely formed to check or keep back the rain, that his tiles may lie more evenly and in the same plane as the general inclination or slope of the roof. Sometimes the battens, both in slating and tiling, are wrongly carried over the lead welt and nailed through it, in which case you are very likely to get water into your roof. The lead welt should stand its own thickness above the backs of the battens, forming a tilt for the tiles, so as to throw the water away from their edge on to the main body of the roof—the secret gutter performing its proper function by receiving and carrying off the water from the dormer itself, or from any gutter discharging immediately above it. The tiles over-hanging secret guttters 1½ in. should not be bedded on the lead, nor their edges pointed. In some cases where this has been done I have found rain drawn into the roof. Tiles, and tile-and-a-half, should be worked against all secret and other gutters, where practicable, alternately on each course. Secret gutters should be such, and in positions where they will always clear themselves; especially where the dwelling is surrounded with trees. Where the roof runs into a vertical plane or parapet wall, 4 lb. lead-soakers, finished with a skeleton flashing, are always a safe arrangement, though they give the tiling an untidy appearance by preventing the tails of the tiles lying close on the backs of the tiles immediately beneath them. Where a wall cuts obliquely into a roof this arrangement is indispensable. Stepped flashings, with lead extending 6 in. on the roof, should not be used, because of the necessity of distressing the lead to fit the backs and steps of the tiles, and the likelihood of breaking the tiles in the act of so doing. In a tiled roof, valley and hip tiles should be used in preference to lead gutters, secret or otherwise, bedding the valley tiles at their heads to keep them *in situ* and steady while

laying the plain tiles; but laying the hip tiles dry, keeping them in position by a single nail at their head.

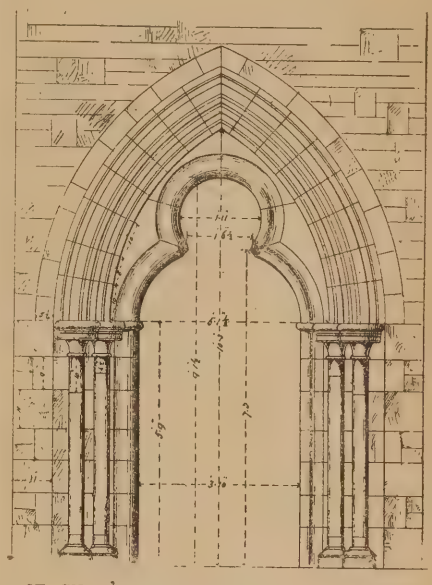
HIP AND VALLEY TILES

should not be ordered without proper regard to their enclosed angle or pitch, as they often appear to be, judging by the appearance they make on many roofs in our midst. There is one thing I would like to especially impress upon Architects—the desirability of making the roofs of dormers and gables, springing from and intersecting the main roof, of the same pitch or inclination as the roof, their intersections with which form the valleys. If this is not done, purposely made valley tiles must be obtained, for all hips and valleys stocked by tile-makers are for roofs whose sides have an equal pitch, or else lead gutters must be resorted to. If the ordinary stock valley tile be used, it will be found that the line forming the tails of the plain tiles in each course will fall either below or above the bottom of the valley tile in each case on *one* side of the roof; and so unsightly and distressing is the result, that in one instance I found it necessary to paint the valleys into straight lines that the correct sense of the eye might not be annoyed by looking at them. Where a minor roof runs in at right angles to a greater, or main roof, intersecting it at a point below the main ridge, it is desirable to use a piece of 4-lb. lead dressed to the shape of the minor ridge, and the slope of the main roof, and called a saddle-piece. This, placed over the tiles on the lower roof and under the tiles of the main, or higher roof, prevents the possibility of rain getting in at the junction of the roofs; and the lead can be of such an area as to be covered by the ridge tile, the appearance of lead in a tiled roof being objectionable wherever it can be avoided. The verge should start with *straight* tiles running from the eaves to the ridge (unless interrupted by a chimney-

DETAILS OF INNER DOORWAY, ST. CHAD'S CHURCH.

stack) and be bedded on the outside 4½-in. of the brickwork—the battens being cut back 4½-in. for that purpose. The outside brickwork should be cut up to the rake of the roof and nearly flush with the back of the hanging battens, that the verge, when completed, will have a tilt on its outer edge of at least ½-in. to throw the rain on to the body of the roof, and so avoid rain drippings from the verge. The tiles to be used on the verge should be soaked to saturation, and allowed afterwards to drain, and then bedded in Portland cement, as by reason of the battens being kept back 4½-in. from the face of the brickwork there is fixing for one nail only (or stubb) for each tile. The verge generally projects from 2-in. to 2¼-in. beyond the finished face of the wall, and is finished either with a plain or angular fillet at its junction with the brickwork. The roof tiles on the verge should be alternately tile and tile-and-a-half (gable tile), in its line of direction, and the same remarks apply to the cutting up to hips and valleys, small strips of tiles being undesirable where they can be practically avoided. The under-eaves tile is seldom used in practice in the way intended by the tile-maker. The tiler simply knocks off the two stubbs or hanging nibs and beds them on their backs, the reverse way intended, for the purpose of getting the under-eaves edge close fitting to the eaves-tile bedded immediately on it, the under-eaves being twice nailed, in addition to the security of position obtained by the tilt or spring of the roof.

RIDGE TILES



should be of such a section as to admit of being pressed or made in one piece. Where an ornamental cresting is required, it should be made as a separate piece entirely detached from the ridge tile proper, the latter being made with a groove to receive the cresting, as shown in Vol. II, "Rivington's Notes on Building Construction." Under no conditions should the cresting be stuck on the ridge tile by means of semi-liquid clay while they are in the clay state. Such work is more or less defective and unsatisfactory in the end. The simplest form of ridge tile, and therefore the best, is that used by the London School Board, consisting of the two wings terminating in a roll at their angle of intersection. Another good form of ridge tile is that of a plain vertical blade rising from the angle of intersection of the wings, and with the square angle at each end of the blade cut off at an angle of 45 degrees; and which can be pressed in one piece by a simple operation. The weakness of this form of tile is at the junction of the crest with the wings, where it is apt to get broken in transit or careless handling. Ridge tiles should be well soaked before use, bedded in gauged lime-and-hair and their vertical joints drawn up solid with cement, not simply pointed after they are fixed.

THE USE OF DOWELS

I consider altogether unnecessary where this is done. A tile, 9 inches in length, is made specially for the last course of plain tiles coming immediately under the ridge tiles. Where the roof is enclosed on the under side it is customary to bed in lime-and-hair the eaves-courses only for the sake of steadiness in the fixing. In one instance I have seen the rafters pugged (in the same way that you would pug a floor) by nailing a fillet on each side of the rafters, about central in their depth, and then lathing between the rafters, and plastering the same from above with mortar and chopped hay, the rafters being afterwards open-battened to receive the tiles. In another instance I have known the tiles to be laid on open battens and bedded in straw, the Architect claiming that the straw prevented the incoming of snow, and did not prevent the air getting at the roof-timbers for their preservation. Well-formed roofing tiles are straight in their width and hollow in their length, that the tails of each course may lie close and tight on the backs of the undercourse. Straight tiles will not clear themselves one over the other, and should therefore be rejected. Where pointing is necessary—on the verges, for instance—it is customary in good work to grind down some of the broken tiles to mix with the Portland cement as a substitute for sand, that the finished pointing may approximate in colour to the general tone of the roof covering. In the case of vertical tiling, it was customary to hang and nail the tiles on battens fixed to a brick-nogged, or to an ordinary 9-in. wall. I am told this is not now permissible. Under these circumstances, it seems to me that the proper alternative is the use of Wright's patent fireproof bricks—or bricks somewhat similar—which are capable of being nailed into, by the use of which the 2-in. by ¾-in. hanging battens may be dispensed with, the tiles being nailed into the bricks, and the tilt obtained by one or two sailing-out courses at the level where the vertical tiling commences.

COPPER, LEAD, AND ZINC.—By GEORGE EWART.

As against slates or tiles, sheet metal as roofing material has obvious advantages. The sheets of metal may be depended upon to keep the water out from roofs constructed very nearly on a level, that is to say, with only just slope enough to give a fall for water, while tiles or slates require a considerable pitch. Then, if the metal is either zinc or copper, there is the important advantage of lightness; and, finally, sheets of metal are not liable to the dangers of being cracked or slipping off, as tiles and slates are. As to the difference in weight, I may mention here that for a 100 ft., whereas copper, well laid, will weigh only about 1 cwt. and zinc 1½ cwt., slates to cover the same area will weigh from 6 cwt. to 7 cwt., and tiles

ST. CHAD'S CHURCH, LICHFIELD. INNER DOORWAY OF SOUTH PORCH.

about 14 cwt. In attempting to compare the relative claims of each of the three metals—lead, zinc, and copper—as materials for roof covering, one has first to consider what are the chief requirements for a material used for this purpose. These may be stated in the following order:—First of all, durability; then, lightness; then, workableness; next, capacity to resist fire; and, lastly, insonorousness. Though lead is so very much heavier than the other two metals, its want of firmness is still more conspicuous, and, on the whole, roughly, it might be guessed that lead and copper would, surrounding conditions being equal, be of about equal

DURABILITY,

particularly as neither of these metals is easily acted upon by acids. As to zinc, although it occupies a middle place between lead and copper, both in the matter of weight and also of firmness, it is yet quite out of the competition as to durability from the fact that acids act upon it with great facility. The softness of lead has its advantages, since it is easy to use it of great thickness, while at the same time the low price makes it possible to do this without a prohibitive outlay; so that lead may be laid of a thickness weighing perhaps 6 lb. or 7 lb. to the foot as easily as copper weighing only 16 oz. or 18 oz. to the foot. And at these relative weights it would be fair to assume that the metals would be about equally durable. In laying either of the metals, care has to be taken to allow for expansion, and if the proper methods are adopted much can be done to prevent the injurious effects of it; but in considering the relative durability this property must not be forgotten. There is one other thing to consider—viz., the capacity to bear traffic without injury. Flat roofs are very likely to be walked over, and to have things placed upon them, round or under which dirt or moisture can collect. On account of its extreme softness, lead, unless very thick, is easily damaged by traffic; and zinc, although harder, is brittle, and is also easily corroded by foreign matter; and both, as already mentioned, are exceedingly liable to buckles and cracks. Copper, on the other hand, is so tough that it is

PRACTICALLY UNINJURED BY TRAFFIC,

and little liable to corrosion. It should, however, be laid with wood rolls and welted caps, and not according to the old method of stand-up welts. So far for flat roofs. For pitched roofs and

towers or spires the great weight of lead is much against its use. In such positions lead has a way of crawling down, as it is called, and this is a very destructive process and greatly shortens its usefulness. The extreme softness of lead makes it unfit for ornamental work. It is always necessary, when lead is being used, that the wood should first be formed into the shapes, and the lead dressed closely over these; on account of their stiffness zinc and copper do not require the mouldings and ornaments to be formed in the wood, but are sufficiently supported by a rough wood core. Zinc, however, suffers in the process of stamping and hammering, as it is seriously injured by the application of heat. Copper, on the other hand, may be heated to a red, or even a white glow, and then immersed in cold water, without being in any way injured, but by this annealing, as it is called, is rendered soft and pliable, and regains its stiffness under the hammer or stamp. On these accounts copper has come to be very much used for ornamental roofs and for spires, flêches, finials, figures, &c., for which it is also specially adapted on account of the little weight per foot which it is necessary to use Lead has been so very largely used for roofs for many hundreds of years, that it is unnecessary to quote instances as to its lasting power when properly laid on flat roofs, but as the durability of copper is not so well known, I may mention one or two examples. The tower of the Parish Church of Hampstead was covered with copper in the year 1784, and the copper is still in good condition, being of a beautiful green colour. Some years ago, however, in a severe gale, two or three of the sheets were blown off, and had to be replaced by new sheets, which, of course, have still the dark look. Next to the paramount question of durability comes that of weight, or rather of

LIGHTNESS.

Here, of course, lead cannot stand comparison with either zinc or copper. Lead is so soft, and has so little coherence that in order to make a good job, it is found necessary to lay it very thick—nearly ⅛ in. But, at the same time, lead is exceedingly heavy, so that a square foot of this thickness weighs upwards of 7 lbs., it thus happens that when allowance has been made for the necessary rolls and laps, the lead necessary to cover a square of 100 ft. weighs rather more than the slates which would be necessary to cover the same area, and at least half as much as plain tiles. Zinc, on account of its superior firmness, is laid in the best manner at about one-fourth of this thickness and less than one-fourth of the weight, say, 1½ lbs. to the foot; but then, as already mentioned, zinc cannot be relied upon to stand more than about one-fourth of the time that lead will. With copper, however, the case is different. Here we have at least equal durability to that of thick lead, with a thickness still less than that of zinc, and a weight of only 16 oz. to the foot. On new structures, substantially built, the question of a few tons, more or less, upon the roof, is not, I suppose, of very serious consequence. Yet, even in such structures, it may be often worth while to be able safely to use lighter timbers; but for an old roof, where the supports are not too strong, a few tons, one way or the other, may make a very great difference. It is unnecessary to add that as a covering to spires, flêches, domes, and suchlike erections, the comparative lightness of copper makes it exceedingly appropriate. Coming now to the next desideratum in a roof-covering, which, for want of a better word, I have been obliged to name

"WORKABLENESS,"

I must explain that I mean by this the possibility of being turned up with moderately sharp angles and twisted over into welts. As already mentioned, all the three metals under consideration expand and contract with changes of temperature—though copper very much less than either zinc or lead—and therefore all require some arrangement which will leave them free to expand and contract without blistering. And then, of course, the sheets have to be somehow joined together, and the joint is to be made, if possible, without solder. For it is found that the places where soldered seams have been made perish long before the rest of the metal is worn out. Although lead is so soft, yet on account of its great thickness it cannot be easily welted, and requires large rolls. On the other hand, its weight and softness incline it to lie close even without joints, only then, of course, it is easily displaced. Zinc, being the most expansive of the three metals, and being also more brittle than lead, requires great care in laying, and the provision of very free play for each sheet, both at the ends and sides. On this account, many drips are needed. This is something very objectionable on account of the increase in height. Copper, on the other hand, expands so little that if wood rolls are used at the sides of moderately-wide sheets, the ends may be safely welted together in considerable lengths, and so few drips are necessary. At the same time, copper is so easily worked that welts are readily made, and may be used not only to connect the sheets in lengths but also to fasten them to the roll-caps at the sides, thus making a very firm and light covering. As a fireproof material, copper is immensely the best of the three metals. The last property I named as required in roof-covering was Insonorousness. Here lead has the immense advantage of its exceeding softness, and the same quality of softness makes it a non-conductor of heat. Lead has the advantage over copper of making much less noise in driving rain or a hailstorm, but copper has perhaps still greater advantage over lead, being only about one-sixth the weight, being almost absolutely fireproof, requiring very little support in ornamental work, having only a little more than half the expansiveness under heat, and consequently requiring fewer drips. To which may be added its capacity for being easily welded, and, finally, the beautiful colour which it becomes from a damp atmosphere after a few years of exposure.

KEYSTONES.

A DESTRUCTIVE fire occurred at Bradford last week, at Penny Oak Mills, the property of the Bradford Banking Company. The mill was gutted, the damage being estimated at £30,000.

MR. H. HEMMINGWAY, retired builder and contractor, of Sheffield Road, Hoyland Common, when about 300 yards from home, was, last week, thrown out of his trap and killed.

A WATERSPOUT has burst over the village of Povoacao, not far from Ponta Delgada, in the Azores, destroying the most important part of the place. There was considerable loss of life.

IN Paris a use has at last been found for the nearly empty Invalides. A military historical museum is to be installed there. Old trophies, it is hoped, will thus be saved from destruction.

Mr. Crouch, C.E., Glasgow, has been appointed consulting engineer by the Dumbarton Board for the new bridge which is to be built over the River Leven between Alexandria and Bonhill.

THE additions to Ayr electric lighting works are likely to take a more extended form than was at first contemplated. Mr. Robert Hammond, the consulting electrical engineer, has received instructions to prepare specifications for two sets of plant, each capable of generating current for 6,600 lights.

MR. ALMA TADEMA has sent to Florence a portrait of himself, which he was invited to contribute to the gallery in the Uffizi, of portraits of eminent arrists painted by themselves, among which are to be found those of Lord Leighton and Sir John Millais.

THE cross of Siberian jasper, sent by the Russian Government to be erected in Northwood churchyard, in memory of the late Sir Robert Morier, formerly British Ambassador at St. Petersburgh, has been landed at Millwall Docks. The instructions for the cross to be cut at Peterhof were given by the late Czar before his death. The cross was especially made from Siberian jasper, with the view of commemorating Sir Robert Morier's successful efforts to open up Siberia to British commerce.

IT is stated as a curious fact that Lambeth Palace has never been properly safeguarded from fire. So far as can be gathered the only water supply actually available on the premises, and the means of bringing it into play are utterly inadequate. It may seem absurd to talk of danger from fire to a building standing on the very edge of the Thames, but a little consideration will show that to leave such a treasure-house for preservation by road or river is not wise. It is expected that Dr. Temple, on entering into the tenancy, will see that such work as is necessary to put the palace into a thoroughly safe condition will be carried out.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
November 11th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

REFERRING to our paragraph last week, calling attention to the rector of Burnham Thorpe's appeal for funds for the restoration of his Church (p. 202), a member of the Society for Protection of Ancient Buildings calls attention to the extraordinary and sometimes grotesque reasons put forward by the incumbents of Churches for the purpose of obtaining subscriptions from the public. The death of an archbishop, bishop, or any other prominent personage is always considered a sufficient reason for restoring or enlarging a Church to his memory, and a proposal has been recently made to build an additional tower to Truro Cathedral as a memorial to the late Archbishop Benson, he having been at one time Bishop of Truro. Elstow Church, near Bedford, was restored on the plea that the immortal and enthusiastic tinker Bunyan, was born at Elstow, and had worshipped in the Church in his youth, the beams of the 14th-century oak roof (which was removed as being unsound), being sawn into slices and used as covers for binding a new illustrated edition of the Pilgrim's Progress. The vicar of St. Lawrence-on-Sea, near Ramsgate, succeeded in raising a considerable sum for the purpose, among other things, of removing the mediæval external plastering from the curious Norman tower of his Church, on the ground that Her Most Gracious Majesty, when residing in the neighbourhood must have in passing frequently gazed upon the tower of the Church. But perhaps the most curious reason assigned for restoring a Church, is that recently given by the rector of Fleet, Lincolnshire, who proposes to restore his Church to the memory of his late wife, and is soliciting subscriptions for that purpose.

AT last week's meeting of the London County Council, considerable discussion arose from the investigation by the Comptroller of certain accounts sent to him by the Works Department for examination. It appears that the system adopted by someone in the employ of the Council had been to debit one job with material which was supposed to have been used on another, and at a greater price than it originally cost. Thus, by way of illustration, it may be stated that when on one job, say, at Islington, it was found that there was about £500 worth of material left, this quantity would be handed over to a job, say, at Streatham, and debited to that particular work always at £500, but more often at £700. Thus £500 worth of materials was made to show in the books as £1,000, and this, naturally, was the means whereby "profits" could be shown.

IN course of time all the main thoroughfares of the metropolis will be provided with subways for the accommodation of pipes and mains. The convenience would be immense, as the constant interruption of the traffic by the breaking up of the roadways would be obviated. The Highways Committee of the London County Council, to which the question was referred in January last, has reported that the lowest estimate of the cost is £46,000 per mile, while a more elaborate system, with occupation vaults on either side of the road, suggested by Mr. Emden, would involve an outlay of £98,208 per mile! Against this last expenditure, however, is to be set an estimated return in the shape of rentals for the vaults and payments from the water, gas, and other com-

panies of £3,942 per annum. The Committee regards the first estimate as prohibitory, and the second as untrustworthy so far as rentals are concerned, and impossible in face of the opposition the scheme would encounter in Parliament.

MR. JAMES F. FIELD, the President of the Auctioneers' Institute, delivered the inaugural address last week at the Institution in Chancery Lane. He dwelt with his subject under the heads of laws affecting land, the law of distress, land transfer, the Building Act, drainage, rating, the law and practice of compensation, sale results, probate valuations, and the progress made by other institutions similar to their own connected with the profession. In opening, the President said he hoped the status of auctioneers might soon be raised by the election of one of them to Parliament, where the multifarious details with which they, as a body, had to grapple would, when their adjustment came before the Houses in bills affecting land, have some exponent of the views of the Institute. Dealing with land sales, he remarked that the profession seemed to be emerging from the recent period of depression, for the sales recorded to October 1st, 1896, exceeded those for the corresponding period of 1895. They had still, however, much leeway yet to make up to get back to the prosperous times of the seventies. It was satisfactory, too, to note that the benevolent fund of the Institution, although not sufficiently developed, was receiving increased support. In conclusion, he congratulated auctioneers as a body upon the progress they were making.

FLEET STREET has at length commenced to be widened, but how many years will elapse before this much needed work is completed no one can guess, and it may be that the end no one now living may see. Two or three new houses at the Ludgate Hill end of Fleet Street have risen above the ground level, with fronts set back to the line to which the whole of that side of the thoroughfare is intended ultimately to conform. The improvement thus effected will be enormous, but so likewise will be the cost; and it is apparently in order not to increase the latter consideration that the widening will be effected only as leases fall in or other convenient opportunities occur. But though this may secure a present saving, it will assuredly prove more expensive in the end, as the experience of widening Ludgate Hill sufficiently shows. The piecemeal process was adopted there, and it occupied thirty years, with the consequence not only that the value of the property to be taken doubled within the period, but that new interests were allowed to be created and additional claims to be accumulated, which enormously increased the cost.

MR. G. A. STOREY, A.R.A., recently read a paper before the members of the Camera Club upon "What an Artist has to say about colour." To the Artist, he said, the subject of colour was of absorbing interest, and, he considered it as necessary to a picture as gold was to a guinea, and one of the chief elements which gave it real and lasting value. He could almost go so far as to say it was the one element which distinguished the true from the false in painting. Speaking of the scientific aspect of the question, the Artist had this one great consolation, that, while science taught us that things were not what they seemed, Art depicted their aspects and showed us what they seemed although they were not. So that while science told us that there is no such thing as colour, our ordinary senses told us that nature was all colour, and that she was decked in thousands of tints a thousand times reflected; nor could we get rid of the idea that poppies were red, the grass green, daisies white, and violets blue. If the photographer was an Artist he would long for colour, and wish to make the best of the monochrome in which his work was produced. If, as science said, there was no such thing as colour, a study of the scientific aspect of colour might save those photographers who were striving to produce photographs in colour, a deal of trouble, for if colour did not exist how could it be photographed, unless, indeed, the very plate itself were intellectual and saw what did not exist. The lecturer gave the grammar of colour; its words, namely its tints; its sentences, namely its combinations of tints; and, finally, its song, the complete composition from which nothing could be taken, and to which nothing could be added without destroying the harmony.

IN view of the large extent to which iron is used in building operations at the present time, the following general conclusions, arrived at be a Commission appointed by the Hamburg Senate to examine and report upon the resistance to fire offered by wrought-iron pillars used in construction, are of great interest. They withstand fire very imperfectly, their stability being quite destroyed at a temperature of about 600 degrees C., and the advantage of filling them with concrete is so slight as to be scarcely worthy of consideration. The case is, however, far different with outer coatings of refractory or non-conducting materials, which have proved capable of protecting the metal from a dangerously high temperature during a certain space of time, and consequently of affording effective protection against fire. According to the Journal of the Society of Arts, the substances which appear to have exerted the best effect are a special cork composition and xylotile encased in sheet iron, which substances give out inflammable gases for two hours and a half, leaving a carbonaceous residue that is not destroyed by the stream from the fire hose. A pillar thus coated only gives way after being exposed to the fire for four hours, while seventeen minutes suffice to destroy it if uncoated when similarly heated.

IN Glasgow at the first general meeting of the fortieth session of the Institution of Engineers and Shipbuilders in Scotland, Sir William Arrol delivered his presidential address, and congratulated the members on the continued prosperity of the Institution. Their membership was 768, and as 33 members were to be balloted for that night, they would start the new session with a membership of about 800. It was pleasing to think that the influence of the Institution was still extending, and that their representations on engineering and shipbuilding questions carried considerable weight in the proper quarter. It was well that they should consider if their Institution might not do more for the engineering profession, in which they were all so directly interested. One suggestion for increasing the usefulness of the Institution was that they should appoint local honorary secretaries in some of the leading engineering centres in Scotland outside of Glasgow, such as Edinburgh, Greenock, Kilmarnock, Paisley, and Dundee. There was no doubt that in this country they wanted good technical colleges and schools. In Glasgow they had had a good technical college for the last 100 years in the Andersonian College, and some of the greatest men in their country had come through that Institution. But at the same time, Glasgow had been very far behind in this question. Up till recently the University had not had such a thing as an engineering laboratory, but he was glad to say that difficulty had been overcome. Some time ago the Bellahouston Trustees offered the sum of £12,500, if a similar sum was raised in Glasgow, for the purpose of building an engineering laboratory at Glasgow University. He was very glad to say that that sum had been obtained within about £100. He also believed that the Bellahouston Trustees were prepared to give £25,000, if the people of Glasgow would raise other £25,000, for the purpose of building a technical college to replace the present one, and he thought that sum would be forthcoming, and that they would have a college which would answer the purpose for the next generation. A great number of their young men, however, counted too much on the technical education they got in schools, and thought they were superior to the ordinary apprentices who had only a good plain education. Young lads were kept far too long at schools, and got notions that they should not go into the workshop and learn to work like other people.

A CONTEMPORARY asks why it is that wall-paper makers abandon old and favourite patterns for new and untried ones, and says, "Common sense would lead one to suppose that so long as there was a demand for a pattern it would continue to be on sale; but not so, if the statement of one of the first houses in the trade is correct—namely, that they never keep a pattern in stock more than two years. This may account for the mediocrity which characterises most of them." Wall-paper patterns, like many other things, depend upon the fashion, and the manufacturers are bound to keep pace with the times or "go to the wall." For our own part we think the designs of the present day by Walter Crane, George Haité, Voysey, and others, compare more than favourably with any of those no longer in general use.

CERTAIN alterations which are now being carried out by the Benchers of the Inner Temple are arousing a good deal of criticism in the Temple. A new entrance to the Common Rooms and Hall is in course of construction. Two or three sets of chambers have been absorbed into the Common Rooms, and a new porchway made to the entrance at the back of the Library buildings. The new porches have been designed by Mr. T. G. Jackson, R.A., and the work is likely to cost a considerable sum, after reckoning in the loss of rent for the chambers. As the new Bar Association has with difficulty extracted from the Benchers a contribution to their funds, there is naturally a little soreness that money should be spent so lavishly in improving the special territory of the Benchers. Report has it that the Bar Association has made complaint to the Benchers upon this large outlay of funds, which they hold in trust for the benefit of the profession, and that some correspondence has passed. At present the alterations are being hurried on in order to be ready for Grand Night. In the Middle Temple, 2, Plowden Buildings has been transformed internally and made into lecture-rooms, while the ground floor has been turned into new Treasury Offices. Here, too, the Benchers have placed a new doorway, which has been designed by the Surveyor to the Inn, and shows as usual the arms of the Treasurer in the arch overhead, to be surmounted by the lamb when it is completed.

AT last week's meeting of the London County Council, a recommendation of the Asylums Committee for the erection of temporary iron buildings to accommodate 400 additional patients on a freehold site adjoining Hanwell Asylum at an estimated cost of £30,000 was adopted. It was agreed to set back certain premises in Millbank Street, Westminster, at a cost of £6,250, in connection with the proposed rebuilding of Lambeth Bridge. A scheme for the efficient drainage of North Woolwich, at an estimated cost of £67,450, was approved, and a tender of £34,350 for two new engines for the outfall works at Crossness was accepted.

AT the adjourned inquiry into the sanitary aspects of the proposed new cemetery at Golder's Hill, Dr. Hoffman presided on behalf of the Home Office; Mr. Augustine Birrell represented the Abney Park Cemetery Company, which proposes to take the twenty-nine acres of land near Hampstead Heath for burial purposes; Mr. Paine appeared for the Ecclesiastical Commissioners, Mr. Johnson for the Hampstead Vestry, Mr. Bevir for the Hendon District Council, and Mr. Done on behalf of All Souls' College, Oxford. Many of the residents and owners of property in the neighbourhood were also represented. According to a very general local opinion as to the scheme, although the site of the cemetery is in Hendon parish, Hampstead is, perhaps, more interested in checkmating the project than Hendon. Mr. G. E. Clarke (surveyor to the company), Mr. John Pollard (civil engineer), Dr. Stevenson and Dr. Poore were the witnesses. They were examined by Mr. Birrell on behalf of the company, and cross-examined by the opposition. The plans of Mr. Clarke and Mr. Pollard, their experience in the drainage of cemeteries, their method of dealing with the sludge, the chemical precipitation of the putrefactions which flowed from the graves—all these were minutely gone into and scrutinised, and the "International Company's system," compared with them. Altogether the upshot of the proceedings, so far as they went, upon exclusively sanitary grounds, was not unfavourable to the establishment of the proposed cemetery. The æsthetic and sentimental side of the question was not gone into.

ABOUT the Royal Society of British Artists' Exhibition, in Suffolk Street, there does not at first seem much that can profitably be spoken. No doubt the canvases that fill the greater part of the walls serve some wise purpose in the scheme of creation—these hand-painted oleographs, these Christmas presentation plates signed by the Artist, these "very foolish sunsets" in feeble water-colour: and we hope without bitterness that the close guild of limners which provides the show

may find it a commercial success. If the British patrons of the British Artists still love to have it so, so be it. And yet a doubt intrudes. Is even the long-suffering public, or some portion of it, getting a little tired of the blue-eyed child with the green umbrella in the brown snow, the mischievous terrier-pup, and the crepuscular tea tray? For such unquiet spirits, if such there be, the British Artists are prepared. They will show themselves "up-to-date," and for those who are discontented with the good old brands, they have a few choice specimens in stock, freshly imported from the students' quarter. To give a list of the oleographs and Christmas numbers were a superfluous task; it would take up too much space, and it might even give offence to a respectable body of craftsmen. The pictures, or some of them, admit of discussion. In the Central Gallery, the first thing to strike the eye is Mr. Bunny's "Eos," hung in the middle of the western wall. The picture is a harmonious arrangement of pearly pink and blue, and is charming in sentiment, and an interesting example of its kind. Mr. Herbert Oliver sends a study of red lilies (No. 8), a piece of patient observation, which yet somehow fails to convince us that the painter has liked the flowers he interprets. M. Fantin-Latour always inspires this conviction with his gift of "natural magic." Mr. Oliver also exhibits two clever landscapes, painted more freely and spontaneously than his larger work, and a portrait head. Mr. Charles Eastlake has two evening landscapes, decorative in colour. Mr. Titcomb, too, has a colour-study in "Nature's Garden." Among other good landscapes one may mention Mr. Brough Johnson's, the "Harvest Moon" and "Sea Holly" of Mr. Julius Olsson, beautiful in colour; Mr. Reginald Frampton's "Inner Quay, Polperro"; and Mr. Warrener's "Moulin Rouge at Night," in which the sky seems too heavy.

THE long agitation for the preservation of the Churchyard Bottom Wood, Highgate, as an open space was brought to a satisfactory settlement at the meeting of the Hornsey District Council last week. The price required for the 25 acres was £25,000. The District Council, at the suggestion of the chairman, Mr. Cory Wright, has voted £10,000 towards the sum required, and Mr. Wright has undertaken to raise the remainder. The time for the purchase expires in December, and after that date the estate would have inevitably been absorbed for building purposes, which would have been regretable. The Gravel Pit Wood, adjacent to the Bottom Wood, belongs to the Corporation, and was opened as a public park in 1886. It is 70 acres in extent. The portions now secured to the public have, therefore, a combined area of 95 acres.

THE decoration of the Choir of St. Paul's Cathedral is now nearly completed, but a large sum is needed to carry on the work in the dome. Moreover, a sum of £3,000 is required for improving the organ and bringing it up to date. The Goldsmiths' Company, Mercers' Company, and Merchant Taylors' Company have subscribed second donations of £1,500 each.

THE last great work of decoration upon which he late William Morris was engaged was a large tained-glass window for the Church of St. Germans, Cornwall, the old diocesan Church. The window, which is 30 feet high and 16 feet broad, and consists of 10 lights, was designed by Sir E. Burne-Jones. The new window is regarded as the finest modern embellishment in any Church in the West of England. It was recently dedicated by the Bishop of Truro.

A NOTABLE local industry in one of the lumber districts in Canada consists in sifting the sawdust arising from the operations and, mixing it with an equal quantity of clay, working the mixture into a building material known as porous terra cotta brick. The material is said to be absolutely fireproof in character, and has a marked deadening effect when employed for partition walls in houses. The material, though light in weight, will stand a prodigious crushing strain, and can be sawn into convenient shapes as desired. Nails can be driven into it, as into wood, and when heated, even to a white heat, sudden immersion into water will produce no cracks.

THE hall of the Tower Hamlets Royal Engineer Volunteers, in Victoria Park Square Bethnal Green, was recently opened by Lord Wolseley, who made a minute inspection of the new buildings, which occupy the same site as the old headquarters destroyed by fire. The drill hall itself is a large and commodious structure, and there is the usual armoury store-room and other accommodation, while a spacious yard in the rear is reserved for practical instruction in engineering work.

THOSE builders who are apt to regard local authorities as common enemies and tyrants, with their regulations as to width of new streets and other matters, will rejoice at the (at least temporary) triumph which one of themselves has obtained over the Yeadon District Council. The District Council, on the other hand, has appealed, and will ultimately have the satisfaction of obtaining a final judicial answer to the question, What is a street? The issue was raised in connection with some building reconstruction which the plaintiff was undertaking on his own land. Between the two houses he left what he described as a mere passage; but the Yeadon District Council regarded it as the beginning of a new street, and insisted that it should be made of the regulation width. Mr. Justice Kennedy, in the Queen's Bench Division, decides that it is a passage, and not a street, because no door opens into it. This seems a clear and plausible definition. But as a matter of fact, many new streets are commenced with an end house, which has not a door into the bye-street. Therefore the Yeadon District Council holds itself justified in appealing, and the result will be awaited with interest by many other local authorities.

AT Hampton Court Palace, hidden somewhat by the great hall, are to be found courts as they were in the days of the great Cardinal Wolsey; quaint nooks with an old-time air about them; a paradise for the antiquary, and artist, for this part breathes of the Tudor period. In the Wolsey part of the Palace, almost under the great dining-hall, and separated only by a dark cloister, are the three kitchens, in which were provided the meals for the Cardinal and his immense retinue. On entering the largest of them, you find yourself in a hall some 30 ft. in height, about the size of the kitchen hall in Windsor Castle; originally the ceiling was a handsome one of wood, replaced at some bygone period by something much inferior. The place is now the repository for articles of interest found on the Palace premises. Among the collection are three horn lanterns, an ancient copper kettle with swing handle, several most beautiful large copper braziers of quaint patterns, to hold live charcoal, used for warming guest-rooms, a portion of a lead water-main, about seven inches in diameter, and metal an inch thick, a similar pipe being in use at the present time, to conduct water from the Home Park to the Palace, From these relics of the past one turns instinctively to the enormous fireplaces and wood ovens built along each side of the hall. The arches are most elegant, but rather low, recessed about four feet and divided by two low walls into three separate fireplaces. In these stand original parts of the old spit used by Wolsey's cooks. The second kitchen is smaller, but the same height, containing ovens. Everything is most crude, with the exception of the ovens. The meals were passed through traps cut in the walls between the kitchens, and taken under the dining-hall up the back steps (now closed) at the rear of Wolsey's retiring-room.

A MEETING of the General Purposes and Improvement Committee of the Belfast Corporation was held last week, and the fifty-one sketch-plans for the new city hall, submitted by various Architects, considered. Mr. Waterhouse, R.A., and Mr. Bretland, city surveyor, who had been deputed by the Corporation to examine the plans sent in in competition, having completed their task, read their report to the committee. They pointed out, we understand, the various defects in the six plans which they had selected as the most suitable. Several of the members spoke concerning the requirements of the Corporation in regard to the building, and ultimately, we have been informed, the committee decided that the three plans, numbered 30, 42, and 43, should be reserved for the final competition. It is stated that any one of these plans could be carried out for the sum mentioned in the Act of Parliament—£150,000. Each set comprised four sketch-plans: the front elevation facing Donegall Place, the ground plan, the first floor plan, and the second floor plan.

AT a cost of close upon £1,200, the hall of the Cutlers' Company, in Warwick Lane, has just undergone complete redecoration. The handsome oak roof has been picked out in gold, and the rest of the building cleaned and redecorated. The ventilation has been considerably improved, and the electric light installed throughout the building. This latter work has been executed by Messrs. Laing, Wharton, and Down, of Gracechurch Street. The redecoration has been the work of Messrs. Harrison and Spooner, of College Hill, the whole being carried out under the supervision of Mr. Alex. R. Stenning.

THE members of the East Riding Antiquarian Society recently visited Hull, for their annual gathering. First, St. Mary's Church, in Lowgate, was inspected, built in 1333, on the site formerly occupied by "the Chapel of the Blessed Virgin," mentioned in the will of Wm. Skayl. The Knights of the Temple of Jerusalem, who had a Preceptory at Ferriby, used the new Church for worship and burial. At the end of a hundred years it was enlarged in the Perpendicular style, and thus was begun the present great Church. Although there never was a parish of Hull, St. Mary's was the first parish in Hull; and within the precincts have been buried 22 Sheriffs and 34 Mayors of Hull. In 1863 the Church was restored by Sir Gilbert Scott. At Trinity Church the visitors saw the old silver plate, chiefly 17th-century work, and a beautiful 13th-century MS. of the Vulgate left in Hull by Lord Fairfax; and an historical and descriptive account of the Church was given by Mr. J. R. Boyle, F.S.A. After dealing with the enterprise of the monks of Meaux in seeking to acquire the Lordship of Myton, in which the fishing hamlet of Wyk-super-Hull was situated at the close of the 12th century, Mr. Boyle spoke of the *capella de Myton* as dependent on Hessle, and as occupying the site of the present Church of Holy Trinity, Hull. Remarking upon differences between the Rector of Hessle and the monks of Meaux, he referred to the destruction of the Chapel as an act of retaliation by the monks, and to the controversies which followed with the Canons of Guisborough. Then, passing to a consideration of the date of foundation of the existing Church, he questioned Burnsall's ascription to Jacobus Helward in 1285. It was in 1341, he said, that Helward founded a chantry; and the Church itself was probably dedicated by Archbishop de Wickwaine about the year 1279–80. Scarcely any other evidence, he observed, could be found relating to the early history of the Church than that furnished by documentary allusions. The structural peculiarities, however, implied the existence of an earlier edifice of considerable dimensions. The choir appeared to have been completed about the year 1361; the nave commenced in 1389, and finished in 1418. At one time, probably, the tower was crowned by a spire. Taking the company round the Church, Mr. Boyle commented on some of the more striking architectural features; the fine specimens of mediæval brick—Hull was famous for brick manufacture in the Middle Ages; the varied tracery of the windows—in particular the admirable examples of curvilinear; the air of elegance imparted to the interior by the tall light shafts; these and other points were all noted.—During the day the Annual General Meeting was held in the Town Hall.

Some interesting particulars in regard to Christ Church, Newgate Street, have been revealed in the demolition of the houses at the corner of Newgate Street and King Edward Street. In the first place is disclosed the fact that the house next to the south side of the Church in King Edward Street was built upon the Church wall, and actually into the Church wall, in a very remarkable manner. It was a house not above eight or ten years old, and was lately occupied by a beef shop. In the first place it blocked up a door of the Church to which access was once obtained by a still-existing panel-door in the wainscotting which surrounds the Church's interior. Besides this, the staircase of the house was accommodated within the most easterly of the window openings on the south wall of the Church. To effect this arrangement the glass was taken from the opening, which was then walled and plastered on the Church side. Part of the

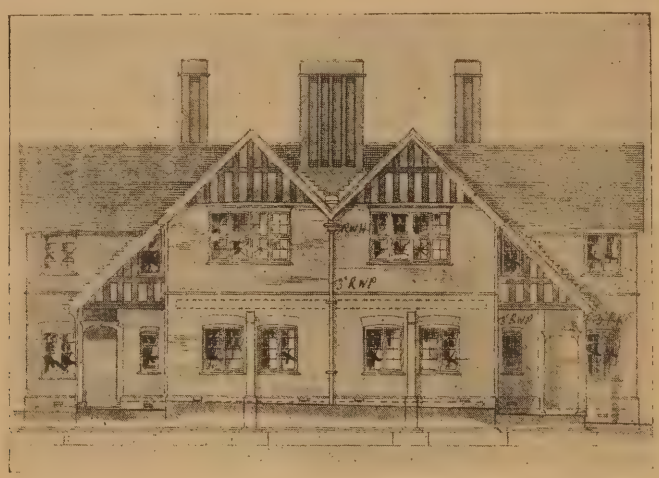
mutilated architrave of the window still remains to show the rough treatment to which the outer stonework of the Church wall has been subjected. To crown all, the top cornice mouldings of the Church have been serving as the ceiling mouldings in the top rooms of the now demolished building, and it is a curious sight to see them in their present revealed state. Moreover, the wall papers in those top rooms, where they adjoined the Church, were pasted direct upon the outer wall of the sacred building, which still remains papered in divers colours. The writer is not prepared with any support for the theory, but, from the existence of the now blocked door on this side of the Church, there appears some possibility that at one time the Parsonage stood on the site of the now demolished house in King Edward Street. When the builders acquired the right to build into the Church window cannot be determined. What, however, is most interesting of all in connexion with the present revelations is the fact that within the cellar of the house alluded to there are to be seen not only the massive foundations of the Church, but also the lower portion of a great buttress which has no counterpart above ground, Christ Church being on this side without any buttresses. It is well known that this edifice occupies the site of the Choir belonging to the ancient Greyfriars. It was destroyed in 1666, and rebuilt by Wren in 1704. The Friary Church was of far greater dimensions than Wren's buildings, for its Nave stood on what is now a disused burial ground at the west end of the present Church. Within the Church itself the present Chancel is elevated upon two steps stretching throughout the whole width of the building. There can be but little doubt that these are the original steps, or have at least taken the place of the original steps, which formed part of the approach to the high altar of the Friars' splendid place of worship. This theory finds confirmation in the fact that the present Chancel, above the steps, is paved with the exceedingly old and much-worn slabs of stone or marble upon which the Friars themselves actually walked, for the slabs were saved from the ante-fire building. In all probability the buttress in the cellar is nothing else than one of the buttresses which formerly supported the south wall of the Greyfriars Church.

UNDER the auspices of the Health Section of the Cardiff Exhibition and the local District Council of the National Registration of Plumbers, a conference of registered plumbers and others interested in public health was recently held at Cardiff, when a number of representatives attended from Bristol, Cardiff, Swansea, Devonport, Cornwall, and South Hants District Councils. Mr. Edwin Seward, Architect, President of the Cardiff Centre, presided. Dr. D. S. Davies, Medical Officer of Health, Bristol, read an interesting paper on "Public Health in Relation to the Registration Movement." It was, he said, indisputably of importance that some limit should be placed upon the undertaking of important work by incompetent men, whose errors and whose neglect tended to bring the whole art of plumbing into disrepute, and to cast an undeserved stigma upon capable and conscientious craftsmen. It was inevitable that sooner or later the experience of the practical plumber would be required in every sanitary inspector; and such experience was, he maintained, one of the first essentials for an inspector in a large town. Some few years ago sanitary inspectors were chosen from almost any class of applicant, but applicants were now required to show the possession of some special knowledge by the production of some such certificate as that granted to inspectors by the Sanitary Institute. Now, he attached a high value to the certificate of the Sanitary Institute, but the weak point about it was that, with coaching, a man might—and did often—acquire such certificate after a few months' reading. In his opinion, the public health service would be best served by the appointment of men as sanitary inspectors who, as registered plumbers, possessed technical and practical knowledge, and who, having in addition taken the Sanitary Institute certificate, had thus added some special knowledge as to disease, legal requirements, bye-laws and regulations. Such men had received the training calculated to yield the best results for the community. Mr. E. Seward, of Cardiff, contributed a paper on "The Architect's Relation to the Registration Movement," in the course of which he advocated the greater development of decorative plumbing. He would like to see the expert work of plumbing in the hands of experts. This was not easily obtained under the system of tendering, but could be done by making separate contracts for plumbing.

THE London and North-Western Railway Company has contemplated establishing a railway museum, and lack of room alone has stood in the way of the carrying out the idea. A National Railway Museum would certainly be interesting. The London Brighton and South Coast have plenty of old stone sleepers and old rails and rolling stock, and the South-Eastern have a very early type of engine, the "Invicta." Apart from purely railway material, some of the lines must have some remarkable archæological relics discovered in the course of construction. There is undoubtedly the nucleus of a railway museum at South Kensington, where may be seen, along with personal relics of George Stephenson, the first railway locomotive ever built. But the importance of an invention and industry which has spread from England throughout the world surely deserves a museum of its own. But if it is delayed there will be a dearth of material—American agents have been ransacking the country for objects for the Field Museum at Chicago, and French agents are looking out keenly for objects for the Exhibition of 1900.

OUTSIDE of Somersetshire—the home of those fine square-built Church towers—it would be difficult to find any structures superior in their style of Architecture to that of St. John's, Cardiff, and one can well imagine the remark of Professor Freeman that the fine old tower of St. John's looked as if it had swum across the Channel. Unfortunately its stability is becoming impaired with the ravages of time, and for three years it has been deemed inadvisable to ring the bells. At a recent meeting, held to consider what action should be taken in the matter, Lord Windsor said he would like to point out one important matter with regard to the work of restoration. There was a great danger of committing one of two mistakes, either to make the work of restoration so complete that all the ancient stones are absolutely replaced, and the structure be practically a new one, when all its archæological interest is lost, or they fell into another mistake which a certain enthusiastic society endeavoured to bring about, that was, that ancient buildings of Archæological and Architectural interests should not be touched at all, and should be left to crumble away as the ravages of time compelled it to do. He thought such ancient buildings as could be preserved should be preserved, and only such new work should be put in as was absolutely necessary. Mr. C. B. Fowler's report on the condition of the tower was read. In this report Mr. Fowler proposed to only restore parts which are perishing and dangerous, preserving all the portions that are sound, and make good the details of lost features similar to the original. Since he had examined the tower in 1889, Mr. Fowler said the north and west angles of the belfry stage and the east and west faces of the traceried battlements had suffered considerably from the effects of the weather. Large pieces of these battlements might at any moment work loose and fall. The buttress weathering, strings, quoins, window-heads, jambs, arches, tracery plinths, and doorways required much repair. Mr. Fowler then dealt with the cost, which totalled up to £2,596 17*s*. This is exclusive of Architect's fees. It was eventually resolved to proceed with the work at once. About £1,000 has already been promised.

AT a recent meeting of the Middlesbrough School Board, Mr. Geo. Mosses moved that instead of tenders being invited for the erection of new schools, the Board appoint a committee to carry out the work without the intervention of a contractor. That course had been taken by the London County Council, and during the half-year ending Oct. 26, the cost of the work carried out in that manner was £80,000, whereas the estimate of the Architects and Surveyors was £85,000. They had thus saved £5,000, and on a total expenditure under the scheme which he proposed of £383,000 there had been a profit with the exception of the commencement. He had a letter from Mr. John Burns, M.P., who said there was no comparison in the quality of the work done by a contractor and that done by the Board itself, and that this had been admitted by the Engineers and Architects. The work done under the Board reached the highest pitch of excellence. He thought they would save between £600 and £1,000 on the work they proposed to do by the adoption of the system he suggested. After full discussion the motion was lost by nine votes to four.



THE Dean and Chapter of St. Paul's Cathedral are again trying an experiment in the lighting of this vast edifice. The present system—the standards in the Nave and the jets at the top of the quarter-arches of the dome—is totally inadequate, and moreover the jets of gas are not only destroying the stonework, but very seriously injuring the splendid mosaics which surround the dome. It is proposed to use incandescent gas, and the authorities are having large globes with five burners to each suspended from the top of the columns of the quarter-arches with a view of spreading a more beautiful and effective light around. It is to be hoped that the experiment will prove to be a greater success than that of the electric light, which was provisionally tried some year or so back.

M. EMILE RIVIÈRE, sub-director of the laboratory in the College of France, has found human bones, flint weapons and pottery belonging to the New and Old Stone Ages, in a cavern at La Monthe, in the Arrondissement of Sarlat. Along with these are remains of the bear, hyæna, reindeer, and ox. Designs on the walls of the cave represent the bison and other extinct animals. Some of the drawings are coloured with ochre, and their antiquity is proved by the fact that stalagmites have been formed over some of them.

AT a recent meeting of the Académie des Sciences, Paris, an interesting paper of a practical nature, on the efficacy of lightning-rods, was communicated by MM. Mildé and Grenet. There is a difference of opinion as to the efficacy of lightning-rods as they are now made, and any practical experiments on the subject are most welcome. The Tour St. Jacques, Paris, is protected by a copper lightning-rod, which is connected to the earth by several bands of copper, and also to a metal ring round the flagstaff on the summit by several metal chains which hang from the ring and form a sort of cage over the platform there. The arrangement permits observers on the platform to witness the lightning discharge through the chains to the rod. The authors have thus observed as many as five successive discharges of lightning in a quarter of an hour, by the sparking between the links of the chains. In one stroke the stem of the lightning-rod was made red hot for a length of about 18 inches at the moment of discharge. This shows that lightning-rods ought to have a diameter large enough to prevent overheating by successive discharges. Thin conductors may be all very well for a first discharge, but might be melted by a succession of them, and leave the building at the mercy of those which followed.

MR. JOHN FAULKNER, of Manchester, says that for about sixty years after St. Paul's Cathedral was completed there were no lightning conductors of any sort, and the new building was liable to suffer in thunderstorms—just as its predecessor had been liable and had suffered before it. In 1769 a committee of the Royal Society took the matter in hand, and, under its recommendation, the metal work of the lantern was connected to the lead of the dome by means of strips of lead and one-and-a-quarter inch square iron bars, the lower portion of the dome's lead roof being connected to the down-spouts on the stone gallery, and so to the down-spouts of the roof of the nave, and ultimately with the ground, into which the lead down-spouts pierced for three feet, a distance considered to be sufficient to carry away any electricity collecting on the building. The pinnacles on the summits of the western towers were similarly connected to the ground by way of the nave roof. In 1873 these arrangements were examined, and it was found that not only had the iron rods rusted so as to be in themselves a positive source of danger, but that in many cases the old iron hoods of the rain pipes, which hoods had originally acted as the connection between the rods and the pipes themselves, had been exchanged for granite hoods six or eight inches thick, through

which the electric discharge was left to pierce. Upon this state of affairs becoming known, the dean and chapter appointed Mr. Faulkner to provide efficient protection against lightning, with the result that the top of the cross surmounting the dome and the tops of the pinnacles on the western towers were then connected with the sewers in a manner believed to be capable of thoroughly protecting the Cathedral from any peril by lightning whatsoever. Mr. Faulkner says that he knows of no building in London which was protected against lightning by a system of conductors prior to 1769, when, the Cathedral conductors were first erected.

PAIR OF COTTAGES, EPPING, ESSEX.—JOHN W. RHODES, ARCHITECT.

PETERBOROUGH CATHEDRAL is in difficulties—apparently, indeed, ever increasing difficulties. Sir A. Blomfield, who has been called in to report upon the great west front, states that it is suffering from original defects in the foundations. Sir A. Blomfield advises that the foundations of at least the west walls of the north and south towers should be examined, and, if found necessary, underpinned and cemented upon the solid rock. Sir A. Blomfield adds that much of the superstructure has become torn and disintegrated, bringing the whole into a dangerous condition, and rendering substantial and lasting repairs impossible without taking down and rebuilding some of the existing work above the caps of the great towers. Altogether some £11,000 or £12,000 is required to prevent the great west front from going to rack and ruin.

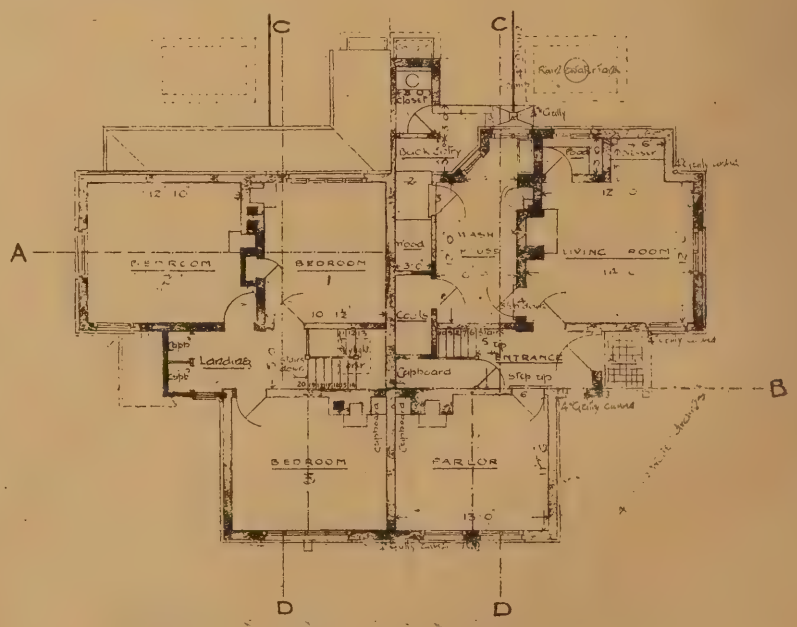
THE second bell in weight in the world, that at Mingoon, in India, has lately been raised from the ground, and arranged so as to ring again after a lapse of nearly a century. This bell weighs between 90 and 100 tons. It is surpassed by the giant at Moscow in weight, but the latter has lost a large piece out of it, and, as it is used as a Chapel, cannot now be rung. The Mingoon bell is 12 ft. high and about 18 ft. in diameter at the rim. The immense wooden beams on which it formerly hung have long since been broken down at the shackle. It has recently been rehung on a steel girder at a height of 25 ft. from the ground. It is proposed to encase the supporting columns and girder with carved teak in a Burmese design, and then erect a cupola over the whole structure. The bell at Pekin, which is the third largest in the world that can still be used, weighs only 58 tons.

NEXT year there is to be an International Art Exhibition at Munich. There is usually an exhibition there every year, but on the forthcoming occasion it is to be on a much more pretentious scale than hitherto. The authorities, however, appear to be rather afraid of the expenses which will be incurred. At former exhibitions there has usually been a British section, the cost of transmission of which was borne by the Munich authorities. They are now asking us to ourselves bear these charges, and this, all things considered, is not a very unreasonable request. Still as Government grants for Art are of the meagrest, some fears are entertained in Art circles lest the necessary funds are not forthcoming. Naturally there is some diffidence in asking private Art patrons to contribute. The Royal Academy, however, is a wealthy body. Why does not it come forward?

Professional Items.

AINTREE.—A new institute and café were formally opened last week and presented to the town by the Earl of Derby. The new premises comprise public and private cafés, reading rooms, lecture hall, recreation rooms, two billiard rooms, and a public hall to seat about 750 persons. The site—at the junction of Longmoor Lane and Warbreck Moor Road—has been carefully chosen, this being the main thoroughfare from Ormskirk, Knowsley, and all the outlying districts by which agricultural produce is conveyed to the Liverpool markets. The hall is designed in the perpendicular Gothic style, and with its old English half-timbered exterior, presents a picturesque appearance. The buildings are erected from Ruabon bricks with Halifax stone dressings, and the roofs are covered with red Ruabon tiles. The total cost of the land and buildings has been £8,000, and the work has been executed from the designs and under the superintendence of Mr. F. W. Dixon, Architect, Manchester and Oldham.

BELFAST.—At the fifth meeting of the general committee of the Belfast Cathedral, held in the Diocesan Rooms, Clarence Place, the Architect's plans were submitted to the committee; and, on the motion of Canon O'Hara, seconded by Lieutenant-Colonel M'Clintock, it was resolved—"That the committee approve of and accept the plans and designs submitted by Mr. Drew, reserving to themselves the power of effecting such alterations in detail, under the advice of the Architect, as may be considered advisable."



BEMERTON.—We understand that Messrs. Harry Hems and Sons carried out the carved woodwork, at the restoration of St. Andrew's Church, further particulars of which appeared in our issue of the 28th October.

BIRMINGHAM.—New Wesleyan schools are being erected in Bristol-road. The new block of buildings will contain a schoolroom, 61 ft. by 41 ft., a gymnasium of the same size in the basement, and large room for young men's institute, a lecture hall, 42 ft. by 34 ft., and nine large vestries on the ground and first floor. The new buildings will provide accommodation for about 1,000 children. The total cost of the building will be about £6,000, this including renovating the present Church, and the erection of a new rostrum, with choir and organ gallery behind. The work is being carried out from the design and under the superintendence of Messrs. Green and Brockbank, Architects, of Liverpool, and the contractors are Messrs. James Moffat, of Birmingham.

BRISTOL.—A bronze memorial tablet has been erected in the vestibule at the museum and library, Queen's Road, to commemorate the generosity of the late Sir Charles Wathen in undertaking the discharge of liabilities connected with the institute before it was handed over to the city. The tablet is of a massive description, and it has been modelled at the museum by Mr. H. J. Margetson.

BYKER.—Foundation stones of a new Presbyterian Church were laid last week. The Church is being built in Gordon Road, off Raby Street, from the plans of Messrs. Badenoch and Bruce, of Pilgrim Street, the contractor being Mr. Alex. Bruce. The Church is planned with nave and aisles, the aisles and west end having galleries. The ground floor is seated for 480, and the galleries for 270, making a total of 750. The design of the building is a simple treatment of the Early English style; the walls are of local stone with rock-faced snecked work outside, the bays of the nave being indicated by external buttresses which finish above the eaves with dressed stone pinnacle weatherings. The Church will be heated on the low-pressure hot water system, and the ventilation is by means of Sherringham and other wall inlets, with two of Cousland and Mackay's concealed roof ventilators, and one of their large ventilators placed in a flèche on the roof.

CHICHESTER.—A new Church Room has been erected to supply the needs of the parishioners of St. Paul's. Red bricks and tiles, with woodwork, chiefly of pine, have been used in the construction of the building, which is of a plain, though very substantial, character, and will afford accommodation for about 250 persons. At one end there is a platform, while there is an ingenious arrangement near the centre whereby a partition can be let down for the purpose of dividing the room into two. In the matter of lighting and ventilation the arrangements appear to be of the most satisfactory kind. The total cost of the building (including furnishing, &c.), will be about £800. Mr. Lacy Ridge was the Architect, and Mr. F. M. Vick the builder.

COTTAGES, EPPING, ESSEX.—JOHN W. RHODES, ARCHITECT.
(GROUND AND FIRST-FLOOR PLANS.)

CHIPPENHAM.—Hungerford Chapel, at the south-eastern end of the old Parish Church of St. Andrew, has been for some time under renovation. The general fabric was most conservatively restored some 18 years ago at a cost of upwards of £7,000. The roof of the Chapel—interesting for the strength of its English oak

timber and ornate character—was not, however, then touched. For a long time past it has been in a bad condition, so much so, indeed, that for many months prior to the recent most necessary repairs it had to be propped up with scaffolding poles. The roof is now entirely new, formed of well-seasoned oak, traceried, moulded, and well carved. It rests upon supporting angels, bearing shields; two of them new and exact replicas of the original 15th-century figures. The intersections of all the roof timbers are covered by carved oak bosses, with "crow's feet" attached, and of the local conventional perpendicular character. The whole is covered in with thick sheets of lead. The works have been carried out from the designs and under the immediate direction of Mr. Graham Awdry, Architect, of London, the general contractor being Mr. William Light, of Chippenham. The carved oak work and the sculptured angels are by Messrs. Harry Hems and Sons, of Exeter.

DUBLIN.—A scheme is on foot to found a society for Architectural students in Dublin, which will place in their way educational advantages beyond mere office work, by classes, access to standard works of Architecture, visits to buildings, and general discussion. It is also proposed to stimulate public interest in Architecture by occasional popular exhibitions and lectures. Mr. Drew, R.H.A., the President of the Royal Institute of Architects of Ireland, has written warmly approving of the project, and has, among other offers of assistance, made a generous offer to form a reference library for the use of the members, and to place a room at the disposal of the association.

FETTERCAIRN, N.B.—A large addition is to be made to the Ramsay Arms Hotel. The present building, which was slept in by Her Majesty the Queen, Prince Albert, and Princess Alice during their visit to the district in 1861, has very limited accommodation; but when the extension is carried out it will have a large coffee-room, servants' premises, drawing room, billiard-room, as well as numerous bedrooms. The Royal apartments are to be retained and fitted up as a suite of rooms, consisting of parlour and two bedrooms. The building has been designed in harmony with the present erection and its quaint surroundings. The walls are to be harled in cream colour, and the roof is to be covered with red tiles. Mr. T. Martin Cappon, of Dundee and Brechin, is the Architect for the work.

FRIZINGHALL.—Standing on an eminence near the centre of Frizinghall, the new Church was recently consecrated by the Bishop of Ripon. The Church is in the decorated Gothic style of Architecture, and was designed by Messrs. H. and E. Marten, of Bradford. The contracts were let to Messrs. James Bairstow, mason; John Moulson and Son, joiners; G. Swaine, plumber and glazier; Andrew Taylor, plasterer; B. and T. Thornton, slaters; and John Roome, painter. The total cost is upwards of £3,500, of which £3,000 has been raised.

GLENTANA (N.B.)—The foundation stone of new School Buildings was laid last week. The Architect, Mr. Truefitt, has furnished an ornate design, and the external appearance of the buildings, though they are still far from completion, is pleasing.

GLOUCESTER.—Considerable alterations have been carried out at the Shire Hall, Gloucester; the additions comprise a new council chamber with Councillor's cloak room, Chairman's private room, and a waiting room and treasurer's pay office on the south side of it. The old grand jury room will be used as an office for the clerk of indictments and as a committee room. The old quarter sessions room has been dismantled and converted into offices for the county surveyor and his staff. A glazed screen, with swing doors, has been fixed at the north end of the entrance hall, and the lighting of the entrance hall has been improved by the introduction of borrowed lights on either side. A boiler house, engine house, and extensive storage rooms or workshops for county use are provided under the Council Chamber and the adjacent buildings. The Assize Courts, the Council Chamber, and the Assembly Room have been warmed and ventilated on the "Leicester Plenum" system. The new Council Chamber, which is 48 feet long by 37 feet wide, and 22 feet high, is lighted principally by ceiling lights. The entrances are at three corners of the room. The walls and ceiling are covered with fibrous plaster decoration, treated in classical style, with high dado, Ionic order with fluted pilasters, enriched entablature, cove and coffered ceiling. On the east side is a bold arch enclosing a handsome oak chimney piece, which bears the Royal Arms. During the progress of the works it was found that the old buildings were in an insecure condition in consequence of the decay of the baulks of timber, which were built in lengthways on the foundation walls. This heavy building was therefore resting on thin facing stones. All decayed timbers have been removed and replaced by Portland cement concrete and hard blue bricks in cement, and the building is now in a safe condition. The buildings were erected by Mr. H. A. Forse, of Bristol, from designs by Mr. Medland, County Architect.

KILMARNOCK.—The foundation stone of the new Academy, which is being erected by the Burgh School Board on Elmbank Estate, was recently laid. The new School is being erected to plans by Mr. R. S. Ingram, and is estimated to cost upwards of £10,000.

LONDON, E.C.—The Cripplegate Club and Institute was opened last week by the Lord Mayor. It is still another of those Institutes which are encircling London, such as the Bishopsgate and St. Bride's Institutes, the People's Palace, the Northern Polytechnic, the Northampton Institute; and its objects and its scope are the same as theirs. It has a lending and a reference library, concert hall and theatre, newspaper and magazine rooms, and class rooms, and it is to have lectures, concerts, and classes for technical and other instruction. A distinctive feature is the provision made for girls and women in the intentions and accommodation of the Institute. The building is situated between the corners where Golden Lane and Brackley Street join Cripplegate Street, and its spacious rooms are well-lighted and decorated in good taste. The Architect was Mr. Sidney Smith, of York Place, Adelphi, and his designs were carried out by Messrs. G. and H. Bywater, of King Street, Covent Garden.

MILL HILL.—Sir William Henry Wills, Chairman of the Court of Governors, recently laid the foundation stone of the new Chapel at Mill Hill School. The new Chapel is being built of red brick in the Renaissance style with white stone facings, the interior being fitted with oak. The cost will be £5,000, exclusive of the site, which is the property of the Governors, and already £3,500 is in hand, £1,000 having been given by Sir W. H. Wills. Sir W. H. Wills said the school was founded nearly a century ago, and testified to the great importance which the old Nonconformists attached to a first-class classical and mathematical education. After a brief historic retrospect, he alluded to the present prosperity of the school, and said that, more space being required, it had been determined to use the present Chapel for more secular purposes and build a more æsthetic edifice. The Architect is Mr. Basil Champneys.

NEATH, SOUTH WALES.—The new working men's club in High Street, will be another Architectural feature in the town of Neath. Building operations were commenced this week by Mr. Abraham George, contractor; the Architects are Messrs. Lambert and Rees, Neath.

NEWCASTLE.—The new building, designed to take the place of the old Blue House, facing Jesmond Dene Road, on the North Road, Newcastle, is now virtually complete. The building will be surrounded by a neat palisading enclosing garden ground for each tenant. The house is of brick, and in the east side has been inserted a stone slab, on which has been cut the following inscription:—"Rebuilt, 1896, by the Stewards and Wardens of the Freemen. Jno. D. Walker, Chairman." The Architect was Mr. Albert Farthing, and the work has been carried out by Mr. F. C. Slater, builder, Bath Lane.

NEWCASTLE.—New premises for the Elswick Branch of the North-Eastern Banking Company, Limited, have been erected on a site at the corner of Scotswood Road and Gloucester Street. On the ground floor is arranged the banking room, entered direct from Scotswood Road, with a manager's office opening off the main room, doors for access being provided from both front and back of the counter. These rooms are designed with panelled ceilings, and the wood-work is finished in polished teak. The strong room is lined with glazed bricks, and has complete fittings. Lavatory and cloak rooms are also provided. The first floor is arranged for offices, to be let off. On the upper floor caretaker's rooms are provided. The exterior is of classic design, broadly treated, with quiet and refined mouldings rather than elaborate ornamentation. The facing is of polished ashlar, with polished granite introduced to the base course, pilasters, window linings, &c. The contractor for the works was Mr. G. H. Mauchlen. The building has been erected from the plans of Mr. Wm. L. Newcombe, who designed the head office for the Company in Gray Street.

NORTHALLERTON.—The Northallerton Consumers' Gas Company, Limited, has just completed extensive alterations and improvements at their Gas Works at Northallerton, having erected new carbonising plant, which has been fitted up on the generating principle by Messrs. J. Welsh and Sons, of Halifax. The new building has been designed by Mr. Wm. Bell, Architect, of Northallerton. With the new plant the supply of gas can be just doubled, while the cost of the new plant is a trifle over £1,200.

RATHMINES.—A large hall, including caretaker's apartments and committee rooms, has just been erected at Rathgar, in Rathmines, to take the place of the old schoolhouse. The new hall is commodious and well lighted. The Architect is Mr. Beator, and the builder Mr. Crichton.

SEDGLEY.—New Board Schools are being erected in Bilston Street. The premises are being constructed in two large blocks—one for boys and girls, and the other for infants—the exterior being composed of batted bricks, with moulded dressings and stonework. The whole of the interior woodwork will be stained and varnished. The accommodation is for 910 children, and the contract price is £5,950. Mr. A. P. Brevitt is the Architect, Mr. T. Jones the builder.

WORCESTER.—At a recent meeting of the Executive Committee of the Infirmary, the tender of Messrs. Wood and Son, Worcester, was accepted for the erection of the new Nurses' Home, adjoining the Worcester Infirmary, the amount of the tender being £4,133. It was stated that £300 or £400 more was required to complete the fund necessary.

GLASGOW ARCHITECTURAL SCHOOL.

THE opening lecture of the session, on the Historic Development of Architecture, was delivered in the Glasgow School of Art, by Mr. William J. Anderson, A.R.I.B.A., on the 2nd inst. The lecturer indicated two different ways in which the study of Architectural history might be approached to advantage. Those with scientific tendencies would seek to assign causes for periods of brilliance or degeneracy, progress and retrogression, and attempt to discover order or design in the whole evolution. On the other hand, those in whom the artistic faculties were stronger would probably be content to mark the variations of the forms and features of different styles, the modifications wrought upon them by constructive improvements, and the exigencies of material and situation. To the practical Architect this latter attitude was all-important, and would form the chief matter of the course; although it would be a shallow doctrine of Architectural development which saw nothing save the constructive evolution in Architectural history. The most powerful of the direct influences shaping Architectural works was their purpose: the destined use of the building. Nothing else counted for so much, and the faithful interpretation of this purpose led to a

study of the race, the national unity, its religion and manners, its psychological bias. It was the conjunction of a great utilitarian purpose with the opportunity of artistic expression that raised Architecture to the importance of a petrification of history, in a larger sense than either the minor Arts or Literature. As examples of the influence of nationality, the lecturer drew attention to such a phenomenon as the Greek race, who, notwithstanding the evanescence of its great period, exercised for two thousand years a repeated influence upon the Art of Italy and Europe; also, the different degree in which the Romano-Germanic nations imbibed the Rennaissance Architecture, in accordance with the extent to which they had been civilized by Rome, or had admitted the Latin language into the current coin of their speech. Such reflections would naturally occur, and could not be ignored by the student of Architecture, however little they might help him in his practical work. At the least they served to g ve him some worthy conception of the dignity of his Art, and emphasized its true glory in all periods in its subservience to the wants of the time, and its truthful expression of its spirit.

SOCIETY MEETINGS.

The Architectural Association.—At the meeting held on Friday night, papers were read on Roof Coverings; Mr. T. Stirling, jun., treating of "Slating," Mr. F. Walker of "Tiles," and Mr. G. Ewart of "Copper, Lead, and Zinc," extracts of which we give in another column. A full discussion followed the reading of the papers, in which the President, Mr. Banister Fletcher, Mr. Seth Smith, and Mr. H. W. Pratt took part. Several questions were put and answered by the authors.

The following were elected members of the Association:—Messrs. E. A. Ould, W. L. Dowton, junr., J. G. Ross, D. H. Bentley, C. L. Brierley, C. H. T. Comyn, M. J. Davies, F. K. Weedon, C. W. Beaumont, C. M. Berington, A. P. Brohier, R. H. Butterworth, W. C. Butterworth, P. B. Chatwin, T. Gray, B. Greig, E. E. Hale, F. L. Coelman, R. G. Parkhurst, P. Procter, F. A. Richards, V. Wilkins, A. A. Carder, T. Gregg, J. D. Hunter, F. M. Kirby, H. C. Norman, R. Spalding, J. B. W. Weaver, S. Wheeler, L. G. Detman, C. H. Gage, C. L. Steel, W. J. Pritchard, E. L. Hall.

Edinburgh Architectural Society.—At a meeting of this Society in Dowell's Rooms, on the 4th inst., Mr. A. R. Scott in the chair, a lecture was delivered by Mr. D. M. Westland, C.E., on "Strains," illustrated with numerous diagrams. At the close the lecturer was awarded a hearty vote of thanks. The drawings submitted by members for Design Competitions Nos. 2 and 3, "A Highland Parish Church and Lych Gate," were on view.

The Institution of Civil Engineers.—The seventy-eighth session of the Institution of Civil Engineers was inaugurated last week by an address from the President, Mr. J. Wolfe Barry, C.B., F.R.S., in the Institution Buildings, Great George Street, London. Mr. Barry having alluded at the outset to the length of the Queen's reign, went on to say that the material advances which the country had made during that period were so remarkable, and had depended so much on engineering developments and progress, that he proposed to make a general survey of the subject, in the direction, however, rather of recording effects than describing the means by which such results had been attained. Dealing first with railways, he illustrated with statistics the great growth of the railways of the kingdom, and said that speed and certainty of supply and delivery of goods meant less money employed by the trader, a quicker turn-over of capital, and often the gain or retention of a market in consequence of such advantages. He could not but think that many persons who so often advocated the renovation of inland canals, and who hoped for some great and radical benefits to trade or agriculture as a result, lost sight of these necessities of certainty and speed in modern trading; and for himself he had little confidence in a mode of transit which was slow, deficient in power of convenient distribution, and necessarily uncertain, as largely depending on rainfall, and liable to be entirely deranged by prolonged frost. Better far than reconstructing inland canals would be the spending of money in improvements of railway facilities and in the lowering of railway rates. In speaking of the enormous business done by the Post Office, he expressed the opinion that the management of the telegraph offices left very much to be desired, holding it to be unpardonable that the bulk of the telegraph offices should be closed for nearly 12 hours out of every 24 on week-days. In his judgment, it should be possible to communicate by telegraph at all times of the day or night. Having referred to the submarine cable, he went on to deal with the work of the sanitary engineer, and the vast benefits to public health which had accrued from that work. Regarding the work of the engineer as applied directly to domestic life, he said that the invention of the sewing-machine, the adaptation of machinery to the manufacture of watches and clocks, nd the invention of the safety bicycle, touched and would continue to touch the home-life of more individuals, directly and intimately, than many other engineering developments of the epoch. The comfort and well-being of all classes had improved enormously by those developments to which he had referred as embraced during the reign of the Queen. He also reviewed the progress of the Institution of Civil Engineers. In 1836, the total number on the roll was 238 and the income £713. Now the roll contained 6,000 names, or nearly 7,000, counting students, and the ordinary annual income upwards of £25,000. In 1837, the Institution was in debt; now the property stood at upwards of £100,000, including the freeholds of the premises—a result attained in spite of the facts that they spent about £20,000 on their former premises and had defrayed the greater part of the cost of the new building in which they were assembled. His closing remarks were for the most part confined to a consideration of the question whether they were quite certain that the present system of gaining the credentials of the Institution was satisfactory. He argued in favour of qualifying, not competitive, examinations for their degree of associate member.

Liverpool Literary and Philosophical Society.—At the last meeting of this society, Dr. Newton presiding, three papers on the late William Morris, dealing with his poetry, art, and social theories, were read by Mr. R. J. Lloyd, Mr. H. Longuet Higgins, and Mr. R. Gladstone, jun., respectively. Mr. Higgins, speaking of work in connection with stained-glass windows, said there was a fine example of the joint work of Burne-Jones and Morris in the windows of All Hallows' Church, Allerton. Morris should be held in remembrance among book-lovers who valued books as artistic works, and among those interested in Fine Art as applied to ecclesiastic purposes.—Mr. Gladstone said that Morris was a Socialist in a general sort of way. His mind was not an analytic one, and his writings did not show a complete acquaintance with the economic aspects of Socialism. He had stated his conception of Socialism as "a condition of society under which there should be neither rich nor poor, neither master nor master's man, neither idle nor overworked," and in which there should be a full consciousness that harm to the one "meant harm to all, the realisation at last of the meaning of the word commonwealth." It was chiefly with the artistic side of Socialism that Morris concerned himself in his earlier days, and it was comparatively seldom that he discussed Socialism apart from Art. Of his opinions in his later years he had left an account in Vol. II. of "The Socialism: Its Growth and Outcome." He advocated the abolition of private property with the exception of each man's personal "gear," as he called it. Marriages were to be abolished, or rather were to be dissolvable at the will of either of the parties. He laid great stress upon the influence of music, and believed that it would occupy a large place in the education of the future. He believed in communal institutions, and accepted all the foremost socialistic theories.—A discussion was opened by Principal Rendall, who remarked upon the slight attention which had been paid to one who, he believed, was the last of the Victorian poets.

LENBACH, the famous German portrait painter, is now at work on a picture of the Prince of Wales. Among his best pictures are those of Prince Bismarck, Pope Leo XIII., and Mr. Gladstone.

THE House Committee of the Sunderland Guardians has decided to build a workhouse infirmary after the model of that at Dewsbury, at a total cost of about £20,000, subject to confirmation by the Board.

Trade and Craft.

IMPORTANT TEST CASE.

At the Howden Petty Sessions, the Broomfleet School Board, Geo. Patchett, farmer, and a member of the Howden Rural District Council, and Robert Martin, farmer, of Broomfleet, were prosecuted at the instance of the Howden Rural District Council, under the provisions of the Public Health Acts, for neglecting to abate a nuisance, which, it was alleged, was injurious to health. The case for the prosecution, which was borne out by Dr. Fisher, Medical Officer of Health, and numerous other witnesses, was that each of the defendants drained their premises into a running stream known as the "Broomfleet Beck," which was the only source of water supply for the parish, and by their action it was said that the water was so polluted as to render it totally unfit for domestic purposes. In November, 1895, the Parish Council of Broomfleet called the attention of the prosecuting authority to the condition of the Beck, which, they complained, was seriously polluted. The Medical Officer of Health subsequently visited the place, and obtained a sample of water, which was analysed by the Public Analyst, who issued a certificate to the effect that the water contained contaminated matter to a very great extent. Upon that the District Council pointed out to the Parish Council that, under the Local Government Act, 1894, they had themselves power to deal with the water supply. Nothing further was done in the matter until the Parish Council communicated with the County Council, when the District Council, to whom the analyst's report was returned, were directed that it was their duty to provide a water supply for Broomfleet. Mr. Villiers, of Beverley, under directions from the District Council, visited Broomfleet, and subsequently reported that there was one of the best supplies that could be obtained in the county, but added that it could not be utilised until the pollution in various ways was stopped. The defendants being contributors to the pollution of the stream, were served with notices for the discontinuance of the same, but they had refused to do so. The water obtained from the Beck was the only water supply of the village, and yet the School Board drained the sewage from their school into it, and the other defendants contributed in a similar manner. In cross-examination, all the witnesses for the prosecution admitted that the stream was polluted before it reached Broomfleet. For the defence it was urged that the prosecuting authority was really the guilty party, inasmuch as they, being the sanitary authority for the district, had failed to carry out Section 15 of the Public Health Act, 1895, which provided that every local authority should keep in repair all sewers, and should cause to be made such sewers as may be necessary for effectually draining their district. The District Council had not provided a proper system of drainage, in spite of the fact that the School Board had promised to abate the nuisance as soon as the District Council had provided proper means by which the sewage could be carried in another direction. At the close of a lengthy legal argument, the Bench ordered the nuisance to be abated forthwith, or, in default, a penalty of £5 would be imposed upon each defendant.

THE VALUE OF A DRAWING.

On Wednesday, the 4th inst., at Westminster County Court, an action was tried in which Mr. Charles H. Smith, of Coalville, Architect, was plaintiff, and the defendants were the proprietors of the Illustrated Carpenter and Builder. The plaintiff claimed £1 10s., being the costs of a drawing for the paper; the defendants were represented by Mr. John Black, who, in answer to questions, stated that he had given the order for the drawing, admitted his liability, and judgment was given for the plaintiff with costs forthwith.

BIRMINGHAM BUILDING TRADE.

The representatives of the Operative Bricklayers in the Birmingham building trade have given notice to the Master Builders' Association for an alteration of rules to come into force in April next. The alterations deal with the times allowed for meals, and the question of apprenticeship.

Modern Lithography and Modern Critics. To those in search of light amusement there is nothing more gaily entertaining in its way than the humour the critic provides when he attempts to write upon things he cannot understand. To be just to him, we believe, as a rule, he really tries very hard in his own peculiar way to appreciate the beautiful, but it is denied to him, he is so constructed that fine form, whether in music or in drawing, is absolutely unintelligible to his mind. How anyone with the faintest Artistic sense can go to the present Exhibition of Mr. Pennell's Lithographs at the Fine Art Society's rooms and fail to be charmed with those sunny impressions of Spain, is beyond our understanding. As a matter of fact it is an impossibility, and the critic who so stupidly speaks of them as "scrawls" only reveals the possession of an Artless understanding. He reminds us of the man who, by chance, happened to go to the opera whilst Wagner's Tannhäuser was being performed, and who, after listening a while, wanted to know what "all this noise was about?" It is impossible to be angry with such harmless critics as these, they can only be treated with amused contempt, or as subjects for some idle reflections. We thought, for example, the last had assuredly been heard of the stupid, antiquated criticism directed against Mr. Whistler's work and ways. But no, for our old familiar friend turns up again, in a well known contemporary, and has returned to the charge like a warrior of old. Here again is the same sort of senseless chatter, disguised in serious paragraphs, which we thought dead and buried long ago, with the criticisms of the seventies. It seems as if this particular critic had been asleep meanwhile—his writing indicates something of the sort—and had suddenly awoke, unconscious of all that which has happened since those days, unconscious of the greatness of Whistler's position amongst the Artists of all times, and, the funniest thing of all, unconscious of the unimportance of inartistic Art criticism, for his opinions are given out with a solemn confidence which is most amusing. His reference to the "dull and shallow public" is particularly good; it would never occur to him, of course, that it is an excellent tribute to the merit of these works that the public are *not* "influenced by this kind of thing." (How that sentence *does* remind us of our unmusical friend and Wagner.) Such drawings are the cherished possession of the few—the Artists—and are *caviare* to the general, to those amongst whom is this intelligent critic, who think the photograph the perfection of modern illustration, and who know so many budding geniuses who "can sketch better either than these men can draw." We should like to see some of these sketches in the Architectural illustration of to-day, and are quite prepared to buy up all that are sent to us, with this stipulation, however—they must excel in daintiness of drawing, grace of composition, and reticence of expression the series of lithographs now on view in Bond Street. We are afraid we shall receive but a poor response.

DESIGN FOR ELECTRIC LIGHT BRACKET, BY W. R. COLTON.

Beating the Air. "O, fond anxiety of mortal men! How vain and inconclusive arguments are those which make thee beat thy wings below!" These familiar words were much in our minds the while we were listening to the latter part of Mr. Lethaby's admirable lecture last Thursday, before the Arts and Crafts Society. No one could have better appreciated and enjoyed that admirable discourse than we did. Its Artistic and

literary qualities appealed to us as strongly as they appealed to all, or most of his audience. It was an Artistic treat on an ideal subject, taken from entirely an ideal standpoint, and as such we have nothing but the friendliest criticism to offer. But if it be viewed in another way, if it is judged by the standard the Society itself has set up for these lectures, then we think it shows a certain failure to accomplish the end in view. That end was defined, last Thursday week, by Mr. Cobden Sanderson, in his lecture on "Art and Life," before the same Society, as "the extension of the conception of Art, and more specifically the application of the idea of beauty, as well as of utility, to the organization and decoration of our greater cities." We followed Mr. Lethaby's words closely, anxiously indeed, in order to some practical suggestion on these lines which might be embodied in, or at all events might influence, some of the schemes for "improvements" with which Londoners had been recently threatened. Something, perhaps, which would assist in preventing another such disaster as the mismanagement of so great an opportunity as Shaftesbury Avenue, for example, provided. But "the anxiety of us mortals" was in vain; we came away not a whit the wiser in that way, and, with one exception, scarcely a single suggestion of practical value. Mr. Lethaby's excellent phrases and Artistic arguments concluded with nothing which we could use, as we had hoped to, in these pages in the service of the Society for which we have so much sympathy. It is not words but direct assistance the governing powers of London require in their endeavours to beautify their city. There was nothing, so far as we can understand, save a few unimportant details—such as a better design for a lamp-post—which would tend to brighten the lives of the working men and women of to-day, amongst whom we are glad to count ourselves. The point of view from which the lecturer approached his subject—for the end we all desire—was wrong, and it was wrong because it was taken at altogether too high an altitude. So long as we are ruled by the spirit of commercialism, which has nothing to do with the heights, and is of the earth earthy, so long will such schemes as Mr. Lethaby suggests remain only as unpractical visions on paper. It is impossible not to feel the greatest sympathy, for example, with such a dream of beauty as he proposed for London, between the British Museum on the north side of Waterloo Bridge, and the Obelisk on the south. This avenue may be possible as a great thoroughfare, and as such, we commend it to the County Council for consideration: it is well worth it. But it is *not* possible as "a sort of sacred way, with fountains, trees, and statues," with all cabs and omnibuses and motor cars prohibited. The idea is very beautiful, magnificent indeed, but it is not *war* with the age which has to be fought with far more practical weapons than are to be found in Mr. Lethaby's armoury. His picture of the "sacred way" is too much like a delicious detail from the Divine Comedy to be of use in this commercial and prosaic age.

A VERY extensive landslip has taken place during the last few days at the Undercliff, near Folkestone, through which the South-Eastern Railway runs to Dover. It is the most serious which has taken place there for at least 20 years. Over 50 acres are affected by the slide, and the indications are that, should wet weather continue, other subsidences may take place. Many of the old and familiar pathways have completely disappeared, and in their stead is a quagmire of clay, chalk and water. In some places the land has slipped to a depth of 30 feet, and millions of tons have bulged forward towards the sea.

Views and Reviews.

LONDON STREET NAMES, THEIR ORIGIN, &c.

By F. H. HABBEN.

THIS is a handy-sized book, which might be profitably used as a companion by the city-loiterer, both at home and when wandering (in the *evening* and on *Sundays*) up and down the tortuous and picturesque streets and alleys of our old City. We have, scattered here and there throughout its pages, some interesting bits of philology and etymology, which will whet the appetite for more. The author (or shall we say compiler?) frankly admits the doubtfulness of some explanations, and is not eager to fill the vacuum in all cases; but probably he has not had the leisure to examine all the old maps, views, and documents at first-hand, and thus to verify the derivations for himself; for such a necessary study would have saved him from the mistake of supposing that Vedast and Foster are derived from different sources. It is interesting to observe how many of the origins of the names may be grouped:—*e.g.*, rivers and streams, wells, moors, fens, trees, greens and gardens, trades and professions, markets, bars and wharves (hithe), settlements of foreigners, walls, fortifications and gates, churches and churchyards, monasteries and nunneries, monuments and crosses, saints, worthy citizens, and famous men, livery-companies, heraldry and tavern-signs, use of some important building, and the name or caprice of a house-builder, or of a land-owner. Many of these have been changed, almost out of recognisibility, by the proneness of the average man in the street to convert sounds which have no meaning to him into such as have, *e.g.*, Golding Lane, into Golden Lane, &c. It is much to the convenience of citizens, as well as strangers, that the number of "John Streets," "King Streets," "New Streets," &c., is being reduced by the substitution of other more individualistic names; but we would suggest that, of such a work as this, an Appendix of these changed names, with cross-references, should be an integral part. In this connection, in new neighbourhoods, our County Councils might receive a suggestion (in the absence of historic association, which should always have strong influence in the selection) from the neighbourhood of the orchard-garden at Liverpool (where all the streets are named after fruit-trees), or of the Parc Monceau, at Paris (where painters' names are used), or round the Opera, at Paris (where musicians' names are given). We wish that, in a book like this, which is a *Dictionary*, the head-lines (instead of merely repeating the title of book) had given the catch-words. The Appendices I. and II. should be incorporated with the other part, so as to have only *one* Subject-alphabet; and an explanation of the various interesting old tavern-signs might be included. A Table of Suffixes, *e.g.*, of -bury, -well, -friars, &c., would be a welcome addition, much as the author has dealt with the Inns of Court, &c. We regret that Mr Habben has confined his work to the so-called "City," especially as the whole of London will soon be one great city; and further, as there are interesting streets, &c., in the old parts of Islington, Clapham, Southwark, Deptford, &c. But he may say that this is greediness on our part, and so we leave it.

LONDON STREET NAMES: their Origin, Signification and Historic Value, with divers Notes and Illustrations, by F. H. Habben, B.A.; London: T. Fisher Unwin.

THE THEORY OF PERSPECTIVE,

By CHARLES SWINSTEAD.

PERSPECTIVE is the application of Science to the representing the appearance of an object as viewed from any given point, on any given surface, when the object is either non-existent or not present. If the object be present, then the Art is merely that of model-drawing; and though a knowledge of rules of Perspective may be useful in this, yet it is not a necessity. The representations of buildings and verandahs in the Pompeian decoration have led some to suppose that the Artists were masters of Perspective; but this was not so—their representations were *Model-drawing* and *not Perspective*. The method of representation of an object that is not before the eyes of the Artist and cannot be copied—which must therefore be projected scientifically from drawings of the plans and elevations of it—is the only method that can properly be termed Perspective. There were many treatises on this application of Science, up to and including that by Peruzzi, given by Serlio in his book; but none was, or could be, complete until Ubaldi in his treatise, published in 1600, placed the whole practice of Plane Perspective on a scientific basis. The term—Plane Perspective—is used, because there is a method of Perspective representation on *curved* surfaces, examples of which (dating from the seventeenth century onwards) are seen in Italy. Mr. Swinstead does not appear to have been aware of this branch of projection, as he entitles his books "Perspective" (i.e., the *whole* of the Science). The applied Science of Plane Perspective is employed chiefly by three classes of persons, and for three distinct purposes:—(1) Painters' Perspective, used by pictorial Artists, for interiors (generally); when, owing to the great distance of the vanishing points, the ordinary Architects' method is impracticable; indeed the Painter often uses—not Perspective, but Model Drawing—copying from some actually-existing room. (2) Architects' Perspective, used by them or by the Architectural draughtsman, for the purpose of showing what a building will look like when erected. This is mentioned in Chapter IV. of Mr. Swinstead's two books; and he amusingly says it is called the direct method "to distinguish it from the Scientific method"; but surely it is quite as Scientific as the third or S.K. method; and certainly quicker when the plans and other data are available. (3) The S.K., or measuring-point method, is used by students who are desirous of possessing the certificates of the Department of Science and Art. It is of the third or S.K. Perspective that Mr. Swinstead treats. The smaller, which is Part I. of the larger work, is published at sixpence. It contains 45 pages, with 25 figures; and is the cheapest book of the kind that we have seen. The larger work, costing two shillings, with 74 pages and 71 figures, carries the subject as far as oblique-planes, shadows, and reflections. There is much that is good in these two useful works. The marking—of the successive steps of the Perspective operation by the letters of the alphabet a, b, c, &c.—and of the successive steps of the geometrical proof by the numerals i, ii, iii, &c.—is admirable, and will be much appreciated by users of the works. The use of leaded type is another aid which is judiciously introduced. There is room for more clearness and literary finish; but *clearness* above everything is imperative in a work of this kind, and in some cases a master would be necessary to explain the explanations. More use might have been made of the different kinds of line—the broken, chain, and dotted lines—as well as of the thin, and the thick line—which are so valuable in diagrams. Each chapter is followed by a number of "Questions" from S.K. examination papers, which can be used as a means of testing the progress of those students who are preparing for that special but somewhat limited purpose. Mr. Swinstead is known as an experienced and successful teacher. We hope he will soon give us editions of these works with clearer diagrams, especially in the lettering, even at some small advance in the price, for, owing to want of this, they may be sometimes perplexing, and his work deserves better illustration and a wide circulation among those for whom it is intended.

THE THEORY OF PERSPECTIVE: For the Use of Candidates for the Examinations of the Department of Science and Art, and Art Students in General. London: Simpkin, Marshall & Co. Price 2*s*.

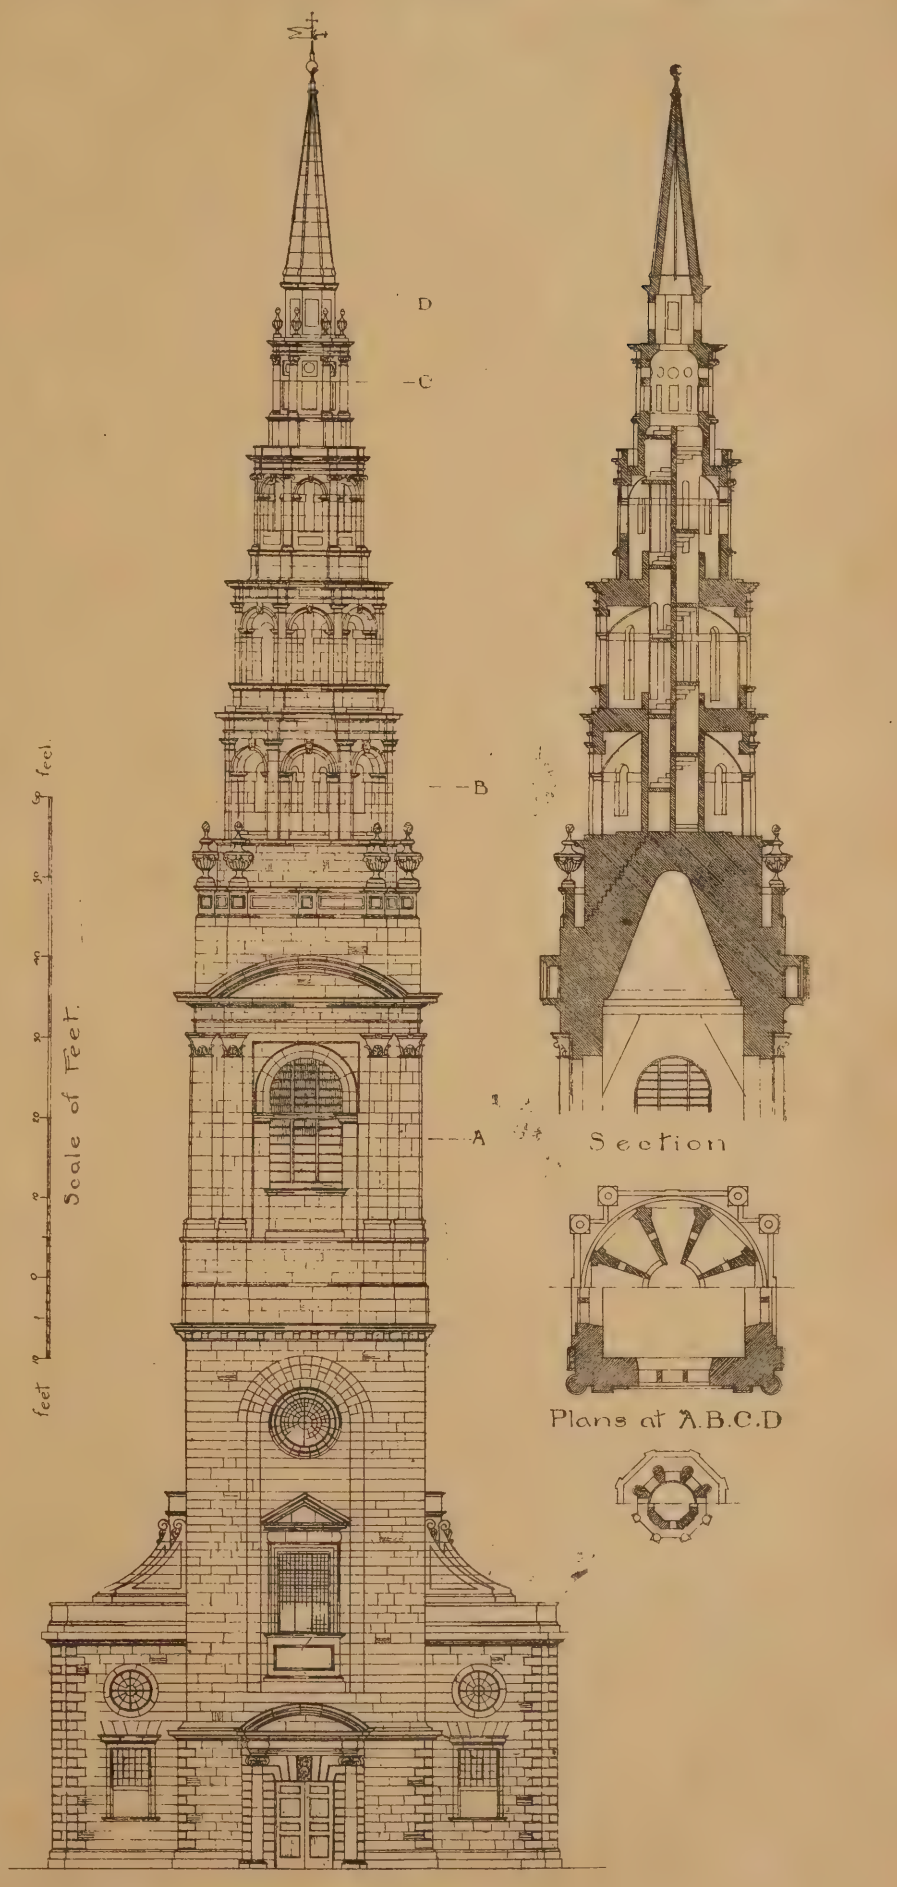
THE Newport Corporation report of the Water Works Committee, assured the Council that the works were progressing very satisfactorily.—Councillor Wilkinson pointed out that the committee proposes raising a further sum of £150,000, which, with the £160,000 already sanctioned, would make £310,000 to be spent upon the new water scheme. The town clerk states that £40,000 of the £160,000 is for the laying of new mains in the town, and he thought that a portion of the sum now asked for is for similar work.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

Sir Christopher Wren and his Work.

AN HISTORICAL AND CRITICAL SKETCH.

By ARTHUR STRATTON.



Read before the Liverpool Architectural Society, and published exclusively by the Builders' Journal.

PART I.—THE LIFE OF WREN.

(Continued.)

Another riverside institution of not dissimilar purport now is also closely knit with the name of Wren. Chelsea Hospital, originally a Royal College, founded by James I, was afterwards acquired by the Royal Society, but was abandoned by them again about 1667. Regranted by Charles II in 1680 for the purpose of a Military Hospital, Wren took it in hand in 1682, and by the simplest means possible produced a building which has never failed to charm all who ponder awhile to learn the great lesson which it teaches so well. Besides the many Churches in London which were occupying his attention, the Custom House, the Royal Exchange and Temple Bar, now all removed, were building; nor must the Monument be omitted, which the inhabitants thought fit to erect as a memorial of the great calamity which had befallen the city. It took seven years in all to complete; a long time, but no doubt delays occurred owing to the difficulty in procuring stones of a sufficient size from Portland. Evelyn contended, with reason, that it would have been most fittingly placed at a point where the fire ceased, and not, as is the case, where it originated. It was at first intended that the figure of Charles II should have crowned the summit, but the emblematical flaming vase found more sympathy with the people.

All this while, in spite of his enormous Architectural occupations, Wren never seems quite to have abandoned his favourite science, and he certainly intended to have made use of the Monument in the course of his astronomical investigations. The oscillation, however, at a height of over 200 feet, was found to be so great that the idea had to be given up. One may almost be excused for thinking that he was being drawn into another sphere against his will, and that if the Fire had never taken place he would have devoted himself almost entirely to a study so congenial at all times. The mere fact, however, of his having appeared as Architect before that occurrence points to his liking for the Art, but probably through force of circumstances only did he ultimately practise it to the exclusion of all else. This trait in his character, linked with the fact that his training, using the word as we know it now, or even to some extent as Inigo Jones knew it, was absolutely nil, could not fail to evince itself in his work in after years. A few words must be said of the long list of designs prepared at large which were never executed. Charles II, through his Commons, ordered that a mausoleum should be erected at Windsor, to the memory of his father, "the Royal Martyr," and, on January 30th, 1678, the sum of £70,000 was voted for the purpose. A design was produced, very magnificent according to all accounts—circular, with a dome, after the fashion of the Temple of Vesta, and most ornate both within and without. It met with the King's approval, but nothing more had been done at the time of his death, when other matters pressed forward, and no more was ever heard of it. Yet another undertaking, commenced about the year 1689, fell through. Charles had taken a great fancy to the glorious old city of Winchester, not only for its own sake, but for other considerations, which possibly appealed more forcibly to him. Situated in the midst of peaceful rural scenery, surrounded on all sides by undulating stretches of mossy down, and yet within reach of the New Forest, it seemed to him to be an ideal centre for a hunting resort. Wren produced a

ST. BRIDE FLEET ST.

DRAWN BY ARTHUR STRATTON, A.R.I.B.A.

design for a grand country seat, to be perched on the higher ground overlooking the city, and in an immediate line with the axis of the Cathedral. This was to have been made a special feature of, and the avenue of tall elm trees, which gives the Cathedral so great a charm at present, would have given way to a still longer and statelier one. Works went on apace, and the main wing was roofed in within two years, when a sudden check was given by the death of the King, and none but tentative efforts were ever made afterwards to complete it.

Whitehall must have been full of gloomy recollections, and, after the experiences of Inigo Jones, can scarcely have had a favourable prestige for an Architectural successor; whether Wren ever looked for great things there is doubtful, but it is certain that his designs, produced about 1697, for its completion, shared no better fate. That the talents of such men should have been so recklessly imposed upon is no credit to the times in which they lived. In the case of the first, it is little short of a national disaster that his life should have been thus frittered away; in the case of the second, it is true that with such a glorious list of completed works the omissions are not of such consequence, but it points to a tendency, so fully developed in our own day, to think lightly of and treat with actual indifference the claims of the Architect for support and consideration. The year before the King died another public appointment was conferred upon Wren; already Surveyor-General, he was now made Comptroller of the Works, a post which required much attention, and which brought with it many harassing little disputes, and the handsome remuneration of £9 2*s.* 6*d.* per annum. His stipend for the rebuilding of St. Paul's and the city Churches had already been fixed at £200 per annum; a mere pittance, conclusively showing that he worked with the highest motives that a man can work for—the ennoblement of his Art and the welfare of his country, and not just for the sake of his own advancement and the glitter of his name.

Although in Charles he certainly lost a good and tolerant patron, he was so handicapped and under such strict supervision that at any rate as regards St. Paul's his decease must have come as rather a relief. Undoubtedly he had quite exceeded the limits of the license granted him to depart from the approved design in small matters, but the work was not far enough advanced for any but a practised eye to detect the differences, and so no notice seems to have been taken of the alterations made during the progress of the works.

James II. was careless of such matters; he was no patron of the Arts, and his short reign passed away without leaving any monumental works to record his name. Restorations and rebuildings were going on all around him, and he issued a commission for continuing the works at St. Paul's, but little heed did he pay to them, and at least cannot be blamed for interference. Wren now practically had a free hand to follow out his own conceptions, so long as he was mindful of the public exchequer. On the other hand, one of the first acts of William and Mary on their accession was to commission Wren to add extensively to Wolsey's Palace at Hampton Court, to fit it for a Royal residence. The delightful red brick wing and the very Palladian design of the front facing the Home Park and enclosing the Fountain Court, executed between the years 1690 and 1694, are deservedly well-known and have met with better treatment than his Kensington Palace, erected about the same time for the same Sovereign.

After being released, as it would seem, from the ties imposed upon him whilst holding the Presidency of the Royal Society, Wren appeared as a Member of Parliament; first, for a borough in Devonshire, and later, in 1689, he sat in the Convention Parliament, which ratified the ascendency of William and Mary, as a representative for the borough of New Windsor. Nowhere is any mention made of his political opinions, but considering the influence of his father, who was a staunch Royalist, and the school in which he was brought up, we may safely conclude that he too was a firm supporter of the Crown.

These last years of the seventeenth century must have seen the finishing touches put to many of his works. About forty of the Churches in the city of London were either rebuilt or were well on the way to completion. Many a tower had risen again above the dull rows of bricks and mortar which everywhere lined the streets. St. Mary-le-Bow, the queen of them all was finished, and the graceful little St. Martin's, on Ludgate Hill, was already waiting for the great giant whose strength it was intended to emphasize so keenly by inviting comparison with its own subtle forms. Productions of his own mind must have met his eye at every turn within the city walls, gladdening his heart no doubt, but ever kindling bitter reflections at the recollection of the opportunities which had been denied him, of an ideal becoming day by day more and more remote from realization. St. Paul's had been steadily progressing under his immediate supervision, but records are scarce, and only a glimpse of his doings there is afforded us from time to time. The Coal Tax, which was not repealed till 1700, still largely helped to defray the enormous expenses, which up to 1684 alone, had amounted to £100,000. In 1686 the old west end was entirely cleared away, and two years later the new choir was ready for roofing. The Treaty of Ryswick afforded an excellent opportunity to throw it open on the Day of Thanksgiving, December 2nd, 1697. The morning chapel, which is said to have caused so much discussion, was next opened, and for a long time nothing is hinted at beyond the interest which was fast kindling and the speculations which were becoming rife as to the effect of the great dome now towering aloft. How should it be covered externally was soon the question, with copper or with lead? Wren seems to have inclined to the latter, but there was much argument in 1708 on the subject. It was probably on the score of expense that lead was finally decided upon at a cost of £2,500, or some £600 less than it would have cost to execute in copper. We have no cause to regret the beautiful silvery hue of this material, lending itself more readily to the London atmosphere than the uncertain effect of copper under similar conditions.

ST. MARTIN LUDGATE HILL.

DRAWN BY ARTHUR STRATTON, A.R.I.B.A.

Another change of Sovereign had in the meanwhile taken place, and Queen Anne's reign was destined to give much encouragement to the Art of Architecture. "The Act for Fifty New Churches" was passed in 1708, and Wren was placed on the commission to superintend their erection. Apart from the fact that so many years of hard and unappreciated labour were fast telling upon his physical strength, he could hardly in his official capacity have been eligible to carry out any himself; accordingly he contented himself with addressing a lengthy letter to his contemporaries, in which he gave them such advice as his exceptional experience enabled him to do with all discretion.

Living in comparative retirement at Hampton Court, which he loved for its quiet, peaceful situation beside the glistening Thames, he paid frequent visits to Westminster Abbey as well as to the new-born Cathedral. The busy throng of workers there at last showed some sign of cessation in their labours; the din and clamour gradually melted away, leaving the mighty structure in all its fulness of repose and strength, most forcibly shadowing forth the approaching end of its master-builder, whose long life of turmoil and strife awaited now its consummation at the hand of death. But both were yet to be harassed and maltreated at the hands of a ruthless and ignorant monarchy. There was nothing now in which the narrow-minded commissioners did not endeavour to thwart him. At first they insisted that the railing which Wren put round the precincts of the Cathedral was a "poor, mean iron rail," and they themselves substituted a heavy cast-iron one, which sufficiently obscured the lower portions of the structure to materially affect its proportions. This alteration took place about 1711, or shortly after the last stone of the lantern crowning the cupola had been laid by his son Stephen and Strong, his master-mason, in his own presence. Then arose a quarrel about the balustrade. Wren never intended that these should have been more than a blocking course, and he protested most strongly, declaring that such a feature would be contrary to the principles of Architecture as he understood them. He admitted that something of the kind was admissible in Gothic work, and that "ladies think nothing well without an edging." On the whole it is difficult to see the force of his argument. This was in 1717, and

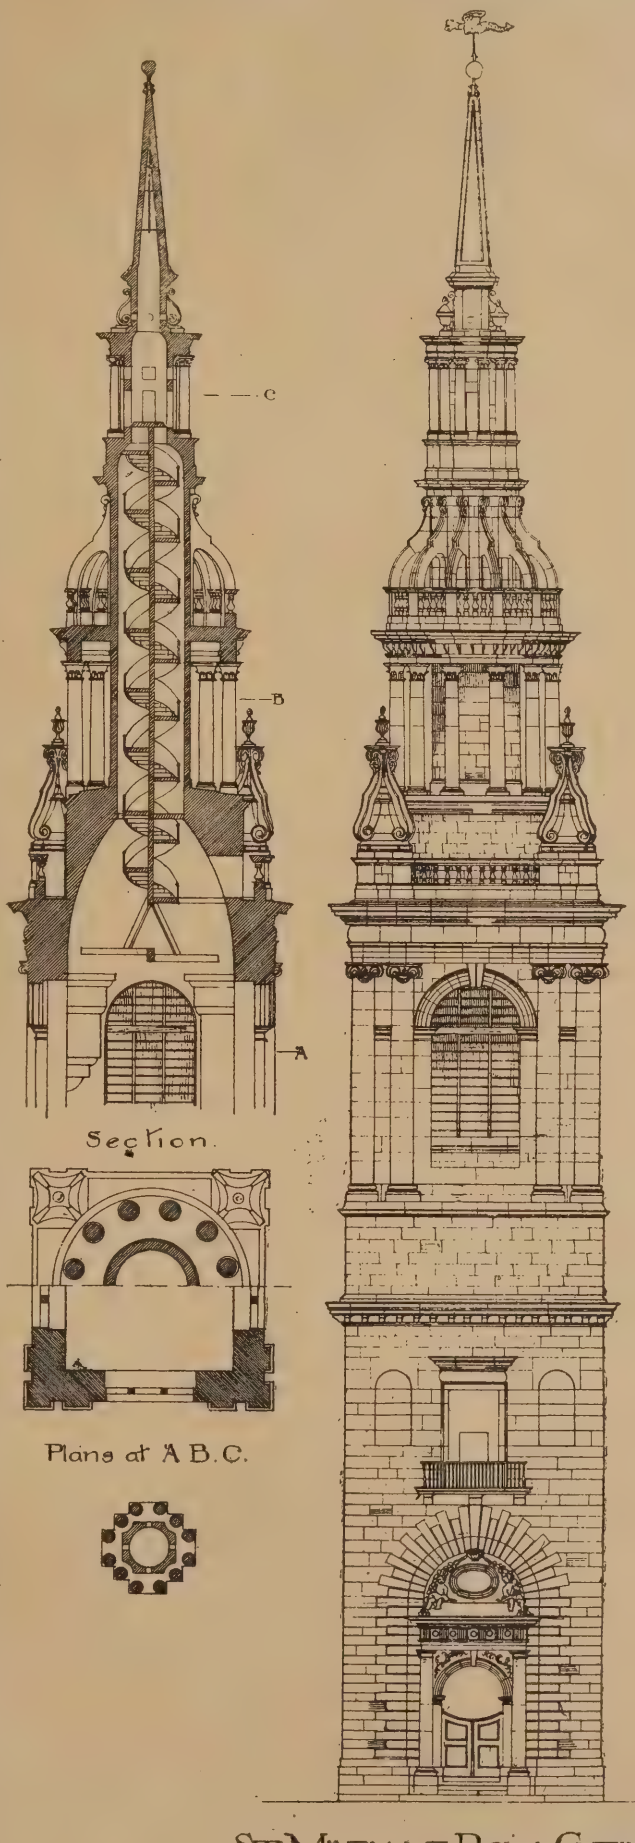
the treatment which was now accorded him was only in any measure equalled by the gross insult and injustice proffered him a few years previously with regard to his stipend for carrying out the whole of the city work.

As far back as 1697 a clause had been inserted in the Act for the completion and adornment of St. Paul's, "to suspend a moiety of the Surveyor's salary until the said Church should be finished," as the opinion was becoming general that Wren was prolonging the work for the sake of his paltry £200 per annum. He protested again and again in vain that the delay was no fault of his, if there can have been much delay at all! He petitioned the Queen later, for his salary was getting in arrears, and, being successful in the end, it was paid him in full on Christmas Day, 1711. It seems almost incredible that such insults should be showered upon him at the crowning point of his life. He had lived to see five Sovereigns, and had passed through the troublesome years of the Commonwealth with still no stain upon his honour when the climax was reached, in his dismissal from office. It must have come as a great relief to him, nevertheless, when King George, on April the 14th, 1718, to his everlasting shame, was induced to supersede his Patent in order to confer it upon a mere court favourite in the person of Benson.

Wren, now free from taunts and disrespectful treatment, rose high above his ignoble persecutors, and his calm and dignified demeanour show us, all the more plainly, what a truly noble character, what an ideal citizen London had driven from her midst. Without a murmur the good old man, full of righteousness and honour, betook him once more to his meditations, in a few short years to pass away and to be laid within the walls of the one temple which had cost him so much—his very life soul's work. He died at his house in St. James's, on February 25th, 1723, in the ninety-first year of his age, when on one of his periodical visits to London.

"Thin, and low of stature," is a sufficiently full description of his personal appearance. We can imagine what force of character must have emphasized his every gesture, what purity of thought must have stamped his every word. Well has it been said: "His knowledge had a right influence on the temper of his mind, which had all humility, graceful modesty, goodness, calmness, strength, and sincerity of a sound and unaffected philosopher."

THE WORK OF WREN.
SECOND PART.



IT was as a prime mover in the introduction of Palladian modes of design, which characterised the true Renaissance in England, that the influence of Inigo Jones was mainly felt. Wren did not willingly acknowledge his obligations, but he must be considered as the direct successor of Inigo Jones, not only in the school of Architecture founded by him, but also in the methods in which that school worked. These methods were far removed from those of the mediæval craftsmen who took part in the actual execution of their designs, and by Wren's time were so remodelled that we may consider that he worked under very similar conditions to ourselves. Individualism was henceforth to be deeply associated with Art, and it was a very potent factor in the work of Wren.

Profiting by a study, as complete as it was possible for him to make it, of all that had gone before, he nevertheless stamped everything with his own genius, and left it essentially English. The use of scale drawings and models, fully established by this time, was indispensable to him, and already the race of men who contract to carry out other men's designs absolutely from such drawings and models had sprung up. The knowledge of classic forms was fast increasing, but Wren practically had no traditions to work upon. He found plenty of mechanical labour at his command, but workers in the Arts accessory to Architecture had often to be sought out diligently. It was easy to build a wall, but to clothe it was often a serious matter. Accordingly, except when special facilities offered, Wren gave up the attempt, and borrowing still from the ancients, fell back upon proportion and beauty of line and balance of mass as a means to a nobler end. His mathematical skill told him that such properties must be at the root of all good design. By making everything subservient to them he produced works which were readily executed from drawings by the ordinary artizan of the time, but which, nevertheless, always rank high as works of Art. When he came across such men as Grinling Gibbons and Tijoue, we have ample proof that he gave them every scope for the unfettered play of their genius; but it is all characteristic of his work, that although its value was greatly enhanced by their decorative treatment, yet had their enrichments never been applied, the Architecture would still have remained intact, and still would remain intact were they swept away.

Wren, of all men, best realised that an Architect should ever strive after an ideal, but that it is most expected of him that he should achieve the possible. His genius owed much to his irrepressible faculty of painstaking; he never spared thought, but lavished it as freely upon the smallest undertaking as upon the most pretentious.

Art, in fact, to him was a reality, he deduced the beautiful by a system of logical reasoning. The inspirations which had produced and the sentiments which prevaded the Art of the religious enthusiasts of the Middle Ages, could only be seen by him through a deep mist which nothing but an innate reverence for the works of the past helped him to pierce. His constant reliance upon his scientific knowledge has sometimes been considered sufficient ground for accusing him of being an Engineer rather than an Architect. Such an accusation, we may feel sure, only reflects upon the minds of his accusers, who could in no way distinguish between mere construction and construction beautified. If sometimes his Architecture falls below a certain standard usually associated with his name, it should only be a wholesome reminder to us that he, too, was human. In the non-acceptance of his scheme for the laying out of London after the Fire, as well as in the many obstacles placed in his way throughout his career, we see plainly that he worked, for the most part, under very great difficulties in no degree dissimilar from those which beset the path of the more modern practitioner.

The principles which underlie his designs throughout are distinctly laid down in his few Architectural treatises which remain to us. They resolve themselves into a few golden rules, safe for all time. "There are two causes of beauty," he says, "natural and customary. Natural is from geometry, consisting in uniformity and proportion. Customary beauty is begotten by the use of our senses to those objects which are usually pleasing to us for other causes, as familiarity or particular inclination breeds a love for things not in themselves lovely." "Geometrical figures are naturally more beautiful than

ST MARY-LE-BOW CHEAPSIDE.

DRAWN BY ARTHUR STRATTON, A.R.I.B.A.

other irregular." "The square and the circle are not beautiful next the parallelogram and the oval." He attached very great importance indeed to the study and application of Perspective. To quote again:—"An Architect ought to be above all things well skilled in Perspective." "The Romans guided themselves by Perspective in all their fabrics, and why should not Perspective lead us back again to what was Roman?"

These few aphorisms, chosen at random from the "Parentalia," a work compiled by his son Stephen, suffice to indicate the main channel of his thoughts, and to give some idea of the basis of his Architectural creed.

He was particularly fortunate in having such trusty and capable workmen under him as Strong, his master-mason, and Jennings, his master-carpenter; whilst in Grinling Gibbons and Cibber he had with him always the two most accomplished sculptors of the day. They were both foreigners, the one a Dutchman and the other a Dane, but so great was their influence that they created quite a school of carving among Englishmen, still highly esteemed for its fanciful and luxuriant design and marvellous execution.

So much has been said, and so much has been written, from time to time, about the group of Churches, and about the Cathedral of St. Paul, to which they one and all owe deep relationship, that in a general review, such as this purposes to be, time will not allow of more than a few critical remarks and a few heartfelt words of admiration.

In considering, firstly, the construction of St. Paul's, we must uphold the rational though much maligned treatment of the central dome. Wren boldly accepted the fact that the same domical covering could not be made of pleasing proportions both internally and externally, and solved the problem before him with great common sense and consummate skill. Whatever scruples may exist in the minds of many as to whether deception is practiced by the triple arrangement or no, all must agree that the result is one of the most perfect domes, at least externally, ever erected. For his own part, Wren contended that a lead-covered roof over a dome was no more deceptive than an outer roof over a vaulted nave, and apart from sentiment he felt justified in resorting to such a method of gaining increase of height and bulk, which the people clamoured loudly for, seeing that they had been long used to the lofty towers and spires of the mediæval Cathedrals.

The flanking walls of the nave are possibly open to some objections: they are nothing more than huge screens concealing the clerestory windows, the flying buttresses which support the main vault, and the roof covering over it. We must remember, however, that it was part of Wren's teaching that in buildings other than those of a "private" nature, "no roof can have dignity enough to appear above the cornice, but the circular," *i.e.*, spincal, and most certainly, his design required the solidity afforded by the extra mass and severity of line so easily obtained.

The use of the double order was necessitated by very practical considerations; stones could not have been obtained from Portland, or from any other suitable quarry in England, of sufficient scantlings to carry out the portico and other portions in due proportion, had one giant order been adopted.

Such objections as these only tend to strengthen the claims which the building has to greatness, but perhaps the two faults which might have been most easily remedied originally are the most flagrant. The Chapels at the west end may have been forced upon Wren as is so often stated, but without doubt they give to the plan of the Cathedral a proportion and beauty of form which it would much have lacked without them. They also were the means of procuring the grand treatment internally, in the shape of the narthex, or vestibule, which is so impressive on entering. Externally only are they to be regretted; the mistake is that the outer walls of the Chapels are in the same place as those of the Campanile, whereas had they been recessed, even so slightly, the vertical lines of the Campanile would have been unimpeded, and much more interest would have been imparted to that portion of the structure as seen in perspective. The one eyesore, however, will be found in the treatment of the oblique sides of the octagon carrying the dome; it is hard to imagine how Wren could have perpetrated such a medley, but one instinctively shrinks from too freely criticising such a masterpiece, and we must look upon it rather as a freak of design than as a deliberate blunder.

Mosaic was originally intended for the decoration of the dome and roofs throughout, but the privilege of fulfilling Wren's desires has been left to our own day, and slowly but adequately is it being done.

The organ, too, after more than one move, now stands in the most suitable position and probably in the one originally allotted to it. It stood for years upon a screen at the entrance to the choir after the fashion of the mediæval Cathedrals, but the screen and the columns supporting it beneath on the crypt are clearly an insertion not provided for at the first.

The columns remain in the crypt, but the organ with its screen was removed in 1860.

In St. Paul's Church, through no fault of Wren's, the one chance of erecting a typical Protestant Cathedral was thrown away. He planned to meet the requirements of the day, which necessitated that a Church should be as much a place for preaching in as anything else.

In 1603, James I. was asked, in the Millenary Petition, that none should be allowed ordination unless thoroughly competent to preach, and enough of the Puritan spirit yet remained to exert considerable influence. The Churches which had been destroyed by the fire were of one accord of the mediæval type, adapted to a certain ritual, and when the necessity arose for rebuilding them under the new dispensation, curious anomalies arose.

In very many instances, for practical reasons, Wren thought fit to build upon the old foundations which then dictated the plan minutely. For the most part the sites allotted to the Churches were of the most irregular shapes and sizes, and many were the problems presented to Wren, and he always strove to ingeniously solve them and generally brought every foot within his roofing area. These were the main influences to govern the type of plan, and it is most interesting to notice the variety which he evolved; considering that they are a group of buildings erected by one man for one object they are probably unique in this respect. He never lost sight of the requirements of "the preaching house," with its large central space, and when at liberty to make a choice, he adapted either the stunted Basilican plan, which is arranged along a central axis, or the Byzantine plan, which is arranged about a central point. It is quite impossible to draw hard and fast lines between certain types, but, of the city Churches, 38 may be considered to belong to the first mentioned class, whilst nine belong to the latter.

The mode of roofing grew out of the necessities of each case, and it is in the manipulation of domes and vaulting surfaces that the one charm of the interiors is often to be found. The fact of their being often composed entirely of lath and plaster must not, in fairness to Wren, be allowed to detract from their merit. It was not his fault that a more noble construction was not employed.

The body of the Church is often uninteresting and the impression conveyed is far from elevating; depressing monotony is often avoided solely by the exquisite handling of the fittings and the delicate carving which bedecks them.

To quote a recent writer, Sir Walter Besant, "The Churches were what is commonly called 'ugly,' *i.e.*, they were built by Wren or by imitators of his style. The people sat in pews, each family by itself. All the Churches had galleries, and the service was conducted from a three-decker." These remarks, which apply fully enough to many of the pewed and galleried Basilican Churches, are altogether out of place with regard to those designed on the central area plan, or those in which the dome, or some modification of it, is the dominant note. It is impossible to describe in words the charms of St. Stephen's, Walbrook, the best of them all. By simple means an unrivalled variety of perspective and beauty of proportion is obtained; a work which alone would have established its designer for all time. Canova said, that if ever he revisited England, it would be to see St. Paul's, Somerset House, and St. Stephen's, Walbrook. The treatment so successful here and carried to such great length at St. Paul's, of supporting a dome on eight pendentives, is also found at St. Mary's Abchurch, and St. Swithin, Cannon Street; but wherever the necessities of the case demanded any other figure than the octagon, Wren freely evolved it. St. Benetfink and St. Anthony, Watling Street, once stood as admirable examples of geometrical skill applied to Architectural design.

It is in the towers, with their great variety of superstructures, that the living charm of the city Churches lies. Owing to the irregular crooked streets, and the chaos of brick walls everywhere lining them, Wren knew that in the majority of cases it would be simply throwing work away to lavish detail upon the lower portions of his designs, and he accordingly concentrated his whole attention upon the upper stages of the towers and often surmounted them with elegant lanterns or spires of wood or stone. He felt that the one opportunity left him of giving individual interest and at the same time redeeming the city from the commonplace was here. It was a grand opportunity, and putting forth his whole strength he made them burst into every exuberance of design characteristic to a remarkable degree of the versatility of his own genius. Before his time the highest development of the tower in England was a square surmounted by an octagonal spire, tapering to a point and broken only by lucarnes and crockets. The much-felt awkwardness at the junction of the two forms was slurred over by the introduction of angle pinnacles of all sorts.

The ancients, content with the tremendous grandeur of horizontal lines, had never striven skyward. Wren, in spite of his strong classic predilections, could never free himself from the secret workings of the Gothic Art of his native land within him: seizing upon the perfection and avoiding the defects of the works of the tower and spire builders of the middle ages by a stroke of genius, at one step he advanced far beyond them. He did not return to a Romanesque style, but taking the fully developed Gothic one as a basis, he entirely re-modelled its detail without attempting to obliterate its unmistakeable origin. It must be claimed for him that by the free use of Roman detail and constant reliance upon his mathematical skill, he evolved an entirely new epoch in the history of spire building, as beautiful now as it is strikingly original.

I will show you some typical examples of his tower and spire treatment in conjunction with the façades to which they belong. It will be noticed that the vertical lines are always carried down to the ground, a consideration too frequently overlooked in after years.

In St. Mary-le-Bow, a succession of cleverly designed stages rise one above another in perfectly natural sequence, altogether making a composition absolutely unrivalled for elegant flow of line and exquisite proportion of solids to voids, whilst a glance at the section exhibits the constructive skill displayed. St. Bride's spire lacks the spontaneity which gives the great charm to St. Mary's. It is more a result of deliberate calculation, and owes its success to the graduated rhythmical repetition of one composition.

In St. Vedast, with great cunning, are solids of contrary curvature superposed, producing a daring and effective play of light and shade quite unique. St. Martin's especially must not be spoken of without reference to St. Paul's. One prevailing idea underlies the whole group of these spires, each is related to one or other of the remainder, and directly or indirectly leads up to the great centre-piece. Nowhere is this so strongly marked as in the case of St. Martin's, midway up Ludgate Hill. From base to summit it is one succession of graceful profiles and delicate proportions, rendered even more graceful and more delicate by the forced comparison with the grandeur of the mass hard by. In spite of the just claims of these fifty or so towers to a foremost place amongst the Art treasures of England, they are day by day in peril and already has their number been sadly diminished through pure vandalism and gross utilitarianism. Their construction, sound from the first, has stood the ravages of time unharmed; they defy all still but the ravages of men.

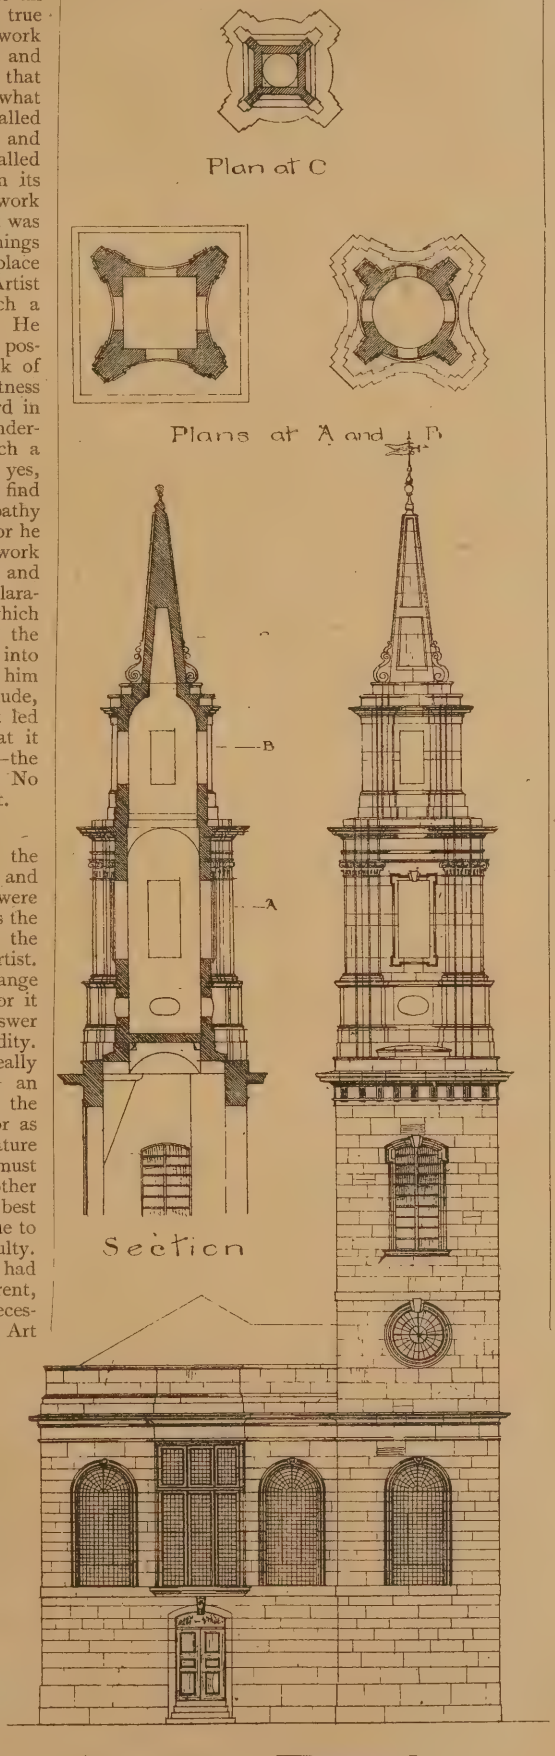
The Scale attached to the illustration on page 227 is applicable to those on pages 228, 229, and 231.

(*To be continued.*)

NEWCASTLE will celebrate the 60th year of the Queen's reign next year by an electrical and engineering exhibition, which will be designed to illustrate the progress in these and other leading branches of industry since 1837.

"THE ART LIFE."

ONE BY ONE FOR JUDGMENT AT THE ACADEMY.



AT the Birmingham and Midland Institute, last week, Professor Hubert Herkomer, R.A., delivered an address upon "The Art Life," which contained many interesting personal reminiscences. Professor Herkomer said that all true Art workers loved their work, and true enthusiasts loved to talk about Art. As work could not be done without enthusiasm, and enthusiasm naturally led to talk, it followed that Art workers must necessarily talk Art, or what was more expressively though colloquially called "shop." What palace would take its place, and what sanctuary rival the sanctuary they called "shop"? And let them take the word in its broadest meaning; to mean not only the work done by the worker, but the place in which it was done. For so closely were the two meanings allied in the life of an Artist, that man and place became one. Unhappy was the itinerant Artist who could not make himself one with such a sacred asylum. And what of the Artist? He could think of no greater honour for man to be possessed of than the power to create a great work of Art, for this was the power to recall the greatness of Nature, to interpret the veritable God-word in Nature by means of a language that was understood by all "seeing" mankind. Was such a worker not to speak of his work? Assuredly yes, for the storm and stress of such a gift must find collateral help in the touch of human sympathy to its possessor, through speech to his kind, for he must have a mental friend. Man and work became inseparable, hence the words "work" and "work talk" became synonymous. The declaration of "yourself" and "your work" for which he pleaded, and which was understood in the term "shop talk," need never lead the Artist into social "*gaucheries*." He would not have him adopt the alternative of silence and solitude, because this alternative was not safe, for it led the Artist to such extreme sensitiveness that it made him unfit for his real position in life—the position of a man belonging to mankind. No man belonged to mankind more than an Artist.

IT WAS NOT IN THE SCHOOLS

that the Painter learnt his Art, but with the people. From these he must not separate, and could not displace himself. Few workers were so quickly cheered and so quickly depressed as the Artist, but likewise to no other worker was the red-hot "shop talk" so welcome as to the Artist. The whole Artistic temperament was a strange quality of the brain; but how did it arise, for it was a combination of many qualities? To answer that they must knock at the door of heredity. He thought it was not on record that a really great Painter had a son who also became an equally great Painter. It seemed that in all the laws of Nature progression was necessary, for as soon as a culminating point was arrived at Nature seemed to "shut up shop," and say they must begin all over again but start from some other point. But although this would explain the best chances for successful offspring, it gave no clue to the production of the Art taste and Art faculty. It had often been seen that where there had lingered the love for Art in one or other parent, it had culminated in a child possessing the necessary gifts to succeed in Art. That a love for Art may have existed a long way back in a family was exemplified in the fact that they often found a boy born with full Art genius of apparently impossible parents. It was no small matter when such a creature came to life in surroundings that knew nothing about Art. Invariably

ARTISTS CAME FROM THE MIDDLE CLASSES;

hence the greater difficulty of his surroundings to understand this queer upshot, for the parents might be, and mostly were, in humble circumstances, and were seldom guilty of having knowingly given way to Art. But by an inscrutable law some combination had taken place in that child which constituted the Artist. Professor Herkomer described the student days and early career of the young Artist. Few Art student or young Artists of to-day, he said, failed to attend certain Art functions or social gaieties because they had no dress suit; yet in his day, may be, one student in a dozen possessed such a thing, and that one suit was not infrequently worn in turn by several comrades. But, strange to say, in those early days, and in England, the actual respectability of the calling was mostly doubted by the very middle classes which mostly produced the Artist. That it meant starvation in the eyes of many worthy people was not to be wondered at. Professor Herkomer narrated through what a series of accidents he

ST. VEDAST FOSTER LANE.

DRAWN BY ARTHUR STRATTON, A.R.I.B.A

sold his first picture. The question of selling the picture before it went to the Academy occupied his thoughts, but how to get to work was not quite clear. Of dealers his knowledge was limited to one occasion, when, two or three years previously, he took some water-colours to a man in Broad Street. He looked at them, and showed him the door without a word. Besides, his first picture was too large to take round, and he knew no dealer would come to an unknown Painter. One day he happened to be going to Piccadilly in an omnibus with a frame-maker with whom he was on good terms—having always paid him for the hitherto ordered water-colour frames—and they fell naturally to talking "shop." A gentleman sitting next joined in, and he was invited to see his oil picture. He accepted the invitation, but asked to be allowed to bring a friend. They both came, and number two gentleman asked permission to bring his friend, and the same boundless invitation was accorded. To shorten the story, number three bought his picture, and gave him a commission to do another. Here was a chain of circumstances that would have been entirely lost had he not grasped the initial link. Success was the ever-present thought in the Artist. It started him; it encouraged him on his way, and its accomplishment was the real balm to his old age. Let it be understood, however, that that reserve power in man, which stubbornly supported an inward conviction, was a commendable, and, he would say, indispensable self-assurance. There must be nothing negative about an Artist. He must affirm. If the affirmative did not touch a chord somewhere, it was barren. The approval of a minority was all that was required. It was not infrequently all that was meted out to those who finally conquered the world. To show how little the Artistic temperament had changed, he suggested how the masters of the past could be placed on modern pedestals with but a change in detail. But if types had remained, surroundings had changed. The increase of exhibitions, for instance, was one of the terrors of the age. Every dealer had an annual show. The alarming increase of Artists had, of course, necessitated an increase of room for showing work; and the increase of quantity had been about 300 per cent. Abnormally large prices prepared dangerous ground for the living and the dead. The long depression in trade had caused much suffering among Painters, for they had "worked up" to the unprecedented times of plenty, believing them to be permanent. Little by little the prices were raised and raised, until they had reached a dangerous pitch. Then came the change, and the Painter was unwilling to change his prices with the change of times, with the result that he was in many cases dropped altogether. In the successful times he had prepared no bridges for escape, and when the blow came he had no change of weapon to fall back upon—no side Arts. It would be a poor general who went to war with so little forethought of possible disaster. Yet a

PROFESSIONAL LIFE WAS A FIGHT,

and often a hard one, necessitating all the forethought, circumspection, and daring of the military man if it was to succeed. As the prominent dealers found their hands full of modern works they could not sell, they turned their attention to the dead, and it soon became a fashion to give high prices for old and past masters. But, the supply being limited, attention was again, with the revival of trade, turned towards the living workers, but with this difference, that the prices began again where they began when the great days started, and not where they left off. Notoriety in former days grew more out of the studio than by independent effort. How picture exhibitions, as we had them now, originated he did not know, but he knew that notoriety nowadays began and ended in the exhibition, and the Artist must take the plunge sooner or later. It was, and always would remain, a shock for the Artist to see his work crowded together with others—frame upon frame, subject upon subject, a confusing, eye-deadening, heart-aching, back-aching invention, torture alike to public and to Painter. Professor Herkomer described the method of procedure as to the judging of pictures at the Royal Academy, and said that the Council of the Academy consisted of ten members. They sat in a semicircle, with the president in the centre, and the pictures were brought in

ONE BY ONE FOR JUDGMENT.

During the first week in April the weather was

often very trying, and the members sat with mufflers, thick overcoats, and rugs—doing what he could only call heavy penance for their sins. (Laughter.) Imagine sitting from ten in the morning to six o'clock in the evening, with one hour for luncheon and twenty minutes for tea, seeing picture after picture, and this for eight days, during which they looked at perhaps twelve thousand objects, purporting to be works and objects of Art. Was it human to expect the eye to keep its clearness and the mind to keep its attention and power of judgment? Still, it was with the utmost conscientiousness that the members of the Royal Academy fulfilled their duty. It was easy for the outsiders to cry "Justice, justice." They got it, so far as human effort so strained could give it. But out of ten men there might be great divergence of opinion, and then the president took the vote on a picture by show of hands. There was no question when a striking picture came before them; the difficulties arose with the works that were good, but not excellent, and they formed the bulk of the works sent in. And so few were the excellent works sent in that the Council only actually accepted an average of seventy or eighty pictures, which, of course, must be hung. The rest were either made "doubtful" or rejected right off. There may be two thousand or more made doubtful, and these were dealt with by the five members of the Council, called hangers. He related how, at the age of twenty-five, he sent his picture to the Academy, and with what anxiety he awaited the decision of the Council. Five days after the picture was sent in the post brought him, not a letter of rejection, but two letters from two members of the Council. He was watching by a sick bed when the letters came, and he was not ashamed to say that when he read them he broke down. Fully equipped, sound in body and mind, free to exercise every moment's desire for Artistic experiment, free from all cares of bread-winning, possessing all the honours within his reach, his name a household word, this was the life of the successful Artist—a life second to none in the world for its comprehensiveness, its joy in work, and its immortality in work. Artists on the whole now strove for noble lives more than they were wont to do at any other period of Art's history. In the present time Artists had been upbraided for too great a striving after grand houses and a fashionable life; upbraided for looking at their Art too much from a commercial point of view. Artists as a class might claim generosity of heart as their most strongly-marked characteristic.

A STAINED-GLASS window is to be placed at the east end of Silk Willoughby Church, near Sleaford. The cost will be about £400, of which sum £280 has been subscribed.

MR. ALBERT W. LAWSON, of the City Survey's Department, Manchester, has been appointed surveyor for the borough of Rawtenstall.

AT a recent meeting at the Church House, it was resolved "That the memorial to the late Archbishop of Canterbury shall include, primarily, an effigy of the Cathedral of Canterbury, and that the further efforts of those interested in the memorial be directed towards the completion of some part of Truro Cathedral."

FOR the school premises connected with the New Road Presbyterian Church, Woolwich, the London School Board has made an offer of £3,000, which has been accepted, with the approval of the Presbytery. The money will be applied to the erection of new schools for the Church on another site.

NEW premises have been opened for the Liberal Club, at Beverley. On the ground floor are rooms for the caretaker, a room for the secretary, and a reading room, and a lending library. At the rear a brick structure has been erected to form a billiard room and a card room. Special attention has been paid to lighting, ventilating, heating, and furnishing.

A STAINED-GLASS window has been placed in the east end of the Parish Church of Atherstone. The window has cost over £450. The lower central light represents the Nativity, and on either side are portrayed the Annunciation and the Presentation in the Temple. Three upper central lights delineate the Crucifixion, and, on one side, the figure of the Prophet Isaiah represents "Prophecy," whilst, on the other side, St. Paul figures as "Testimony." The upper part is filled with figures of saints and angels.

THE GREAT MOSQUE OF THE OMEIYADES, DAMASCUS.

By MR. R. PHENÈ SPIERS.

AT the R.I.B.A., on Monday night, a paper on this subject was read by Mr. Spiers, who said that the principal cause which led him to take up the subject was that, when travelling in 1866, he was accorded a special permission to draw inside the mosque, and had, therefore, in his possession, illustrations of the great dome and other features hitherto unpublished. The destruction of the mosque by fire, on the 14th October, 1893, led him, in February in the following year (when first he heard of it), to take up the subject in order to solve, if possible, the problem which has exercised the minds of many Archæologists, viz., the determination as to what part, if any, of the mosque belonged to the Church of St. John, commenced by Theodosius in the middle of the fourth century (who utilised the remains of a Roman temple), and enlarged by Arcadius, his son, at the beginning of the fifth century. The paper was virtually written two years ago, but the preparation of the plan, elevations, and sections was delayed by want of further information, now partially obtained from additional photographs. Mr. Spiers first described the mosque itself, the main building of which runs east and west, and is built in between two ancient towers at the south-east and south-west corners respectively.

THE MOSQUE MEASURES

internally 446 by 123 feet. Exactly in the centre is an immense transept running north and south, with a dome over the crossing and on each side, viz., to the east and west; a nave and aisles, or, more correctly speaking, three aisles (for the divisions are of equal dimensions), 180 feet long. The north and south transepts have horizontal ceilings in wood carried on beams supported on corbels, all richly carved, painted in brilliant colours, and gilded. The dome on the crossing is carried on squinch pendentives; the nave and aisles to the east and to the west of the transept are divided each by an arcade of eleven bays, with columns taken from some more ancient edifice raised on octagonal pedestals and surmounted by Roman capitals and Byzantine dosserets. Above the arcades the walls are pierced with semicircular arched openings. Similar openings of the same size run the whole length of the mosque in the north and south walls, being there fitted with pierced arabesque designs in stucco filled with stained glass. On the north side of the mosque is the great court, of the same length as the mosque, and 160 feet in depth, surrounded with an arcade with openings above, similar in size and design to those already mentioned in the nave and aisles. Externally the mosque is

OF THE SIMPLEST DESIGN.

The walls are all built in ashlar masonry in courses varying from 2 feet 9 inches to 3 feet in height. The transept rises 30 feet above the walls of the two wings, and has a low-pitched gable on the north and south fronts, with a single bold ogee moulded cornice. There are three minarets, two of them built on the ancient towers between which the mosque was erected. The principal entrances are the triple gateways with bronze doors on the east and west sides, which lead into the great court. In front of the east and west gates there existed a double colonnade, the remains of which are built in the shops at the si e, and at the west end of the western colonnade is a magnificent archway, the greater portion of which still exists. Forming part of the south wall of the mosque are, first, the two towers before referred to, one of Syrio-Greek work, the other Roman or Byzantine; and, secondly, the great doorway of the Roman temple which served as the entrace to the Church of St. John, and was used afterwards by both Christians and Moslems, when the Church was divi e l into two portions. After a brief escription of the chief historical events connected with Damascus, Mr. Spiers, relying on Mr. Guy le Strange's translation of the works by the me iæval Arab geographers, proce le l to trace the history of the mosque from the time when it was

ENTIRELY REBUILT, IN 705,

by the Khalif Al Walid, down to the present day. The conclusion arrived at by Mr. Spiers is that Al Walid first pulled down the ancient Church of St. John and then built the existing mosque, which is virtually the same now, subject to restorations of the north minaret and the addition of two others, to the cementing over of portions of the exterior stonework damaged by the fires of 1069 and 1405, and to the encasing of some of the columns of the great court. In conclusion, Mr. Spiers described the remains of Roman work existing round the mosque, drawing especial attention to the great gateway on the west side, which he considered to be the portal of a Roman palace no longer existing. The paper was illustrated by plans, sections, and elevations of the mosque, mainly derived from his own drawings and from photographs, and based on the plan measured by Sir Charles Wilson, and published in Fergusson's History of Architecture, by drawings made in 1866, and by numerous large photographs taken before and after the fire, in October, 1893.

Mr. Holman Hunt said he had visited that part of the world, and found Mr. Spiers' address most interesting, especially his detailed account of the different epochs. Although he was at Damascus in the year 1854, it was at the time quite impossible to make observations at all, and he had often looked with longing eyes upon the interesting structure. Colonel Watson, in seconding the vote of thanks, said: "I am sure we are all greatly indebted to the lecturer for the interesting way in which he has described to us this most interesting building. There is one point I should like to mention, and that is, that, in my opinion the actual principal entrance to the mosque was not in the place indicated by the lecturer."

Professor Aitchison said, "I don't know that I have anything to say myself on the subject, except that I am rather apt to fancy that these savages, when they came out of Arabia, did not bring the least bit of Architecture with them, and that almost every bit of this ancient structure was built by the inhabitants of those civilised countries which they had overrun and not succeeded in exterminating. In Mahomet's time, the Arabs were so absolutely ignorant, that they had scarcely even the crudest idea of Architecture. I daresay when the temple over the Kaaba was erected, they could build up a wall around it either with or without mortar, but they could not themselves have roofed it over. Nobody at Mecca knew anything about roof carpentry. A story runs that a vessel was wrecked off the coast and the Arabs applied to the captain for advice. The captain gave himself out to be an able Architect, and offered to roof the structure on the understanding that they would buy the timber of the wreck for that purpose. I doubt whether the Arabs made very much headway in Architecture until many centuries afterwards. You see, the Kaaba temple was erected in 623, and this mosque was only built between 705 and 715, when Al Walid lived. Therefore, the chances are that it was not an Arab who did it. I am not sure whether it was during the reign of Diocletian II, but they had some wars with the Roman Emperor, at Constantinople, and I suppose the Saracens got the best of it. Anyhow, at the conclusion of that war, the conquerors had a clause inserted in the treaty with the Roman Emperor, to the effect that they were to receive some 70 camel-loads of mosaic and gold, and that a certain number of workmen were to be given to them for the completion of this mosque. The whole structure reminds one very much of Diocletian's Palace at Spalata. These extraordinary savages, who were possessed of that tremendous energy, in their peregrinations no doubt absorbed a great amount of the knowledge accumulated by the civilised peoples they conquered, and applied this knowlegde in their structures, and thus gave a new phase to Architecture. After all, we are still groping considerably in the dark, probably owing to the fact that the records of the Arab writers have not been sufficiently studied, in fact, very little, and that Arabic is almost an unknown language even amongst the most civilised nations ot the west." Mr. Spiers having replied, it was announced that a business meeting for the election of candidates would be held on Monday, 30th November. At the conclusion of the meeting, a special general meeting will be held, when the books and drawings bequeathed to the Institute by the late Secretary wil be laid on the table. Mr. A. S. Flower, one of the Hon. Secretaries of the Library Committee, will then give an account of the late Mr. White's drawing and sketching work.

ARCHITECTURAL MOVEMENT IN DUBLIN.

THE FORMATION OF AN ASSOCIATION.

A MEETING has been held for the purpose of inaugurating an association for the co-operation and mutual improvement of students of Architecture in Dublin. Mr. Albert E. Murray, Secretary of the Royal Institute of Architects in Ireland, presided. The meeting was largely attended. Mr. W. R. Gleave, Hon. Sec., read a letter from Mr. Thomas Drew, R.H.A., President of the Royal Institute of Architects of Ireland, stating that he learned with satisfaction that there was a movement on foot for the formation of an Architectural Society for the improvement of students in Dublin. He wished the movement every success. Letters expressing sympathy with the project, and promising support, were read from the Lord Mayor, Mr. J. F. Fuller, W. J. Doolan, L.C.E.; Messrs. W. J. Fennell, Belfast; J. A. Fullerton, Armagh; Kaye Parry Beresford Pite, President London Architectural Association, &c. Mr. Howard Pentland proposed—"That the establishment of an Architectural Association for the mutual improvement and advancement of its members in the interests of professional education and social intercourse is desirable, and as such the proposed Association is entitled to the support of the Architects, assistants, and the profession generally." It was, he said, a great anomaly that no such association had been already formed in Dublin. The fault of the Dublin Architects had to a large extent been what he might call pot-hunting. They did not hold together, and the assistants did not hold together to see what was best for them mutually. It was encouraging to see juniors and seniors coming together at that meeting in order to call for the best efforts of all for their mutual benefit. Mr. Holloway seconded the resolution, and said that if there were nothing more than the social intercourse which would arise from such an Association that would justify its being established. He hoped professional jealousy amongst rising Architects would disappear by means of the new Association. Mr. Caulfield Orpen, speaking in support of the resolution, said that the large attendance at that meeting afforded every promise of success. The Association would do an immense amount of good by affording opportunities to its members of coming together, of knowing each other, and of entertaining fear of each other's healthy criticism. The resolution was adopted. Mr. Thomas Drew proposed a resolution to the effect that the movement about to be initiated was a laudable one, and was deserving of the help and encouragement of the senior members of the profession in Ireland. They had, he said, all the elements for one of the most successful co-operative societies of Architectural students perhaps in any part of the Kingdom. The Association on social lines would, he believed, be a great success. One of the great advantages it would be to the seniors would be that it would afford them an opportunity of knowing what able assistants they had about them in Dublin. They had not full knowledge of the capabilities of the Dublin assistants, and as a consequence, very valuable work had sometimes to go away to London. For his part, he would do all he could to assist the movement. He promised to supply books for a reference library for the use of the members. He would have great pleasure in placing a room at the disposal of the Association. Lectures on special subjects might be delivered under the auspices of the Association, and the senior members of the profession would feel it a privilege to be asked to spend an evening with the members of the Association. Mr. W. H. Mitchell seconded the resolution. He said that the Association, if carried out on proper lines, would be a great success. Almost every large provincial town in England had its Architectural Association, and many of them were very flourishing ones. Mr. Walter Doolan, L.C.E., said that the Association could do a great deal of good, and the seniors should assist it in every way hey possibly could. Mr. W. H. Beardwood, T.C., said that the seniors were anxious to meet the assistants and to encourage them in every way in connection with the Association. The resolution was adopted. Mr. M'Loughlin proposed that the Association be called "The Architectural Association of Ireland," that it be established at once, and that the offices of the Association be at 22, Clare Street, Dublin, by permission of Mr. Drew, and that those present constitute a general committee, and arrange to take a ballot for officers. Mr. Tighe, of the Board of Works, seconded the resolution, which was adopted. Messrs. William R. Gleave and Frederick Hicks were appointed honorary secretaries and treasurer *pro tem.*

EDWARDIAN ARCHITECTURE.

By B. PRIESTLEY SHIRES, A.R.I.B.A.

THE DEVON AND EXETER ARCHITECTURAL SOCIETY.

THE inaugural meeting of the Winter Session of the Three Towns' Branch of the Devon and Exeter Architectural Society took place last evening, at the Plymouth School of Art, Princess Square. Mr. Charles King presided, and those present included Messrs. B. Priestley Shires, A. S. Parker, C. Pinchard, J. H. Vincent, R. S. Baker, G. Hancock, R. A. Mill, A. Rooke, H. Wattes, and E. M. Leest (Hon. Sec.). The minutes of the last meeting having been read and adopted, Mr. B. Priestley Shires delivered the first of a series of lectures that have been promised by Mr. Edmund Sedding, Plymouth, and Mr. A. H. Fellowes Prynne, and others. The subject of Mr. Shires' lecture was "The Domestic Life of the Edwardian Period, as shown by its Architecture, Manners, and Customs," and it was profusely illustrated with measured drawings, monographs and sketches, and included Markenfield Hall, Belsay and Alnwick Castles, Archbishop's Palace, Southwell, several sketches of York, cartoons from ancient MSS. Lutterell Psalter. Mr. Shires said, the Edwardian Period for Art and Architecture was perhaps one of the most brilliant and flourishing epochs in English history. The people not only enjoyed peace and prosperity, but made rapid progress in civilization. It was exactly for this period, and no longer, that the Decorative style prevailed. Many of the houses were of large extent and great magnificence, and testified to the wealth and prosperity of their owners. The general arrangement of a house of this period chiefly consisted of a hall, and Mr. Shires was pleased to observe that that feature was being greatly developed in the many fine mansions that have been erected in recent years. Originally it sometimes occupied the whole height of the house, and not infrequently had a low ground storey under it; the "wings" were commonly of two storeys only, the cellar below and the solar over it; in other instances they formed towers of three or four storeys in height. The other buildings for offices and stables, &c., were so arranged as to form a quadrangle, with the hall in one angle of the principal, and the gate-house in the centre of the open side, opposite to it, and generally the whole was surrounded by a moat. The plate and garniture of the hall table was also a great feature; the display of plate was extensive, and indicated the increase of natural wealth. Silver dishes, cups, and salt-cellars, wrought in curious devices, glistened upon the board, and the taste displayed in their manufacture was great. The distinctiue features of a banquet of the period, and the mode of serving the same, were dwelt upon. The manners and customs also came under review, and also the recreations and amusements indulged in, as well as the class of provisions partaken of, and the style of apparel worn.

The Chapel was also an important apartment, the size and situation varied considerably, but was generally near to the hall, the window was large and of an ornamental character, the altar was placed immediately under it, the sacrarium for the use of the chaplain generally extended the whole height of the building, and included a piscina and locker and sometimes a sedilla. Another interesting feature was the solar, the use of which corresponded to the with-drawing room of modern times, and was the private apartment of the lord, his family, and principal guests; one of the most striking features was the window, the recesses of which were of a fair size and usually built as in the preceding century, with the masonry left so as to form benches on each side: these were the favourite nooks and corner of domestic life, and the votaries of chess haunted these old-fashioned retreats, and it was here, too, that my lady and her fair damsels brought their spinning and 'broidery, and wrought those marvellous and beautiful fabrics for which in mediæval times their needles acquired an European fame.

Mr. Shires concluded a very interesting lecture by describing the many other offices, the state of the public roads, and details connected with the domestic life of the times.

A vote of thanks was accorded to Mr. Shires, on the proposition of Mr. Parker, A.R.I.B.A., seconded by Mr. Pinchard.

KEYSTONES.

AT a general meeting of the Royal Institute of Painters in Water Colours, Piccadilly, Mr. Frank W. W. Topham was elected a member, and Professor Hans von Bartels an honorary member.

CAPTAIN BALFOUR, the owner of Branksea Island, in Poole, has decided to rebuild this fine old castle, which was almost completely destroyed by fire in January of the present year.

THE City Commissioners of Sewers have decided to serve notices to acquire the freeholds of all the properties from Bride Lane to Salisbury Court, Fleet Street, for the purpose of widening that thoroughfare, providing the London County Council agree to contribute half the cost.

THERE is no truth in the rumour that the Church of St. Mildred, Bread Street, is threatened with speedy destruction. It is true that the vaults are being cleared of some ancient human remains, and that it will in consequence be closed for six months, but there is no project on foot for destroying the building.

IN South Staffordshire, operations have been commenced to see if coal could not be proved on the other side of what is known as the "Western Boundary Fault." The boring is taking place in the Baggeridge Woods, about a mile beyond the "Fault," which runs through the bottom of the Himley Road close to Dudley.

AT the present time there is a movement going on in Dundee to have a new railway station provided at Stannergate. About six acres of ground, it is stated, will be available for the proposed new station and goods yards, and the proprietor of the ground has offered to give off the ground at a very cheap rate.

AN explosion of sewer gas occurred last week in a deep sewer recently laid in Alfred Street, Burton-on-Trent. The iron lid of every manhole in the thoroughfare was displaced, and all the houses were shaken. A bricklayer, named Parry, was severely burnt, but fortunately no one else was injured.

IMPERIAL confirmation has been given to important concessions arranged by Li Hung Chang in the interest of English and American firms. These concessions represent something like 3,000 miles of railway, including a line from Hankow to Pekin, which covers a length of over 700 miles, and involves the bridging of no fewer than 27 rivers.

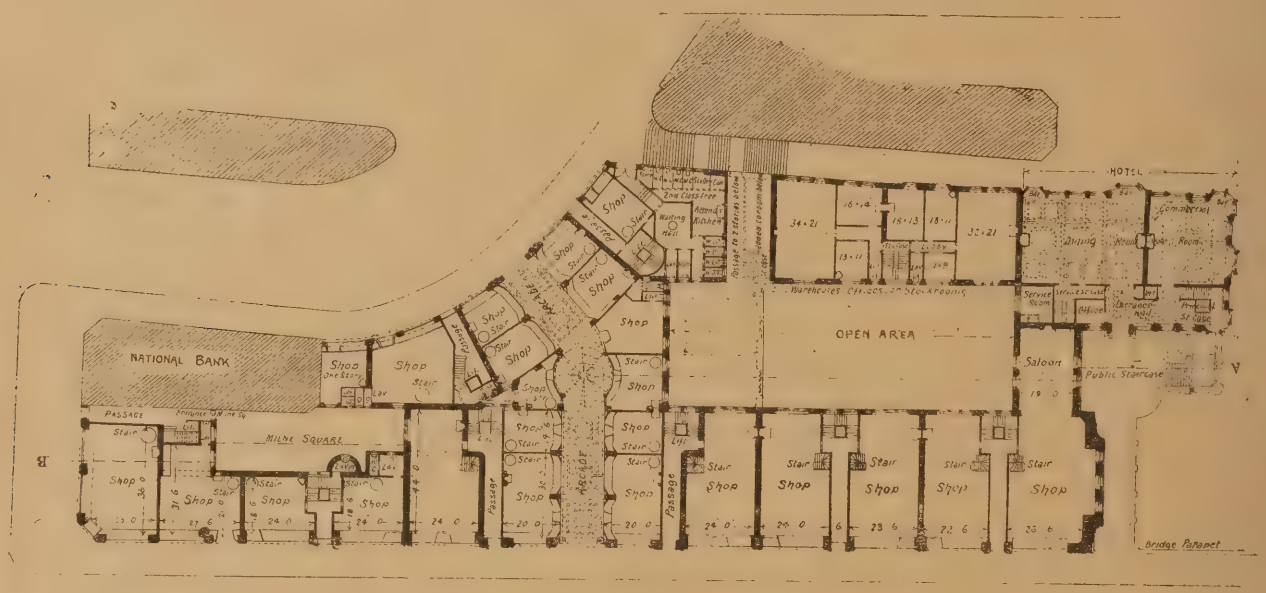
AT Stockport, Colonel Hasted, R.E., recently conducted a Local Government Board inquiry into an application by the Council to borrow £43,000 for gas-works purposes. The Gas Committee has decided in favour of a carburetted water-gas plant, to relieve the great pressure on the existing resources.

THE excavations carried on by the Archæological Society in the north-west of Thessaly, near the modern town of Agya, have at last been rewarded. The discovery has been made of the foundations of ancient towns and citadels, the names of which are still unknown, together with tombs of the Mycenian era, containing terra-cotta vases with inscriptions, weapons, and objects of Art. Important results are anticipated from a closer examination of the various relics.

MR. HENRY HARBEN, chairman of the Hampstead Vestry, laid the foundation-stone yesterday of a free central public library for Hampstead, to be erected at a cost of £5,000, the whole of which has been given by Mr. Harben, leaving only the cost of the site—£1,920—to be paid out of the parish rates, less a donation of £350 given by Sir Spencer Maryon Wilson, the owner of the land. The site is at the corner of the Finchley Road and the Arkwright Road, in a most eligible position for a central library, there being also branches at Kilburn, Haverstock Hill, and in High Street.

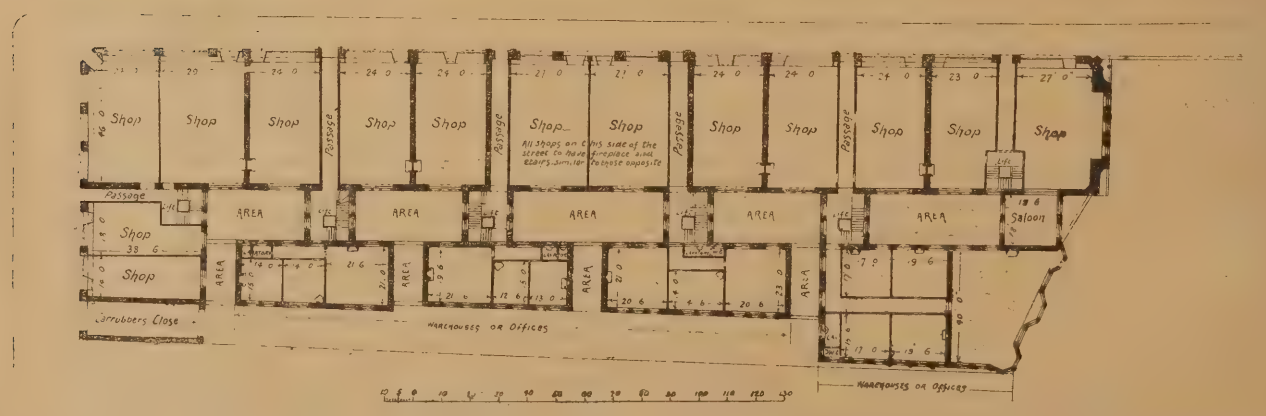
Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
November 18th, 1896.



"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gildea ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE result of the Exeter Church Competition has been made known, and the Assessor, Mr. Ingelow, has distributed the awards as follows:—First Premium of £100, Mr. Harold Brakspear, A.R.I.B.A., Corsham, Wilts, and Premiums of £25 each, to the following: Mr. Fk. Bligh Bond, A.R.I.B.A., 36, Corn Street, Bristol; Messrs. J. E. P. and J. K. Cutts, 34, Maiden Lane, Covent Garden, London; Mr. Gordon P. H. Hills, A.R.I.B.A., 4, Adam Street, Adelphi, London. These were selected out of a total of 420 competitors. We are making arrangements by which we shall illustrate the best of these designs (not necessarily the premiated) in an early number.



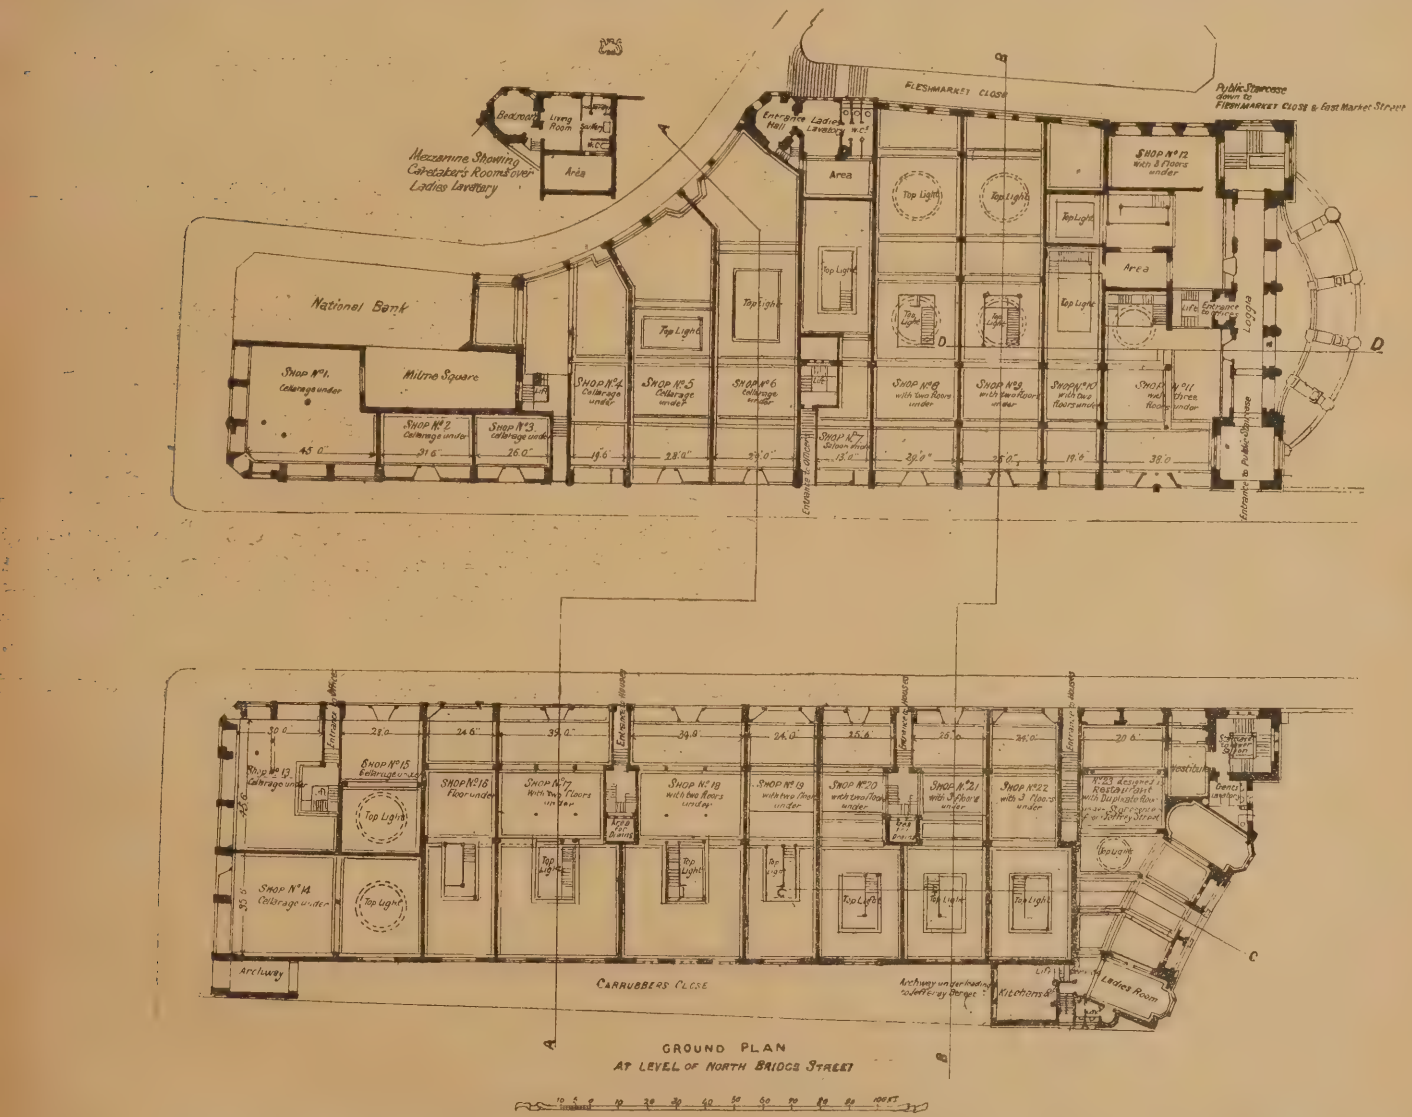
SPEAKING at the Victoria Technical Schools Bazaar, at Preston, the Right Hon. R. W. Hanbury, M.P., said technical schools had had the effect of bringing Art down from the skies to the light of day, and of making it of practical use in our homes, factories, and workshops. If we were going to hold our own in the competition and race that is going on our work must be skilled and artistic, and good work. Still, it was no use making pretty things, and useful things, unless we made things that people wanted. The Germans were introducing a lot of goods into this country which he certainly did not think were of high artistic merit. It was somewhat striking to notice the fact that while we were fighting for markets in semi-barbaric areas, the civilised nations of Europe were actually competing as hard as they could for entry into our home markets.

In a preliminary prospectus of a new work on the Art of William Morris, edited by Mr. Aymer Vallance, the Editor remarks "In view of the extraordinary revolution which has taken place in nearly every branch of the industrial and decorative Arts during the past half-century, and of all that has been achieved in the way of preserving ancient buildings from demolition, or, what is practically as bad, disfigurement in the name of restoration, it certainly seems strange that no book has hitherto appeared which attempts to give a comprehensive account of the work of the gifted Artist, to whom before all others belongs the credit of being the leading spirit of these movements." This want Mr. Vallance's book is intended to supply, and will contain, among other illustrations of decorative work designed by Mr. Morris, a drawing by Mr. H. P. Clifford, of the Red House, Upton, Bexley, designed by Mr. Philip Webb for Mr. Morris; the Manor House at Kelmscott, near Lechlade; Kelmscott House, Hammersmith; and other places of interest in connection with Mr. Morris. Mr. Philip Webb, of whom the public has heard more of late than at any other period of his life, may be called the Artist's Architect, his work being mostly confined to the erection of mansions for wealthy men of Artistic taste and dwelling-houses for painters. He has built but little in London, but his admirers recall with pleasure the massive building for the Earl of Carlisle, at Kensington Palace Gardens; the charming house for Mr. Val Princep, in Melbury Road, adjoining Lord Leighton's; Mr. G. P. Boyce's house, Glebe Place, Chelsea; and the block of offices on the north side of Lincoln's Inn Fields, half hidden between Mr. Waterhouse's terra-cotta front to the Equity and Law Life Assurance and the pretentious common-place of the Inns of Court Hotel, all of which are from Mr. Philip Webb's hand.

IN so far as the area controlled by the Commissioners of Sewers is concerned, London is the best cleansed city in the world, and the contrast between the thoroughfares east of the Law Courts and those that lie to the westward is very marked. Vestries, in whose hands the responsibility rests, do not pay as much attention to keeping the streets in their parishes as sweet as the civic authorities are compelled to do theirs by reason of the enormous traffic which daily passes through the highways and byeways of the one square mile having for its centre the Royal Exchange. According to a day census taken by the Corporation, in 1891, there entered the City, on foot or in carriages, 1,186,000 people, and on the same day 29,000 vehicles were counted passing into and leaving the City. About 310,000 persons spent the whole day at work within the civic boundaries. There is reason to believe that during the last five years these figures have enormously

GROUND FLOOR PLAN - NORTH BRIDGE STREET LEVEL

NORTH BRIDGE STREET RECONSTRUCTION, EDINBURGH.—PLAN OF FIRST-PREMIATED DESIGN BY MESSRS. SCOTT AND WILLIAMSON.



increased. They will show what great care must be taken in keeping the thoroughfares clean, and in removing the refuse produced by so vast a traffic and such a large day population. City scavengers are, indeed, always at work, with the exception of Sunday afternoons. About 700 men, women, and boys are regularly employed, and annually an average of 74,000 tons of manure, paper, straw, sweepings, road scrapings, and market refuse are removed from the roadways.

AT a conversazione, given by the Carpenters' Company at their hall in London Wall last week, the prizes were presented to the successful exhibitors at the fourth exhibition of works in wood and wood-carving, held at Carpenters' Hall under the auspices of the Carpenters' and the Joiners' Companies. An account of the exhibition appeared in the BUILDERS' JOURNAL of October 28th. The Master of the Carpenters' Company presided, and the awards were presented by Sir Arthur Arnold (the Chairman of the London County Council). Professor Banister Fletcher read the report of the Judges' Committee, of which he is chairman, and in which a marked improvement was reported in the works sent in in competition in all the divisions in works in wood and wood-carving. Sir Arthur Arnold then distributed the awards, which consisted of one gold medal, eight silver medals, twenty-five bronze medals, and £91 in money prizes. Replying to a vote of thanks, Sir Arthur Arnold said it had always been his desire that the guilds of the City should have a practical, real, and abiding interest in the trades with which their names were identified. He went on to speak in flattering terms of the exhibition, and of the efforts made by the Carpenters' and Joiners' Companies to promote technical education, and benefit the crafts with which they were so closely identified.

THERE is material for comment in the constitution of the committee which the Lord President of the Council has just appointed "to consider the mode in which the grants in aid of the Science and Art Schools are distributed, and to report if it is desirable to make any alteration therein." While it includes two officials of the Science and Art Department and one from the Treasury, there is not a single member of it who has any practical acquaintance with Art matters. The only representative of Art, indeed, is Mr. W. Armstrong, the Director of the Dublin National Gallery, whose post is hardly one that brings him in contact with Art School work. All the other members of the committee are scientists or educational experts who have already served on the Royal Commission on Secondary Education. It seems quite ridiculous that in such an inquiry no part should be assigned to a prominent Artist or Art teacher. The omission greatly discounts the value of any conclusions at which the committee may arrive.

AT a recent meeting of the Executive Committee of the "National Trust for Places of Historic Interest or Natural Beauty," held at 1, Great College Street, Westminster, it was announced that £80 was still required to secure for the nation the charming head-land which is known as Barras Head, and which forms the whole of the north side of King Arthur's Cove, and on either hand commands fine prospects over the rock-bound Cornish coast. It is from the head-land, too, that the finest and most inspiring views of the grey ruins of "Dark Dundagil by the Cornish Sea" are obtained. It is necessary to permanently protect Barras Head, if the associations of Tintagel Castle are to be preserved. The castle and the whole of the neighbourhood are so inseparably linked with the romance woven round King Arthur and his knights, that it might be thought no difficulty would be experienced in raising the small sum required to save the head-land. Unfortunately this has not been the case. The Earl of Wharncliffe offered the bluff to the "National Trust" for £505—the price for which he purchased it. The coast in the locality of Tintagel and Boscastle is being so rapidly built over, that the council of the Trust, feeling that in after-years the nation would be grateful for the preservation of a piece of typical Cornish scenery in its wild and unspoiled condition, decided to endeavour to purchase the property, more especially as "Barras Head" is pregnant with poetic and historic associations.

PROFESSOR HERKOMER, R.A., at a recent meeting of the Birmingham Welsh Society, delivered a lecture entitled "Art Culture in Wales." He said, that although it was known to most people that he was a teacher, it was not usually known that his life's teaching had been done as a love, and not as a business. Let him be freed, therefore, from any suspicion of sordid motives when he took up a nation's cause in Art. He considered that no nation could be said to have fulfilled, in an intellectual sense, its entire mission until the graphic and the plastic Arts had been adequately represented, and it was from an enthusiastic desire to help Wales to attain this indispensable condition that he held out hand, heart, and experience. He did not know when the graphic Arts were introduced into the programme of the Eisteddfod, but it was certain that it had played, so far, an almost inappreciable part, all the excitement, all the emulation, going out in the poetic and musical directions. The best friends of the Eisteddfodau were forced to acknowledge that too much time was devoted to studying the few things given out for competition, and too

NORTH BRIDGE STREET RECONSTRUCTION, EDINBURGH.—PLAN OF SECOND-PREMIATED DESIGN BY MESSRS. GIBSON AND RUSSELL.

little to general improvement. Again, the time given for the production of original compositions was far too short, and that was to a great extent the cause of much "scrappy" work being done. This also gave the enemies the opportunity of asking "what has it all amounted to?" But all this was remediable. As the Art-teaching in Wales had hitherto not only been scanty, but for the most part of the wrong sort, the Art aspirant who could go away, did go away, with the result that he never returned. If the Art-workers had been few, the Art-patrons had been fewer, and this proved that the best workers did not venture back for fear of not getting patronage, and that the native patrons of Art seldom thought of looking for the workers within the Principality.

Those two conditions of things had acted and reacted upon each other with disastrous result. The remedy was simple: if there were Welsh Art-workers abroad, entice them back, and then tell the patrons that they had come back! If the Welsh Artists and Art-craftsmen living in or out of the Principality would only send to the National Eisteddfod, they should soon find the workers who were worthy of being recalled. Those would be the masters, and when once the right schools were formed, Wales would progress rapidly. Architects were at a loss to know where to get Artistic work satisfactorily done, therefore there was a future for the Art-craftsman. After criticising the system adopted by South Kensington, the machinery of which he described as gigantic and unwieldy, Professor Herkomer went on to say, that, granting that the Kensington system was of use once upon a time, and that without it schools of Art would not have been established at all, they must look the matter straight in the face, and acknowledge that they had now arrived at a point when it must change its form, in order to fulfil a great duty and to be of use, or else be disbanded. But in the future they must see freedom of action given to each master, to each town possessing an Art school. And this independence was only to be obtained by municipal support, assisted by money at the disposal of the County Council for educational purposes, each town to itself, each town with its well-paid responsible masters. This emancipation from the apron-strings of Kensington, through municipal and County Council support, would produce an individuality in the Art of each town. They had heard him say that certificates obtained from such a system as that practised at South Kensington were worthless as guarantees of ability; therefore, the whole question for Wales resolved itself into the following:—"Wales needs masters who will establish Art schools on a new and rational basis."

AMONGST the many mementoes of the past which surround Winchester, the Hospital of St. Cross claims first attention. The hospital was founded by Henry de Blois, Bishop of Winchester, and brother of King Stephen. In the course of time its benevolent character was diverted from its original purpose, but all its charitable institutions were fully restored by William of Wykeham, and his successor, Cardinal Beaufort, in 1444. The building suffered somewhat during the Wars of the Roses, and also at the Reformation, a large number of its possessions being sequestered and alienated. The hospital, although greatly diminished in revenue, still maintains a master, steward, chaplain, and thirteen brethren. The church consists chiefly of Norman Architecture, and was erected in the time of King Stephen.

A LIBERAL response has been made to the appeal issued early in the year for subscriptions towards the cost of repairing the nave roof of Winchester Cathedral, the amount already received or promised being £7,500. Excellent progress is being made with the work of repair, which is expected to be completed by the middle of next year. Serious cracks and dislocations have been found in the beautiful stone vaulting, designed by William of Wykeham, and great skill and care will be required in the repair of the mischief. The total cost of repairing the roof and vaulting, including Architects' fees, &c., is estimated at about £8,500.

IT is hoped that the existing deadlock in respect to the erection of the new offices of the Commission of Sewers will shortly be overcome, and the work of building resumed. When the new offices reached a certain height in Basinghall Street the Commissioners of Sewers were restrained under an injunction from proceeding further, as a question of ancient lights was involved. The success of the injunction came as a matter of surprise to the members of the Commission, who imagined that no restrictions could be placed upon the land, and, after considerable delay, the surveyors to the Commission prepared a sketch-plan of a building which would, according to their expert opinion, be within the line, and, therefore, free from any further injunction. The question was, after considerable discussion, referred to the engineer to prepare working drawings of a building on a modified plan. These plans have been drawn by the engineer, and adopted by the committee, who will submit them for adoption by the Commission. In the meantime a heavy claim by the builders for compensation has been considered, and negotiations are in progress with a view to an adjustment of that claim, and the preparation of an amended contract for carrying out the modified plans. We believe that the original plans have been greatly altered, and have suffered greatly in the process.

A MOTION is about to be brought before the Common Council, for a grant of £10,000 for the enlargement of the Guildhall School of Music. The money is needed for new class-rooms, as the present accommodation is absurdly insufficient for the 3,700 pupils on the books. Whether the proposed new wing would not wisely be rejected in favour of an extra upper floor is, of course, worthy of consideration. The space at the back of the present school, part of which has been taken for the City Girls' School, was originally set apart for a suitable concert room and practice theatre, but the funds were never forthcoming.

IT is proposed to carry out a much-needed improvement in the neighbourhood of the churchyard of St. Peter Cheap by throwing into the roadway of Wood Street a portion of the churchyard. St. Peter Cheap was one of the parishes in London where the Church having been destroyed by the Great Fire, the Church was never re-erected. The churchyard, however, has remained, and the living has been united with that of several other City Churches. The churchyard was used for purposes of interment up to 1859, when it was finally closed by an Order in Council. An agreement has now been entered into with the Commissioners of Sewers for throwing into Wood Street about 94 ft. of the churchyard, the purchase-money, £200, to be paid into the Bank of England. It is also proposed to erect a new railing and kerb on the east side of the churchyard. Any human remains discovered it is proposed to remove to Ilford Cemetery. In giving evidence before the Consistory Court of London, Mr. Francis Chambers, surveyor, mentioned that the celebrated plane tree, which had formerly been one of the landmarks of the City of London, would not be interfered with, although it was proposed to build the rector's house near it.

IN a letter to the Daily Graphic, it is stated that Birmingham is about to follow the example of London in pulling down what are said to be its "superfluous Churches." And the Commission appointed by the Bishop of Worcester to consider the question has scheduled three of them for destruction. They are Christ Church, St. Peter's, and St. Mary's. We must acknowledge that none of these buildings are, from Architectural or Archæological points of view, so valuable as the Rolls Chapel and Hanover Chapel, Regent Street, which London has just lost; yet, in a place like Birmingham, which cannot be said to be rich in examples of ecclesiastical Architecture, one, at any rate, of these buildings will be greatly missed by all who know the city of the Midlands. That building is Christ Church. Partly on account of its magnificent site, this Church has always been one of the chief landmarks of Birmingham, and it forms an important feature in the group of public buildings surrounding the Town Hall. It is built at the angle formed by the junction of New Street and Ann Street, and although in reality a small building, its Tuscan portico and lofty stone spire present an imposing appearance. These are by no means badly designed, and the Architect who planned them thoroughly understood the secret of making a small building hold its own when surrounded by far larger and more important ones. What is still more singular is the fact that, though all these large buildings have been erected since the Church, which was completed in 1805, they have not dwarfed it. It is undoubtedly an ornament to the locality, although it is in a style of ecclesiastical Architecture which is at present unpopular. Yet if people wish to realise the injury which may sometimes be done to the appearance of a street by the destruction of one of these classical Churches, they have only to look at Regent Street. Our great English Architect, Cockerell, R.A., had given interest to the north-west portion of this street by a work of undoubted genius—Hanover Chapel—yet, in spite of the protests of all known authorities upon Architecture, the building is now destroyed, with the result that the part of the street where it stood looks mean and uninteresting.

MR. GEO. C. YATES, F.S.A., recently read a paper before the members of the Lancashire and Cheshire Antiquarian Society, in the Library of Chetham's College, Manchester, on Old Hulme Hall (demolished about 1848), Mr. C. W. Sutton, the Chief Librarian of Manchester, presiding. Mr. Yates said: having obtained four old drawings, by Dr. Greaves, of this old historic mansion—the Gateway and Tower, the Garden Front, the River Front, and the Courtyard, and also a general view, by F. Tavaré—he thought a short description of the hall would be of interest to the members. From the monochrome drawings made by Dr. Greaves in 1843, it would appear that Hulme Hall was a house of considerable size and importance. The building was arranged around an internal courtyard. The detail of the timber work would seem to correspond with that of the earlier part of the 17th century, but since its erection the building must have been considerably altered and added to, and partly rebuilt. In the North of England Magazine, published in 1842, it says "that old chateau, evidently in its last stage of decrepitude, is Hulme Hall, the scene of Harrison Ainsworth's first romance, 'Sir John Chiverton.' Approaching it from the north and crossing the River Medlock by an old dilapidated bridge, which here empties itself into the River Irwell, you passed through a fine meadow, with a line of tall and noble-looking beech trees planted on its margin; then, turning to the left, you came upon an ascending slope of rich green sward, on the extreme brow of which stood the old hall with its white front and intersected black beams, its foundation a red sand rock overhanging the River Irwell, with a narrow pathway only intervening between the latter and the mansion. Down to this part of the stream there was a steep winding path, thickly covered with brushwood, and a sloping ledge called the Fisherman's Rock, about which some terrible stories were told, giving probably to Ainsworth his first impulse to romance. Hulme Hall is believed to have been occupied, in the reign of Henry II., by John de Hulme. It appears from ancient deeds, that Adam, the son of Adam de Rossendale, held the 'Manre de Mamecester,' meaning the Manor House, in 31 Edward I. (1302-3). In 12 Henry VI. (1433-4), Ralph de Prestwych granted this Manor House to Henry de Byron, in whose possession it remained only five years, for in 1439 the same Henry reconveyed it to Ralph de Prestwych. In July, 1654, the Manor of Hulme was mortgaged to Nicholas Mosley. In 1695, Sir Edward Mosley died, leaving an only daughter Ann his heiress, who married Sir John Bland. Upon the decease of her parents and husband, Lady Bland resided altogether at Hulme Hall. Her gardens were celebrated for their beaty, and she delighted them with various works of Art, amongst which were several Roman altars and other ancient relics found in the district. It continued in the Bland family till the year 1751, when it was sold to George Lloyd, Esq., F.R.S., of Manchester. In 1764 the manor and mansion were purchased by the Duke of Bridgewater, whose trustees pulled down the old hall to give place to buildings in connection with the Bridgewater Canal. A series of antique panels, 41 in number, adorned with curious grotesque carvings, chiefly heads, and supposed to be by foreign artists, were removed from the hall before its demolition, and are now preserved at Worsley Hall, the seat of the Earl of Ellesmere. These carvings are engraved in Baine's Lancashire.

AT a meeting of the Institution of Civil Engineers' Yorkshire Association of Students held at the Law Institute. Leeds, Mr. Arthur Greenwood, the President, dealt with the training of civil

and mechanical engineers, and the relations between engineers and the great institution to which they all belonged. They numbered, he pointed out, some 6,000 or 7,000 members of different classes. Alluding to competitive examinations, he said he was not a blind advocate of this system. The question arose, however, whether they would not have to adopt some course like that followed by their brethren in other Arts and Sciences, and insist upon certain technical qualifications before admission to the association. Commenting on the value of technical colleges, and the opportunities for studying science at the Universities, he observed that whatever was now being done in this matter was distinctly a step in the right direction. The man who could best combine the practical with the technical training was the man who would make the greatest success. Surprising progress had been made in France of recent years in the manufacture of engines and machine tools. Although French engineers were not now aggressive, we might expect to have to reckon with them as competitors; and, indeed, he said, there was evidence of this just now in Russia, where Frenchmen had taken advantage of friendly relations to obtain concessions. The Belgians had also improved in their engineering products, and were showing themselves keen competitors; but the most serious of all competition was to be found in Germany, where not only the engineers but the workmen were better educated. The German engineers were not original or inventive, but they were industrious, patient, frugal, and plodding; they were not content to speak their own language only, and they were to be found all over the world.

ON Thursday, Messrs. Sotheby, Wilkinson, and Hodge commenced the sale of the third portion of the remarkable English series of coins formed by the late Mr. Hyman Montagu, vice-president of the Numismatic Society. The two other portions of this series sold previously realised £4,221 and £5,660. This portion now selling includes the gold and silver coins from Mary Tudor to Anne, and among the many notable items may be mentioned Simon's petition crown, a specimen of which sold in the Bieber sale some few years ago for £500, and Oliver Cromwell's fifty-shilling piece for £227. Never before has such a splendid array of English coins of this period been brought together by a private collector. The following were among the most notable prices:—Queen Mary, 1553-1554, gold: Fine sovereign, the Queen seated facing on throne, £16; Ryal, £42; half-angel, £20 5*s*. Silver: half-groat, rare, from the Gibb's collection, £18; London penny from several noted cabinets, £20 5*s*.; Philip and Mary, gold angel, from the Martin and Shepherd collections, £21 10*s*.; half-angel, from the same collections, £15; silver pattern half-crown, bust of Philip to right in armour, bust of Mary to left on reverse, only two other specimens are known, one in the British Museum and another in the Hunter collection (this coin sold in the Bieber sale for £140, and in Clarke collection for £120), £96. Ryal, first issue, from the Brice collection, £24 10*s*.; another from the Cuff, Hastings, and Nash collections, £20 5*s*.; Ryal, second issue, with the crescent on reverse, £21; another, ornaments on ship, varied, £20 10*s*. Milled coinage: half-sovereign, star on both sides, £16 15*s*. Portcullis half-dollar, quarter-dollar, and eight dollars, £15 15*s*.; milled shilling, £15 10*s*.; three farthings of London, 1563, rare (sold in the Shepherd collection for £21 10*s*.), £17. The day's sale realised £1,170 18*s*.

DR. FLINDERS PETRIE, Professor of Egyptology, University College, London, lectured last week in Queen Street Hall, Edinburgh, to the members of the Philosophical Institution. The lecture was the first of the season, and the subject was "Excavating in Egypt: its Methods and Results." The general character of the country was first shown by the lecturer, with views of the plateau of limestone rocks through which the Nile valley is cut to a depth of 1,500 feet, channelled along the sides with grand gorges cut by the ancient rainfall. The excavations were sometimes in towns, or else in temples, or in cemeteries. The carved limestone lintel of the Temple of Nubt, found last year, was shown by the lecturer as a fine instance of the delicate carving of hieroglyphs and symbolic scenes. A great source of historical information, he continued, was in the deposits which were placed in the foundations. These were models of the vases used in the ceremonies, of the tools employed, of the building materials, and of the food and utensils required by the workmen. The date was shown by blocks of stone or of metals bearing the King's name. Another class of technical remains was the series of drawings and trial sculptures from the schools, which practised inside deserted temples where fine work could be found for copying. The common material for writing and drawing on was potsherd, and the spirited and able sketches on that rough material were often admirable—such as a peasant lad going out into the world, and heads of kings, and of a girl. The last-mentioned had been ridiculed by another student, who had added a dog scratching the girl's nose. In another technical line they had the set of iron tools discovered at Thebes, with an Assyrian helmet belonging to probably 670 B.C., and showing the high state of tool manufacture in Assyria at that date, at which most of the modern tools appeared already in use—the saw, chisel, rasp, file, twist-scoop, and centre-bit.

OF the great historical discoveries of recent years, one of the most important was the tablet with the mention of the war of Merenptah with the Libyans, and his subduing the people of Israel in Palestine. That was a vast block of grey syenite, over ten feet high and five feet wide. It was first cut and engraved by Amenhotep III. for his temple at Thebes, about 1420 B.C., and was taken from there by Merenptah to build it into his own temple, and inscribe the back of it with the account of his wars, about 1200 B.C. It bore the only mention of the Israelites yet known on Egyptian monuments, and was earlier by four centuries than any such record from Assyria. Beside that tablet, a splendid half-length figure of King Merenptah was also found, which showed far the best portrait yet known of the King, who was believed to be the Pharoah of the Exodus. That and the tablet were found last spring in the ruins of the temple of that King at Thebes. Near there was also a beautiful head of a Queen, carved in limestone. A little fragment which showed the naturalistic work of earlier times was also found this year—an ivory carving of a boy carrying a young calf on his back, which belongs to the twelfth dynasty, about 2500 B.C. From the curious artistic movement of naturalism which took place about 1380 B.C. under the influence of Akhenaten there were shown by Dr. Petrie some examples. The actual death-mould of that King's own head was found on the spot where his funeral furniture was prepared. The dreamy, thoughtful, and delicately marked character of the King were strikingly shown in that strangely preserved copy of his living self. The spirit and freedom shown in sketches of horses' heads, carved on limestone and drawn upon pottery, was like the work of a Greek or Renaissance Artist. In fresco work shading was used, as shown in a group of two little Princesses seated together. The work of excavating was carried on by gangs of carefully selected workers; each was observed, and his character considered, and he was educated to straightforwardness and skill, so that after a month or two of training, the best lads were just like the hands of the master; they could do whatever they were told to do, and could be well trusted. Such work was a most interesting study of character and ability. The complete confidence which could be established with the better class of Egyptian peasant was the most pleasing part of his nature. In place of trying to always elude authority, as he had been accustomed to do all his life, he would trust his master absolutely, make him his banker, and implicitly do what he was told. The best age was from twelve to eighteen, when their wits were at the brightest. In the Delta the girls also worked, and did quite as well as the boys. The amount done without any pressure, entirely by piecework, was amazing. Two boys of twelve or fourteen would cut and remove twenty-four cubic yards a day, as much as three English navvies, and be ready for an hour's ball play at the end of it.

WE are now in a position to arrive at something like the total cost of the new dead-meat market for Birmingham, certain figures required to complete the account being furnished by the recent report of the Markets and Fairs Committee. The first estimate of cost, which was admittedly to a considerable extent conjectural, was embodied in the statement of the scheme presented to the Council in 1894. This estimate was put at £48,000, of course exclusive of the cost of the land. At a later period, when the plans of the committee were more thoroughly worked out, and when certain contingent expenses were ascertained, the estimate rose to £53,000, which included building, gas and water services, sewering, all permanent fittings, and Architects' commission, but which did not include refrigeration plant, pumping machinery, electric lighting, lifts, boilers, water tanks and some other items. It was estimated that these matters, unprovided for in the original and revised estimates, would require £10,000 to £12,000. The lowest tender for the lighting is that of Messrs. Mavor and Coulson, of Glasgow, which comes to £7,877, and there are other works connected with the installation, bringing up the total outlay in this department to £10,143. Another sum of £2,610 is required for lifts, boilers, tanks, &c.; and then comes a further charge for general fittings, the lowest tender for which is that of Messrs. Murdock and Cameron, of London and Glasgow, amounting to £10,553. Towards this, however, £5,000 was provisionally included in the builders' contract for engineers' work, so that the excess of expenditure is £5,533. These items together show an additional outlay of £18,286, and a total general expenditure of something over £71,000. The cost of the freehold land (about 12,000 square yards) was £33,000, and to render the site at once available certain leasehold interests had to be bought out. Probably we shall not be far out in assuming that, with legal and other expenses, they may reach a total of £7,000. In that case the final account would stand in this way:—Land and expenses, £40,000; building and fittings complete, £71,000; total expenditure, £111,000. Considering the extent of the market, and the advantages it will confer, it may be reasonably assumed that the cost will not be excessive.

FOLLOWING upon the appointment of Mr. J. Price as Birmingham City Surveyor, some important measures in the way of reorganising the Surveyor's department are now in progress. From various causes several officers and servants under the Public Works Committee left the service of the Corporation shortly before Mr. Price commenced his duties, and the Committee came to the conclusion that it would be desirable to await the arrival of the new Surveyor before filling up the vacancies. It was also thought that a favourable opportunity presented itself for reorganising the departmental work in many respects, so as to bring it more directly within the immediate control of the chief officer. In various ways the work had become somewhat unwieldy and difficult to cope with since the enlargement of the city boundaries, whereby the area of the borough was increased from about 9,000 acres to 12,000 acres. In a few days the report of the Committee for presentation at an early meeting of the Council will be issued, containing all the detailed changes which, in the judgment of the Committee, it is thought practicable to carry out. The most important proposal is the division of the city into four or five districts. Each of them is to have its full proportion of the general staff, and at their head a thoroughly experienced official, who will be directly responsible to the City Surveyor for the due performance of the work. It is believed that in this way the duties involved in the sewering of the city, the cleansing of the streets, and the inspection and control of the erection of buildings will be more effectively carried out than heretofore.

"THERE are a number of stories in circulation going to show why the American Executive Mansion was called the White House, and by whom it was first called such," says a Washington historian, "but I think the evidence tends to give that credit to James Madison, who was the fourth President, and who was driven out of the Executive Mansion when the British burned it in 1814. The Executive Mansion is built of freestone, which was quarried down on the Potomac River. The Capitol proper was constructed out of the same stone, though, of course, the wings for the Senate and House of Representatives are built of marble, with granite foundations. At the time the British burned the Executive Mansion they did a lot of other damage, and the country was pressed for money to repair the same. The walls of the mansion were but little damaged, other than being blackened by smoke. Money was scarce, and

Congress made an appropriation to have the outside of the house painted. White was selected as the best colour. The Capitol was not painted for nearly 20 years afterwards. Madison, in a letter to a personal and political friend, wrote: 'Come in and see me any time. You will always find me in at the White House.' The Executive Mansion may have been called the White House before that, but I have never been able to find any record of it. The letter from Madison had an important political bearing, and was very extensively circulated. Up to that time, the Executive Mansion, which is the legal name for it, was generally spoken of as the President's House."

JAN VERHAS, the Belgian Artist, who has just died, owed much of his success to the timely hint conveyed to him by Mr. Alma Tadema, who was one of his fellow-workers in the Antwerp Academy. Verhas sought to study academic precedents, but the English Artist urged him to seek his subjects from contemporary life. The Belgian Artist took the hint, with the result that he eventually came to be recognised as one of the most successful painters of children and animals. The Modern Museum at Brussels contains several examples of his Art, one of the most admired pictures being that representing a procession of school children defiling past the King.

MR. EDWARD CROSBY has recently drawn attention to an interesting bellows-stand, which is in the collection of old furniture on the ground floor of the South Kensington Museum. The stand was originally an appendage to the Church of St. Mary Somerset, Thames Street, of which all but the tower was demolished in 1866. It is of seventeenth-century workmanship. The wood, both of the stand and of the double lever, is oak, and the whole is richly carved. St. Mary's was one of the Churches which Wren rebuilt after the Great Fire. Mr. Crosby is of opinion that the stand belonged to some old country Church before it came to town. He says that he has searched in vain for any reference to it in works on the City Churches, but considers that its probable obscurity in the organ-loft may be responsible for its having been overlooked by ordinary observers. Probably there are some who remember its existence in the old Church, or its removal to South Kensington.

GRIEVOUS complaint is made respecting the disrepair and dirt of the London Bridge roadway. It appears that the authorities of the Bridge House Estates are not quite decided among themselves on the best system of paving, and, meantime, the public, which has to traverse the river at this point, have to suffer. It is hardly to be believed that the most important city in the world should let its greatest bridge get into a condition resembling a country road, with such deep ruts in it that the horses stumble badly, while wheels skid down inclines. As to the dirt, the mud is drawn to the sides of the footway, the horses which pass splashing the unfortunate pedestrians from head to foot, and bespattering even the stone parapets till they are quite thickly coated.

A CORRESPONDENT writes that no one who visits Spain should miss seeing the famous Palace of the Escurial, lacking though it is in the grace which is such a notable feature of structures like the Alhambra and the Mosque of Cordova. Philip in building this Monastery designed to have his palace and the cemetery under the same roof, and it really seems as if the splendour of the Pantheon surpasses all other portions of the Escurial. It is under the Chapel, and is entered by a long descent of granite steps, through corridors lined with jasper and splendid marbles, and adorned with pillars and bronze statues. Once within, seen by the light of glimmering torches, the chamber of dead sovereigns shapes itself into an octagonal room, lined with magnificent tombs, upon which the luxury of funereal Art has been exhausted. In long regular rows they lie, literally shelved one above the other. The kings and queens are divided, the former lying on one side and the latter on the other.

AT the instance of Mr. Hughes, a committee of the Bristol Council has been appointed to consider the terms upon which the Fine Arts Academy could be transferred to the city. The task is not free from difficulty. It is necessary to respect the interests of the existing School of Art, and also of the Artists who form the local academy. But it is obvious that if there were a municipal Art gallery with a permanent collection, which could be supplemented from time to time by exhibitions, the profit, as at Liverpool and elsewhere, being devoted to the purchase of pictures for the permanent collection, local Art would be benefitted, and the entire community would be afforded a means of intellectual pleasure and refinement. It is not, perhaps, generally known that the Bristol Fine Arts Academy contains some valuable works of Art which are rarely seen. There are three Hogarths of considerable value and interest; some of the pictures given by Mr. Robert Lang are representative of the best of local Art, and there are other works that would be worthy a place in a permanent municipal collection.

THE death took place on Friday, at Coventry, of Mr. Francis Alfred Skidmore, who was widely known as an Art metal-worker. The deceased, who was eighty years of age, during his business career turned his attention to artistic metal work in the form of gas-lights, ornamental gates, and ecclesiastical work of all kinds. Of his ecclesiastical productions may be mentioned works consisting of chancel screens, altar rails, lecterns, gas coronæ, standards, pendants, &c., memorial brasses, and communion plate, in twenty-four Cathedrals, including Canterbury, York Minster, St. Paul's (London), Westminster Abbey, Durham, Hereford (screen), Lichfield (a screen designed by Sir Gilbert Scott), Chester, &c., and the Archiepiscopal Palace at Lambeth, St. Giles's (Edinburgh), St. Mungo's (Glasgow), Calcutta, Graham's Town, South Africa; also in St. George's Chapel, Windsor; St. Nicholas, Antwerp; St. James's, Philadelphia; a Church at Valparaiso; St. George's, Demarara, &c. His works are also to be found in 300 or more parish Churches, all over the country; in fifteen Colleges, including no fewer than eight in Oxford and six in Cambridge, and King's College, London, and the University of Glasgow. His most conspicuous work was the metal Gothic canopy which forms a part of the Albert Memorial in Hyde Park. Designed by Sir Gilbert Scott, and enriched with enamels and stones, this is the largest and most elaborately enriched monument extant.

THE subway from Essex Court, in the Temple, to the Law Courts, is apparently to be formed at last. It is to be constructed primarily for the convenience of the Templars, who are to pay the cost; but the public are also to have the free and unrestricted use of it. As an application from the Treasurer of the Middle Temple for permission to construct the subway was favourably received by the Strand Board of Works on Thursday, and the Works Committee was instructed to put itself in communication with the authorities of the Temple, the matter will doubtless be settled.

AN evening contemporary has given prominence in its columns to a suggestion for a London Decoration Committee. The writer of the communication thinks that unless some such step is taken the metropolis will not be adequately decorated in the summer, when the time arrives for the celebration of the sixtieth anniversary of the Queen's accession. The proposal is not to supersede individual efforts, but to supplement them. For this purpose, he says, a "well-thought-out scheme is necessary at the chief points, and in the principal thoroughfares, to do justice to the long vistas and Architectural features of London." To this end he suggests the immediate formation of a committee, to consist of men of position and influence, including the Lord Mayor, the Chairman of the County Council, with, say, the President of the Royal Academy as chairman, to consider and decide on a general scheme for the decoration of our streets, for the erection of triumphal arches, trophies, masts, &c.—"a scheme by which we should all be bound, and of which none need be ashamed."

THE General Purposes Committee of the Penrith Urban Council has received from Messrs. Brierley and Holt, Engineers, Blackburn, a scheme for a new sewerage system for the town. It is proposed to spend at least £16,000 on improving or replacing existing sewers, while in addition there is a plan for purchasing 20 acres of land lying between Broughton Hall and the River Eamont for constructing works for the disposal of the refuse.

Professional Items.

BARROW.—It is proposed to erect a new Wesleyan Church and Schools in Barrow. The scheme includes a Church to accommodate a mixed congregation of about 800, schoolrom to accommodate about 500 children, with Church parlour and vestries. The cost of this, including the site, will be about £6,000.

BATTERSEA.—The Battersea vestry proposed at the recent Local Government Board inquiry, to borrow the sum of £5,000 to purchase a site at Nine Elms for the erection of new public baths and washhouses for that portion of the parish. Mr. W. W. Young, Solicitor, appeared on behalf of the vestry, and the opposition to the proposal was led by Mr. Horace Turnor. Mr. Young, in opening his case, said that in seven months of the present year 126,332 men, women, and children, out of a population of 160,000, had used the existing baths in Latchmere Road, and this showed the need for additional accommodation, especially in a part of the parish where gas works and other manufacturing concerns were carried on, and where the people had no accommodation for washing and drying their clothes. Mr. J. T. Pilditch, the Surveyor, the Rev. E. F. Best, the Rev. Dr. Whereat and others gave evidence in favour of the baths, and the inquiry was adjourned.

BOOTLE.—The new tower of St. James's Catholic Church is completed. The tower was left unfinished at the time the Church was opened some thirteen years ago. It stands at the south-western corner of the building. A staircase turret at the north-west corner leads up to the belfry ringing floor. Externally the south doorway enters a porch with arcaded walls, and stone-vaulted ceiling 33 feet high, with an eye or ring through the centre for the passage of bells, and which has been utilised during the recent work for the raising of all the material by means of a steam lift. At the belfry stage the plan is changed from the square to an octagonal form, with partially engraved pinnacles, which are detached near the summit. In the four cardinal faces there are two light deeply-recessed windows with leaded louvre boards and crocketted pediments. The parapet is embattled, and from the corners project gargoyles. The work has been carried out by the contractors, Messrs. S. Woods and Son, Bootle, under the supervision of Mr. C. Hadfield, Architect, of Sheffield.

BRIDGEND.—The Bridgend Cottage Hospital was opened, last week, by Mrs. Turberville. The building, which has been erected upon a beautiful site, the gift of Lord Dunraven, has accommodation for eight patients, and consists of male and female wards, isolation ward, operating room, nurses' room, four bed-rooms, committee room, and domestic and other offices. The work was entrusted to Mr. Edward Pruce, Builder, Bridgend, under the supervision of the Architects, Messrs. Lambert and Rees.

BRIGHTON.—The new wing for nurses at the Royal Alexandra Hospital for Sick Children, Dyke Road, Brighton, was formally opened on Wednesday last by Councillor W. T. Dewe, Chairman of the Committee of Management. The new wing has been built entirely for the accommodation of nurses; it is a separate building, in two storeys, and is connected with the main hospital by a covered way. It provides sleeping accommodation for 12 nurses.

CLENT.—A new workmen's club-house has been opened. The premises comprise a reading room on the ground floor, 25 ft. by 14 ft. 6 in., a similar sized room above for recreation, etc., and the usual offices are provided. There is also a caretaker's house, the whole forming a substantial block of buildings. The Architect is Mr. Tom Grazebrook (Stourbridge), and Mr. Walter Bayliss (Bellbroughton), the contractor.

EXMOUTH.—A bazaar was held in the Public Hall, last week, in aid of the fund for erecting a new Wesleyan Church and Schools. The new buildings will occupy a central position. The plans of the Church provide for 612 sittings, and consist nf nave, transepts, and chancel, with a gallery over the vestibule. To the right of the chancel would be the organ chamber, with the

minister's vestry on the left. The schoolroom immediately behind the Church accommodates 374 children, infants' room, adult Bible class room, ladies' parlour, and five other class rooms. Great attention has been paid to heating and ventilation, whilst the illumination would be by incandescent gas light. The total cost, including land, is estimated at £6,000.

GLASGOW.—The High School Building Construction Students under Mr. Dobson, paid their second monthly visit, last Saturday, to the new Y.M.C.A. Club, Bothwell Street. The building, which adjoins the Institute, has been erected to provide efficient lodging for the Christian young men of the city, with delegates also from the provinces. It has been successfully designed to harmonise with the Institute, which forms the central block with the Club on the left and the Bible Training Institute on the right. The dining room of the Club will be 70 by 38 feet. The ventilation of the building has been successfully carried out, the main furnace flue of iron passing up the centre of the foul air duct. The accommodation provides for over 200 bedrooms. The washing-house is being erected at back with part of the main roof of breeze concrete to form a drying space. Messrs. Clarke and Bell are the Architects of the building.

HOVE.—After an interval of two years the completion of the Parish Church of All Saints has been taken in hand. A perspective drawing of Mr. Pearson's original design appeared in the first number of the Architectural Review. At present about half the Church has been built at a cost of £19,000, but as the eastern portion will contain more important and expensive work it is estimated that £22,000 is required, towards which about £4,250 has been raised, including a sum of £500 promised by Mr. G. B. Woodruff, Chairman of the Hove Urban District Council, on condition that £10,000 is secured before the work is commenced. The eastern portion of the Church must necessarily be built altogether, though the town could very well wait a few years. The work includes a quasi-transept which would make the Church cruciform, the arch being nearly half as wide again as the bays of the nave, and going up to the full height of the building. Beyond the transept will be the choir, consisting of two bays similar to those of the nave, and beyond the choir will be the sanctuary, of considerable depth. Beyond the transept on the south side will be a Chapel, with an apsidal end, and on the north side will be the organ, raised on arches, while the space beneath may be used for seating. The pipes of the two faces, into the transept on the west, and into the choir on the south, will go up the full height of the building. On the north side will be the vestries, with an entrance from Eaton Road, and over the vestries will be a large room, seating about 100 persons. Below, under the east end of the Church, there will be a large room, and under the vestries there will be another room to be used as a muniment room, and lavatories will also be provided. The north transept will have a five-light window, and the daily Chapel will have two six-light windows in the body of it, and four windows at the east end. The south view of the Church will be of great Architectural beauty, with the three two-light windows of the sanctuary, enclosed between two graceful towers, which will not only have a fine effect, but will also serve the purpose of buttresses, by reason of their weight. There will also be two three-light windows north and south, and thus there will be seven windows round the sanctuary, filled with stained glass. At the east end of the Church there will be a reredos of sculptured work, with a representation of the Crucifixion, and canopied niches of apostles, saints, and angels. The sanctuary, like the Chapel and the already-built baptistry, will be vaulted. On the north and south side of the sanctuary it is intended that there shall be richly carved panelled sedilia. The Church, when completed, will accommodate 1,300 worshippers, the present accommodation being for 730.

KEIGHLEY.—For a considerable time an enlargement of the Keighley Volunteer Drill Hall has been in contemplation, and the work is now in progress, under the direction of Messrs. Judson and Moore, Architects. It is proposed on the site of the present yard to erect a two-storey building, providing a gymnasium, billiard room, and canteen on the ground floor, and a large room for band practices above. The work is estimated to cost about £700

LEAMINGTON.—The Midland Counties Home for Incurables is to be extended by the establishment of a home for ladies and gentlemen only in a detached building to be situated in the south-west corner of the garden. Mr. Hawley Lloyd has prepared plans for the proposed new building, which will contain thirty rooms, capable of accommodating sixty persons. The cost of building and furnishing is estimated at £7,000.

OTLEY.—A new technical school in connection with the Otley Mechanics' Institution was opened last week. The buildings are at the rear of the Mechanics' Institute, and were erected from plans prepared by Mr. Alfred Marshall, Architect, Otley, At a cost of about £2,300, a building, including departments for Chemistry, Fine Art, Domestic Arts, and kindred subjects, has been provided. Four large, well-lighted rooms. For the teaching of the Domestic Arts, Cookery, Laundry Work, &c., there are two rooms, one of which is also available for classes in Wood Carving, Shorthand, &c. A well-equipped chemical laboratory affords accommodation for thirteen students.

PLYMOUTH.—The first section of the new tower of Emmanuel Church, Compton Gifford, has been dedicated. In February, 1895, the tender of Mr. Jonathan Marshall, of Plymouth (lowest of the eight which had been invited) was accepted for £4,910, and shortly after the contract for the first division of the work, namely, the tower to the top of the cornice under the parapet, was commenced. The committee did not feel justified, indeed, have not since felt able, to undertake the spire without further support. The cost of this part of the work, including Architects' fees, is estimated to be £3,500, of which about £1,300 still remains to be raised. The height of the tower is 71 ft. It is built of local limestone. The crockets and finials over the pediment of the entrance are of Doulting stone, and have been carved by Mr. Trevenen, of Plymouth. The entrance doors are of oak, and are hung each with a pair of bronze butt hinges, made by Mr. Thomas Elsley, of Great Portland Street, who also made the wrought-iron strap hinges for the inner doors. The tympanum above the doors is filled with oak tracery. The lower stage of the tower forms a porch to the Church. It is paved with Portland stone and rubbed Delabole slate, in large squares alternately, like a chess board. The ceiling is of oak moulded beams, and the walls of Bath stone. The long belfry windows are of Doulting stone, with traceried heads. The louvres are of oak, covered with green Westmorland slates, which form a good contrast to the Doulting stone. The upper portion of the tower has a corbel course and cornice, both of Doulting. The Architects are Messrs. Rogers, Bone, and Coles.

PONTEFRACT.—In a limited competition for a new Wesleyan Church and Sunday schools at Purston, near Pontefract, the plans and designs by Mr. George F. Pennington, Architect, of Castleford. have been accepted. The plans provide accommodation for 450 in the Chapel, which has circular galleries, a choir and organ recess, also minister's vestry, with lavatories, &c. The school premises communicate with the rear of the Chapel, and provide accommodation for 250 scholars, with four class-rooms, also kitchen, &c. The buildings are designed in the Italian Renaissance, and will be executed with local brick and stone.

SHEFFIELD.—Glossop Road Baptist Church has been recently closed for general repairs and has been completely overhauled, a new system of ventilation and heating being introduced, this portion of the work having been carried out by Messrs. Bell and Sons, Glossop Road, and the painting and re-decoration by Mr. T. G. Woof, Devonshire Street.

SHEFFIELD.—Gas has been superseded by electric light at the Cutlers' Hall. The plans of Mr. S. V. Clirehugh, of Manchester, have been carried out, and the contractors were Messrs. Verity (Limited). The installation is now practically completed, and on Thursday the light in the principal parts of the hall was used for the first time. In the new banqueting hall the massive ornamental glass chandeliers have been retained, and each is wired for 120 lamps, the average illuminating power of the lamps being 16 candles. In the old banqueting hall the lights are arranged in keeping with the architectural lines of the room. None of the lamps depend from the ceiling, and nothing obstructs the view from one end of the room to the other. The electrolier on the staircase is a Florentine bronze fitting, of a design specially got out by Messrs. Verity for the Manchester Corporation, and will carry 24 lamps of 16-candle power. A special feature of the lighting of the entrance hall will be the introduction of reflector dishes.

SWANSEA.—The borough surveyor has taken advantage of the preparation of plans for the widening of Castle Street, to point out another very desirable improvement in the same neighbourhood. This is a proposal to widen Castle Lane by the entire demolition of the "Lion" public-house and several cottages in the lane, which seem at present very puny opposite the handsome premises of Messrs. Ben Evans and Company, Limited. The suggested improvements, which would also include Mr. Bunney's shop on the opposite corner, would disclose to view a great portion of the curtain wall of the old Swansea Castle, leaving a roadway of 30 feet in width. By carrying the roadway 15 feet further, the ancient round tower, the base of which, at present, descends through the roofs of the puny premises referred to, and the whole of the wall, would be disclosed.

SWANSEA.—If handsome inducements will tempt the Welsh University Court when they are deciding the location of the university offices, there is a likelihood that Swansea will win in a race which has become rather keen. It will be remembered that Cardiff obtained Parliamentary sanction to spend £6,000 on providing the university with headquarters. This sum sinks into insignificance when compared with the provision which Swansea is willing to make. We have already stated that the Swansea offer comprised a site and buildings. The corporation intends to promote a Bill in Parliament, giving powers to make a gift of any part of its estate which may be best deemed suitable as a site for, and also to spend £25,000 on building, the university offices. The scheme has been widened out to include, not only a residence for the registrar and the necessary offices for the university, but a national museum, a national Art gallery, and a record office. The plans have been prepared by Mr. Herbert W. Wills, Architect, Swansea. Space for a colossal building is found adjacent to the free library and science and Art schools in Alexandra Road. This property belongs to the corporation, and the plan of Mr. Wills shows how the site may be laid out to advantage. The design gives a building, covering a space triangular in form, and facing Alexandra Road, Orchard Street, and Pleasant Street. The main features on the ground comprise a large and lofty "university hall," 60 ft. by 35 ft., a reception or council room, ladies' and gentlemen's cloak-rooms, registrar's apartments and offices, despatch and delivery rooms, &c. These face Alexandra Road and Orchard Street, and on the same floor are placed museum galleries and research rooms. The first floor is given up to the Art and museum galleries and record and store rooms, with the exception of that portion which is taken up by the upper part of the large hall.

TONNA (SOUTH WALES).—The school for the Llantwit Lower Board were opened formally on Monday last, by Mrs. J. H. R. Ritson. The school has accommodation for 312 children, and has large central hall with five class-rooms, and was built by Mr. Evan Thomas, Seven Sisters, at a cost of £2,400, from designs prepared by the Architects to the Board, Messrs. Lambert and Rees, Neath. The Clerk of Works was Mr. D. Wagstaff.

TORQUAY.—At a meeting of the Town Council, last week, the Harbour Committee recommended that the plans of Mr. E. Richards, winner of the first premium at the recent competition for the pier pavilion, be adopted, subject to modification in certain respects; that Mr. Richards be appointed Architect at the rate of charges laid down by the Royal Institute of British Architects, and that he be authorised to prepare drawings, specifications, &c., and estimate the cost of the works. After some discussion the motion was decided upon.

THE foundation-stone of a new church for the parish of Wortley, Leeds, was laid on Saturday by the Misses March, of Beech-grove House.

SOCIETY MEETINGS.

Sheffield Society of Architects and Surveyors. — The monthly meeting of the Sheffield Society of Architects and Surveyors was held at the School of Art, the chair being occupied by Mr. R. W. Fowler, Vice-President. There were also present:—Mr. F. Fowler, Treasurer; Mr. C. J. Innocent, Hon. Sec.; Messrs. E. M. Gibbs, Thomas Winder, J. R. Wigful, J. Smith, T. H. Waterhouse, J.P., C. Gibson, E. C. Skill, F. Wilson, W. Watkin, W. Potts, C. F. Innocent, W. G. Buck, F. W. Chapman, J. C. A. Teather, L. W. Ensor, H. C. Brameld, and others. Mr. J. D. Leader, F.S.A., delivered a lecture on "A Study in Domesday," which was illustrated by a large map of the Hallamshire district. After some introductory references to the circumstances under which the Domesday survey was undertaken, Mr. Leader said the object of the survey was fiscal, not topographical. The lecturer quoted the extract from Domesday relating to the manors of Hallam, Attercliffe, and Sheffield, and remarked that it was anomalous, and argued at considerable length that the vill of Hallam was the High Street of the present town of Sheffield, and that Waltheof's Hall stood on the site known as Castle Hill, where the Norman lords in after years built a castle of stone. He quoted instances to show how the boundaries of manors had been changed since the time of the Domesday survey, and pointed to a diagram, prepared by Mr. C. J. Innocent, Hon. Secretary of the Society, to show how small a portion of the whole manor of Hallam had since acquired the name of Sheffield. His contention was that the manor of Hallam, at the time of Domesday, extended up to the junction of the rivers Sheaf and Don, and that the Sheffield of Domesday was Sheffield Park, and nothing more. Granting this, all difficulties as to the site of Waltheof's Hall would vanish, and we could understand that the Domesday vill of Hallam was neither in the Rivelin Valley nor at Burnt Stones, but lay between the Hall and the Townhead at Sheffield. How and why the name Sheffield absorbed the name Hallam, or caused it to shrink within the limits of two rural townships, was not explained. Certain it was that the superiority of the name Sheffield had fully established itself in 1284, the date of Kirkby's Inquest, when Sheffield, Bradfield, Ecclesfield — three vills — and half Handsworth, were held by Thomas de Furnival of the King in *capite*. These vills constituted the division called Hallamshire, and Mr. Leader made the suggestion that Hallamshire took its origin as a taxable unit in pre-Norman times, and that the same explanation might account for other so-called shires within the county of York, such as Northallertonshire, Sowerbyshire, Mashamshire, Richmondshire, and perhaps others. — On the motion of Mr. E. M. Gibbs, seconded by Mr. C. J. Innocent, a resolution of sympathy with the Council of the Royal Institute of British Architects on the loss sustained by the death of the Secretary, Mr. W. H. White was unanimously passed.

Architectural Association of Ireland.—At a General Meeting of the Association, Mr. Walter G. Doolin, M.A., B.E., in the chair, the following officers were elected for the ensuing year:—President, Mr. R. Caulfield Orpen, M.R.I.A.I.; Vice-Presidents, Mr. Howard Pentland, M.A., B.E., and Mr. Joseph Holloway, M.R.I.A.I.; Hon. Secretaries, Mr. W. R. Gleave, A.R.I.B.A., and Mr. R. M. Butler; Hon. Treasurer and Librarian, Mr. Frederick Hicks; Hon. Auditors, Mr. A. J. M'Lloughlin and Mr. W. Beckett, jun. It was decided to ballot for a committee of seven, having power to co-opt two additional members.

Plymouth, Stonehouse, Devonport, and District Master Builders' Association.—At a meeting of this Association, held at Plymouth, on the 9th inst., the following officers for the ensuing year were elected. President, Mr. R. Jenkin, of Devonport; Vice-President, Mr. A. W. Lethbridge Plymouth; Treasurer, Mr. C. H. Tozer, Plymouth; Secretary, Mr. J. H. Blackell, Plymouth. Several new members were enrolled, and a committee was appointed to report on the applications received from the Plasterers' and Carpenters' Societies for a rise of wages, from 7½*d.* to 8*d.* per hour, and a revised Code of Rules, and from the Labourers' Society for a rise of wages from 5*d.* to 5½*d.* per hour, and a revised Code of Rules.

National Association of Master-Plumbers.—The half-yearly Conference of the National Association of Master-Plumbers of Great Britain and Ireland was held at Birmingham last week. Mr. A. E. Biggs (Leicester) presided, and delegates were present from London, Halifax, Leeds, Huddersfield, Newcastle, Wolverhampton, Derby, Leicester, and other towns. The Secretary announced that the Association continued to progress in numbers and finances, and was now well consolidated. The question of the registration of the Association was discussed, and it was resolved to form the Association into a limited company, but it was pointed out that the object was not to make it a profit-making concern. The President, in his address, explained that the object of the Association was to see that the plumbing trade was carried on by the plumbers of the country, and not by those who had no training for the work, and therefore were personally unable to undertake the work. It was decided to hold the next annual conference in London.

Hawick Archæological Society. — Dr. Christison delivered a lecture to the members of the Hawick Archæological Society, last Thursday, on camps and forts. The Rev. Mr. Johnman, who presided, referred to the finding of a cist and skeleton near Cavers. He said it was one of the most remarkable finds associated with the Border district. In the cist there were no relics of the Bronze or early Iron Age, or of the Stone Age, but there was a wonderfully perfect skeleton of a highly-developed man, of great brain power—perhaps a great Border chief. The cist was carefully formed, and there were also found two bone or horn pins, showing clear proof of having been manufactured; also a number of calcined bones lying beside the skeleton.

New Swindon Junior Engineering Society.—There was a large attendance of members at the Mechanics' Institute to discuss a paper read by Mr. J. W. Cross, entitled, "Notes on Locomotive Practice on the London and North-Western Railway." As might have been expected, the use of compounding received a large share of attention, as a great many of the London and North-Western Railway Company's locomotives are arranged for this principle. Another point of interest was the statement with regard to the great accuracy of the fitting work turned out, which enabled the authorities to efficiently carry on a system of interchangeability of parts. Details of machine shop practice were described at length, also the construction and preparation of all important parts. The use of cast steel appeared to be pretty general, and Mr. Cross asserted that now the castings are more reliable this metal would be employed to a much greater extent. Mr. Cross then turned his attention to an exhaustive comparison between the different types of engines. Many other items in locomotive practice were explained.

As a memorial of the late Mr. Peter Martin, a new organ has been placed in the Lee Congregational Chapel, Horwich, at a cost of £500.

IN Rome, a small popular theatre, called the Alhambra, situated in the Prati di Castello quarter, and built of wood, has been entirely destroyed by fire, but there was no loss of life.

A NEW Fire Brigade Station has been opened in Shottendene Road, Fulham. The new building has been erected at a cost of £11,570, and contains accommodation for twelve married and eight single firemen.

IT is reported that on Monday night (October 5th), a fire broke out which destroyed half of the city of Guayaquil, and finally burnt itself out after consuming 100 blocks of buildings, and goods and property of immense value.

THE National Schools extension is progressing at Normanton satisfactorily. At Dodsworth (Woodhouse) the schools have recently been enlarged, and an institute built; at Hopetown, the work of enlargement is now going forward; whilst at Normanton proper, it is proposed to commence enlargement and improvement almost immediately. The cost at Woodhouse is about £1,200, at Hopetown £300, and at Normanton probably £500 to £600.

Trade and Craft.

GOVERNMENT WORKS.

Since the summer of 1893 not less than £160,000 has been expended by the Government authorities in dredging new mooring spaces for battleships and cruisers off Devonport and Keyham, and plans have just been submitted to the Admiralty which will entail the outlay of at least another £100,000. It seems that during the last three years so many new ships have been added to the navy, and that so many more are now in course of construction that in two years time the whole of the berthing space at Devonport and Keyham, which has been provided at so much cost, will be more than comfortably occupied, and the commencement of new works is therefore almost immediately necessary. To this end a further £100,000 will be asked for in the next Naval Estimates, and at least £50,000 more will have to be voted in the following year.

LIGHT FROM DUST.

The Shoreditch vestry has purchased a site, on which will be placed the electric generating station, the new baths and wash-houses, and the free library. The furnaces which burn up the dust will heat boilers, which will in their turn supply steam to engines of 2,400 horse-power, and these will work the dynamos for creating the electricity, which will be distributed all over the parish in the form of electric light and motive power. And, finally, the exhaust steam will heat the water in the baths and wash-houses, and so save an expenditure of £500 a year in coals. The furnaces and boilers are of the newest and best description, and are being erected by Messrs. Manlove, Alliott and Co., of Nottingham, Messrs. Kincaid, Waller, and Manville being the engineers. The dust will be carted in and shot into hoppers, whence it will be conveyed by overhead tramways to the furnaces. Here it passes into the drying cells, and is raked forward on to the fire-bars, where it is burnt by forced draught. But the most interesting thing about the present scheme is the system of thermal storage, by means of which the heat of the furnaces is stored up in the daytime to be used at night when the electric lighting plant is in use. Every part of the plant is duplicated, and in some cases triplicated, to provide against accidents and breakdowns. The street lighting to be provided, consists of 67 arc lamps and 36 lamps of 32 candle-power.

ELECTRIC EXPRESSES.

The Metropolitan District Railway Shareholders' Association has issued a copy of Sir Benjamin Baker's report, and estimates for the construction of electric express lines under the existing system of the Metropolitan District Railway. Sir Benjamin says the proposed line will commence by a junction with the main line of rails of the District Railway, about midway between Earl's Court and Gloucester Road, and curving to the right will run under the Cromwell Road for a distance of about 300 yards on a descending gradient of 1 in 42, when it will be at a sufficient depth to pass under the side wall of the covered way of the District Railway, near to the west end of Gloucester Road Station, whence it will continue to run under the District Railway to the terminus at the Mansion House. It is proposed that there should be one intermediate station at Charing Cross. At Earl's Court the existing platforms would be used by the Electric Railway passengers. At Charing Cross the platforms for the latter would be 63 ft. below the present District Railway platforms, or 78 ft. below street level, and at the Mansion House the corresponding depths would be 71 ft. and 95 ft. respectively. Hydraulic lifts and stairs would be the means of communication between the platforms of the Electric Railway and District Railway at Charing Cross and Mansion House, and above that level the existing entrance and exit stairs, slightly modified, would be common to passengers by both lines. Sir B. Baker estimates the cost of railway work, land, and buildings at £1,000,000; the electrical installation, rolling stock, &c., at £264,000; and the Parliamentary and other expenses, including interest, during construction, at £189,000; making a total of £1,453,000. The necessary legal formalities are being pushed forward as rapidly as possible.

An Ideal Architect: Artist, Constructor, Engineer.*

WE belong to a profession that is amongst the noblest, as it is certainly the most Artistic and Scientific of all professions, and the most enjoyable. The pursuit of Architecture is not a labour, it is a pleasure. It is the most Artistic, because it embraces all the Arts which are really subservient to it, and which are called in to embellish and adorn it, and are part and parcel of it ; it is the most Scientific, as, in like manner, a knowledge of all Sciences is necessary to the proper carrying out of a great Architectural work, and they are, in fact, essential to it. Let us consider what an Architect must be, and know, to approach the ideal standard which we propose to set up. He must, in every sense of the word, be an *Artist*. He must be a *Constructor*. He must be an *Engineer*. You need not smile at this last assertion, it is absolutely correct, and we shall see, by considering what has been accomplished by Architects in this direction, that it is so. Let us go back to remote times, times so remote that our oldest monuments seem but as things of to-day ; I allude to the stupendous works of the Egyptian Architects, as we now see them in the magnificent Nile temples. The stone generally used in these temples was a species of granite called "Syenite," of excessive hardness, and it was used in blocks of such huge dimensions that it almost passes belief how they could have been handled at all, and lifted into their places high above the ground. For instance, many of the stone slabs forming the roof of the great Temple of Karnak weigh upwards of 50 tons, other stones are calculated to weigh from 100 to 300 tons, all set without mortar, and jointed with such accuracy that the blade of a penknife can hardly be inserted between them. Lord Armstrong (then Sir William Armstrong), than whom no higher authority lives on such a question, on the subject of the construction of these temples, speaks thus of the huge masses of masonry which he saw there. He was speaking, in this instance, of the celebrated Memnonium at Thebes, and of the great statue of Rameses the Great, which is cut out of a single block of Syenite, calculated to have weighed, before the Artist commenced upon it, 1,300 tons. He says, "to have brought such a block of stone from a distance of 135 miles, was a feat which would daunt the courage of a modern engineer, although aided by the powers and appliances unknown to the ancient Egyptians." Sir William, also describing the process by which these huge blocks of stone were quarried by means of wooden wedges which were inserted, and afterwards swelled by water, says, "if any engineer of the present day were to attempt to detach by this means, a block of Syenite weighing 1,000 tons or more, I would bet long odds against his succcess." When we consider the enormous masses of these stones, the distance they were transported, the admirable accuracy with which they were built and finished (although it is almost certain the use of steel or iron was unknown to the Egyptians), I think we may surely assert that the Egyptian Architects accomplished engineering feats of no mean excellence. But, great as these are, they almost pale before similar feats which have been accomplished in the building of the "Great Temple of the Sun," at Baalbek. Here we see in the basement of the temple stones of such dimensions as to take their place amongst the wonders of the world. One stone placed in position, 20 feet above the ground, measures in length 69 feet, in width 10 feet 5 inches, and in depth 13 feet. Another stone, lying in the quarry ready for removal, measures 69 feet in length, and is 14 feet square, the weight being calculated at 1,100 tons. The entablature of this same temple, with all its Architectural enrichments worked on it, is got out in solid blocks 14 feet deep, and when lifted on to the columns which support it, reaches a total height of 90 feet from the ground. Let us come to more modern times and nearer home, and see if these Architects were also Engineers. The late Robert Stevenson, who as an authority we may mention on the same line with Sir William Armstrong, told me that he had measured the Lantern of our beautiful Tower of St. Nicholas, Newcastle, and found the weight to be 70 tons, adding, "I have always regarded the construction of it as one of the greatest engineering feats." For myself, I always look on the construction of that

FIREPLACE OF AN ARTIST'S STUDIO.

* We have pleasure in giving prominence to the opening address of Mr. Archibald M. Dunn, President of the Northern Architectural Association. We are able to exclusively publish this interesting paper, with the conclusions of which we are in entire agreement. Indeed, they voice the attitude to Architecture repeatedly expressed in these columns. The Article will be concluded next week.

beautiful mediæval form, the Gothic Spire, as no mean engineering effort, and, I think, the Architect who first reared the delicate shell work of stone, varying from 11 inches to 6 inches in thickness, which forms the spire itself, and was satisfied to carry the same to the height of 300 or 400 feet, and felt that it was safe, must indeed have been a daring as well as a scientific man, and, I confess, when I came to build spires myself, although I had gone carefully into the construction, and had the old examples before me, I could hardly realise that such slight and delicate construction was all that was necessary to be self-sustaining, and, at the same time, sufficient to resist the pressure of the winds at such great altitudes.

(*To be concluded.*)

DECORATION IN PUBLIC BUILDINGS.

By WALTER CRANE.

IN connection with the Arts and Crafts Exhibition, a lecture was given to the members of the Society, on Thursday night, by Mr. Walter Crane, who said, there appeared to be two theories regarding mural decoration: one might be termed *Organic Theory*, in which the decoration is an essential and integral part of the structure to which it gives final expression; and the other, the *Inorganic Theory*, in which decoration is considered merely as so much surface ornament, and often not so much for composition as to conceal structure or to furnish a mosaic for it. With the development of Gothic Architecture, *sculptured decoration* (or, indeed, decoration of all kinds) became more and more important, while still strictly organic, being used to ornament structural necessities, such as the ribs and junctions of interior vaults, also for clustered shafts, the tracery of windows, as well as spandrils of arches, corbels, arcades, canopies, parapets, and so forth. One cannot separate the decorative features of a Gothic building from its structure. They are an organic part of it, as the leaves and flowers are of a tree; and the sculpture of a Doric temple is also organic, though on a different principle. In the course of social and Architectural evolution, however, we have become somewhat mixed and composite in our Architectural styles. With the complexity of life, complexity of form has increased, and the result is that modern buildings have lost, to a great extent, that impressiveness which is due to simplicity, and that organic character, or relation between structure and decoration, which he had endeavoured to indicate. Each period has left its Architectural deposit, but the present century has been more destructive than the Great Fire as regards Old London. The commercial spirit of the age is reflected in the vast structures which seem to be supported by sheets of plate-glass. The many-storied flats and the cloud-capped towers of the modern hotel inspire scarcely any other feeling than one of dread lest they should fall down. Nevertheless, as a nation, we possess many beautiful survivals of by-gone days. There seems to have been a constant endeavour on the part of Architects and builders, since Sir Christopher Wren, to reconcile the classical pediment and pilaster with public, domestic, and street Architecture; to design imposing façades of Greek and Roman temples, and then to brick up the portico and cut windows in it; to repeat the pediment over every window, and to make a Doric, Ionic, Corinthian, or composite portico over every door. This classical taste has

LEFT ITS MARK

on London with more or less happy effect. Mr. Crane thought he need only refer to the residences on the south side of Regent's Park and to the British Museum. The City, of course, has had its share in such buildings as the Bank, where, to say the least, the effect has been anything but a happy one. Further, we have the Royal Exchange with the memorable inscription: "Great is the Earth and the fulness thereof"—this, probably, for fear that it might be forgotten in the very heart of finance, and in the neighbourhood of the valuable sites in that district. The Mansion House also has received its complement of classical *pillars*, probably in order to inform the public at large that *the pillars of society* are being entertained very frequently in that building. We may consider the subject of the Decoration of Public Buildings from several points of view—(1) from the point of view of public sentiment and national characters and ideals; (2) as the expression of the design, object, and purpose of particular buildings, interior and exterior; (3) from the technical point of view of methods and materials, adaptation to climate and conditions. We are often credited with being a reserved race; somewhat sombre, even in our pleasures; clinging to fixed habits and traditions, averse from outward display, self-conscious, distinguished more for business qualities than lively imagination, and possessing an eye more generally fixed upon the

MAIN CHANCE THAN UPON MURAL DECORATION,

and more bent on material prosperity than spiritual beauty. Does not the general aspect of our big towns on the whole suggest, or reflect in the character of their public buildings, such characteristics, so far as they are capable of being expressed in Architectural design? First of all, Architectural evolution and the development of design has not kept pace with the social evolution and the advance made in machinery and science during the 19th century. Look at the revolution in the means for obtaining light! In the olden times of the candle, the lamp or the torch, these appliances were quite in harmony with their surroundings; but, owing to the invention of gas some 50 years ago, our buildings have been disfigured rather than ornamented by gaseliers, which are intended to replace the old appropriate and Artistic designs for candelabra; the same applies to electric light installation: electric light and fittings are often planned on the principle of the gas-pipe. At the time when these new appliances came in vogue, Architectural design was not up to date enough to be able to harmonize these new features with the styles and methods of building which were then in use. English law guards its dignity in a fortress of the 13th-century Gothic style, whereas the Life Guards' Headquarters, in Whitehall, looks anything but military, and ornament is conspicuous by its absence. We all admire the Albert Memorial, and the friezes on the Albert Hall are, on the whole, very pleasing to the eye. Passing on to Westminster, we find that the decorations of the National Speech House consist mainly of towers. Towers, indeed, play an important part in the decoration of cities. What would Florence be without its towers? As to the interior decorations of the Houses of Parliament, Mr. Crane said he liked Poynter's St. George and the Dragon in the House of Commons least. The best decorated interior in London, in his opinion, is the National Gallery; "I mean, of course, the pictures, which, after all, are the finest interior decoration imaginable; but then the pictures on the walls of the National Gallery were executed by Italian masters! Let us hope that the spirit of St. George continues to exist in the House of Commons, and that St. George exists not only on the reverse of our coins; I have a strong belief that St. George would never have sanctioned the spoliation and extermination of half-armed Africans by means of Maxim guns and such like implements of civilisation. The most successful building I have seen, with regard to mural decoration, is the new Public Library in Boston, Mass.; it is a two-storied structure of imposing dimensions, built in white stone, with circles in black, which surround designs illustrating the early printer's craft. The interior decorations are in equally good taste and

TRULY MAGNIFICENT;

the wall decorations in the large reading room are executed by such men as Puvis de Chavannes and others. I will only just refer you to the Natural History Museum at South Kensington, with its terra-cotta monkeys and other animals for gargoyles. We are all familiar with Westminster Abbey, where many a record in stone brings us back to the grand and stirring days of the past. The decoration of public buildings should be the

HIGHEST FORM OF POPULAR ART,

as it was in the Middle Ages, when a town-hall or a Church was no bad equivalent for a public library, stored with legends and symbols, which impress themselves upon the mind through the unlettered though vivid language of design. At present, the highest form of popular Art appears to be the poster, which, if it does not always decorate our buildings, at least often covers them. And, what is most astounding, some of our most eminent Artists help to contribute to these public waste-paper baskets. Perhaps the new development of municipal life and spirit of our towns may do something by fostering a sense of citizenship and local pride, and centralising and giving proper life and purpose to the vast jungle of bricks and mortar we call cities or districts. We seem to have reached a period of development when street improvements generally take the form of clearances for the traffic. Primitive man had to clear the primeval forest to build himself a log hut or simple dwelling, and civilized man has to clear a forest of buildings. We cannot, it seems, get Artists appointed on the County Council. Municipalities and vestries are too much absorbed in the fundamental difficulties of contracts and the necessities of drainage, paving and lighting of vast and populous areas. These ought they to have done, but not to leave the other undone. The history and legends of localities should be carefully preserved and identified with public buildings, such as town-hall, schools, and meeting places of all kinds. In France, Artists receive encouragement by being permitted to decorate the public buildings of their native towns; with us such opportunities are wanting; quite lately, however, Manchester has made a move in this direction. I am speaking of the paintings in the Manchester Town Hall. At present Painters mostly work for the dealer. Churches from time immemorial have been the most sacred of public buildings, and have been the recipients of untold treasures of Art and craftsmanship of every kind, and still seem to make the greatest and most permanent demands upon, and to offer the largest opportunities to the designer, as is clearly demonstrated by our Exhibition. There is another variety of public buildings, however, which might well take some thought and work of the Artist. I mean The School. Here again, permanent mural design might find a home and fill an important part in stimulating the imagination, in forming the mind, and thus perhaps make good citizens of our young by means of painted histories and typical figures. It would certainly lighten the teacher's task immensely. We cannot get outside our times; if we do not care for harmony and beauty in our public buildings; if we are entirely absorbed in seeking our

INDIVIDUAL PROSPERITY,

and are oblivious of the social bond, we are not likely to get noble buildings or impressive decoration. We must remember that a people without Art, collectively speaking, is inarticulate, and that, after all, the highest and most vital Art is the expression of character, the point of view of methods and materials. For the decoration of public buildings the principal means and materials are: sculpture in marble and stone, terra-cotta or bronze, mosaic, marble and glass, stained and painted glass, leading and lead work, metal and iron work, cut brick, sgraffito, wood-carving, painting in oil, fresco and tempera, plaster, stucco and gesso, tile-work and glazed faïence, also panelling, inlay, and tapestry. Owing to climatic considerations, sculpture has been the chief means of decorating European buildings externally, both ancient and modern, and although it has a severe struggle for existence in our times of public apathy and coal-smoke, the Sculptor remains the chief decorator. Terra-cotta seems to wear very well and keep its colour through London smoke. Mr. Conrad Dressler and Mr. Harold Rathbone, each in different ways, are engaged in noble artistic efforts to revive Della Robbia ware, and adapt it to modern Architectural decoration, and both have done remarkable and interesting work in that material. Of course, due consideration should be paid to the climate in selecting a style. For instance, those fine classical structures of the Greeks and Romans, which impress us by their grandeur and magnificence under the blue and always serene sky of Southern Europe, fail to do so in, and are unsuited to, our damp and foggy climate. In the decoration of public buildings the attention should be centred upon some leading and distinctive feature, and the effect should depend upon the use of one kind of work. If sculpture is to be the main feature, concentrate the interest upon the sculpture; if mosaic, then everything must be subsidiary to it. The same principle applies to material."

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

Notes on Mural Decoration.

By HARRY THOMSON, Glasgow.

IN submitting these Notes on Mural Decoration, it is not my purpose to give anything more than a brief outline of the history and practice of the Art of Mural Decoration, together with such facts as have come within my knowledge, from what I have seen, and what I have read.

It is a matter of very little importance who first practised the Art of Architectural Decoration, but from the evidence of temples and other relics of antiquity, the Egyptians were the first among nations to show appreciation of the effects to be obtained on wall surfaces by means of colour. The method employed by the Egyptians seems to have been that of Tempera, and, occasionally, Encaustic. In Tempera painting the colour pigments were mixed with weak size or other substance of a glutinous quality, in sufficient quantity to attach the colouring matter to the part to be decorated. Owing, perhaps, to the durability of the pigments employed, and to the purity and preserving qualities of the climate, the work of that noble race exists before us as fresh and pure as if painted yesterday.

Encaustic, or Wax Painting, seems to have been employed to some extent in Egypt, and, later, more extensively by the Greeks and Romans. In this system the pigments were mixed with wax rendered fluid by the addition of oil or a resinous liquid added in sufficient quantity to enable the colour to flow freely from the brush. The surface, whether of wood or stone, was first prepared by coating with wax, and thereafter painted with the waxy pigment till the design was completed. Then heat was applied by means of a brazier, at a short distance from the surface, till the wax melted, and as it were fused the outer coat of pigmented wax with the under layer, and in that manner imprisoned and protected the colour.

As showing the durability of this class of painting, and as possibly another quality in its favour, encaustic paintings may be seen which are supposed to be nearly three thousand years old, and are even now very little discoloured through the lapse of time. The Greeks, however, and later, the Romans, seem to have encouraged this Art, and specimens of some beauty are frequently seen in interiors on walls or in panels.

Fresco Painting as a means of decoration was practised by the early Greeks, and very likely, too, by the Egyptians. In this method the wall was plastered with lime, and, while still damp, water colours or colours mixed in lime water were washed over the surface, outlines being indicated here and there by lines or incisions made with a pointed stick. Owing to the fact of the plaster drying or "setting," only a part of the work could be done at a time, as may easily be supposed, and the work proceeded with in successive stages till completed. If the result when completed seemed unsatisfactory, the only possible remedy was to hack the work to pieces; hence an Artist working in fresco encountered no small difficulty in decorating by this means.

PICCOLOMINI LIBRARY, SIENA.

The Art of working in Mosaic was probably known to the Egyptians, though so far as I am aware no specimens of their practice in this Art have survived, but of Greek and Roman examples there are many which show that the Art was of extensive application on walls and pavements. The Byzantines and the early Italians made continual use of this fascinating Art, which, though simple in theory, is beset with difficulties which are only overcome by repeated and enthusiastic application. In his usual practice the mosaic worker drew his pattern on the dry plastered wall, and, selecting a portion for his day's work, cut into the plaster with a chisel to the depth of an inch or two, and having at hand some cement and a trowel, filled with cement the space thus made, subsequently inserting pieces of "tesseræ" *i.e.*, chips of stone, marble or glass, of the desired color. From the quick-setting quality of the cement only a part, and that a very small one, could be done each day, and, as will be imagined, the work proceeded rather slowly, so slowly in fact that in many cases a comparatively small work would take years to complete.

PICCOLOMINI LIBRARY, SIENA.

The Art of Mural Decoration received great impetus from the advent of Christianity, when truly, religion and Art may be said to have walked hand in hand, and by degrees as the wealth of the Church increased, and power and luxury required the necessity of gorgeous display, the service and talent of men imbued with religious feeling and discernment for colour and beauty of form, were called into request to satisfy a desire to contribute to the glory of the Mother Church. In these times, indeed, all men may be said to have been Artists alike, for all were inspired from reverence and from religious faith to lavish in profusion genius and talent in the adornment of places set apart for worship, and vast Cathedrals were reared whose pavements glittered with mosaic and marble, whose stone walls, diapered and powdered in vivid tints, gave background and relief to panels and niches of martyred saints, while piers, arches and mouldings seemed alive with glowing colour.

High up, over head, would be seen a roof whose vast expanse shone with stars, a heaven of azure and gold, while windows of ruby and sapphire and emerald shed their dazzling lustre on marble, on jewelled altars, shrines, and sculptured images of gold. Our forefathers had a true and honest love for colour and delighted to show it in this manner, a little exhausting, perhaps barbaric, but surely better than whitewashing Nature or clothing her in drab. Of the decay of the Art of Mural Decoration and its present revival there is little need to speak. There is a wide-spread evidence of a wholesome reaction to a better state of things, a return to the study of the old while asserting what is new in modern expressions of thought.

In the modern practice of decoration there are some methods which, though suggested by older practice, seem intended as easily and quickly executed substitutes for the more enduring fresco, encaustic, and mosaic, and of these we may proceed to describe those of the leading types.

Sgraffiato, an Italian Art, has some resemblance to the first process of fresco painting. The design is scratched or incised on the nearly dry plaster ground. This method suggests immediately how different effects may be produced by putting successive layers of coloured plaster on the wall, and chiselling off certain portions of the different layers, thus giving an effect such as we see in cameo work.

Stucco-duro, a method sometimes employed for wall decoration, the material for which is composed of lime, sand, and marble dust. The work is modelled in relief, and, when dry, is painted.

Working in Gesso may be said to be a painter's rather than a sculptor's Art, and consists in painting the wall or other surface with a mixture of plaster of Paris and glue, or some such composition, high relief being obtained by repainting the parts desired to be raised, and still higher relief by modelling with teased wool soaked in the

mixture of plaster and glue, the work when dry being painted or glazed with colour.

Stereochrome, or Water-Glass, is a modern method of working designed to take the place of fresco. In this method the wall is wetted with a sponge and the colours laid on while the wall is damp. When dry the work is fixed by spraying through a rose with weak water-glass (a mixture of silicate of soda and water), somewhat in the manner of fixing charcoal drawings. An extremely thin coat of glass is thus left on the surface of the painting, and is supposed to protect it from atmospheric influences.

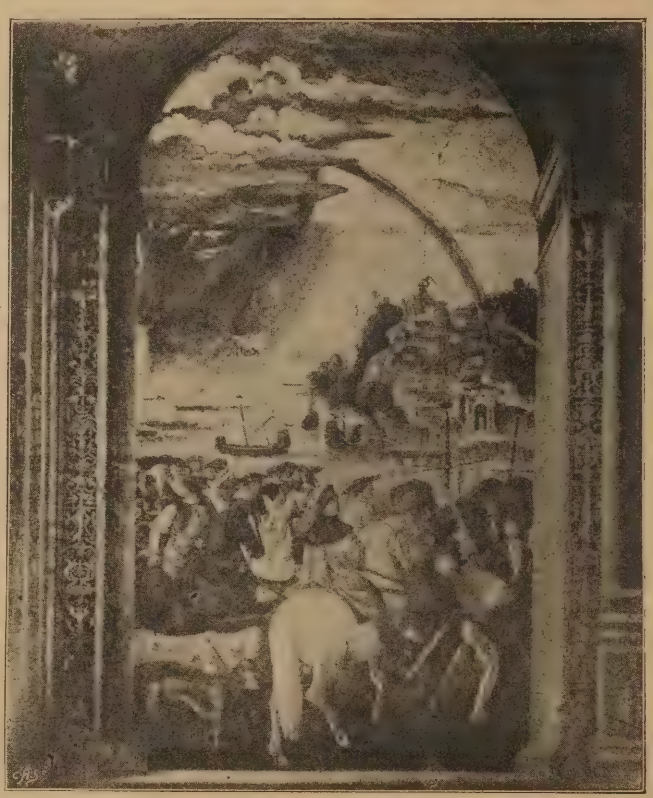
Spirit Fresco is similar to water-glass in the method of working, the fixing vehicle in this case being a compound of certain gums dissolved in spirit of wine.

Oil Painting is a comparatively modern method of decoration, and consists in coating the wall or other surface with colour pigment mixed in boiled oil.

Distemper or Tempera Painting has been already noticed, is the oldest, and in my opinion the best of all processes in use for the decoration of interiors.

Other methods of decoration may be enumerated, such as sculpturing in stone and marble, carving in wood, covering surfaces with woven fabrics, such as tapestry, painting on canvas, covering with wall paper, leather, &c., and the filling of window spaces with glass, all of which, though slightly outside the scope of my paper, are intimately connected with the art of Mural Decoration, but sufficiently well-known to need description.

Of all the processes enumerated, fresco, encaustic, and mosaic are the three Arts which seem deserving of encouragement, but have fallen into disuse, simply, I should suppose, on the ground of utility, their great cost, and the delay necessary to complete work executed by these methods. Oil painting, distemper or tempera, and the use of wall-papers, are of very general application in the decoration of our houses and public buildings, and all three are economical in cost, of ready application, give an effect with little delay, with the additional advantage that the work can be easily altered and remedied while in progress. An argument sometimes advanced against the use of wall-papers is the fact that their use is unwholesome in a sanitary sense, that papers gather dust, and microbes of all denominations find there a convenient and happy hunting ground. I venture to think that the use of wall-papers is clearly being overdone, and that most rooms would be more artistic in aspect and decorative in feeling if painted in oil and distemper alone.



It is true there are many cleverly designed wall-papers produced by Artists of experience and of note, and wall-papers are certainly a very handy means of covering a wall space; but are, I think, in most cases entirely unsuitable in colour and design and scale to most rooms.

The pattern, too, is terribly assertive and monotonous from the necessary repetition compelled by the process of printing. Distemper and oil paint, on the other hand, are entirely within the means, and under the control and skill of the decorator. The work produced on a wall by these means is more direct, and more pleasing to the eye. A certain discrimination, however, must be exercised in the application of oil or distemper in the presence of damp existing within, or outside of, the wall, tempera being best able to cope with internal damp, oil paint having most power of withstanding moisture from without the wall. In distemper painting the usual practice is to have a vessel containing whiting and water and size, adding the powdered color at intervals until the desired tint is reached. When painting in oil the colours may be mixed with boiled linseed oil, and a little litharge, or sugar of lead, added to hasten the drying, turpentine being added to thin the colour if necessary. Oil paint dries with a certain gloss, and this shining effect may be increased by varnishing, or, if a dull "mat" surface be desired, somewhat similar to the surface of distemper painting, a varnish called "mat varnish" (composed of wax and turpentine) is coated over the work instead.

Designs to be painted by hand are usually "pounced" through from an outline drawing, the guiding lines having been chalked on the wall with the assistance of the plumb-line and compasses. Stencilling is often resorted to as a means of decorating large surfaces. The pattern is drawn on a sheet of cartridge paper which has previously received a coat of "knotting" varnish (shellac dissolved in spirit of wine) to make the paper stiff and non-absorbent to paint. A knife is used to cut the open parts of the pattern, and the necessary ties are left.

Gilding is the sheet anchor of the decorator whose work "hasn't quite come up to the mark," and "needs just a little picking out here and there." In my opinion gilding is really unnecessary in most cases. The money saved in gold might be well spent on some worthy portion of the decoration.

Graining, in imitation of different woods, is too often practised, and the practice is one which can hardly be defended. I do not object to the practice of graining in itself, but to the servile imitation of the grain of wood. It seems to me that a very satisfactory effect could be had by using the graining tool, or comb, to give fantastical shapes suggesting certain forms in design, but not an imitation of knots and cracks.

PINTURUCCHIO, 1454—1513.

The imitation of marble is open to the same serious objection, the time spent in the pursuit of this so-called Art being practically wasted, that is, so far as the advancement of Art is concerned. Still, good effects might be had by blending colours harmoniously together, without, of course, imitating the streaks of marble.

I think it is a pity the work of the mural decorator should be considered a thing entirely separate and apart from the work of his fellow craftsman. It is perhaps a necessity of the times, from economical reasons and expediency, that the work of decorating the most ordinary building should be allotted to half-a-dozen or so of individuals whose work is quite dissimilar in tone, colour, style, and feeling. I do not know where the fault lies, or what remedy to suggest, unless, possibly, there is a little jealousy among craftsmen and an unwillingness to allow one's province to be intruded on by another, a dread of competition or what not, that prevents those joining hands whose pride should be in a beautiful result produced by a united rather than an individual effort. Perhaps the Architect should be his own sculptor and modeller, carver and decorator, and design such things as tapestry, mosaic, tiles, furniture, and superintend the exhibition and arrangement of pictures, bric-a-brac, china-ware, and glass-ware, in fact, everything that goes to produce a harmonious whole; a difficult and perhaps impossible ideal to reach, but one much to be desired. At least, however, the Architect and the different craftsmen engaged in the decoration should be in direct sympathy with each other. Let us suppose, then, the same guiding hand and brain will direct all operations from first to last, and examine what the decorator will proceed to do when confronted with a wall which it is proposed to decorate.

I take it for granted he will confine himself to the use of oil and tempera, abstaining from the use of wall-paper, which is, from the reason I have already given, generally unsuitable for use in Artistic decoration.

A design will have to be sketched and allowance made for the introduction of sculptured panels, gesso and fresco or encaustic paintings, mosaic, tiles, brass and iron work, bronzes and placques, sconces, and in fact everything that is seen on or against the wall, and all this material reduced to order and harmony with the scheme of decoration.

As to the style to be followed I do not quite see why decoration should be of a particular style, any more than that Architecture should be of a particular style. Certainly it would be incongruous to put Hindoo ornament on a building of classical influence; but given a certain space to decorate without being particularly hampered by prudish considerations of style, the designer will approach his work with something like a feeling of joy, earnestly endeavouring to produce a result in harmony with its surroundings and yet with an individuality of its own.

Pompeiian wall painting embraces, to my thinking, all that it is desirable to emulate in decoration, not, of course, necessarily to copy. The wall is usually divided into panels and spaces alternately, the panels by their enrichment and detail contrasting with the plain space adjoining, and producing on the mind a grateful feeling of placidity and repose. The mural decorator who aspires to work with the feeling of Pompeiian decoration, would be sadly hampered in his aspirations by the prevailing fashion of planning rooms. Usually the average room has on the ceiling a florid enrichment or centre plate, and at the top of the wall a cornice making a straight hard succession of lines round the room, and at the floor a skirting board without a break to its monotonous undeviating course.

Certainly a fairly creditable decoration can be executed even under these disadvantages, but the result is, in consequence of the initial difficulty put in the way, far from perfect.

But, supposing the Architect and craftsmen have laboured together to produce a general effect pleasing to the eye, individual in the treatment of its parts yet subservient to the effect of the whole as a picture, how different are the conditions and how satisfactory are the results.

Let us imagine a room decorated under these conditions, and examine the progress of the work. The ceiling of wood or plaster with beams showing at intervals and inserted into the wall. On the wall, shafts and mouldings of plaster or wood supporting the beams. No cornice in the usual acceptation of the term; the wall covered with plaster and divided into panels decorated in sgraffiato, mosaic, or gesso. At the under portion of the wall, wood panellings stepping or curving to the floor, and perhaps the floor itself in two levels. The windows high up in the wall and reached by several steps, the light admitted by that arrangement being the top side light so restful to artistic eyes.

Such a room would need no framed pictures for its embellishment, for the wall itself would contain the pictures in stone, marble, fresco, and mosaic. It may be said that this ideal is difficult of attainment on account of the initial cost involved, and that may be true, but if the money paid in the purchase of easel pictures and proof etchings were expended in this more legitimate decoration, a more harmonious and possibly not a whit more costly picture would be the result.

That there is a tendency this way I think all

PICCOLOMINI LIBRARY, SIENA.

will allow, if one may judge by the progress already made in this direction by some of our Art-fostering enthusiasts, and I suppose the time will come when a house will be sold, not merely on its merits as a house well built and drained, but as a store-house of things that are beautiful.

In treating the subject of my essay, I have taken it for granted that Mural Decoration refers to our houses and our Churches. Our public buildings are rather impossible to decorate, and we have no Angelos or Titians to decorate them for us. And, indeed, our Art should be domestic, because our lives are domestic. We lead indoor lives shut up with our families, and we naturally feel impelled to make our surroundings pleasing to the eye. The agreeable task of decorating a wall surface is not rendered less agreeable by practical considerations of economy. Indeed, this very consideration is an advantage rather than otherwise, the ingenuity called forth to economise within certain limits exercising a restraining influence on one who is inclined in his enthusiasm to run into riot and extravagance in the practice of his Art, and a restrained simplicity, the first great lesson we have all to learn, the practical result.

Notwithstanding, a knowledge of detail is essential though its persistent exhibition is a thing to be avoided. Simplicity should be the guiding principle in all decorative work intended to stand the test of cultured criticism, and detail, where shown, should be put in with a reluctant, grudging hand. This quality of simplicity leads almost naturally to a quaintness and originality in design, and the value of these qualities can hardly be over-rated, but, like riches, these may be said to be the root of all evil, and a barbaric quaintness and ugliness a thing to be avoided if we would not have people turn from our work in disgust. The use of figures in the decoration of walls is a charming application of talent, and already we see stencilled figures which are intended to take the place of the usual florid wall-paper; and, speaking of stencilling, I may say I am glad to see distinctly signs of the revival of this Art, and a better appreciation of its capabilities as a means of giving expression to form in decorative work.

The very necessity of having to show ties to keep the stencil together serves the useful purpose of simplifying the form of the design, giving a severity and conventionality which, in this form of Art, has a peculiar charm of its own, perhaps this very quality of conventionalty as opposed to unrestrained realism.

Realistically treated figures and plant form are, I venture to think, entirely unsuitable for treatment in Mural Decoration, no matter how excellent in execution their detail may be. A strictly Architectural feeling should pervade the work, a squareness and solidity, such as one sees in the work of Michael Angelo and Alfred Stevens.

On this subject Mr. Watts has said — "the highest expression of painting as an intellectual effort belongs to designs composed with reference to Architectural combinations, and I cannot but feel that when the habit of requiring and producing such works falls into absolute disuse, Art must take the lower place of only a luxury." "Landscapes are scarcely permissible as a treatment for surface decoration, unless worked out in a very archaic manner. The one objection to the use of landscapes is the suggestion of "a hole in the wall."

The addition of figures might obviate that objection and give a more surface-like effect. The colour sense is denied to some, and sparingly extended to others. Some again have the feeling for colour to excess, and in the endeavour to gratify that feeling neglect other equally important considerations, the simplicity and beauty of form which should embrace the colour. It seems a pity that we should have a fashion in colour, that one year the prescribed colour should be magenta, and the next year, green. In effect these fashions make our Artist jaundiced, and he, perhaps unconsciously, paints magenta or green in order to be in the fashion, emulating in his changes of allegiance the example of the Vicar of Bray. However, the Artist who has a true love for, and a perception of colour, will appreciate all colour for its own sake.

He will colour well while he colours unconsciously, because he colours without prejudice, and while he has a hankering for beautiful colour, will be ever on the alert for the goodly form which surrounds it. A great deal has been said as to the desirability of securing permanence in works of a decorative character, and some Artists have been at great pains, while endeavouring to accomplish that end, to follow the example of the old masters who ground and prepared their own colours. I do not exactly see how the question of permanence is one of very great importance. An ordinary oil painting may last for three hundred years, and this time in the majority of pictures is far too long. An existence of fifty years is quite long enough for all but the most important works of Art. It is questionable if any good object is gained by philosophizing much in Art matters, and really, in the hurry of every-day affairs, we have little time to spend in oppressing our minds and hearts with networks of theories. DLGK

Certainly, there are underlying rules which govern Art, general principles and canons of taste which must be obeyed to a certain extent, but beyond that the mind should have full liberty to wander at will in the dreamland of invention, holding the mirror up to Nature, and reflecting back something human, full of manliness and grace; "Nature," as Emerson says, "passing through the alembic of man."

A NEW organ and choir gallery, built at a joint cost of £500, were recently formally opened at Kingswood Wesleyan Chapel.

TWO stained-glass windows, erected to the memory of the late Mr. Alexander Mackay, in the baptistery of the Parish Church of Trowbridge, have been unveiled by the Bishop of Salisbury.

THE new dock recently finished at Dunkirk on the north coast of France is the largest one in the world. It is 600 ft. long and 80 ft. wide, and will be able to receive the largest vessels at any stage of the tide. The dock has been seven years in construction.

THE Duke of Buccleuch has resolved to build a new bridge over the River Esk, about two miles above the town of Langholm, just below the mansion of Potholm. The late Duke of Buccleuch thought of bridging the river at this point about thirty years ago, but for some reason the project was abandoned. The new bridge is to have stone piers and abutments and iron girders, and will have a carriage-way 10 ft. wide.

AN Architect who had agreed to accept £15 for the design and superintendence of the erection of a house which was to cost £878, has been mulcted in £200 damages for having given certificates to the builder for no more than 85 per cent. of the value of work executed. He has been very justly made to pay for having underbid his brethren to an extent which could not have permitted him to give the needful supervision.

THE Liberal Unionist Club premises in Edlestone Road, Crewe, on Saturday morning suddenly collapsed with a loud crash, and fell into the street. The accident occurred soon after six o'clock in the morning. The roofs of the two houses, which formed the club premises, fell in, and the whole of the top floors fell through into the rooms on the second floor. The rooms of the second floor immediately collapsed under the weight, and the houses were in ruins. Mrs. Beech, the wife of the caretaker, was buried in the ruins, and was extricated with difficulty and conveyed to the Cottage Hospital. The other inmates fortunately escaped unhurt.

MOSAIC AND SHELL NICHE, POMPEII.

Sir Christopher Wren and his Work.

AN HISTORICAL AND CRITICAL SKETCH.

By ARTHUR STRATTON.

Read before the Liverpool Architectural Society, and published exclusively by the Builders' Journal.

PART II.—THE WORK OF WREN.

(Continued.)

AT St. Dunstan's-in-the-East, Wren indulged his fancy and gave us the well-known Gothic spire, which bears resemblance to the original St. Mary-le-Bow spire and much larger example still extant at Newcastle. In this, as in nearly all, the safety largely depends upon the use of pendentives, which carry the thrust well down the walls, sometimes to the belfry floor. Possibly the latest of all to be built was the tower of St. Michael, Cornhill, which study follows a Gothic type. Wren may have worked with ease and pleasure after such models, but it cannot be allowed that he ever obtained such mastery over them as will entitle him to be considered a great Gothic Architect. In fact it is one of my main endeavours to show that the spirit of the age was adverse to any such development on his part, and that he fully expressed the sentiments of the times in which he lived in the phase of classic Art which he made his own. His knowledge of Gothic forms was complete, but it can never be given to any man to excel at the same time in two diametrically opposite branches of Art. He treated all examples which came in his way with reverence, and as we see, when circumstances demanded it, he deliberately laid aside his own convictions; but he would willingly have recased any in "a good Roman manner" nevertheless. His details, not at any time over-refined, owing to his lack of training, quite miss the true Gothic spirit, as may well be expected. It is, however, only right to assert that the present excellent state of preservation of most of his work in London, is largely due to his oresight in this respect; a more delicate treatment would surely have succumbed to atmospheric influences. The best materials alone ever entered upon his work. The stone almost invariably came from Portland, for Wren had full control over the quarries there in his capacity of Surveyor of the Crown Lands; his timber was sound English oak, and his roofs were covered with lead such as is seldom met with now-a-days.

A few words must be said as to the internal arrangement of his Churches. As the plan itself, so also did this grow out of the requirements. The chancel arch, distinctly defining the limits of nave and sanctuary is lost sight of, and a wooden screen in most instances fulfils the functions. The altar was enclosed always within a rail, sometimes of marble, but generally of wood; it was raised a few steps only above the body of the Church.

Wren did not use lofty flights of steps at the east end of his Churches. The greatest care and skill was bestowed upon the east wall, which was panelled and elaborately enriched in oak. The panelling often ran all round the Church. The pulpit was naturally given great prominence, and, together with its sounding board, was often made an exquisite piece of ecclesiastical furniture. The fonts, too, with their covers, are unique specimens of the carver's skill, generally of the baluster type. The system of pews and galleries which was forced upon Wren, never received the artistic handling which ought to have resulted from a necessary provision; in fact, with a few exceptions, they offend by their excessive ugliness. Wren urgently advocated benches, but the columns, in so many cases standing high upon pedestals, show that he had to design so that the bases would not be hidden.

The staircases within the towers are very cleverly arranged and almost seem to suggest a study of conchology. They never appear as external excrescences. The line of the of the steps always runs to the face of the newel and not to its centre, giving the best tread.

The open well staircase in St. Paul's, leading to the Library, is particularly beautiful, but many examples on a smaller scale, with excellent balustrades and wall dados, are to be found in his works, both ecclesiastical and domestic.

His domestic work is pervaded with a truly English feeling, and nothing can excel the beautiful simplicity and homely character of all that is left to us. Like the Churches these, too, are in daily peril, and it is quite difficult to identify many examples with any degree of certainty.

In his larger works, Wren always introduced the orders in their entirety, "his favourite Doric," as it is often spoken of, occurs again and again, sometimes with coupled columns as at Greenwich. He never allowed himself to be fettered by changeless rules of proportion, but evolved his own with a nicety which never fails to please the eye. The sense of security is never wanting, and his knowledge of graphic statics always saved him from violating natural laws.

"Architecture aims at Eternity" was a maxim with him. We have but to study his handiwork, and to endeavour to unravel the great truths, and to learn the noble lessons embodied in it, to see how he grandly lived and worked up to an ideal, high amongst ideals and far beyond the reach of the ordinary mortal.

"An Architect," he said, "should think his judges as well those that are to live five centuries after him, as those of his own time." Not half that period has passed away since his hand ceased to work, and, through widely different epochs, his influence, however slight, has scarcely been quite unfelt; whilst in these, our own eclectic times, there are manifest classic tendencies on all hands which it is not altogether impossible may not some day culminate in a strong and faithful allegiance to Wren and his work once more.

THE EXECUTED WORKS, IN CHRONOLOGICAL ORDER, OF SIR CHRISTOPHER WREN, 1632—1723.

When two dates are given for any one work, they define the approximate period occupied in the erection of the same.

Those works printed with an asterisk against them have since been destroyed or removed from various causes.

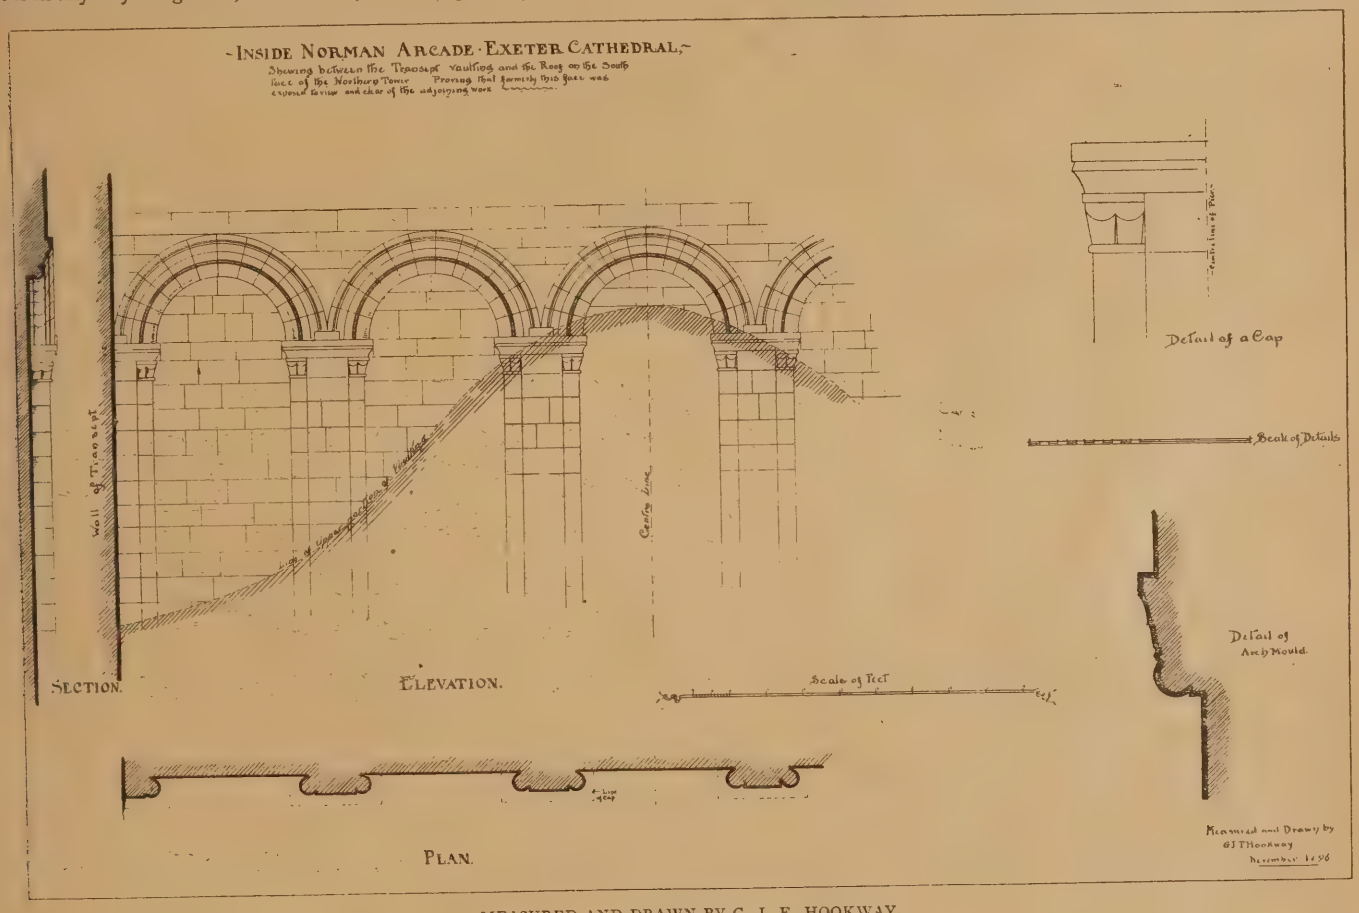
FRIDAY NIGHT AT THE A.A.

GARDEN DESIGN.

By F. INIGO THOMAS.

FASHIONS have come and gone in gardens as in everything else, and until lately for well nigh a century it has been the fashion to dispense with a garden altogether. That is to say, the substitute that has usurped its place is what in a better period would have been called a wilderness. In their haste to obtain a luxurious growth of rare shrubs and plants people have lost sight of the subtle charm that lies in a fusion of well-designed Architecture and symmetrical spaces with natural foliage. And, above all, they have ignored the sense of fitness that a frankly-designed garden bears to the Architecture of the house itself. It is significant to contrast the description of gardens that appear in the current horticultural journals with those of John Evelyn or any writer on the subject a few centuries ago. In the one, horticulture is the only point of view that is in any way recognised; in the other, a keen appreciation of design balances the interest taken in the growth of plants or in any new species that may come under notice. During the last few years the point has been discussed at some length in the leading papers and reviews. The point at issue was the comparative Artistic value of two rival methods, for there have never been more that two ways of laying out a garden — the "formal," and the so-called "landscape" or "natural" style. Paradoxical though it may sound, the formal method seems to have been the natural one until the middle of last century, and then, at a time when we should probably all agree that Art in this country was on the decline, there sprang into vogue this fashion of attempting artificial landscape in the neighbourhood of the house. On a large scale, such as one sees at Blenheim, it may be said to have proved successful in the course of years. But surely, until the garden itself has been fitly and properly laid out, it is no time to launch into improvements to the surrounding country. And, furthermore in a

"LANDSCAPE" SCHEME,



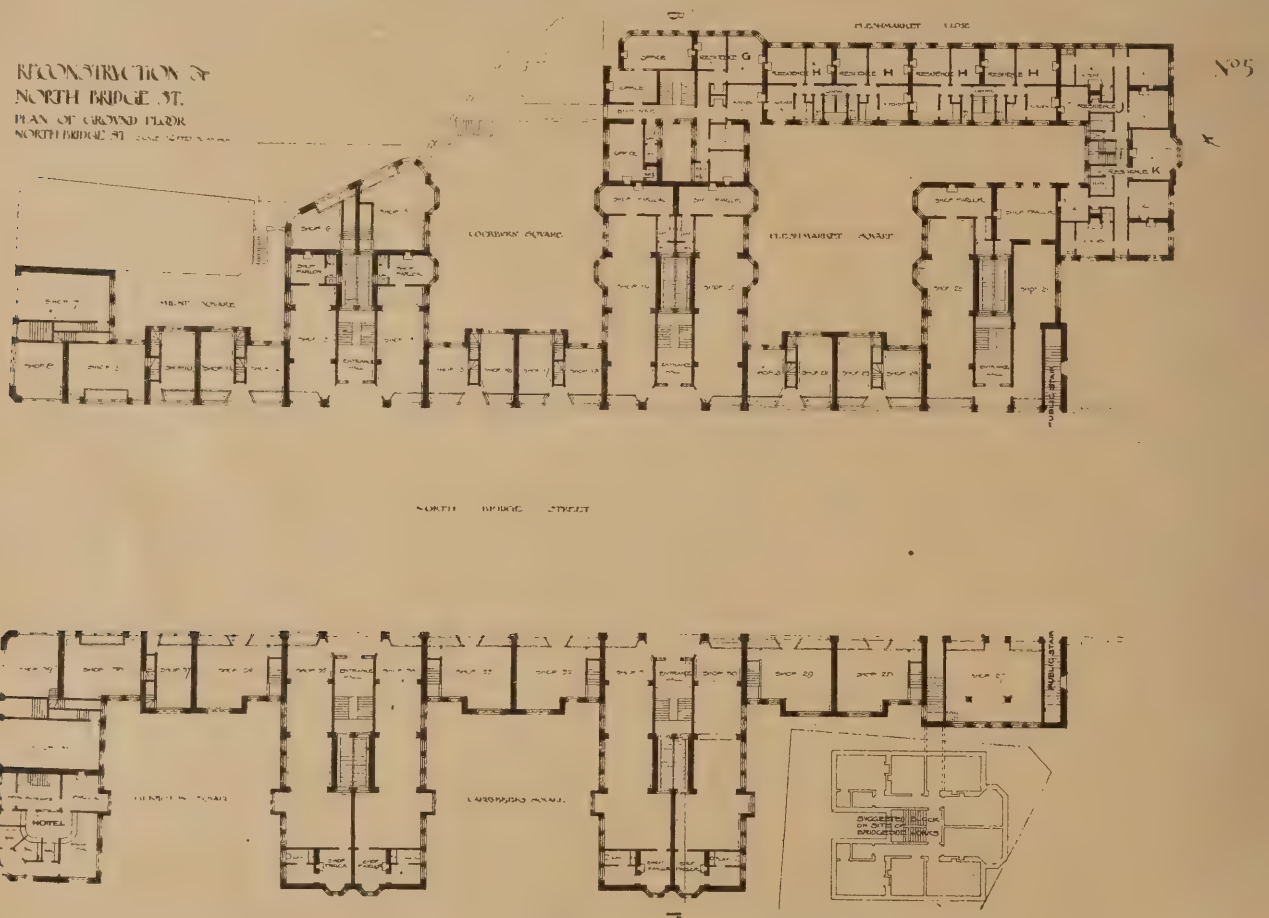
by the time it is nearly ready for criticism, all traces of the originator's hand has been "kindly obliterated by nature," which makes a comparison of results somewhat difficult. On reflection, the development of Architectural design in this direction has proceeded by very natural stages. In building, the prime object of man has always been to protect himself from the weather and from his enemies. To such a period belong all secular buildings, from the mud hut to the feudal castle. Next comes a stage in which men built for the pleasure of building, in addition to convenience. And lastly, a period into which is imported a third element, namely, that of display and magnificence. Beyond this stage nature seems to re-assert itself, and drive us back to the verge of barbarism; at least, so it would seem to have been in England, at any rate, judging from its Architectural history for the last century. House-planning was practised in a rude way in feudal times, but it was not till later that the idea of the house and garden making one concrete whole generated in the mind of the Architect, and not till later still that the approaches and planting of timber were so ordered as to form integral parts of a conception that was sometimes colossal in its proportions. Now, the formal treatment arrived at its climax in England in the second half of the seventeenth century, and in its fullest development we find

TWO DISTINCT SPHERES OF DESIGN.

There is the greater lay-out of avenues and approaches, scattered broadcast over fields and park land, heralding the proximity of the house; and there is the smaller lay-out of garden courts, and bosquets that cluster round the house itself. And, just as in planning a building, the plan, elevation, and section develop in the mind of the Architect by equal stages, so the two lays-out and the plan of the house itself were made to accord, in the schemes of the seventeenth century. In the earlier examples that are left, we seldom find signs of a greater lay-out. This may be for two reasons —either that the avenues have perished and never been replaced, or, because being anterior to the Dutch influence and that of Versailles, they had never borne these stately attributes. Avenues, to be seen to advantage, should be planted on wide plains or table lands, for the long perspective, which is their chief beauty, is lost in a rolling country. But, in the smaller lay-out, the opposite holds good, so that the ideal site to treat would be one with more or less fall towards a level plain stretching away to the distance. The whole scheme of buildings and surroundings was planned by the old masters of the craft so as to fall on four successive levels, a centre line running through from end to end, on which the principal features are plotted, and a certain symmetry on either side. Great pains were sometimes taken to preserve this balance, even in the

MOST DIFFICULT SITUATIONS.

The approach from the road to Colonna, some 600 paces long and bordered with lofty cypresses, parts opposite a fountain in the foot of a great cliff of masonry, and climbs by means of "pentes douces" to the first terrace. This, in itself, is a rise of 55 ft.; and since the original fall of the ground was in a diagonal direction, a great deal of masonry was required to bring one end of the terrace to the necessary height. At four points in the parapet there are massive banded columns, each bearing on its summit a slender iron cross. These four huge sentries stand out against the sky and the olive-clad hills with magnificent effect; but their *raison d'être* was not quite so evident until I found that the great vaults on which the terrace is supported were once the palace kitchens, and two at least of the columns were nothing more than ornamental shafts to carry the smoke clear of the windows. This terrace was probably paved throughout with "palombino," and used for the reception of magnates, with their retinues, from Rome. But there seems to have been a garden under the palace windows on ground that rises gently to the level of the main courtyard. Here the buildings lie on three sides of a court planted round with rows of elms, the fourth side being divided by a niched wall from the privy garden. This was laid out with plots of turf in borders of flowers, and two circular fountains in the centre. A fine arcaded loggia, by Ponzio, fills one end, and raised on a terrace opposite is an amphitheatre of inlaid marble fountains. From here a door and flight of steps lead back to the main-court entrance, and opposite this a wealth of flowers borders the foot of a great bastion wall that supports the bosquets and vineyards at a higher level still—that is to say, about 150 ft. above the level of the avenue. One curious thing is the small garden



MEASURED AND DRAWN BY G. J. F. HOOKWAY.

that lies on the roof of part of the building at about the same level as the great court of the palace. Now let us turn from a noble site and great undertakings in the neighbourhood of Rome, to a level site and a humbler effort in one of our midland counties. Thorpe Hall, of which this is a survey, was

BUILT AND LAID OUT BY WEBB.

The house is surrounded with a wall enclosing an oblong space, 120 by 200 paces. He put a gateway in each of the four sides opposite the entrances to the house, and relieved the long stretches of wall with a couple of niches at intervals. Next he divided the space unoccupied by the buildings and offices into six parts. One is given to the forecourt, four to pleasure gardens, and one to the kitchen garden. The forecourt is bounded on either side by a wall balustraded on top, and has elaborate piers at the entrance. On the right side, as you enter, a narrow alley is screened off as a way to the offices. The large garden to the east is again subdivided by yew hedges into three parts. The centre being given to parterre with

PLAN OF THIRD PREMIATED DESIGN BY MESSRS. LANCHESTER, STEWART, AND RICKARDS.

a terrace on the right, and a piece to the left in which the design is no longer to be traced. The other spaces are a green court south of the house, a bowling-green, and a rose garden with fountains among the beds. There is one long vista taken through from east to west, starting with the summer-house by the terrace steps, and ending in the entrance gate to the rose garden. On the whole, it is a very compact lay-out, under the simplest conditions, and is interesting as an instance of contemporary design in house and garden. Some of the principles are common to both large and small scales, and run through all garden designs. First of all, enclosure decided and uncompromising. Not of sunk fences or iron palings, but of good honest masonry, high enough to cast broad shadows early and late, and keep the wind from the flowers and fruit-trees. Then subdivision, either by subsidiary walls, or hedges of yew or box almost as dense as the masonry itself. Then the proportioning of the surface of the ground with much the same treatment that a designer deals out to the façade of a building. With regard to a

HISTORY OF GARDEN DESIGN

in England, which has already been treated of elsewhere, and should be pretty well known by now, I only propose to give a slight historical sketch. A house of the period of Elizabeth was approached through an avenue and one or more courts in quiet tones of green and grey. Out of this rose a stately mass of buildings—two wings and a centrepiece—with broad retreating shadows between, sparkling with myriads of small panes set among softly moulded mullions. Through the walls on either hand, festooned with a wealth of climbing roses, there would be splashes of sunlight and colour from garden courts beyond, while at the back the brewhouse, offices, and so forth would be screened off from garden courts and orchards by walls of ample height. If there is one thing that was more characteristic than another of the pleasure-grounds of the past it was this system of enclosure and subdivision, and, to my mind, when that was abandoned the main charm of the old English garden vanished. It was foreign to the idea of a garden to allow forest trees within the walls. The grove had its place, and that was outside the garden enclosure, where a lofty cliff of green would be more than welcome as a background to fruit and flowers. And it was probably from a wish to obtain a background of even tone that hedges first came to be trimmed. This trimming, or pleaching, as it was called, which seems reasonable enough on these grounds, was eventually carried to absurd lengths. They had felt the need of single yews to mark the salient points in complicated patterns of flower beds, and these they cut into a variety of forms: first into cubes and obelisks, and then, by degrees, into every shape that fancy might suggest, until at last the repose of the garden was as much hampered by verdant sculpture as Westminster Abbey is with its monuments. And since, of course, to keep the yews in shape requires considerable labour, it is hardly surprising that there should be few of the kind remaining. As I have said, old gardens were divided into several departments, and each of these bore a character

DISTINCTLY ITS OWN.

There was the parterre, or flower garden, with its fountains, and flower-beds in geometrical designs of box. The bowling-green with its garden house and shaded seats. The fruit orchards, wilderness, and so forth. There is always a charm, too, in length of vista that could not have failed to appeal to garden designers. And to give point to the long perspectives that were planned to pass through house and grounds alike, they were adorned at intervals with fountains, statues, or other objects of interest. Each of these would form the centre of a network of cross vistas, so that sunlight or shadow, front view or profile, should offer the scene afresh as often as it was approached from a new direction. When large sheets of water came to be included in the dressed grounds they too were treated in the same formal manner. The most ambitious efforts in this direction were probably of Dutch origin, and due to the same energy and skill that made the canals and huge drains of the Fen country. Here are two instances from Drest, in Bedfordshire, a T-shaped piece of water some 400 paces long, with broad turf verges next to the groves, and the fish pond in a secluded spot in the wood among yew hedges that are now some 20 ft. in height. The development of garden design may be said to have been the elaboration of these few principles, for the object of the old-time designer was to make a stage on which to play the drama of everyday life; but, unlike the stage, the scenery was real, and the acting an unaffected pleasure in existence and in the sights and sounds and scents of nature. Architecture lost a little of her sobriety in the summer-house, and Sculpture a trifle of her classic finish in the garden.

THE STATUARY USED

in the ornamentation of English gardens was mainly composed of lead, and, if we are to believe the date on a figure of Nelson at Fingask, in Scotland, the old moulds were still in use as late as the year 1820. Perhaps the period of greatest activity may be placed in the reign of William and Mary, for to that time belongs the English classic on the subject, a fine folio of views drawn by Knyffe and engraved by a fellow-countryman of the name of Kyp. Then we have the diary of Celia Fiennes, a lady who spent some years riding about England and taking a lively interest in the improvements that her many friends and relatives were making to their country places. And to this time, too, belong the great plans of Wren's devising for the beautification of Hampton Court. But with the progress of the eighteenth century interest seems to have flagged. People,

THE EDINBURGH COMPETITION. THIRD PREMIATED DESIGN BY MESSRS. LANCHESTER, STEWART, AND RICKARDS.

perhaps, began to tire of spending the sums that their over-grown schemes must have needed to keep up. Pope struck a note of ridicule, and the stupidity of a decadent age was ripe to root them out of fashion. Then came the opportunity of the landscape gardener. Kent and "Capatility" Brown stepped on to the scene, and though they mowed down avenues, and destroyed every vestige of dignity under the protest of "helping nature," they seem to have

FORGOTTEN HOW TO MAKE A GARDEN.

It is mainly due to people of this persuasion that so few of the fine old places are left intact. But there is a more potent influence at work in many parts of England at the present day. The smoke of factories, mines, and foundries is killing the timber, robbing the colour from the stonework, and driving out the occupants from many an old-world paradise. And the only hope is that force of association will lead them to build and lay out their new homes with some of the dignity that still clings about the old. In connexion with the greater lay-out I spoke of the influence of Versailles, and probably the extension of design beyond the limits of the garden proper, was a good deal due to rumours of what the French King was doing near Paris. Moreover, Le Notre is supposed to have come over to England, and to have done some work in and about London—if not in the provinces. It must be admitted, of course, that he was a great master of his craft; but, to my mind, either his own ambition, or that of his royal patron, ran away with him at Versailles. The spaces are immense. So vast, indeed, are they that one cannot help feeling the place is out of all scale with humanity. Moreover, there is nothing in the conception of the palace itself to warrant this treatment in the grounds. The extent of the façade is great, no doubt, but there is nothing Titanic in its structure, nor is there any great elevation from which it might be possible to grasp the huge scheme of terraces, bosquets, and fountains that surround it. I think there is much more feeling for proportion in the lay-out of the Trianon, and though it only forms a part of the

GREAT SCHEME AT VERSAILLES,

at the same time it is sufficiently complete in itself to be looked upon as a separate conception. The parterre under the windows centres with the house and forecourt, and it is not till we descend to the parterres enclosed in Berceaux on the second level that the influence of the great scheme in connexion with the king's palace begins to make itself felt, and a fountain with two pavilions and alleys beyond are made to centre in some measure with an arm of the great canal. But whatever influence Versailles may have had on contemporary work in England was probably through the medium of Hampton Court, and to follow the changes through which that palace has passed is to read the history of garden design in England. Then, too, there was the Dutch influence that came in with the Hanoverians, but exactly in what direction that differed from the French I am not in a position to tell you, for I have never travelled in Holland except as an etcher, and, accordingly, have had no opportunities of studying existing remains. Ideas direct from Italy do not seem to have had much influence in England after the time of Elizabeth. Their work was always more severely Architectural than ours, and in the meantime we had begun to look to Nature for more of our effects. In outdoor Architecture there has always been a scenic and playful character, though with us a certain restraint runs through the work that is not so observable in the south. The organ-case at the Villa Deste is a good instance of Italian extravagance. It is built of the rudest materials, rough brickwork and some sort of black concrete, but coated over with boldly-modelled stucco, and finished with gesso-duro and colour, some of the panels being a very fair imitation of bronze relief. There is something of a stage-like effect, too, in the way this building is perched on a terrace and reflected in the still waters of the pool beneath. Another quaint conceit at the same villa is the long stone trough that borders the upper side of a terrace and receives ninety jets from as many fountains, each with a subject-panel from Ovid's Metamorphoses. At the Villa Lante, not far from Viterbo, Vignola has been quite humorous. In the foreground of the view is a stone table for *al fresco* feasts, down the centre of which runs a stream of water as a cool accompaniment to the meal. Behind the table rises a combination of fountain and staircase, with a colossal deity on either side. And hanging his claws over the balustrade above is a giant stone crayfish that the Architect has inserted in punning allusion to his patron's name, and drawn out is seventeen long vertebræ to form a channel for the water. But these are palaces and playgrounds for the courts of kings, and we are mostly concerned now-a-days with people of humbler station. I will try to describe one or two places of my own devising that are either finished or in progress at the present time, commencing with one in Dorsetshire that has been finished and growing into shape some three years or more. The house was of various dates, mainly from Edward VI. to Elizabeth, but with other additions down to the present century. The wing to the left, and that containing the dining-hall, it was decided to leave untouched, but the comparatively modern work in the south and right wings is rebuilt on the same lines as the older portions. The site of the present gardens was a grass field, falling somewhat from left to right. There were a few trees here and there, and a larch plantation across the windows of the south front. The high road bounded the ground on the left, and a back drive skirted the near side of the field, and continued behind the grove to the back of the house. When the ground was cleared of trees and the roots grubbed up, the soil from the south garden and pool was excavated and removed to form the terraces round the sunk garden. Lines were laid down to make vistas through the centres of the courts, and sundial, fountain, or wrought-iron grille placed where most they seemed to be needed. There are three main lines on which the work is planned. One from the south gate catches the reflection of the house in the long pool, passes through the doorway in the south front and out into the court beyond; thence down the centre of the tennis-lawn, and across a pool at the end to a sculptured figure in a yew hedge by the river. Another line, centering with a window in the left wing, passes down the rose garden and through the circular coronet to a niche fountain between the two arches at the far end. The third is taken from a summer-house in the grove to the right, across the south garden, through the coronet and up a flight of steps with a wrought-iron gate, to the sunk garden. Here it catches the fountain and continues up another flight of steps to end in a stone seat that projects from the back of the terrace. The water for the fountains is forced by a ram in the river to a couple of tanks in the roofs of the pavilions, which gives it a fall of about 20 ft. to the long pool in the south garden. All the stonework, with the exception of a little Doulting, came from the Ham Hill quarries. It is a warm, rust-coloured stone, taking a grey lichen, and I have tried to embody some of that variety in the walling that makes such a marked contrast between the old work and that done at the present day. This is rather a

DISCONNECTED SCHEME,

and has the prime fault that neither of its main axes lead up to the chief block of the house itself. However, this must often be the case when the house and contiguous buildings have already been erected before the grounds are designed. A simpler scheme of suggestions that was made for a place in Norfolk a few months since, but is, I regret to say, going to remain on paper, was to add some gardens to a house built some 20 years ago, and designed without envisaging any Architectural treatment of the grounds about it. The site was pitched on a high plateau, falling away rapidly in a wooded hill-side at the back of the house, and from the edge of the plateau a magnificent view of the Wash, and the Boston Stump in the distance, was visible through the trees. For a smaller lay-out, I suggested a forecourt and three garden courts plotted as shown on the plan. And to make the most of the distant view, an elliptical lawn was to be hollowed out of the hill in a line with the central alley. This was to be balustraded and buttressed with seven life-size stags on the parapet, and belvedere pavilions at either end. For the greater lay-out there was to be a fan of five avenues, radiating from the centre window of the saloon, and springing from an arc with a radius of 260 yards from the point of intersection. The local stone is of a deep rust colour, and never looks garishly new, which made one all the more keen to handle it. The principles I have been enunciating were not, of course, confined to the surroundings of

COUNTRY HOUSES ONLY.

They were, and are still, equally applicable to town houses where there is any ground to treat, and also to the streets and squares of towns. There are not many towns and villages in England that have been laid out with much attention to this, though I daresay, with thought, one could enumerate a few. Pitcairn Green, in Scotland, for instance, has a pretty plan and a festooned arrangement of trees, that gives it quite a gala-like appearance. It is easier to call to mind instances in France, and the two that suggest themselves most readily are Quimper and Quimperle in Brittany. The latter, especially, with its trim canopy of green, surrounding the square like an awning, under which one can wander round in the shade from the Hotel de Ville to the river. I have been applying these principles to a building town in Ireland. The principal streets and squares are laid out as you see, and by the time the place is built up, the avenues and groves should be affording some shelter from sun and wind. The court-house forms the focus of the whole arrangement. Beneath it is the butter market, and through the trees across the road the houses and shops that form the market square. There are two pools and groves of trees at one side of the square, with tall columns for electric light at intervals in the balustrade. Down the street to the west we catch a glimpse of the Calvary in the churchyard wall, and up to the east a fountain. The main buildings and shops round the market square are designed in the rough, but are only to be built as they are required. Now it is a fault with most of us to somewhat overrate the beauty of things we have lately seen. Our enthusiasm outruns our judgment, and could we but know it, the undigested mass has not had time to settle, so I may as well confess that I have not long returned from a miscellaneous tour in Scotland, which may account for a certain preponderance of Scotch views; a tour comprising most things, from surveying the pace of a racehorse to pacing the survey of a scheme of laying-out. Castle Kennedy, near Stranraer, was the first point I made for. It is large for England (about half-a-mile through), and lies in a beautiful situation between two lochs. But, do what I could, I could find no exceptional merit in it, and on the whole went away disappointed. The specimen tree is rampant, even to the extent of some of the ilex avenues having been replanted with puzzle monkeys. And the new castle of Loch Inch has been built across the upper end since this plan was made. Thence to Dalziel, in Lanarkshire, which is a fine old castle, with hanging gardens between it and a burn that runs close under the walls; and while there I paid a visit to Wishaw House, only to find the old garden forlorn and derelict, a playground for the rabbit and the mole. From Dalziel I went to Edinburgh, and so to Newhailes, a fairly complete lay-out, finished and adorned probably by the brothers Adam. You have already seen the leaden sphinx at the corner of the beech walk. On the other side of Musselburgh lies Pinkie House, with its beautiful gallery ceiling and stately walled courts. Perth was the next point, and a good centre for most of what is interesting in Scottish Architecture.

DRUMMOND CASTLE, NEAR CRIEFF,

claimed priority from its reputation, but excepting the terraces below the castle walls and the green court, I thought it disappointing. There are grand masses of yew, and the floriculture is wonderful, but the great garden below lacks enclosure, is marred by the specimen shrub, and, moreover, it is not levelled. But to my mind the harmony is most destroyed by the high note of colour struck now and again in the white marble figures and busts, of which, to say the least, there is no scarcity. The garden at Murthly is small, but full of surprises. It was the subject of Sir John Millais' picture of an old garden, and lies under the shadow of a huge "modern Elizabethan" house, a house that never was tenanted, but can boast of a fine approach of lime avenues, and a bowling green, overlooked by story above story of blank mullioned windows. Not many miles away from this lay Stobhall, on a steep green slope, overlooking the brawling waters of the Tay. Scattered up the hillside and along the crest by the wood was a haphazard cluster of buildings,

and spires of yew topping a terrace wall betokened the presence of an old garden. Here is the sun-dial among a few simple beds cut in the green sward. The house, the Chapel, and the garden were all in miniature, and the whole charm of the place lay in its proportion, position, and colour, a symphony in dark greens with a setting of pale autumnal flowers. Melville, in Fife, came next, and was interesting for its scheme of planting, and also for a forecourt designed something like that at New Park, in Surrey. The house and wings enclose one end of this forecourt, and the end towards the avenue has a gate in the centre, with flying figures on either side. The gilded vanes of two pavilions fall on a line with the counter avenues. The gardens were, no doubt, at one time on the far side of the house, but the site of them has long ago been thrown into a park, the main entrance made on that side, and the original forecourt converted into a flower garden. In the woods at Melville, which, by the way, are all part of the design, there is a circle of beeches, 100 paces in diameter.

THE EFFECT IS MAGNIFICENT.

A wall of sombre green all round 100 feet in height, melting from shade into sunlight, and row behind row of sturdy trunks, receding into the gloom of the woods beneath. Eight paths in a level lawn radiate from the centre, where, no doubt, there once stood a temple dedicated to some sylvan deity. A fortnight later I came upon a somewhat similar arrangement in the woods at Tynningham, but on a much larger scale. This time with a turf terrace all round. But in the interval rain and wind had stripped the beeches of their leaves, and robbed it of half the charm it might otherwise have possessed. It is with flat sites in low-lying countries that we generally find the boldest schemes in artificial water and planting. The land is probably divided into squares or rectangles by the necessary dykes, and to plant the banks of these dykes with rows of trees seems only natural, both to protect the cattle out at grass from the wind, and also to lend shade to the wide droves between the pasture. A long trudge over sand dunes on the coast of Elgin brought me to Gordonstown, a place of this character. The house and grounds lie enbosomed in groves and enclosed pastures, with a long piece of formal water to the south, the soil from which has gone to form broad embankments on either side. To the north there is an ample forecourt, and winter gardens are set in the groves on either side the central approach. As far as these latter are concerned, the plan is mainly conjectural, as they have practically disappeared, and I had no time on the spot to search for remains. However, the old bee-hive shelters still exist in the wood, facing the two central alleys of the gardens. They are of stone, with pent roofs, and a solid wall at the back to keep out the north wind. All the stabling, grooms' lodgings, granaries, and other farm buildings are collected round a circular court, which is an arrangement I had not seen elsewhere. The effect of this from the interior is delightful, the long sweep of roof being broken here and there by rows of dormers and crow-stepped gables over the party walls. There were one or two places further north still that I should have liked to visit; but there is a limit to human endurance, and apparently none to that of the Scotch weather fiend when he is ill-humoured.

AT Shrewsbury, the Shropshire Horticultural Society has undertaken to defray the entire cost of erecting a statue to Charles Darwin, at an expenditure of from £1,000 to £1,200.

THE Doddridge Congregational Church, at Northampton, has been restored in commemoration of its centenary, and a new Church has been erected in the St. James's End. The total cost has been £3,047.

A NEW organ has been erected in the Church of Our Father, Rotherham. The total cost is £430, and has been subscribed. Mr. A. Keates, of Sheffield, has been the builder.

THERE has just been placed in Christ Church, Morningside, a stained-glass window to the memory of the late Dr. Bremner, Streatham House, Canaan Lane. The window, which is a two-light one, has been executed at the studios of Messrs. A. Ballantine and Gardiner, George Street, Edinburgh.

THE NECESSITY OF REGISTRATION.

BY WILLIAM WATSON,

President of the Leeds and Yorkshire Architectural Society.

I DO not intend to speak on the Art side of the profession in which we are all engaged, but rather confine my very few remarks to the practical or business side. First, I would call the serious attention of every person practising as Architects to the very great disadvantage we are placed in not being a recognized registered body; therefore, being unprotected, are subject to all the unpleasantness and opprobrium of being considered a profession of such small importance, that whether a man has been highly or properly trained and proved himself competent to practise, or whether he emerged from a drawing school, a builder's workshop, stonemason's yard, or similar position, only very partially trained, he suddenly becomes, with the additional aid of a brass plate, a practising Architect. Now I take it that this state of things could very soon be changed, if only the R.I.B.A., the Architectural Association, and the Society of Architects, could come together and formulate a good registration Bill, and lay the same before Parliament; a Bill which should be broad on its basis, moderately far reaching, so as to receive the support of the Associations named as well as their affiliated Societies. We, as a body, will have to accept such a Bill, as we may fairly compare with those which enabled the Legal and Medical professions to become registered and protected bodies. Most men in these professions had to be included because of their then being in practice; but very soon time brings matters to the altered and present position, and now no one can practise either Law or Medicine without having passed through the various examinations. This I believe to be the only course for adoption if ever we are to become a

REGISTERED BODY

and practise under protection; the first ingathering must necesarily be broad, after that, admission or leave to practise would be restricted only to men properly qualified by the examination, which would be formulated and conducted by the governing body elected for the purpose. The Bill introduced to Parliament by the Society of Architects, in the session of 1892, I think fairly meets the case, and the framers of it evidently felt the same difficulties of drawing a very hard-and-fast line at the commencement. As the Act operated it would harden. None but qualified men could be admitted, and time, as we all know, would in a few years so place the profession in such a position, that none would be practising but those who had shown their ability to do so, after due qualification and admission. If this course was adopted we should have more interest shown by the young men who enter our offices as pupils in their work and studies; the knowledge that they could not practise until lawfully qualified, would spur them onward in their work and study: some, no doubt (as in the case of the other professions), would remain without, and take what would be considered outside positions, useful men some of them, no doubt, in their way, but they would remain workers and assistants, unable to lawfully practise their profession in consequence of non-qualification. Again, if such a Bill becomes law, I think we should find a different class of men, in due time, occupying the important positions of Surveyors to County Councils, Corporations, District Councils, or other public authorities. We have all had these men to meet, and know the difficulties and annoyances we have had to encounter in the passing of plans before the various authorities and in obtaining sanction and approval. Some of those occupying these positions we respect and admire for their integrity and intelligent knowledge of their work and duties, having previously received proper and careful training, but others we may resemble to square pegs in round holes, quite unsuitable and incompetent to act in a judicial capacity, or properly fill the professional positions in which they have been placed. Before leaving this subject, I would strongly urge the members of this Society, as well as all professional men not connected with this or similar Societies, to urge the three important Architectural bodies I have before named, to come together, draft a Bill to meet the case, which I am sure would, if again brought forward, succeed in Parliament, our present weakness now being, as an M.P. a short time ago said to me, "You can't at present agree amongst yourselves, but as soon as you can there will be no difficulties whatever in the way." In concluding this

IMPORTANT SUBJECT

of registration, I would call your attention to the words of Mr. Ellis Marsland, at Cardiff, in March last, where he said, "At present there are only three professions, the Church, Law, and Medicine, to all of which it is considered an honour to belong; and why? because to be a member of either is synonymous with having undergone a prolonged and complete study and preparation, which has fitted them for the position to which they have attained. Why is Architecture excluded from amongst these? To possess the knowledge to build and the skill to plan and design a building, and to deal with the innumerable questions, Scientific, Artistic, Legal, and Sanitary, which continually present themselves in ordinary practice, requires a training as arduous and as prolonged as that of any to which I have alluded. If the men who look after our souls, and those who look after our bodies, and those who conduct us through the mazes and intricacies of the law, are to be honoured with the dignity of being called professional gentlemen, surely the men who provide the necessary skill to erect our Churches and public buildings, and to make our homes healthy and Artistic, are entitled to the same dignity." I should like to say a few words on the subject of the disastrous strikes and lock-outs, which periodically take place in the building trades, and which paralyze our work for sometimes weeks or months. In Leeds during this year there has been a prolonged and weary dispute; in some other towns I know of, the like, but perhaps not so acute and of shorter duration. Could not a Society like ours suggest, when these differences arise, that arbitration should take place, and could not we recommend the forming of a Board of Conciliation, representative of masters, workmen, and some eminent and experienced member of our Society, or of other kindred societies, to undertake the settling of disputes, after hearing both sides and careful deliberation, without having resource to the prolonged stoppage of work during the best part of the building season, causing a great monetary loss on all concerned? These periodical strikes or lock-outs injure us all, workmen as well as masters, practitioners as well as clients, causing, at times, such ill-will and bad feeling to remain that years elapse before the mischief is undone and the misery incurred forgotten. I will be brief on my next subject, that of

"QUANTITIES."

It is well known that without bills of quantities being furnished to contractors of every trade it is almost impossible to obtain tenders, either from public or from private invitation, such being now the recognised custom. I should like to see the introduction of a system whereby payment should be made for this work direct to the Architect or Surveyor, by the client, instead of, as in very numerous cases now-a-days, through the contractor. I am pleased to find public bodies are beginning to understand this part of the work of Architects. In many cases bills of quantities are furnished to contractors free of charge (on the understanding bonâ fide tenders are returned). This custom should now, I submit, be made a *sine quâ non*. The schedule of quantities should be supplied by the Architect, whether taken out by himself or a Quantity Surveyor, the client in all cases paying for the work, in addition to the other recognized Architect's charges. If this system was adopted it would entirely remove from the mind of a contractor that he is paying the Architect a fee or a percentage (as it is frequently called), forgetting the while that he has already added the amount to his tender for that part of the Architect's work, which also comes out of the pocket of the client. To the younger members of the profession I would say make yourself conversant with quantity surveying. You will find that as your building operations proceed you will work off your details within the limits of your bill, avoiding extras; you will also have personal knowledge of all unforeseen and necessary additional work, as well as omitted work, as they arise; you will be better enabled to deal with those items in measuring and balancing and preparing the final accounts for the contractors. I strongly advise the avoidance of numerous P.C.'s in a specification and bill of

quantities. There are some items which are required in a building when it is absolutely necessary at the time the specifications are drawn to be put down as P.C.'s, but there are scores of others where P.C.'s can be avoided, simply by specifying certain articles made by well-known manufacturers, which are known to be excellent in quality and fair in price, always inserting subject to the protecting words, "or other equal." This shows to a manufacturer he cannot take any undue advantage, it also allows the contractor as well as the Architect latitude and opportunity for careful consideration of quality in materials or workmanship of any goods to be supplied. By adopting this course a better article than that named in the original specification can often be obtained. The next point is the question of letting contracts in so many separate trades. In Yorkshire it is almost the universal custom to divide the work required in any ordinary building into five or six sections (without specialist's work), except in very large contracts, and in these, generally, the system of sub-contracting prevails; this latter system often is a great hindrance to an Architect. He virtually has one contractor to deal with, who signs for the whole, and who is supposed to be responsible: he may be what is termed a builder, he may be a carpenter and joiner, or he may be a plumber; in any case the builder seldom troubles himself about the joiner, or the joiner the plumber, and so on; consequently before the building is completed the Architect is left to deal with the subs. (as they are called) as best he can. I say, avoid such numerous divisions and sub-contracting, and introduce, if possible, a system of contracts divided into three sections, viz., first, the building trade, secondly, the wood or timber trades, and thirdly, the metal trades. If Architects generally would encourage this system I venture to think they would soon find contractors for excavating, brick, stone, slate and plaster work in one, carpenter's and joiner's work in another, and plumbing, glazing, ironwork and painting in a third, reducing the number of principal contractors. We generally now have from six to three. Exceptional cases arise where we bring in the specialists for important iron work, fireproof work, wood blocks, tile floors, or numerous other specialities. I think the members of the profession may be congratulated at the present time in being fairly well engaged; in the large cities, towns, and populous places, important buildings of a public character or otherwise are in progress, the larger share of the work being in the hands of local men. Important works are being carried out by corporations and public authorities, under the direction of their professional advisers, in the opening out and improvement of leading thoroughfares, clearing out the insanitary areas of our cities and towns (which have for years been reproaches to civilized communities). In all directions a better class of dwellings are being erected for the working classes, districts drained and supplied with good and wholesome water, roads, streets, and footpaths properly made and finished, public parks laid out, recreation grounds provided in suitable places, together benefitting the general public and all classes of society. These works are more or less initiated by the advice of, and under the guidance of, professional Architects and Surveyors, men who, I believe, have a general interest at heart in improving and beautifying our cities, towns and villages.

The Presidential Address to the Members on Nov. 16th.

IN Pietermaritzburg, Natal, South Africa, has just been unveiled the statue of the late Sir Theophilus Shepstone, who was born at Westbury-on-Trym, Bristol, on the 8th January, 1817, but who resided nearly the whole of his life in South Africa. His father, who was an Architect, left England with his wife and family, and went out to the Cape in 1820.

IT is well that the attention of householders should be directed to the recent important decision in the Court of Appeal. From this it appears that though a Vestry can compel an owner to put his drains in a proper condition, it has no power to force him to connect his drains with any new system which it chooses to create. The point is important, as the construction of a new drain involves a very large outlay, and it is as well that owners of house property should be aware that the Vestry has no power to lay this burden upon them.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
November 25th, 1896.

"*I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs.*"—JOHN RUSKIN.

WE announce with regret the death of Mr. Perdue, of John Street, Adelphi. His father held a post of importance in Somerset House; his third son, William, who was born at Ringwood, Hants, was articled to Mr. S. Beazley, the well-known Architect of several theatres, as well as a prolific writer for the stage. While a pupil he was admitted as student at the Institute, and, later, at the Royal Academy also. The office of Mr. J. Johnson, of the Adelphi, so well known as a most accomplished draughtsman and designer, next gave Perdue a real impetus towards drawing, and also a desire to study on the continent. Between the years 1854 and 1858 he spent four years abroad, in Italy mostly, bringing home portfolios of sketches and drawings as proofs of assiduity and taste; this proficiency with the pencil he displayed through life. Numerous contributions to the pages of the Illustrated News and other publications are evidences of combined accuracy and taste. A labour of love to him was the scrupulous copying by him of the almost unique MS., Queen Mary's Psalter, better known as No. 2, B. vii., in the British Museum. Here unwearied patience and delicate skill in the delineation of each figure or detail is manifest, and, as a reproduction of mediæval drawing, Perdue's publication is probably unequalled, if we may accept the late William Burges as a competent judge. He carried on a practice of a miscellaneous character for several years, and was much esteemed for his amiable, unselfish character. His death took place on the 14th inst., at the age of seventy-one.

No. 1, Duck Row, at the foot of Canongate, Jedburgh, generally known as the Piper's House, is at present undergoing alterations. This house, one of the oldest in the burgh, is supposed to have been built by one Adam Ainslie, at the beginning of the seventeenth century, as his initials, A. A., and those of his wife I. A.—Janet Ainslie—with the date 1604, are to be seen on a lintel over one of the windows. The house is two stories in height, with attics. The walls have been built with clay instead of lime; at the tops of the gables are corbie steps, characteristic of Scottish Architecture in former times, and at the top of the wall next Canongate is seen the effigy of a piper with his bagpipes, carved in stone. The window over which is the carved lintel above alluded to, was originally a door to the second storey, which was approached by an outside stone stair, taken down shortly before 1730. The upper half of one of the gables was found to be 4½ feet thick, while the lower half was only 3½ feet.

AT present a great deal of very unnecessary agitation is being expended over the question whether or not Mr. Poynter will continue to hold the Directorship of the National Gallery now that he has been appointed President of the Royal Academy. Why he should not fill both posts with credit to himself and advantage to two such kindred institutions, it would be hard to say. Certainly there is among the men now available no one so suited as he is for this sort of officialism, and his withdrawal from the National Gallery would be a distinct disaster. As there is no practical objection to both offices being held by the same individual, opposition on the ground of mere sentiment is both foolish and dangerous. So few of the Government appointments which have to do with the control of Art matters are entrusted to men who are really fitted for them that we cannot afford to lose a Director who has, even in the short time that Mr. Poynter has had to prove his capacity, shown himself adapted for the work. Much of what has been said against Mr. Poynter remaining Director of the National Gallery is too evidently inspired by would-be successors to him to be quite acceptable. The old fallacy is being advanced that what is needed in Trafalgar Square is not an Artist, but an Art theorist, whose Art knowledge is literary rather than practical. The National Gallery is not a museum, a place where archæological curiosities should be gathered together, but an educational centre, where the methods of as many schools as possible may be examined and compared. A working Artist would be far more likely to be able to appreciate exactly what would be most useful to the members of his own profession, and to select judiciously from the works of Art offered to him, than an Art historian chiefly interested in questions of chronology and curious facts in the development of this or that Artistic fashion.

AT the invitation of the Master and Wardens of the Carpenter's Company, an inspection was recently made of the Trades Technical Schools carried on by them and other city guilds in Great Titchfield Street. An informal meeting took place before the inspection of the buildings, at which Professor Aitchison presided. Professor Banister Fletcher made a short statement, in which he alluded to the progress made since the schools were founded in 1893. The number of students had now reached 205, and the average weekly attendance was 405. A new feature, which had been suggested by the London County Council, and acted upon, was that students under their control received a free nomination to the Carpenters' Schools. The buildings have been extended and a reading-room with a small library instituted for the scholars. Professor Aitchison stated that he hoped the students would learn the Art of making things not only tasteful in design, but solid in workmanship.

WATTEAU—the Theocritus of painting—has now his statue or bust in the Garden of the Luxembourg. According to a contemporary, it is characteristic of the French that, in wit and literature, they respect the old works. In England it is almost out of fashion to quote old writers, and little is heard nowadays of such great painters as Sir Joshua Reynolds, not to speak of Barry (the "Wild Irishman from Cork," as he was called), or Blake. There are connoisseurs who honour these names, no doubt, but the bulk of the people only know the Alma Tademas and the Herkomers. In France, every poor as well as rich man honours Watteau, just as, in literature, Molière, Montaigne, Beaumarchais, and all the others are respected and admired. Watteau's pastoral scenes are still visible in many a shop window, and command a steady sale. His is another case of a stone being given for bread. In his youth the plumber's son from Valenciennes had a desperate struggle when he came to Paris, burning to imitate Rubens and Vandyke, whose pictures he had studied in the Churches and convents of Flanders. He often wandered, footsore and famished, through that garden where his memorial was unveiled on Sunday last. Even when he was supposed to be prosperous he was in reality poor, and died on returning from a journey to London, at the age of thirty-seven. His Art work is less licentious than that of his rivals, Bouchard and Fragonard.

IT was the wish of the late Mr. William Morris that his library should be sold, if possible, in its entirety. It is to be hoped that this will be the case, for as a collection it is unique—not from the point of view of rarity, but from that of Artistic beauty. Among the illuminated MSS. more than a hundred are of the twelfth century. A precious example of English work is the Bestiary, containing 106 miniatures, supposed to be the one presented by a Canon of Lincoln, in 1187, to the Church of St. Mary and St. Cuthbert, at Radford. In the mediæval collection of the library there are not only devotional works, missals, psalters, and "Books of Hours," but manuscript copies of ancient classes, among them Virgil, Cicero, and Columbella. The library is also rich in thirteenth-century Bibles. Scandinavian books, including the Icelandic Sagas, are also well represented.

The examples of early woodcuts are very numerous, and there are some of the earliest products of the press of Augsburg and Ulm. The Herbals are very curious and valuable, the collection including the supposed earliest one, and also the finest, that of Fuchsias, printed at Basle in 1542.

AT the opening meeting of the session of the Architectural section of Glasgow Philosophical Society, Mr. P. Macgregor Chalmers delivered his presidental address. Choosing as his subject "Art in the City," Mr. Macgregor Chalmers urged the propriety of preserving many of the old remains connected with the city, and expressed the wish that interest in such buildings as the Cathedral was more general. Especially did he wish that the interest in the Cathedral should be sufficiently active as to lead to the proper adornment of the fabric and to the furnishing of the nave as a Church. In the memorials and monuments erected throughout the city, he said he found little that indicated the presence in the minds of those who erected them of any tender thought towards those sought to be honoured; nor was there any attempt to give expression to feelings which might inspire future generations. Although there were two beautiful fountains—the Stewart Memorial and the Jubilee—these were in the parks. There were no fountains in the city, where they were most required—none, at least, worthy of the name, or to be compared with the fountains in Paris or Rome. Regarding the statues in George Square, he thought the present arrangement was most defective, and he suggested that if they were re-arranged, with all the faces turned to the west, it would both improve the Square and add to the effectiveness of the municipal buildings. He drew attention to the fact that of late there had been illustrated in several buildings the happy union of Architect and Sculptor, and he expressed the hope that Architects and Artist painters would yet be brought together, to the great advantage of Art. The wall painting in the municipal banqueting hall would ere long give the citizens an opportunity of seeing what such a union meant. In the interest of all craftsmen, he appealed for the immediate founding of an industrial school of Art, under the direction of an Artist, and if possible freed from all extraneous authority.

MR. John Wolfe Barry, the new President of the Institution of Civil Engineers, enjoys his most popular title to fame as the designer of the Tower Bridge; but comparatively few are aware how many of the structures familiar to Londoners are due, either wholly or in part, to his genius. Under Sir John Hawkshaw he was resident engineer on the bridges over the Thames at Charing Cross and Cannon Street. The Earl's Court Station, the St. Paul's Station, the Inner Circle Railway between the Mansion House and Aldgate, the extension to Whitechapel, that to Ealing, and the railway bridge across the Thames at Blackfriars, are all the work of Mr. Barry. But their importance is dwarfed in comparison with the great dock and railway works at Barry in Glamorganshire, carried out under his direction. One of the docks has an area of 80 acres of water, and is said to be the largest in the world. Mr. Wolfe Barry was born in 1836, and received his earlier education at Trinity College, Glenalmond, Perthshire. His elder brother, the Rev. Arthur Barry, was then sub-warden of the college. Later he became more widely known as Bishop of Sydney and Primate of Australia.

A LONG article appears in the Belfast News Letter upon the advantages to be derived by the construction of a tunnel between Ireland and Scotland, in which it is stated that Messrs. Hawkshaw & Hayter, of Westminster, on the one side of the Channel, and Messrs. Barton on the other, unitedly give their opinion of its practicability and its approximate cost. We may well consider what the extent of the commercial advantages is likely to be, and how far the interests of Ireland would be affected, if it were accomplished. The project is a double-line tunnel of 35 miles, of which 24½ miles would be under the Channel, and the remainder in approaches; it would connect the existing lines at Stranraer with the Northern Counties Railway of Ireland, about 10 miles north of Belfast, and by means of a third rail would run the English gauge with a double line into the city of Belfast. The total length from Stranraer to Belfast is 51 miles.

IN the course of the excavations now proceeding upon the Stray, in front of the Prospect Hotel, a very fine glacier-borne Milstone Gril boulder has been unearthed. It is an excellent specimen, and weighs about a ton and a half, and has been placed in the Boys Valley Garden. It is computed that the ice stream which carried this remarkably fine pebble specimen to the spot where it was found travelled from a northerly direction, and came from the neighbourhood of Sigsworth Crags, near Pateley, which is situate about 1,100 feet above sea-level, or from Brimham Rocks, which have an altitude of 950 feet.

AT the Japanese Gallery another exhibition of the works of Watanabe Seitei, has been arranged by Mr. Larkin, and includes, besides several examples of another noted Japanese artist, Kwasou, who has much of his fellow-countryman's daintiness of fancy and method. Their drawings are for the most part studies of birds, fish, and flowers, painted with exquisite delicacy, and with an intention to be decorative rather than merely realistic. The best traditions of Japanese Art are well maintained in this modern work. In the gallery is also shown a small but especially well selected collection of Chinese and Oriental porcelain and ceramics, among which are some unusually choice specimens.

TEN years ago Sir William Siemens, speaking at a meeting of the Iron and Steel Institute on the progress of electrical science, suggested, to the amusement of his hearers, that, at no distant date, the Falls of Niagara themselves might be harnessed to the car of science, and utilised for the generation on a large scale of electrical power. When the scheme first assumed definite commercial shape, it was received by the lovers of nature with groans and protests at what they termed its audacious profanity. The execution of the plan, they declared, would involve not only the degradation but the disfigurement of one of the most sublime spectacles on the American continent, and they already beheld in imagination the famous waterfall ignominiously caged in gigantic water-wheels, and flanked on either side of the river by clusters of hideous engine-houses and factories, belching forth volumes of smoke dense and foul enough to choke a hardened Black Country furnaceman. What manufacturing enterprise may have in store for Niagara in the future we cannot pretend to say, but as yet neither chimneys or factories are anywhere visible in the neighbourhood, and the falls themselves are free from any evidence of mechanical restraint. All that has been done has been to divert a small stream of water from the rapids above the falls into a series of turbines 175 ft. below, each driving a powerful vertical steel shaft at a speed of 250 revolutions per minute. At the top of each shaft revolves a dynamo developing 5,000 horse-power of electrical energy in an alternating two-phase current of 2,200 volts, and the product is transmitted to a number of factories, houses, and street lamps in the neighbouring Niagara City and various places on the road to Buffalo. Last week the City of Buffalo, twenty-six miles distant from the Falls, was formally connected with the water-driven machinery, and the interesting fact was announced to the world at one minute past midnight by a salvo of twenty-one guns. The power, which now represents in the aggregate 7,000 horses, and will shortly be increased to the equivalent of 10,000, is utilised in Buffalo for a variety of public and private purposes. About 1,000 horse-power is absorbed by the requirements of the Buffalo Street Railway, and the remaining 6,000 apparently will all be too little for the wants of the 375,000 inhabitants, and especially the manufacturing section of the population. Fortunately there is an enormous reserve of power in the Falls themselves, which are estimated at something like 16 million horses; and as the power is supplied at a very low figure—about half a farthing per unit, or £2 per horse for 5,000 or over—it is not unlikely to revolutionise the industry of the North-Eastern States, and cause an immense development of manufacturing enterprise by-and-by in the immediate vicinity of the Falls.

BARON DE BAY, a French archæologist, has been digging up the Kurgans, or old turtleback burying mounds, near Tomsk, in Siberia. Some of these, dating betore the Russian conquest of Siberia, contain beads, earrings, knives with artistically-carved bone hafts, copper kettles, rings, bracelets, and ornaments of silver. The oldest mound was five or six centuries old. The mounds that were built only 300 years ago showed a much poorer stage of civilisation, very few metal objects being found, and the arrow-heads and knife-blades being made of bone.

AT St. Blane's Church, Kingarth, extensive excavations have been carried out during the past year, at the direction of the Marquis of Bute. This ancient ruin, which down to the 17th century had been the Parish Church of Kingarth, was allowed to lie in a very neglected condition. The Abbacy of Kingarth itself—such is this St. Blane's—one of the earliest foundations after the Columban type, has the distinction of mention from the 7th century of the Christian era, the *obits* of several abbots and bishops finding permanent record in the early Irish annals, and the beauty of its surroundings, as well as the antiquity of the edifice, has long made it a favourite resort for summer tourists. The two contiguous graveyards—one for men, and a separate one for women—were also in a very neglected condition. In the upper cemetery men alone were buried down to 1661, when the Presbytery of Duncon interfered to stop this superstitious custom, a relic of monastic times. Although the old Church was deserted for the new Parish Church of Kingarth, in the beginning of last century, interments in this upper cemetery have continued till lately. In 1875 this highly interesting spot was restored to decency and order at the sole expense of Lord Bute, and it was then made plain that in St. Blane's—or, as is should be spelt, St. Blaan's—there is preserved one of the finest of those sacred edifices which were frequented by worshippers according to the Columban and Roman forms of worship. Further restorations have now been made by Lord Bute, and the excavations have now proved that a place of worship and cemetery existed before the nave was built. Many old Celtic remains have also been found. The excavations and repairs, which are very extensive, are being executed under the direction of Mr. Schultz, Architect, London, and his resident assistant, Mr. Pechell.

AT Burlington House the works of Lord Leighton will occupy all the rooms which will be open for the Winter Exhibition. His great canvases will be seen altogether in the large gallery, where year after year, since 1869, one or other of them will have held the centre of the long wall. In the water-colour room will be found those landscapes which he himself valued less highly, but some of which fetched such large prices at his sale, and with the landscapes there will be cabinet pictures and studies for the more important works, while the vestibule will be devoted to his statuary. How Leighton will stand the ordeal of such an exhibition we have yet to see. It is understood that the following year the Winter Exhibition will consist of Millais' works. No one who remembers the Millais collection at the Grosvenor can doubt the success of that exhibition.

DURING the excavations through the bank at the side of the railway at Brightside Station, for the purpose of laying down additional lines, the workmen have unearthed some very interesting examples of the larger forms of vegetation that flourished at the time when our coal seams were formed. The bank side is composed chiefly of sandstone mixed with shale, and embedded therein are numerous specimens of ferns of the carboniferous period. These, buried in the sand and mud that silted up the land where they originally grew, have now been disinterred, after having been hidden probably for many millions of years. A still more striking example of carboniferous vegetation was unearthed last week, when the sandstone which the men were removing fell away from the round trunk of a tree, which had been broken off about three feet from the roots. Under the direction of Mr. Herbert Sherdon, the base of the tree was carefully cleared, and the roots exposed. The one on the left has been abruptly broken off where some deeper excavations had been made, and the root has been split open horizontally, showing a dark carbonized layer where the internal pith was. There are three other principal broad roots extending from the tree, and it may be possible to expose and preserve these for a considerable distance, when the sandstone is further removed. The bark of the tree can well be seen, converted into a thin layer of

coal, adhering to the outer surface in various parts. The tree itself, of course, has lost all its woody character, and has been converted into a mass of clay ironstone. On exposure to the air, after its burial of long ages, the outer surface showed a tendency to break off, and the trunk itself readily split into sections. The form of the tree is very distinct, and is almost upright in position, after allowing for the general dip of the sandstone.

MR. HANBURY, the Financial Secretary to the Treasury, said some very welcome things about the attitude of the Government towards Art and Technical Schools at Preston. His admission of an opinion that such schools ought to be encouraged at the public expense was certainly one to rejoice over, and it was cheering, too, to hear that during the past year he had favoured an increase in the grant to Art Schools from £22,000 to £56,000. But the best news of all was that he had amended the ridiculous system under which it was obligatory on such institutions as the South Kensington Museum to return any unexpended balance of the funds put annually at their disposal. The old method of granting money to museums merely put a premium on extravagance, and careless use of the money available, and did nothing to encourage wise economy. Now that any surplus which may remain in a year of few opportunities may be added to the fund available for purchases when the market is better supplied, there is every reason why the museum officials should limit their buying to those things only which they really want. It is, too, most fortunate that the value of Technical Schools, where the way to do thorough and Artistic work can be taught, is becoming more appreciated in official circles. Hitherto much of the applied Art of this country has suffered because the men upon whom the responsibility of production rests have been allowed no opportunity of learning properly the technicalities of the crafts they follow. As the basis of all sound Art is fitness, it is obvious that neither Artist nor Craftsman can produce anything really excellent except by the assistance of a detailed training in the work they have to do. It is this training that the schools exist to supply, and so long as they adequately fulfil their functions they deserve every encouragement that can be given them.

DR. HANS HILDEBRAND, of Sweden, delivered in the lecture hall of the National Portrait Gallery, Edinburgh, the last of the present course of Rhind Lectures on "The Early Relations between Britain and Scandinavia." With "The latest relations," as his particular subject of lecture, Dr. Hildebrand dealt in the first place with the light which the importation of Anglo-Saxon coins into Scandinavia, and especially into Sweden, shed on the subject. In connection with this branch of the question, he devoted some attention to the numerous and extensive "finds" of Arabian coins, together with personal ornaments in silver of similar origin, which had been discovered in Sweden, and to the numismatic as well as historical value of these discoveries. He also adduced his reasons for holding that many of these silver ornaments were undoubtedly of indigenous workmanship, and revealed a development or evolution of the original type imported from the East. Coming to the subject of Anglo-Saxon coins found in Scandinavia, he pointed out that in regard to periods covered by the reign of certain of the Anglo-Saxon kings the royal collection of ancient coins in Stockholm was vastly richer in the number of different specimens than was the collection in the British Museum of similar coins found in this country. For example, while of Anglo-Saxon coins belonging to the close of the tenth and the beginning of the eleventh century, the Museum in Stockholm in 1881 had 4,389 different specimens, the British Museum had only 408; and while of coins of the reign of Canute the Great the Stockholm Museum had as many as 3,904 different specimens, the British Museum had but 617 specimens. The lecturer likewise pointed out that it might be assumed from the designs on certain Scandinavian coins that they had been minted by Englishmen who had been invited over by the early Scandinavian kings for this purpose. Coming to the subject of Runic memorial stones found in Scandinavia bearing reference to England or Englishmen, Dr. Hildebrand said it had been the custom in foreign countries to regard all Runic inscriptions as belonging to Pagan times; but in reality most of the Scandinavian Runic inscriptions belonged to the first Christian times. The majority of the Swedish Runic stones belonged to the middle of the eleventh century, and that they had been erected by Christians was clear from the inscriptions.

UNTIL recently the highest price ever paid for a single coin was £500, given for the Simon Petition Crown; but this sum has been beaten in a sale at Sotheby's of the "Juxon Medal" for £770. This historic coin, which was included in the Montague collection, is one of the finest works executed by the engraver, Thomas Rawlins, and was presented by King Charles I. to Bishop Juxon on the scaffold, just before that monarch's execution. Although called the "Juxon Medal" from that circumstance, it is a gold pattern five-broad piece, bearing upon it the bust of the King, bareheaded, in a lace collar, with armour, and scarf across the breast. On the reverse are the Royal arms in high relief. It weighs 732 grains, and thus sold for upwards of a pound sterling per grain. Its pedigree is well authenticated, and it changed hands in the Cuff sale in 1854 for £260, and in the Brown sale, some years later, for £345.

THE celebrated blast furnaces at Coneygre, Tipton, belonging to the Earl of Dudley, have been sold by auction for the old materials they contain. The furnaces were erected more than 60 years ago, and were kept regularly at work until 1892 or 1893, when they, in common with so many other Staffordshire blast furnaces, were blown out, the reason being that, under the altered conditions of the pig-iron industry, they could not be worked at a profit. Each of the three furnaces was capable of producing only about 150 tons of iron per week, whereas the new type of furnaces with which they had to compete, produce two or three times that quantity. There was also the great cost of local iron-stone, which rendered their profitable working almost impossible. We understand that Staffordshire iron-stone costs 10*s.* or 12*s.* a ton to raise it from the mines, to which cost has to be added the charges for calcining, whereas ironstone in the competing districts of Derbyshire, Northamptonshire, and other places can be delivered to the furnaces for about 4*s.* or 5*s.* a ton—facts which fully account for the great number of blast furnaces that have been demolished in South Staffordshire within the last two or three decades, Tipton itself being the chief sufferer in this respect, for the district of Tipton has lately seen some 30 of its furnaces sold as old material and levelled to the ground, while more than a dozen of its mills and forges have also been demolished as affording no hope of profitable working.

THE system of electric clocks which has been under the consideration of Glasgow Corporation for some considerable time was inaugurated last week, when, for a beginning, ten dials will be erected in various centres of the city. The idea is to give uniform time throughout the city. The system was originated and perfected by Professor Becker, of Glasgow Observatory, from which the clocks will be regulated. There will be three circuits, one being placed in the Municipal Buildings in George Square. In due time the area will be extended, and the intention of the Corporation is to erect some 200 or 300 dials at the corners of the leading streets.

THE parochial authorities (presumably those of St. Margaret's, Westminster) are just exhibiting the grossest possible piece of Artistic incapacity. Having erected at Picadilly Circus a very commonplace central lamp standard, they have had no further use for the lamps abutting on the pavement. In an unusual fit of economy they have cut these off about four feet from the ground, and inserted in the top an iron ball-shaped finial. Can we possibly expect our schools of Art to improve the nation's taste when the most central promenade in the metropolis is thus ignorantly treated by those who presumably should be educated to the point of designing a lamp-post?

THREE interesting relics of the early days of Chicago have been presented to the Mayor there. The relics consist of a carpenter's square, a whetstone, and a large key. The articles were covered with rust and were of odd design. The square was used by a Mr. Philips, who is a carpenter, and now 85 years old, in building the first frame house ever constructed in Chicago. The house was built near old Fort Dearborn, for Mark Beaubien, and was used as a tavern. The whetstone was given Mr. Phillips by Lieutenant Jamieson, who was stationed at Fort Dearborn. It was also used in building the tavern. The key was made by Mr. Phillips for Lieutenant Jamieson to unlock the Government strong box in the Fort, the original key having been lost.

PROFESSOR BALDWIN BROWN, Edinburgh University, recently delivered the first of a series of lectures on Art, in the Academy, Moffat. He explained that the course will embrace Architecture, Sculpture, and Painting. Taking the first head he stated that Architecture must be considered with relation to site and surrounding. An Architectural monument must be imposing in mass, and give an idea of sublimity. It should be employed in due relation to the service it is to fulfil, and express the spirit of the age. Proportion must be regarded as the essence of Architecture. The lecture was illustrated by numerous views of buildings, ancient and modern.

A SUM of £10,000 is required for the repair of the fabric and an endowment fund for Tewkesbury Abbey. The appeal by the Archdeacon of Gloucester ought not to pass unnoticed among the thousands to whom this ancient edifice has been an inspiration and a delight. As at present constituted the Abbey is without endowment, and its income is far short of the sum required for the maintenance of the building. Even now the roofs and walls need immediate repair, and any delay in finding the requisite funds to put them in order can only result in the necessity for greater expenditure at a future date, for it cannot be supposed that the Abbey will be suffered to continue in its present neglected condition.

FOR some time past an agitation has been going on for the widening of the historic old bridge which crosses the Tweed at Berwick and links England to Scotland. The bridge, which occupied over 24 years in erection, was completed in 1634. It is 338 yards long and 17 feet broad, and is composed of 15 arches. The Corporation of Berwick still receive an annual grant of £100 from the Crown towards its maintenance. Messrs. Sandeman and Moncreiff, C.E., Newcastle, have prepared a report, stating that they could not recommend that anything be done to alter the present bridge, as they were afraid that it would not bear interference. They recommend, therefore, that a new footbridge be erected near the the present bridge at a cost of between £6,000 and £7,000.

WITH regard to the proposed new hospital for Manchester, Mr. Walter Speakman, Secretary to the David Lewis Trust, writing to Mr. Thomas Browning, Secretary to the St. Mary's Hospital, says:—The advantages of the Stanley Grove site are so overwhelming compared with any other site in or near the centre of the town which it would be possible to obtain that its adoption must be considered an essential part of their scheme. These advantages are as follows:—1. A large area—about 9,000 square yards. 2. No expenditure of any part of the funds in the purchase of land, except a small annual chief rent of £105. 3. Fresher air, more light, and greater freedom from noise than can be obtained in the centre of the town. 4. The contiguity of the Whitworth Park, ensuring a permanent open space opposite the hospital, which would be useful to patients during convalescence. The cases of patients who, your committee suggest, would suffer owing to the distance from their homes of the proposed hospital would, in the opinion of my committee, be fully met by the town establishment for out-patients and maternity and emergency cases which forms part of the scheme. Under these circumstances, my committee instruct me to say that they are unable in the public interest to modify this all-important part of their proposal. Assuming that this decision represents the feeling and deliberate judgment of the subscribers to your hospital, my committe have come to the conclusion that it would be useless any longer to continue negotiations with the joint committee, and they have, therefore, no alternative but to withdraw their offer of £70,000 for the erection of a new building to take the place of the present St. Mary's and Southern Hospitals.

Professional Items.

ABERDEEN.—A new gymnasium in Blackfriars Street, which forms the latest addition to the equipment of Robert Gordon's College, has been opened. The gymnasium has been erected from the designs of Messrs. Jenkins and Marr, Architects.

BARNSLEY.—At a meeting of the School Board, it was decided to accept tenders for the alteration and enlargement of the Eldon Street Boys' and Girls' Schools, as follows:—F. Taylor, mason, £345; E. Ashworth, joiner, £396; Rogers and Squire, plumbers, £66 10s.; E. Fleming, plasterer, £39 15s.; J. Charlton, painter, £13 10s.; E. Fleming, slater, £62; S. Rushforth, heating apparatus, £124. The amount of tenders for the alteration of the Harvey Institute had been considered, but their amount was so far in excess of the amount anticipated that the committee had instructed the Architect to amend his specifications, so that the work might be done at a cost more nearly approaching the amount thought of—£2,000.

BATTERSEA.—The new theatre has been opened, it is built on Lavender Hill, within easy reach of Clapham Junction. It is a two-tier house, the reserved and unreserved stalls and pit being on the ground floor, the dress circle and balcony on the first tier, and the amphitheatre and gallery on the second tier. The stage is 70 ft. wide and 50 ft. deep, and the whole building is well fitted up and furnished.

BELFAST.—The Rosetta new National School buildings were opened last week. The managers decided that the school should be subdivided on separate floors, and accordingly adopted a plan especially devised for giving easy facility for assembling all the scholars in one auditorium. The centre of the group of school buildings is the large schoolroom, 62 feet long by 32 feet wide and 23 feet high. Opening off this in transepts are a pair of minor schoolrooms, separated from the central hall by large sliding screens of special construction. There are also a number of separate class-rooms, each being 13 feet square. The gas lighting is chiefly by coronæ, and the heating is by Musgrave's small-bore apparatus. The material used is brick, relieved with cut-stone dressings and carved panels in suitable positions. The work has been carried out by Mr. James Kidd, from the designs and under the superintendence of Messrs. James Phillips and Sons, Architects, Royal Avenue.

BIRMINGHAM.—St. Patrick's Church, which has been erected in Frank Street, Highgate, as a chapel of ease to St. Alban's, was opened last week. The edifice is in the early English style of Architecture, and when completed will form an interesting addition to the ecclesiastical buildings of the city. At the present time the Church consists of a nave, north aisle, and double south aisle, with a chancel in course of erection, and a baptistery under the future tower. There is seating accommodation for between 600 and 700 worshippers, and the total cost of the building, which will ultimately form a parish Church in an independent district, will be between £4,000 and £5,000.

BIRMINGHAM.—The Tame and Rea District Drainage Board gives notice of its intention to apply to Parliament for various powers in connection with the scheme for the extension of the sewage farm and works. The scheme to which the notice relates was before the Drainage Board in April last, and contemplates the acquisition of additional land, of which the principal portion is an area of about 807 acres, situated immediately below the present farm boundary, and bounded on the north by the Tamworth Road, on the south by the River Tame, and on the east by the road from Curdworth Bridge to Dunton. There are also other plots proposed to be taken, which make up a total of close upon 1,200 acres. Powers are also sought to make new conduits; to acquire the mills which give the name to the locality, known as "Forge Mills"; to deepen and otherwise interfere with the River Tame, its weirs and sluices; to erect a pumping-station near Minworth, so as to permit of irrigation upon land above the gravitation level; and to carry out other works, and to borrow the requisite funds necessary to the extension of the sewage farm and works. The total capital expenditure contemplated is £244,500.

BOOTLE.—Mr. Bicknell, of the Local Government Board, held a public inquiry at the Town Hall, Oriel Road, with reference to the application of the Bootle Town Council for sanction to borrow £4,698 for the purchase of land as a site for Technical School, the extension of the Corporation buildings, and other purposes. The Town Clerk said he did not think there would be any opposition to the application. Negotiations had been entered into with Lord Derby, who agreed to sell to the Corporation the whole of the unoccupied plot of land, covering 10,440 square yards, lying to the east of the Town Hall, at a cost of 9s. per square yard. This was the price of the freehold, which was thought very reasonable, as the site was a most suitable and convenient one. The present buildings were totally inadequate for the purpose, and were of such a character as to be absolutely prejudicial to the health of those attending the Technical School.

BURNLEY.—The new Congregational Church recently opened here is an effective specimen of the Renaissance style of Architecture, the material employed being the soft grey sandstone of the adjacent Yorkshire moors. The site has been ingeniously economised with a view to providing space for both school and Church in a continuous line of building; and extra class-rooms, together with a large gymnasium, have been constructed under the Church, and rendered conveniently accessible by means of a small stair from the interior of the school. The Church provides sittings for 670 worshippers, and it is furnished with most modern appliances, except the electric light. There are two transepts at one end, and a small gallery at the other, opposite the recess prepared for the organ. The Architects are Messrs. Hitchon and Pritchard, of Burnley.

BUXBURN, N.B.—The new Railway Station buildings, which were commenced in March, are now approaching completion, and it is expected that they will be opened by the end of December. The main building, containing the booking office, stationmaster's room, and the principal waiting-rooms has been erected on the down platform, and a little to the north of the old building. It is a wooden structure, founded upon a solid stone and lime base, and has a length of about 100 feet. The distinguishing features of the frontage are two projecting gables, one at the end and one midway along the main structure. Between these gables is the main entrance to the station, opening into the general waiting hall. The main building stands some 20 feet from the edge of the platform, and the intervening space is covered by a substantial wrought-iron verandah with a glazed roof. The verandah is supported on metal pillars with ornamental tops. On the up platform there has been erected a smaller building, measuring 68 feet in length, which is divided into two waiting-rooms. Its erection was a matter of considerable difficulty, owing to the fact that some few feet from the line the ground falls away suddenly, sloping down steeply to a large pond about 40 feet below. This circumstance necessitated the driving of long piles into the bank, and on these the building is based. The contractors for the station buildings were:—mason, John Smith, Kintore; carpenter, John Buchan, Monymusk; ironwork, Messrs. M'Kinnon and Co., Aberdeen; painter, George Donald and Sons, Aberdeen; glazing, The Pennycuik Glazing Company; plumber, Blaikie and Sons, Aberdeen.

EDINBURGH.—On Friday last was opened the new Church at Montgomery Street, Abbeymount Hall. The Church, to be known as the Kirk Memorial Evangelical Union Church, fronts Montgomery and Elgin Streets, and is designed in a phase of the perpendicular period, a style developed in the fifteenth century in England, but little expressed in Scotland. It is cruciform in plan, and comprises nave, with transeptal projections and choir recess with organ chamber. The ground level of the site is considerably below the street level. That condition has been utilized by forming a substructure to the Church, arranged as hall, manager's room, vestry, kitchen, lavatories, and cloak accommodation. The entrance front is to Montgomery Street. The door, with its projecting crenelated and sculptured stone porch, is placed at one side of the main gable, and is flanked by the retiring room projection on the west side. The main gable bears in the centre a wide and gracefully traceried window, flanked by buttress projections, which are terminated with relieved carved pinnacles. Similar buttresses with pinnacles are carried up at the outer angles of the gable. The east and west fronts are treated in a simpler manner, but assisted by the transept projections group very harmoniously. Beside the west transept is an entrance to the hall and vestry staircase, forming also an egress door from the Church, and a further outside entrance is provided for the hall on the east side. The Church accommodates nearly 400 persons, and the hall upwards of 200. The interior of the Church is constructed with open timber roof, with infilling of plaster in a series of panelled spaces, the length of the nave being subdivided by heavy frames set on the walls and strutted up from moulded stone corbels. The Church is built of Binny stone. The Architect for the work is Mr. Hippolyte J. Blanc, R.S.A.

RETFORD.—The Parish Church of North and South Wheatly with West Burton was reopened, on Thursday, by the Bishop of Southwell. The Church had been closed since April last for alterations. The work has been supervised by Mr. Hodgson Fowler, Architect, of Durham, and the contractors were Messrs. Close, of Lincoln. A new roof has been constructed, and the chancel arch has been restored. The Church has been re-seated, and the cost of the whole alterations has been £1,400. As part of the restoration, the bells in the tower have been re-hung, and one new bell has been added, making a peal of six.

SELSTON.—A special meeting of the Selston Parish Council was recently held to examine the revised plans of the sanitary scheme for the parish, submitted by the Basford District Council. The plans, when first prepared, were for a general scheme for the whole of the parish, at an estimated cost of £13,500, but believing such a scheme to be unnecessary the Council strongly opposed it, and as a consequence the engineer was instructed to prepare a fresh set of plans for a scheme to deal only with those parts of the parish that really required sewering. These were the plans now laid before the Council. Mr. W. Gill presided, and Mr. E. Briggs also attended the meeting. The Clerk read the estimate which had been received from the engineer, and which stated that £7,000 would cover everything that could possibly be foreseen. It is proposed to divide the scheme into five sections, as follows:—No. 1, to include Westwood, Jacksdale, and Pye Hill; No. 2, to cover the locality near the Bull and Butcher. The third is only a small section at Underwood, and the fourth will deal with the Pinxton Station and Beaufit Lane localities. Section No. 5 will deal with Upper Mexborough. The Council unanimously approved of the plans.

FOR the Friends' Adult School, at Barnsley, new premises are about to be erected, for which a site has been secured in Wellington-street. The cost is estimated at £2,000, of which £1,200 has been raised.

A HUGE transmitter has been placed in the pulpit of St. Michael's, Chester Square, London, by a telephone company, so that Canon Fleming's sermons may be heard in hospitals and elsewhere.

MR. HENRY TATE has offered the site of a library for Balham. Balham has increased enormously of late, and has now reached the dimensions of a large town.

MACCLESFIELD Parish Church is to be restored at a cost of £10,000 or £20,000, of which £500 has been promised by Mr. Peter Brocklehurst, provided the work is begun in two years.

AN attempt will be made during the next Session to obtain Parliamentary powers for the construction of an electric tramway or light railway from Bridlington to Flamborough.

THE Stockholm Exhibition of 1897 will have a machinery hall of iron and glass, with an area of about 100,000 square feet. There will be three large halls for Norway, Sweden, and Denmark, and smaller buildings for other countries. It is claimed for the industrial section that it is one of the largest wooden structures ever built. It will have a dome 300 ft. high, surrounded by four turrets.

SOCIETY MEETINGS.

The Architectural Association.—Considerable discussion followed the reading of the paper on "Garden Design," which we give in another column, by Mr. F. Inigo Thomas, on Friday night. In the absence of Mr. Beresford Pike, Mr. John Begg occupied the chair. Mr. J. A. Gotch, who proposed the vote of thanks, said that Mr. Thomas was a master of the Art both of laying out gardens and describing them. Those present, he was sure, had all gained some few notions, and, of course, one of the principal things was the desirability and use of fine formal lay-outs. However, he was not one of those who were in favour of lay-outs on an enormous scale, like those of Versailles, because, as a rule, one could not appreciate them at all, unless one had a plan as one went round. One could not at one glance divine what was in the designer's mind. A formal lay-out on a vast scale, such as had been shown to-night, might have done very well for great nobles in times past, yet he ventured to think that for ordinary 19th-century people, smaller lay-outs would be more suitable, especially if one considered that the chief thing was not to get, say a Dutch garden of this or that period, but a pleasing effect generally. Of course, he stood under correction by Mr. Thomas, being only one of his pupils. In his opinion, a garden should be so arranged that one could get a good view of the house from different points, and different views from different rooms of the house, and that there was no necessity for seeing the whole of the gardens at once. Mr. Thomas was very partial to long vistas, terminated by either a summer-house or a statue; the latter is rather a high note, which might be unsuitable for small lay-outs. The vista should not always be terminated by a summer-house, because summer-houses had often better be situated in more secluded spots of the garden, for reasons which it should not be difficult to guess. Anyhow, there should be a certain part of the garden which could not be easily seen. There ought to be thickets for birds, &c., and places only penetrated by the gardener and people in search of tennis-balls, or something of that kind. Mr. F. G. Hooper said, that there ought to be level spaces arranged at different levels, connected by slopes or steps, and divided off by some definite boundary, such as hedges; one could thus obtain different shades. Hedges in general make a delightful background both in winter, when they were dark, and in spring, when they charmed as by their bright-green appearance. Another important thing was to get one's paths level and dry. The views, which he was glad to say were shown with the Association's own lantern, were very fine, especially some of the Italian ones, though one need not go so far south as that to see fine lay-outs. He himself had only lately returned from Italy, and recollected having seen a magnificent lay-out at another Villa d'Este than that mentioned in Mr. Thomas' paper, viz., on the shores of Lake Como. It had been said that the larger lay-outs had nearly all disappeared. This was perfectly true, If he remembered rightly, there was a large lay-out near Kettering, in the grounds of Bowden (?) House, where the paths and avenues totalled up to something like 70 miles. This was due to the whim of one of the former owners, a duke, who wanted to have a drive constructed all the way from his estate to London; but, as there were certain difficulties in the way of his scheme—even for a duke—he decided to have the whole distance laid out in his own grounds, where this unique lay-out was to this day. He then seconded the vote of thanks proposed by Mr. Gotch. Mr. F. M. Elgood also spoke.

Leeds and Yorkshire Architectural Society.—The members of this Association held their opening meeting on the 16th, at the Queen's Hotel, Leeds. The proceedings opened with the presidential address of Mr. William Watson of Wakefield, which will be found on page 251.

THE Admiralty has given instructions for plans to be immediately prepared for the erection of new naval barracks at Sheerness, for the accommodation of the Gunnery School established at that port four years ago. The block of buildings occupied at present affords insufficient accommodation, and quarters are to be provided in the new building for 30 officers and 1,000 seamen.

Correspondence.

A SUBSCRIBER, EDINBURGH.—Dear Sir,—We are obliged by your letter, and are writing to Messrs. Menzies with regard to your complaint.—THE PUBLISHER.

THE L.C.C. AND THEIR WORKS.

To the Editor of THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

SIR,—Will you permit me space to draw your attention to one of the efforts of the Works Department of this unaccountable body? The fire station to the Embankment, which is being built by these self-constituted contractors, is now approaching completion, and on removal of scaffolding a more unsatisfactory result can with difficulty be imagined.

A lofty, barrack-like, stock-brick structure rears itself to John Carpenter Street with distressing effects, viewed from the Embankment and Blackfriars Bridge. There might have been a picturesque grouping with Zion College and the Thames Conservancy Office, and to add to the disfigurement a zinc revolving ventilator appears to terminate Sir Arthur Blomfield's roof.

A considerable sum, however, has been spent on the Carmelite and west front, which, judging from the proximity of the buildings to be erected opposite, and its distance from the Embankment, will be practically unseen.

I am, Sir.
Yours obediently,
JOHN W. RHODES.

Mitre Court Chambers, E.C.

KEYSTONES.

AT a public meeting held at Belfast last week, it was decided to erect a statue of the Queen, in commemoration of Her Majesty's reign. The cost of the statue will be £5,000.

FROM excavations made on the site of Carthage, in Tunis, M. Delattre has found that the ancient amphitheatre was much larger than has been supposed, and attains to the dimensions of the Colosseum at Rome. The seats still bear the names of what we should now call "regular subscribers."

THE district north of the Marylebone Road, at the Lisson Grove end, presents a scene of devastation. Two squares and 25 streets have been obliterated to make room for the terminus of the Manchester, Sheffield, and Lincolnshire Railway, which will run through St. John's Wood, and end at the Marylebone Road, on which thoroughfare the terminal station will have its principal frontage.

WE hear that Hengrave Hall, near Bury St. Edmunds, which was for generations in the Gage family and latterly belonged to Earl Kenmare, has come into the market. The Hall, with its magnificent carved facade of Tudor Architecture in stone, the inner quadrangle, the Chapel, and nun's gallery have long been objects of special interest to antiquarians, in fact Hengreave is commonly regarded as the finest example of ornate Tudor work in England.

THERE has just been placed on exhibition in the Egyptian Galleries of the British Museum a sacred shrine inscribed with the name of Necho. The shrine is about four inches square, and shows traces of having at one time been inlaid with either silver or gold. These shrines were mostly kept in the temples of the gods to whom they were dedicated, and were carried about at the different festivals. A few gold and silver statuettes of gods, together with a crystal representation of Ta-urt, the Phœnecian goddess, have also been exhibited.

MR. MOIR, Inspector of Weights and Measures, reports that there had been discovered in a lumber-room, at Marischal College, "an accurate standard brass scale of comparison," made by Edward Troughton, London, in 1801. The instrument, which is valued at £60, was used in 1811 by Mr. Jardine, Edinburgh, and Professor Patrick Copland, who occupied the Chair of Mathematics in Marischal College, in the comparison of a small ell-bed, the property of the Magistrates of Edinburgh. The instrument was afterwards used by the Astronomical Society of London, but disappeared.

Trade and Craft.

THE SEWAGE AND ELECTRIC LIGHTING WORKS AT WAKEFIELD.

Yesterday, at the Wakefield County Court, before Judge Greenhow, Mr. Hudson, on behalf of the City Council, obtained an extension of the period during which the Corporation is to carry out works of sewerage and sewage disposal for twelve months from September last.

ASBESTOS FOR DECORATIVE PURPOSES.

Another instance of the fireproof character of the asbestos patent "Salamander" decorations is given in a recent issue of the Irish Times, with reference to the decoration of the Burlington Hotel and Restaurant, owned by Mr. Thomas Corless:—"The ceiling in the principal department consists of over 200 ornamental panels of asbestos, beautifully moulded. This portion of the decoration has been executed by Messrs. Martin and Sons, of Stephen's Green. When Messrs. Martin's establishment was partially destroyed by fire, the ceiling for the Burlington was in one of the workshops which was burned down. It was found the day after the fire that, while everything around had been completely destroyed by the flames, and that even solid metal pillars had been melted by the tremendous heat, the asbestos ceiling remained absolutely uninjured." This is a second case of the kind which has occurred within a short time, and it is not surprising that these new decorations are already finding much favour among Architects, and superseding inflammable materials. We understand that the ceilings of the extensive new premises of Harrod's Stores, at Brompton, have been covered with the "Salamander" material, which is highly effective artistically, as well as being fire-resisting. It has also been adopted for the decoration of cabins in ships of H.M. Navy. The patentees and manufacturers are the United Asbestos Company, Limited, No. 158 and 160, Charing Cross Road.

M. S. AND L. COMPENSATION CLAIM.

The award given by Sir Frederick Bramwell, upon the claims of the Nottingham Corporation and the Nottingham Board of Guardians against the Manchester, Sheffield and Lincolnshire Railway Company, in respect of property to be acquired in the borough for the purpose of the Company's extension to London scheme, has been made known. The total claim of the Corporation amounted to £225,155, and that of the Guardians to £130,986. Sir F. Bramwell has awarded the Corporation £122,653, and the Guardians £31,244.

FIREPROOF PAPER.

An account of the new fireproof paper prepared by L. Frobeen, of Berlin, shows the production of a valuable article for industrial and other purposes. Ninety-five parts of asbestos fibre of the best quality are washed in a solution of permanganate of calcium and then treated with sulphuric acid, the fibre being thus bleached. After treating the fibre in this manner, five parts of ground wood-pulp are added, and the entire mass placed in the agitating box, with an addition of some lime water and borax. After being thoroughly mixed the material is pumped into a regulating box and allowed to flow out of a gate into an endless wire cloth, where it enters the usual paper-making machinery. Paper produced in this way, it is reported, will resist even the direct influence of a flame, and may be placed in a white heat with impunity. Ordinary paper may be made fireproof by treating it with a fluid consisting of 33 parts manganate of chloride, 20 parts ortho-phosphoric acid, 12 parts carbonate of magnesia, 10 parts boric acid, and 25 parts chloride of ammonia in one quart of water. This solution is applied several times, and paper saturated with it will resist great heat and the direct influence of flame for some time.

JARRAHDALE JARRAH.

The "Norden" has arrived from Rockingham, W.A., with 724 loads of Jarrahdale Jarrah aboard, to the order of McLean Bros. & Rigg, Limited, 1, Fenchurch Avenue, London, E.C.

The proposed Infectious Diseases Hospital at Southampton.

THERE has been some considerable dalliance in the Southampton Town Council with regard to the acceptance of the design for the new Hospital. It will be remembered that about a month ago the first place in this competition, for which forty-three firms of Architects entered, was awarded, under the assessorship of Mr. W. Emerson, to Messrs. F. H. Greenaway and J. A. Smith, the second award falling to Messrs. George E. Halliday and John W. Rodger. It appearsfrom a report in the Hampshire Advertiser, of a meeting of the County Council for the borough, that there is a strong wish that a local firm should be entrusted with the building. The number of the designs next in order of merit was asked, and as the third happened to be that of the Southampton Architect, the attitude of a certain party in the committee was strengthened, and, in face of the conditions of competition, which explicitly granted the building of the Hospital to the firm awarded first premium, its members have been trying to get round their undertaking in a manner which certainly does not do them very great credit. Quoting from the account of the Hampshire Advertiser, it seems that on the proposal for the adoption of the report of the Health Committee, stating the awards of the assessor and the names of the submitters of the four first designs, "Mr. Le Feuvre asked what was their" (the Council's) "position with regard to the gentlemen who sent in plans, on the question of copyright?" and added that "his idea was that the committee was not satisfied with any of the plans." When the town clerk had stated that under the conditions the first and second awards only were to become the property of the Corporation, "Mr. Sanders remarked that the award of the assessors was as to the payment of the premiums, but it would be more satisfactory to the people of the town for the third plan to be carried out." Then "Mr. Burbage wished to know whether in voting for the report they were binding themselves to accept the first and second awards?" and "Mr. Lamport asked whether they were under a contract to confirm their awards?" and went on to suggest that as a question had been asked at a previous sitting as to the title to the freehold of the site, the question of the awards should be set in abeyance to the acquisition of the land. After the town clerk and the senior bailiff had reminded the house of their undertaking in the conditions, that the Hospital should be built in accordance with the design of the first award, and that the purchase of the site only awaited the decision of an arbitration organised to settle the price. "Alderman Bance thought that the plans would provide a Hospital that would be too expensive and luxurious for that borough," and that as "they could not take a bit out of one, and a bit from another," they ought to pay the awards and refer the plans to an emergency committee to "thrash out" and reduce in price. Mr. Lemon then spoke forcibly, calling on the committee as "honourable men" to carry out their engagement; explaining that the Hospital was cheap, that a better set of designs could not have been submitted; and pointing out that the inducement for Architects to enter in competition was not the premiums, but that the promise that the submitter of the successful design should be employed to execute it. Upon this, Mr. Le Feuvre rose to say that "fortunately they had not secured the freehold of the land on which they proposed to erect a Hospital," and that "the only way out of the difficulty would be to make a compromise with the tenant, and decide not to erect a Hospital there, thereby saving a considerable sum," and Mr. Sanders said they were in an unfortunate position, because he took it that the feeling of the Council was not that they must not select the first design so much as the fact that they were putting it into the hands of absolute strangers to carry out this important work," and added that it would have been a source of the greatest satisfaction to see the local firm carry out their design. Alderman Bone expressed sorrow that "the matter had fallen into the hands of other than local men," and said "a

"ST. KEVERNE," HARROW. ARNOLD MITCHELL, ARCHITECT.

simple way out of the present difficulty would be to pay the men their premium, and then let the emergency committee go through the plans and see whether they could not be cut down." Finally, on the suggestion of the senior bailiff, the discussion was postponed, and there the matter rests. The report of the Health Committee was, however, accepted by a large majority, though several members did not vote. Surely we may think it is cases such as these that the Royal Institute of British Architects should take up. For what material purpose does the Institute exist, if its first business is not to watch and forward the interests of the profession in general, and its members in particular? The successful competitors are both associates, and the assessor a fellow and the hon. sec. of the Institute itself.

THE R.I.B.A. MEETING ON MONDAY NIGHT.

THE Third General Meeting of the R.I.B.A. was held on Monday night. The minutes of the last meeting having been signed by the Chairman, the decease of the following members was announced:—The Right Hon. Lord Savile, Hon. Associate; Frederick Morley, Dublin, Associate; William Alphonsus Purdue, Associate. At the close of the meeting a Special General Meeting was held, Mr. Aston Webb in the chair, when attention was called to the books and drawings belonging to the late Secretary, Mr. Wm. H. White, which were on the table. Mr. Arthur S. Flower, M.A., F.S.A., then read his paper on

DESIGNS AND SKETCHES BY WM. HENRY WHITE,

and said, "The drawings exhibited here to-night almost speak for themselves; they are by no means a complete collection of the sketches and designs of our lamented Secretary; they are simply a chance gathering of specimens of his work, many of them seeming to owe their preservation to accident. Enough are here to bear witness to the high quality and versatility of his powers, but it is obvious that between these drawings there are many gaps. Results, such as we see here, could not have been achieved without many intermediate stages; some of these are just indicated; others not at all. I have tried to arrange all the obtainable drawings in chronological order, so as to, if possible, add a little to the life-history of our friend. The earliest of the drawings exhibited is the small sketch in water-colours of a farm and a heap of elms, done near Lewisham. The date of this is 1857, its author then being 19 years old, and it may be called slight, of course, though not without promise; but the following year shows an extraordinary advance. This holiday work of 1858 (Mr. White was then serving his articles with George Morgan, in London), is represented by six sketches, which would do credit to any Artist of the same age. They are water-colour sketches done at Lewisham, Ravensbourne, and Frinton (near Walton-on-the-Naze). Of the next year we have no reminiscences, and of 1860 only one English sketch of some Norman work at Canterbury. Later in that year White's continental period begins; this tour seems to have begun with Belgium and the Rhine. All this time he has been considerably influenced by the work of Pront, as may be seen in the sketches from Antwerp (Cathedral, water colour), Ghent, Louvain (Hôtel de Ville), Cologne (Cathedral), and Strassburg. Further, we have some beautiful sketches of the Palais de Justice at Rouen, the Church of St. Ouen, Rouen, and portions of Rheims Cathedral, and others. There are also some remarkable and carefully executed views of Mount St. Michel. A few brown ink drawings from Carcassonne remain from 1868, and the French series is completed by the water-colour sketch of the Tour de Philippe le Bel, at Villeneuve-les-Avignons, 1869, a capital rendering of the four-squareness of the tower and the glare of Provençal sunshine.

WHITE'S ARCHITECTURAL WORK IN FRANCE,

so far as illustrated by the drawings before us, mainly consisted in the rebuilding, on a much grander scale, of the Chateau de Boizy, at Vernon, and of large additions to the old Chateau de Martinvast, near Cherbourg Manche. In 1870, White entered into several competitions, both in France and in England. When in the former country he received several medals for being placed second and third. All this was done at the age of 30. Of his Architectural work in India we have here sketched plans of the Court of Small Causes in Calcutta, the Bengal Presidency College, a Monument to Chief Justice Norman in Calcutta Cathedral. After his return to England, White never had another chance of erecting a building of his own designing, though some competition drawings for a large boys' school are among our collection, to which no particulars are attached, and which have a great deal practically, as well as artistically, to recommend them. The last, but not the least, important drawing I may draw attention to is the one known as the 'Queen Anne,' and which was executed to illustrate a paper read before the Architectural Association, on January 23rd, 1874, on 'The Present State of Thought Concerning Architecture.' The drawing was accompanied by a table, specifying the foreign and English sources from which each item of the design was copied. The whole thing is highly characteristic of Mr. White's sense of humour, and the design bears the inscription: 'De Gustibus Non Disputandum, &c.' If we were to take the trouble to peruse this paper now, we should clearly find White to to have been a true prophet. I think we cannot do better now than inspect the plans on the table, and the drawings on the screens. I think I may state without fear of contradiction that while the Institute gained an ideal Secretary, the world lost an Architect of no mean ability." Mr. Statham said he was very pleased to propose a vote of thanks to Mr. Flower, for, although his paper was a short one, it must have taken him considerable time and cost him a good deal of trouble to prepare it. From the drawings exhibited in that meeting it clearly showed that Mr. White possessed more varied accomplishments than many of his friends were aware of. Mr. Brydon seconded the vote of thanks and said that he did so because in the interesting paper read by Mr. Flower they had seen Mr. White as an Architect and not only as their Secretary. What had struck him more particularly was that the man who could design and carry out work in the eighteenth-century French style of Architecture and then produce a paper like that accompanying the Queen Anne drawing must of necessity have been a most remarkable man. His paper on the "Present State of Thought on Architecture" was all the more remarkable considering that at the time the English were all running after Gothic, and that since then in the whirligig of time they had more or less come round to old Classic instead of old Gothic. The drawings and plans should be carefully treasured among the belongings of the Institute. Of course they all remembered the gentle satire he used to infuse into his papers. The President then suggested that perhaps Mr. Stannus might be able to tender some further information about Mr. White's career, but Mr. Stannus replied that all the information he was able to give had already been published in THE BUILDERS' JOURNAL; he had been obliged to write the notice in question rather hurriedly and under great pressure. The more he looked into Mr. White's work the more he was permeated with a strong feeling of reverent admiration. When he had come in contact with the late Secretary, he had often thought him a little masterful, but then he never once realised that there was all this work behind him. Had he known at the time what he had learnt to-night, he would gladly have bowed down to him, and it was somewhat sad to think that now they could no longer pay reverence and respect to him. He had much pleasure in supporting the vote of thanks to Mr. Flower for calling attention to these drawings of Mr. White's. Mr. Aston Webb: I am told that the two shadows will go back to the owners, who very naturally and properly were anxious to retain the ownership of them, whereas, thanks to the kindness of Col. White, the remainder of the collection had become the property of the Institute. Mr. Stannus asked if it were not possible to retain some photos of the shadows in question, and suggested that they might eventually be added to the illustrated journal of the Institute. Mr. Webb, in reply, said that one might try and obtain the owner's consent to do this. "Our late Secretary has unsparingly devoted himself to our interests for 18 years, and indeed he seemed to have no other interest in life but to further and improve our position." He had much pleasure in putting to Mr. Flower the various votes of thanks, and he thought that he might couple with it a vote of thanks to Col. White for these drawings and books.—Mr. Flower said that his paper was certainty short, but he thought that the main object of those present should be to look at the drawings, and not to hear comments on a man whom he had only known for a few years. He was almost surprised to hear that these drawings were not better known, but this was probably greatly due to Mr. White's reticent disposition. He took this opportunity to thank Mr. Northover for bringing the drawings together and arranging them.—Mr. Aston Webb then announced that the next meeting will be held on Monday, December 14th, when Messrs. Wm. C. Street and Max Clarke would report upon the second series of experiments upon brickwork, conducted by the Science Standard Committee.

GLASGOW IMPROVEMENTS.

THE Glasgow Corporation Improvement Bill has been issued. It consists of six sections and contains forty-six clauses. Part I. relates to the city improvements, and contains powers for the widening of Nelson Street, and to shut up the following streets, namely, Nelson Street, Market Street, Back Wynd, Margaret Place, Antigua Place, Antigua Court, Wallace Court, Tontine Lane, Union Court, Buchanan Court, Jeffrey's Close, and Merchant Lane, and to acquire the lands referred to in the different sections, the period of compulsory purchase being limited to ten years. Clause 10 gives power to deal with unhealthy areas on a report from the Medical Officer of Health, and, after petition, to the Secretary for Scotland. Clause 11 makes special provisions and modifications of the Land Clauses Acts, so that the lands required for the purposes of the Act shall be acquired by arbitration. By Clause 14 the Corporation are authorised to take lands by agreement, and under the following clause power is asked to take down buildings on the land acquired, to lay out or sell such lands, to maintain such portions for the purpose of providing open spaces or places of recreation, or to erect buildings upon the lands, to dispose thereof, or to lease the same. By Clause 16 power is given to erect and maintain dwelling-houses, including model lodging-houses for mechanics, labourers, and other persons of the working and poorer classes; and by the following clause it is provided that the Corporation shall not eject within any period of six months any number of the labouring classes exceeding 500 without certificate from the sheriff that suitable accommodation has been provided, or exists for them in the immediate neighbourhood. Clause 17 authorises the imposition of an improvement charge in respect of any substantial and permanent increase in value, clearly shown to be derived from street-widening or other operations carried out under the Act. Power is given by Clause 20 to borrow, for certain purposes of the Improvement Acts of 1866 and 1894, £103,245; and for the purposes of this Act such moneys as they may think proper, not exceeding £600,000. Clause 22 provides for a depreciation fund of 1 per cent. on the cost of all buildings erected under the Act; and by Clause 24 an assessment for the purposes of the Act, not exceeding 1d. per £1 on the rental, is authorised to be levied in equal proportion on owners and occupiers.

THE DECORATION OF PUBLIC BUILDINGS.

BY WALTER CRANE.

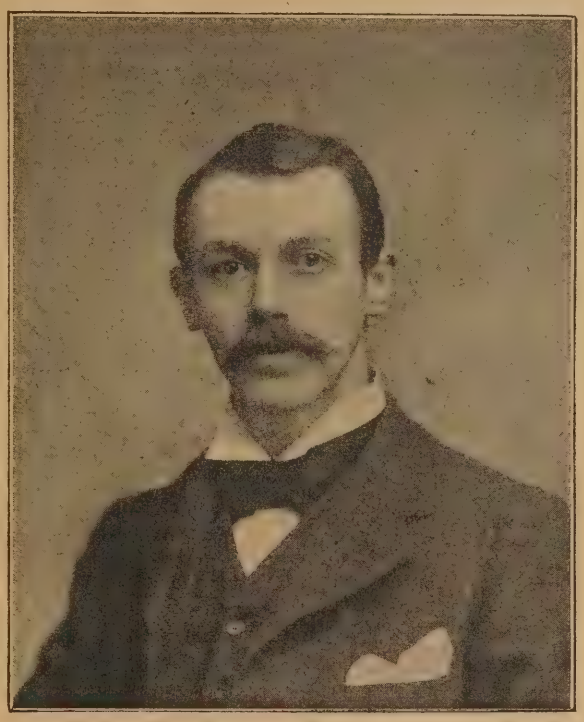
IN the extracts of the lecture delivered at the Arts and Crafts Society's Exhibition, which appeared in our issue of the 25th November, please read "best" instead of "least" in reference to Mr. Poynter's St. George in the House of Commons.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

MEN WHO BUILD.

No. 47.

MR. ARNOLD MITCHELL, F.R.I.B.A.



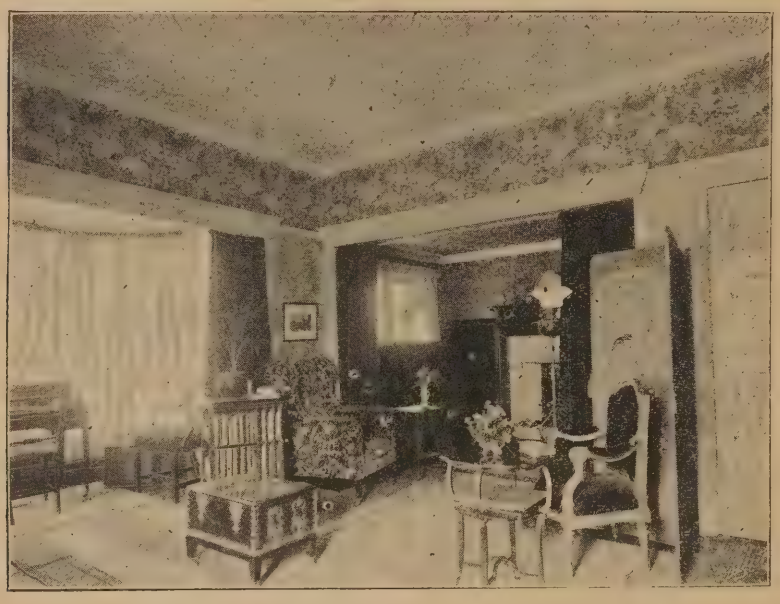
MR. ARNOLD MITCHELL is one of those happy men who have been able to avail themselves of the Architect's prime prerogative, and build himself a house, and he has further had the ability and the good fortune to furnish it and surround himself with elegant and beautiful things. Rare Persian rugs are upon the floors, striking water-colours and drawings decorate his walls, and the ruder needs of furniture are supplemented by interesting and quaint cabinets, tables and chairs, among the latter being one that belonged to, and was used by, Voltaire. Indeed, acquisitiveness for desirable personal estate must be not the least of Mr. Arnold Mitchell's intuitions. One frequently enough hears wonderful stories of people who win lottery prizes; of people who, when they buy a copper coffee-pot, discover it to be a sacramental chalice, or catch a fish to find a jewel in its stomach, but to sit *tête-à-tête* with one of these is a new and flattering experience. If one of *us* goes down the Mile End Road and buys a trifle, let us say a pair of brass candlesticks for half-a-crown, he may come home and discover them worth two shillings or three, he finds excitement to the extent of the sixpence one way or the other; but, when Mr. Arnold Mitchell betakes himself to the East End, he lays out his half-crown, it seems, when it will profit him to the tune of 480,000 per cent. This is a fact. Buying a dirt-crusted wooden box, Mr. Mitchell found it to be a handsome brass-bound oak chest, and finally that it was a historic treasure chest worth five or six hundred pounds.

Mr. Arnold Mitchell built him a house, or, as he terms it, "cottage," some years ago, on Grove Hill, Harrow, where now there is to be seen a long frontage of houses all identified in authorship with his own. Indeed, it is to this enterprise or astuteness on his part that the Architect attributes a great many of the opportunities that have fallen to him, and of which he has so happily availed himself.

GROVE HILL COTTAGE. MR. ARNOLD MITCHELL'S HOUSE AT HARROW.

Grove Hill Cottage, Mr. Arnold Mitchell's house, which is illustrated in this page, is of somewhat a quaint and unusual plan, or, to be exact, *section*. Mr. Mitchell takes pride in pointing out to the visitor that its eleven rooms are on nine different floors. The Architect elected to admit the exigencies of the site, and express them in his building, and however seriously the arrangement might be criticized in a mansion, it is certainly apt and picturesque in the cottage. As may be inferred from the above, the decline of the land

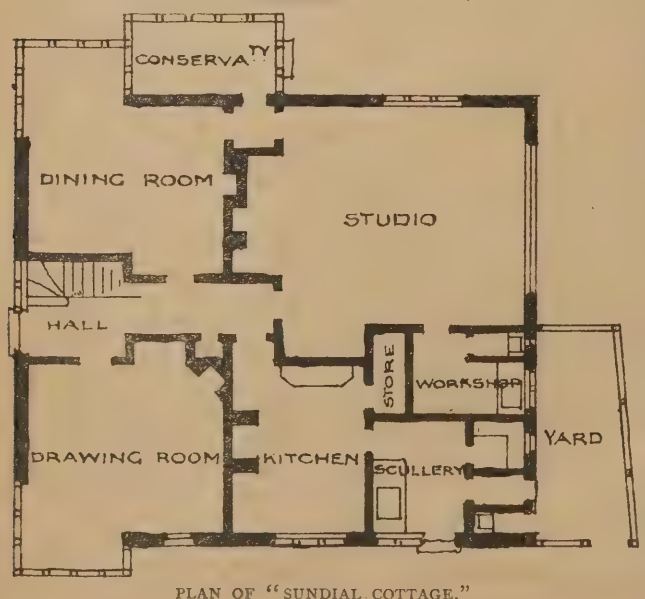
is steep; there is a drop of 13½ feet in level along the diagonal of the plan starting from the top front angle, and the Architect has accordingly arranged his staircase (without stair-well) in the centre, and planned the rooms to open off its many landings; there are no corridors. The house is, therefore, snug and compact. Mr. Arnold Mitchell has availed himself, in the scheme of decoration, of Messrs. Hayward's well-known wall papers and friezes, and the ornamental design is not confined to the reception rooms, but is considered in all the bedrooms, it being Mr. Mitchell's pleasure to have a separate colour scheme for each apartment of his house, and this scheme is elaborated throughout, even to the curtains, furniture and bed-hangings, in a very graceful and pleasing manner. To all this electric light, with coloured shades to match the tone of decoration, lends the aid of its charm, for even at Harrow an enthusiast may arrange for the light to be supplied.



The drawing-room, the bay window of which is seen in the illustration, is planned with two recesses, one formed by the bay first mentioned, which serves as a boudoir, and the other in which the fireplace is set. Here the ceiling falls, and is coloured in rich, warm tones, and the nook is furnished with settles, and, with curtains drawn, to cut it off from the rest of the room, it forms an ideal snuggery for a winter evening.

But if Mr. Mitchell owes to this circumstance of having built his house in a manner and place which has enticed others to come and do likewise, he also recognises competitions among his stepping stones. He is a stickler for competition — "the young man's friend," says Mr. Mitchell. He will hear no word against them — none; if they are sometimes abused, yet they remain a great blessing to us all. But this mystery is not far to seek, for Mr. Arnold Mitchell himself numbers as many competitions to his hand as he does years to his life, and has been scrupulous in putting an average of one in every four to his credit. Mr. Mitchell, however, has never deigned to condescend to any competition when a qualified assessor was not appointed, and strongly deprecates the practice of Architects in doing so under any circumstances.

I thought, when I suggested to Mr. Arnold Mitchell that some account of his life would be of interest, that he would at once tell me that he was born of poor but honest parents, and brought up on oatmeal porridge, like the rest of us; but, instead, he told me directly that he was articled for three years to Mr. R. S. Wilkinson, of Furnival's Inn, and brought up on Doulton's Lambeth works. During these years the pupil attended closely to the office work, and besides studied in the Art Schools of evenings. It was not till his term was expired that he saw much of English traditional Architecture, and about this period he sought, as it were, to make up for lost time, and "measured up five Churches" at different dates. Mr. Arnold Mitchell holds that making measured drawings is the finest of all training for a young Architect, and would advise none to begin sketching seriously until they have served an apprenticeship to this method of chronicling Architectural effects. The next professional work Mr. Mitchell saw was in the office of Messrs. George and Peto, and after being employed there a year he was engaged as clerk of works, superintending the building of St. Luke's Church, Bermondsey, during which time he prepared a design for a "Municipal Mansion," which won for him the Soane medallion in 1885. Then there came a term of employment in the School Board Offices, where, no doubt, he obtained that intimate knowledge that has found success for him in the planning of Board Schools, for he has just completed the large school in Woodstock Road, Finsbury Park, which he won in competition. After this term of office routine he flew to the opposite extreme, and travelled; first for six months in Italy, and later for a similar period of time in France. Of this tour he regrets that he had not learned to draw before he started: "I wasted my time in Italy, learning to draw—not that I can draw *now*," Mr. Mitchell hastened to assure me, with an inkling that his work might have prejudiced me into that opinion. After a short time in a City office, "to see all sides of the profession," Mr. Mitchell became tenant of the rooms in Finsbury Circus, which he has since held as his office, and that was thirteen years ago.



Mr. Arnold Mitchell prides himself in no predilections in the enjoyment of his profession, and that word "enjoyment" hits off the attitude in which he regards his work. To be able to design and execute as his taste and inclinations direct, to live and work without contentions, without unnecessary restrictions and limitations, to draw

about him in his pretty home the things that please his eye and fancy, and surround himself with a placid unconcern, free from all identification with one cult or another, with this party or the other, is the desire and realized ambition of this Architect. Mr. Mitchell holds that, while considering the client's needs in every detail, and working the plan to a complete solution of the requirements, an Architect should not consent to

DRAWING ROOM, GROVE HILL COTTAGE, HARROW.

have his design lopped and spoilt because a client will not see that his estimate of value for the house he requires is understated. Mr. Mitchell has always declined to work on any such understanding, and it is interesting to know that not only has he no cause to regret the position he has taken in such matter, but he has never found that it handicapped him in any substantial respect. To return, so thoroughly does this philosophic attitude of imperturbability belong to Mr. Mitchell that he was puzzled to tell me whether his taste lingered in preference with the Gothic or Classic Architectures, and finally had to give up my riddle. It was a thing he had never considered, he told me, or concerned himself to recognise in distinction. These things, in Mr. Mitchell's view, all help to rub the bloom off the plum of Architectural design, and I became at length so imbued with the placidity of his contemplative view, that I lost all interest in several fretting questions I had but an hour before run all agog to put to him, and strolled about the house, chatting with him over his pictures; so I find the questions—"Do you consider Architecture an Art or a profession?" and "Is marriage a failure?"—still standing unanswered in my note-book.

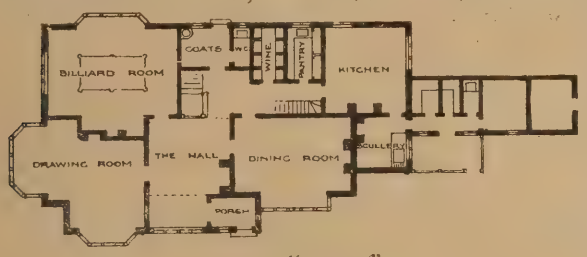
PLAN OF "SUNDIAL COTTAGE."

THE MODERN HOUSE.

By P. MORLEY HORDER.

I AM afraid modern Architecture has very little interest for the generality of men, and their admiration for old buildings does not go very far or to the extent of being interested in every effort for their preservation, and I am afraid it is a sentimental interest of past association rather than a knowledge of their intrinsic merit. Perhaps for some of us this admiration for all that is old is very genuine, but it has small influence on our surroundings and results in mere *dilettante* enthusiasm for old furniture and mere bric-a-brac, and in condemnation of everything that is not old instead of encouraging all efforts towards the production of modern work on the principles of the old we admire. Such thoughtless enthusiasm has often, too, gone far in the spoliation of the very object of over-admiration and a selfish desire to be possessed of any fragments of antiquity. A thing is not good just because it is old, neither is it beautiful, probably, apart from its place and setting. There is everything to be gained by intelligent study of the Arts of the past, in fact we can have no pretence to knowledge of beauty until we have carefully observed these and formed opinions about them, and if such a study goes no further than mere desire for reproduction of past forms it will only be proof of the superficial way we have approached the subject. Rightly understood, the old work will encourage a still greater interest in the improvement of modern work on the principles of the old, but suited to the particular needs of our own age. It is quite clear that no kind of general interest exists for modern Architecture, for the very status of the modern Architect seems a matter of considerable doubt, and small distinction is made between the Architect, the would-be designer and fashioner, and the builder who, under modern conditions, has become the mere executant. True, we know very little of the designers of the old buildings we admire, but a good many names have become familiar to us all in connection with their design. This indifference to the comparative merits of modern building and to the individuals who are shaping its style, must retard the production of good work generally, and the question naturally suggests itself as to whether we care as a people for the form and colour of our domestic and ecclesiastical buildings? Are we shocked at the promiscuousness, the lack of thought, the terrible sameness, the hideous forms and colours displayed by so many of our buildings? Have we never been pained by the ruthless destruction of beautiful country, and can we see with no regret the old towns we profess to admire, robbed of their simple dignity and of that something we choose to call the picturesque, without more than a protest—in silent inaction. Building on an extensive scale must perforce go on around the centres of so-called civilisation, and the estates contiguous to our great towns have necessarily to be dispersed and parcelled out into building plots, but need their spoliation be so unordered in plan and execution? Can we have no voice in the kind of house we would live in, or are we satisfied with what is now generally being built, the showy brick box of most of our suburbs? I must presume the brick residence in vogue pleases us because it is marketable, indeed, was built with a shrewd assumption as to its attractions. If we really admired the old and its essential virtue of simplicity, we could never acquiesce in such an assumption, we should at least have and circulate opinions that would in time influence and alter the conditions of building. But I refuse to believe that, speaking generally, we are quite blind to the

"SUNDIAL COTTAGE," NORTHWOOD. ARNOLD MITCHELL, ARCHITECT.



VULGARITY OF OUR STREETS,

notably much of our suburban Architecture and their showy formlessness. I am sure we are pained at the destruction of natural beauty entailed by the extensive and congested building operations of our day; but we have grown accustomed to the inevitable building and its particular form gives no fresh sense of annoyance. Those of us who really dislike that modern invention—the villa—fail to realise that there is no reason with care and thought why a naturally beautiful estate should not be built over without destruction of its identity, without robbing it of every green thing. Even an estate on which the houses have to be arranged to make good use of every available bit of ground, can be made presentable by careful arrangement, and the occasional interruption of the almost necessary monotony. In laying out a modern estate, very little care or arrangement is exercised. After every tree has been rooted up, roads are cut at all

angles, and the land is parcelled out in every imaginable shape and form. A bird's-eye view would shew what a jumbled disordered medley of lines and angles are resorted to. If the estate happens to present any opportunities for variety, and the ground is anything but level, the disasters are only increased. The conditions of a hill are never even recognised, and the buildings appear to be holding each other up in a manner almost humorous. I often think that the greatest work an Architect could turn his thought and ingenuity to in these days would be that of making a building estate really beautiful, at the same time meeting all the demands of modern speculation and stinted means. The aggregate building material of this country is in the hands of men who care nothing for beauty, who have no conscience in the matter of the value of concealed workmanship, whose only aim is to catch the eye by variety of manufactured and coloured material. The houses that present the newest varieties of these repeated ornaments are the most readily let, and so a continual effort is sustained to produce fresh forms by the quickest processes. No human skill or ingenuity is needed in the manufacture of these ornamental accessories, and so at the same time that the taste of the country is being depraved by the currency that is being given to ugliness, human beings are engaging themselves in worthless and degrading toil. This love of the ornate and the formless is being carried into every department, both within and without our houses, until relief can only be found in the absolutely plain in every shape and form. There can be no question that the mere repetition of anything is in itself bad, if only from the point of view of the worker. Apart from such ethical considerations, you may probably say this is my taste, even to the extent of saying I prefer the showy and am not fond of simple things. Do we really consider seriously the details of our material surroundings? Have we taken the trouble to form an opinion as to the intrinsic value of our buildings and the decorative objects wherewith we surround our lives? Because before we have done this we cannot have any claim to taste, and we must be led astray by every wave of fashion and every new craze. An object, I care not what it is, from a house to a spoon, cannot be enriched with ornament until it has some real form of beauty, and the enrichment must only be an added emphasis to its actual shapeliness. In so far as a mere ornateness covers up or destroys the definite lines of the object, it is bad and a mere superfluity. Real taste surely should have distinct elements of what may be called style, which again is the application of accepted forms (by the eye after long usage and thought), always subject of course to new and individual interpretation from age to age. If you will consider, for instance, the collected treasures of our Art Galleries, you will see how the elements of style have always been carried on in this way and freshly interpreted. I certainly am no sympathiser with the mere purist in style, and believe in absolute freedom in all such matters; neither do I share that bigoted admiration of all that is old, and find pleasure only in mere repetitions of old forms. But the study of the past is more than ever necessary to-day when we have forgotten so often the lessons they teach us of beauty of construction, and the simple ingenuity of means to an end. I never remember an old building (and when I speak of an old building it must be understood I include everything up to the middle of the eighteenth century) that did not emphasize rather than destroy natural beauty.

"BOWLS," GREAT STANMORE. ARNOLD MITCHELL, ARCHITECT.

PLAN OF "BOWLS."

SITUATION AND APPROACH

always seem the first considerations, and no lines were ever broken, no ornaments added for the mere sake of variety. I know that the general theory is that age has given most of the beauty they now possess. Let us admit that age may have done something, but it is a consideration which largely concerns the colour of materials used, and in most cases these could never have been originally anything but of the quietest nature. I would like to emphatically say that there are numbers of modern buildings that in my opinion are as good (and better as displaying more real powers of design under more difficult conditions) as the best examples of the old. At the moment, however, we are considering not so much

EAST ELEVATION

STROUD GREEN BOARD SCHOOLS. ARNOLD MITCHELL AND ALFRED BUTLER, JOINT ARCHITECTS.

the isolated examples of modern Architecture as the aggregate and uncontrolled building of the time. Already I think we may see what time is likely to do with these, for of all cheerless spectacles I think it is a typical modern villa when the smoke of our towns has toned its pristine brightness into dingy depression. After a few years the faulty construction, the badly built brickwork, the poor unseasoned wood, the insufficient paintwork (which somehow the landlord neglects when it is no longer necessary to captivate with its glossiness), and the general appearance of past glory is depressing to a degree. To think that so often these places are bought with no conception of their early blight fills one with amazement. You sometimes see ivy struggling with the exigencies of a modern house, bur it so often gets interrupted by some uncongenial ornament that its progress is slow, which is indeed a pity, for it might give a new lease of life and help the brickwork in its

Struggle with Time.

Perhaps it is as well I should not too definitely state my own particular ideas in these matters, although I feel that photographs of buildings are always misleading, as they fail to give the colour and relative situation and scale of a building, which is of vital importance. And, indeed, it is useless really to compare photographs or other pictures with actual buildings, because none but those who are familiar with the evolution of Architectural design can form a correct idea of the appearance of a real building from a pictorial representation of it. My purpose is rather, if possible, to raise the whole question of Architectural taste, and to assert that it is a matter of knowledge, of well-trained judgment and clear æsthetic perception; to remind you that, whether you suspect it or not, there are principles underlying all good work, that you cannot see any improvement should you even look for it as necessary to your well being, until you take the trouble to study and find out

The Best Work that is being Done

and praise it. Ask yourselves seriously if the outward and inward form of our houses please you, and if they are all that you could wish. It may be an idle question for you now, so far as any practical improvement is concerned, but at least you can develop opinions that will influence others and form a consensus of effort towards improvement. At present there is only one conclusion, unless the best work of the past is worthless, that Architecture as an Art applicable to us all has ceased to exist, and only because we, as a people, will not have opinions, will not primarily use our eyes and form judgments as to the comparative value of the work that goes on around us. If you grow to hate the cheap form of modern building, and although necessity compels most of us to live among them, do not fail to say so and that loudly. Encourage by praise all that pleases, and the hand of the individual who fashioned it. This is the only chance of any improvement in the Architecture of our houses, and for the day to come when the poorest of us can live in what is sound, although it may be

Simple to Plainness.

It is a dreadful consideration that Architecture and when I speak of Architecture I include all the complementary crafts) is so controlled at a time when the opportunities for real beauty are so near at hand, when Artists and craftsmen of such originality are so numerous, but their work so seldom seen. I know there is a widespread notion that the employment of individuals in matters of Architecture and craftsmanship is expensive, and in a certain sense and as compared with the ready-made article their productions certainly are. Considerations of durability and the use of fewer materials to produce better effects weigh heavily against such ideas, to say nothing of the pleasure derived from any kind of individual production. Personally, I have a feeling that the Architect and craftsman have not yet done their duty, and have yet to shew practically they can compete, although at a considerable risk and loss to themselves, with the mere commercial influence of the building world; that they must supplement their outcry against the destruction of beauty and the want of taste generally, at some sacrifice to themselves. They must shew a

Disinterested Ambition

to produce beautiful things, and they must even make certain concessions, that a small improvement may be derived. I have spoken of the exceptional opportunities of the times, but the very variety of accessible material makes the danger and difficulty of selection most difficult, and the need for guidance imperative. The reaction from the dullness of the early part of this century, in matters of Art, was so sudden, and followed so rapidly by the manufacture of such varieties of materials, that there was no time for observation or comparison of the relative value of the production. No standards were set up, and the most dreadful combinations of forms and colours have by general usage become familiar. The most grotesque shapes, the most inharmonious forms, are honestly now thought to be beautiful and becoming, if only they are in vogue. Absolute utilitarianism, an utter absence of all attempts at Architectural effect, would be infinitely better than the blundering, ignorant productions that are neither good Architecture nor good engineering. I know it is easy to say disagreeable things about our every-day Architecture, and quite another to make their truth manifest. But, as a test, I would have you make a few comparisons, say between half-a-dozen old houses and a similar number taken at random from a

New Modern Street.

If you are incapable of seeing the superiority of the good in such a comparison you would probably be as satisfied with a coloured chromo as an etching of Rembrandt's on your walls. If, too, you could find sufficient interest to discover the buildings that are considered the best examples of modern Architecture, and compare them with others of a similar size around them, and in this way make up your mind a little on the subject. This is the the only way in which popular education in this direction can at all be advanced. The attitude of journalism towards the subject of Architecture is largely responsible for the want of interest. You would think that the opening of some large and important building would be a sufficient excuse for the employment of some competent critic to discuss its merits, but how seldom is there any but a passing reference to the Architectural value of the building. We have Art, Musical, and Literary critics on all our papers, and from them largely our opinions are determined. Many of the books and music that are so admired become forgotten very soon, but our buildings remain a permanent record of our good or bad taste. Surely it would be quite possible for an editor to employ a competent critic to discuss intelligently the merits of at least our important buildings; as it is, he contents himself with some passing comment at the most, which is worse than useless. Most of our papers, it is true, concern themselves with what they call "Art in the Home," and women mostly are employed to direct the public taste in these matters. An immense amount of harm has been done in the name of Art by means of these agencies, so to speak, for the propagation of Art crazes. For you cannot decorate your house unless you understand its Architecture, and, if it be bad, no amount of applied decoration will conceal it. In most cases the advice given is most unprincipled, the object being to exploit the goods of a particular firm, and with no reference to the conditions of the particular house to be decorated. We may not be responsible for the exterior of our houses, but at least the interior will be evidence of our individuality. As a rule, however, I am afraid the extravagances of the outside are emphasized within, and comfort seems to be considered akin to mere multiplicity, and the beauty of homeliness connected with mere Art fabrics. I am afraid women have a good deal to answer for in the matter of decoration with their insatiability for mere knick-knacks. To what a pass have we come when under the heading "Art in the Home" cream colour aspires to be carved ivory, and mural decorations are found in tambourines, dried grasses, drain-pipes, and milking-stools. I have often tried in vain to shake the faith of a woman for a drawing-room thus bedizened, but the picture of an old panelled parlour hung with black oval and coloured engravings seemed cold and cheerless in comparison with the crowded aspect of a modern drawing-room. I could never understand why people are so afraid of a plain surface, why they must needs cover every available space on their walls, and every nook and corner of their floor. Do people think about the different objects they hang on their walls, the ornaments about their room? You can buy now-a-days, for the price of a few manufactured goods, reproductions of one of the Art treasures of the world. Instead of availing ourselves of such opportunities we buy pictures that I am sure can make no appeal to us, but are merely useful as filling a blank on the wall. As I have said, we can practically do what we like with the interior of our houses, and they might become quite distinct from the sameness and monotony outside. It is curious how we illustrate the faultiness of the Architecture of our houses without hardly realising it. Curtains are always drawn over a portion of the window, which is always really larger than absolutely necessary for light and air, and, indeed, the great condemnation of the

Modern Window

is that it cannot exist in the daylight without the curtain, for the light is in such excess that everything appears garish until covered by drapery. But after all a room is four square, and, if we will only be quite simple, very beautiful effects can be

CARETAKER'S COTTAGE, "DUCKER," FOR THE GOVERNORS OF HARROW SCHOOL.
ARNOLD MITCHELL, ARCHITECT.

obtained without sacrificing comfort, and with very little outlay. The whole effect of a room must necessarily be determined by what we find on the walls, and this must be controlled by the size and ultimate conditions. If we have pictures that interest us it is obviously absurd to put a large-pattern paper that will confuse their meaning and effect; on the other hand, a well-designed paper is a sufficient decoration in itself, and the wall need not be described as bare. If the chimney-piece is ugly it is useless to drape it and call additional attention to it. Instead of spending money on useless superfluities, invest it in sound, beautiful, and necessary furniture and floor coverings, for cheapness in these matters robs the house of its style, and, in the long run, is expensive. All the most beautiful rooms depend entirely for their merit on this right clothing of the four walls, and on just the necessary furniture proportionate to the size of the room. Any other mere ornaments are unnecessary, and will spoil the dignity and comfort of the room, unless they have some unique interest or association of their own. "In a well-painted picture," says Edward Carpenter, in a recent article, "there is'nt a grain of paint which is mere material. All is expression, and yet life is a greater Art than painting pictures. Modern civilized folk are like people sitting helplessly in the midst of heaps of paint cans and brushes and ever accumulating more; but when they are going to produce anything lovely or worth looking at in their own lives and surroundings, Heaven only knows!" In this sense simplification is the first letter of the alphabet of the Art of Life. "People," he goes on, "being extremely muddle-headed about life, are under a fixed impression that the more they can acquire and accumulate in any department, the better off they will be and the better times they will have, consequently when they walk down the street and see nice things in the shop windows, instead of leaving them there, if they have any

EAST END OF LAON CATHEDRAL. DRAWN BY ARNOLD MITCHELL.

money in their pockets they buy them and put them on their backs or into their mouths, or in their rooms, and round their walls; and then, after a time, finding the result not very satisfactory, they think they have not bought the right thing, and so go out again and buy some more. And they go on doing this in a blind habitual way until they can hardly move about or enjoy themselves for the very multitude of their possessions, impediments and duties!" The method of Thoreau towards the simplification of life might be beneficial in its effect on some of our houses. Thoreau had an ornament on his shelf, but, finding it wanted dusting every day, and having to do the dusting himself, he ultimately came to the conclusion that it was not worth the trouble, and threw the ornament out of the window. Are half the things we continually have to dust in our rooms worth the trouble; do they add to our comfort or the sum of effect? I wish I could have written something more practicable, but, as I have said, I think in the general confusion of ideas about Art it is not a time to be too definite, and all I desire is to stimulate an intelligent interest in the materials of our surroundings. "Little trinkets," said Wren to his own day, "are in great vogue, but building ought certainly to have the attributes of the 'eternal,' and therefore the only thing incapable of new fashions."

KEYSTONES.

WE hear that the contract for special steel casements and opening gear, at the Royal Naval Engineering College, Keyham, has been placed in the hands of Messrs. E. Farrar & Co., London.

THE Local Government Board has sanctioned the borrowing by the Coventry Council of the sum of £10,000 for the purposes of the erection of a smallpox hospital and the extension of the City (Infectious Diseases) Hospital.

MISS GREGSON has presented to Liverpool a handsome museum in Garmoyle Road, Wavertree, in memory of her father and mother. The building is to be taken over and maintained by the corporation.

CONSIDERABLE damage was caused last week by a fire in the Wesleyan Chapel, Patrick Street, Cork. And it is estimated that at least £2,000 will be required to put the structure into proper repair.

THE London Electric Supply Corporation has decided to apply to the Board of Trade for power to extend their area of supply to the south of Westminster Bridge, Parliament Square, and Victoria Street. The Fulham Vestry has also given notice that it intends applying to the Board for powers to supply its district.

AN underground passage was accidentally discovered recently under a house in Montmartre. The passage, which is about six feet high and somewhat more in width, evidently runs for a considerable distance, but so far only 250 yards have been explored. It is strewn with human bones, and is believed to have been used as the sepulchre of the famous convent.

THE scheme for the City of London Swimming Bath is being steadily proceeded with. Plans for the proposed site on the river at Blackfriars are in course of preparation, and it is hoped that they will be ready in time for presentation next month to the Conservancy. Resolutions in favour of a swimming bath in the City are, we hear, likely to be submitted at several of the wardmotes on St. Thomas's Day.

THE DUKE OF DEVONSHIRE has sold to the Chiswick Urban District Council four acres of land for the small sum of £1,200, for the purpose of extending the local cemetery. The land is very valuable. The Duke has also undertaken to make a road along two sides of the ground, at a cost of £2,000, so that he will lose £800 by the transaction.

A NEW coroner's court erected by the County Council in St. George's Churchyard, Camberwell, has been formally opened by Sir George D. Harris, L.C.C. The court is handsome and commodious, 36 feet by 21 feet, with panelling and furniture of oak. The accommodation includes a private room for the coroner, and waiting rooms for jurymen and witnesses. The work has been carried out by the Works Committee of the County Council.

ECCLESIOLOGICAL NOTES FROM NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

SUCH typical Westphalian Churches as those of Münster, Osnabrück, Soëst, Vaderborn, and Herford, having been dwelt upon at some length in an earlier number of this series of papers, little further allusion need be made to a district of Germany whose ecclesiastical buildings, although designed on a vast and impressive scale, and enshrining many curious and beautiful specimens of mediæval furniture, are neither so good nor so satisfactory, in a constructional point of view, as those of the Rhine provinces. "As a general rule," remarks one of our most judicious Architectural critics, "it may be asserted, the Churches of Westphalia are singularly devoid of taste and good design." "They are extremely numerous, and many of them sufficiently large for Architectural effect; but in the earlier or Round Gothic period, they betray a clumsiness which is very unpleasing,* and in the age of the Pointed Gothic, their style is wire-drawn and attenuated to a degree almost worse than the heaviness of that which preceded it.† The fact, indeed, is only too apparent, that the Northern Germans were not an Artistic people, for neither in Westphalia, nor in any of the countries between it and the Baltic,‡ do we find any Churches displaying that beauty of style or constructive appropriateness, which characterizes those of Cologne or the cities to the southward of that town." The use of the round arch was continued in Westphalia long into the 13th century, for we find it in conjunction with pointed work in the Cathedral at Münster, where a clerestory of Romanesque triplets surmounts a very peculiar pointed arcade. This arcade is clearly

A WESTPHALIAN LOCALISM.

We meet with one of exactly the same type only, somewhat loftier, and without the clerestory, in St. John's at Osnabrück. Its peculiarity consists in the arches which have perfectly plain soffits springing from pilasters without the intervention of a capital. Throughout each of these interiors, the isolated or clustered column is curiously absent. Such large wall surfaces as everywhere meet the eye in Münster Cathedral—a building distinguished for breadth and length rather than height—have been taken advantage of by the fresco-painter. Almost every inch of space in the Church glows with mural colorisation, the frescoes terminating, in the central vaulting cell of the apse with a "majesty" which imparts an air of dignity an grandeur to the whole. Without these paintings, the Münster Cathedral—deprived as it has been, only within the last few years, of a most beautiful Late Gothic Lettner or Rood screen, would appear cold and uninteresting. Advancing in a south-easterly direction, a manifest improvement is discernible in the Architecture of Germany, be it Romanesque, or Complete Gothic, the Churches of Hildesheim, Goslar, Halberstadt, Naumburg and Erfurt, being among the most refined in this part of Europe.

To the student of Architecture, whether in its ecclesiastical, civil, or domestic aspect, Hildesheim is *embarras de richesses*. The acutely gabled, and cunningly carbed fronts of the timbered houses which line its almost every street, present a bewilderingly varied selection of subjects for the pencil. But as it is with the

ECCLESIOLOGICAL TREASURES OF HILDESHEIM

that our paper is immediately concerned, bare mention can only be made of its domestic Architecture. Although the well-meant, but sadly mistaken piety of the last century has transformed the solemn Romanesque Cathedral of Bishop Bernward into a tawdry Italian *rococo* building, it retains several noble evidences of the æsthetic tastes of that prelate who presided over the see from 993 to 1022. To him are due the lofty bronze doors, rich in wrought subjects, and admitting to the body of the Cathedral from its vestibule at the west end. Likewise the great Corona Lucis,* suspended in the nave, which, 22 feet in circumference, was intended by Bernward to image the heavenly Jerusalem. Both are elaborate and costly works of Art, and, with others, have made the episcopal city of this prelate a museum of his taste and skill. The great rood, which effectually debars those seated in the nave from seeing what is going on in the choir, is one of the few screens of this kind remaining in the Roman Catholic Cathedrals of Germany.

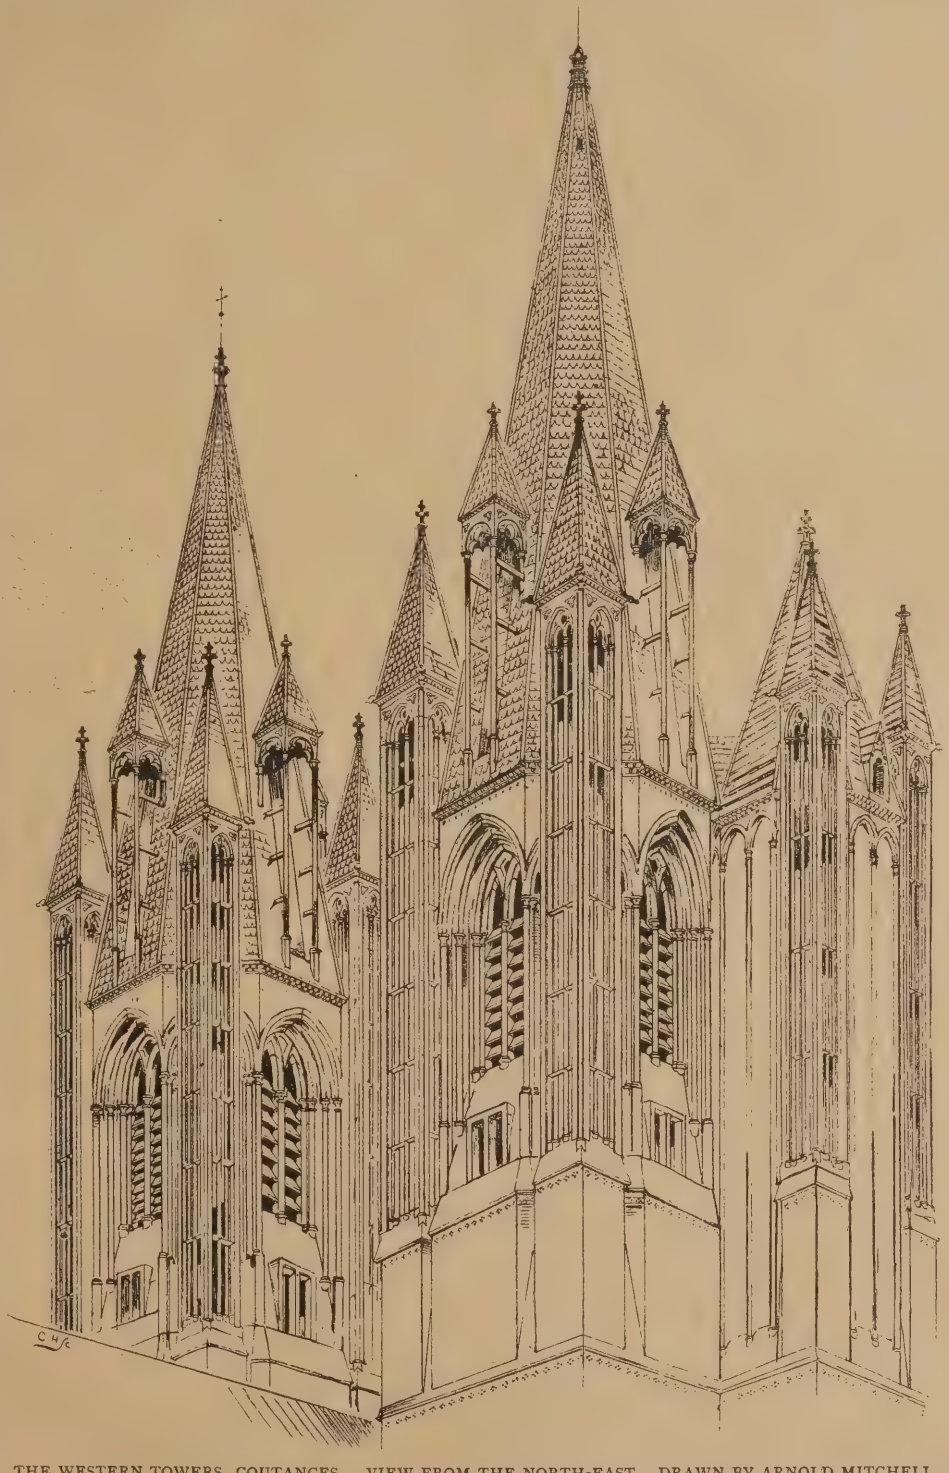
A costly work of the Early Renaissance, it will come in for a more detailed notice in that part of our paper devoted to a brief survey of German ecclesiastical furniture and decoration. The original design of the Cathedral of Hildesheim can be well seen in the noble basilican Churches of St. Godehard and St. Michael, the former held by the Catholics, the latter by the Protestants, and both restored and richly adorned with decoration, mural and vitræous, since the revival of German ecclesiastical Art. The arrangement of these two Churches is very similar, the great beauty of each residing in the elegant proportions and details of their nave arcades. The capitals of the cylindrical piers are evidently copied from the rich Byzantine-Romanesque work of the south; the carving is very varied, and each capital is in itself a study; the arches are simple round ones, and every third pillar of the arcade is replaced by a square pier, an arrangement giving an air of repose and stability to the whole which is eminently satisfactory. Some slight differences, however, in the construction of these two great Hildesheim basilicas must be pointed out. Both are cruciform in plan, with a central tower and spire at the intersection, beyond which is an apsidal eastern limb; and in the nave of each we have a blank wall space between the arcade and the simple clerestory of round-headed windows. In St. Godehard's, owing to the greater altitude of the nave piers, this wall space is much reduced, and glows as does every part of that Church, the roof excepted, with frescoed ornamentation of the richest and most tasteful character. In St. Michael's, this intervening space is much loftier, but it has not as yet received its complement of polychrome. St. Michael's, however, possesses what St. Godehard's does not, *i.e.*, the splendid painted ceiling which furnished the late Mr. L'Estrange with a model for the one at Ely. In both Churches the ceilings are flat; indeed this seems to have been most generally the case with German basilicas of the 10th and 11th centuries. The Abbey Church at Gernrode, and the Liebfrau-Kirche at Halberstadt, in the same district, present us with most interesting examples of

FLAT-ROOFED CHURCHES.

In St. Michael's at Hildesheim, the flat roof is carried right on into the apse, as at Peterboro'. In St. Godehard's, the tower and eastern limb roofs are also flat, but in the apse itself it is domical. Two tiers of round-headed windows, with a very narrow piece of wall intervening between the tiers, light St. Michael's apse, in whose lowest stage is a circumambient aisle not communicating, however, with the body of the choir, the general effect being much heavier than

* St. Patroclus at Soëst, is evidently referred to here. Despite its grandeur of dimension, St. Patroclus is a very plain, almost rude Church, its Romanesque greatly resembling that of the eastern part of the nave at St. Alban's. Doubtless its Architect depended upon colour for ornament, but as this had been almost entirely effaced at the time the above criticism was penned, the building, in common with others which had shared the same fate, *i.e.*, white-washing, naturally presented a somewhat bare and uninviting appearance. Since the Gothic revival in Germany, St. Patroclus has been extensively frescoed, and the same process is now in active operation in the great Transitional Cathedral of Osnabrück, so that the once heavy air of both these Churches has been materially lightened.

† Reference is clearly made here to such great Churches as St. Lambert at Münster, and to St. Mary-in-Meadows at Soëst, with their immense length of window opening. Scattered about the Westphalian Churches, there is much beautiful detail in such adjuncts as the Western portal of St. Patroclus at Soëst, in the Transept door of St. Peter in the same town (about to fall, it is to be feared, into the hands of the "restorer"), in the Paradise or South portal of Münster Cathedral, and in the small doorway leading from the cloister into the nave of the great Church at Minden. Much of the Westphalian window tracery is of great beauty. As specimens of the "plate tracerie" type, the great rose windows lighting the south-west transept of Münster Cathedral deserve especial mention; they resemble the "Dean's Eye" at Lincoln, very considerably. The Soëst Churches display much elegant window tracery of the various epochs in their apses; and there is some charming 14th-century work of the same kind, in the three small windows lighting the choir aisles of Osnabrück Cathedral. The Minden windows are famous, and the clusters of shafts supporting the arches which devide the nave of this Church from its aisles are noble specimens of 13th century work.



‡ The great brick Churches of that part of Germany bordering on the Baltic, *i.e.*, Lübeck, Danizig, Stralsund, Frauenburg, and Brandenburg, although noteworthy specimens of construction in that material, are notwithstanding their magnificent proportions and grandeur of outline, lamentably defective when examined in detail.

* A copy of this Corona hangs in the Architectural Department of the South Kensington Museum.

at St. Godehard's, where the aisle behind the altar opens into the choir by a series of bays similar to those in the nave. Filling up the space between these arcades and the round-headed clerestory windows in St. Godehard's, is a frieze of saints in fresco. There the transepts are open to the choir, whereas at St. Michael's they are shut off from it by screens, which, however, are no detriment, but, on the contrary, serve to impart an air of additional length to the building's interior, viewed from the west door. In each instance we have four very simple arches at the great crossing, relieved, at St. Godehard's, by others consisting of a simple roll moulding, and springing from a slender hook shaft. This same Church possesses one of those tall screen-like western façades, which, rising considerably above the roof-line and flanked by pinnacled turrets, is of a type frequently occurring in this and other parts of Germany. Goslar, a most interesting old town, nestling beneath the Hartz Mountains, on the line from Hildesheim to Halberstadt, has three Churches of the Romanesque and early-pointed epochs, each of which is equipped with one of these screen façades, forming from the railway, or in other views of the town, a strange but highly impressive group. At least half a day should be devoted by the non-sketching ecclesiologist to this old Saxon town. The writer, unfortunately, had not included it in his programme, and, therefore, was only enabled to pay it a hurried visit between the trains. To make matters worse, it was pouring with rain the whole hour and a half, so that his ecclesiological researches at Goslar were conducted under great disadvantages. We meet with a façade of this kind* at Halberstadt, in the Liebfrau Kirche there. In this instance, the portion which appears above the ridge of the nave roof is considerably lightened by some open arcade work; a pair of massive square turrets, gabled on each side and crowned by short stone spires of the Rhenish type, flank it. The western façade of Gernrode, of the once magnificent Abbey Church of Corvey in Westphalia, and of St. Martin at Brunswick, are all Romanesque and good specimens of this treatment; while among pointed examples, those which occur most readily to the memory are St. Catherine at Brunswick, and St. Martin at Halberstadt, these two last-named examples affording a singular proof of how hard old Romanesque traditions died in this part of Europe. In the pointed examples, the façade takes a gabled form. Rising as it does very considerably above the apex of the nave roof, it seems only to have been so raised to impart an air of greater dignity to the pile, viewed from the west.

AT HALBERSTADT

the student will find himself in the region of much good complete Gothic work, chiefly of the late 14th and earlier part of the 15th centuries, good, that is to say, for Germany; for it may be as well to remind him that when the people of that country suddenly abandoned that noble transitional style, which they had brought to such a pitch of perfection—they adopted one which they never thoroughly understood, and which fell far short of the perfection it attained to in France and England. From the absence of a pure first pointed style, free from Romanesque influence, as illustrated in the choir of Worcester Cathedral, to take a solitary example, the Germans have less natural growth to show in their Architecture than we have. Instead, therefore, of our beautiful gradations from Romanesque to Perpendicular, German Architecture presents a series of gaps or breaks in the chain difficult to account for, except on the assumption that they could not abandon their national style. Such breaks render the assignment of dates to German Churches somewhat conjectural, though at the same time their study is an exceedingly interesting and absorbing one. The clerestoried Dom and the two great Churches of the Dominicans and Franciscans, at Erfurt, come to the student as a welcome relief after the monotony of the Westphalian "hall" type of Middle and Late Complete Gothic, though the "hall" Church on a better proportional scale is met with in those cities. The Dom at Halberstadt is unquestionably one of the most satisfactory buildings of the Complete Gothic period that Germany possesses, and although it would stand inside the mighty Cathedral of Cologne, leaving plenty of room to spare, it is the more pleasing building of the two, from its greater sobriety and elegance of proportion. The western façade with its flanking steeples, is a rare and beautiful specimen of First Pointed work; the spires crossing the gabled towers are very similar in outline to those of the Marien-Kirche at Lübeck; truly elegant are their belfry stages, with long windows of three trefoil-headed lights, each beneath an unpierced tympanum, a type of window opening employed also in the lower walk of the cloisters.

THE WESTERN TOWERS, COUTANCES. VIEW FROM THE NORTH-EAST. DRAWN BY ARNOLD MITCHELL.

* It is not improbable that Mr. Butterfield, when designing the west front of St. Augustine's, Queen's Gate, had either these German screen façades in his mind, or those extraordinary rectangular turret-flanked belfries which one encounters in the Haute Garonne district of the South of France near Toulouse, at Montgiscard, Villefranche, and Villenouvelle.

A FORMAL transfer has been made of the Churchyard of St. James, Pentonville, to the Vicar and Churchwardens of the parish of Clerkenwell for the purpose of being laid out as a public recreation ground. Amongst the graves in this burial ground is that of Dibdin, the famous song writer, and of Grimaldi, the clown, and it has been suggested that after Lord Meath and the Public Gardens Associations have assisted the parish in laying out and furnishing the grounds there shall be a public subscription for memorial fountains to these two men.

AN Electrical and Engineering Exhibition is to be opened, in February next, at Newcastle-on-Tyne, to commemorate the sixtieth year of the Queen's reign. It is proposed to illustrate the advances in engineering made since 1837.

THE Bishop of Marlborough has laid the foundation stone of the new Parish Church of St. Gabriel, Willesden, which is to be rebuilt to replace the old iron building that has been used for some years past. The new Church will cost a little over £7,000.

As the result of a petition from the inhabitants of Islington, the Cattle Markets Committee recommends, in a report just issued, that the vacant land adjoining the Metropolitan Market, at Islington, should be offered to the Islington Vestry for the sum of £16,000. The original amount asked for, under a valuation, was £24,000.

AN IDEAL ARCHITECT:—ARTIST, CONSTRUCTOR, ENGINEER.*

(*Concluded.*)

COME to still more modern times, and let us see whether the Architects of the present day are also capable of engineering feats. During a recent visit to America, I had an opportunity of seeing the leviathan buildings which have made Chicago so famous, and I had the advantage of going over, with the Architect, one of the largest in course of construction. I was told that the foundations of Chicago, possibly on account of its proximity to Lake Michigan, were notoriously bad, wet, and shifty, and presented great difficulties (which may fairly be described as engineering ones) to be overcome. Nevertheless, the American Architects, nothing daunted, have managed to erect the highest inhabited buildings in the world on this most unsound foundation; and I must say, although I looked about me with considerable interest, I did not see evidence of settlements having taken place, although the weight of these buildings must have been something enormous. Some of them are of 20 stories, rising to a height considerably greater than the spire of St. Mary's Cathedral in this town, which is 220 feet; and whilst I was there it was projected to erect a building of 34 stories, which would probably be 400 feet high. The buildings are carried on an ingenious foundation or platform of light ironwork and concrete. Each story is a self-supporting structure of ironwork, the stone facing being merely attached to it, the whole presenting an exhibition of engineering skill. Many other examples may be cited where Architects have shown the highest engineering skill in connection with their buildings, and I venture to say our "Ideal Architect" has proved that he is also an Engineer. As distinct from this, an Architect must also be a "Constructor." He must have the most thorough and complete acquaintance with all building materials, and how to put them together. He must understand thoroughly the details of each trade that is required to make up a building. If, in addition to being able to tell a workman that he is doing his work wrongly, he can also *show* him how it ought to be done, then he is indeed an "Ideal Architect." There are Architects who can do this. A practical acquaintance with the trades, more especially the carpenter's, is invaluable. The Architect in whose office I was brought up, thought a great deal of this, and an occasional turn at the bench was part of the curriculum of his pupils. Without such knowledge we cannot hope to be "Ideal." The men who designed the great wooden roofs of Westminster Hall, and of the fine old Parish Churches, the designers of the beautiful fan vaulting with its pendentives, of Henry VII. Chapel, and King's College, Cambridge, of the great stone-vaulted Churches of Spain and Southern France, with their clear spans of some 70 feet, and the men who put up such domes as St. Peter's in Rome, and St. Paul's in London, were all great constructors. The mere contemplation of these inspires to great things, and encourages us in going through the drudgery of acquiring practical knowledge which makes such things possible. Lastly, perhaps it would have been more correct to have said firstly, the Ideal Architect must be an Artist—must be full of Art. By this I do not mean to say that he should be able to paint a picture, or model a statue, but he must have a thorough knowledge, and he must be a judge of all the Arts that go to make up his building, clothing and adorning it in robes of beauty, from the hammered Art of the blacksmith to the gorgeous mosaics that fill the pendentives of his domes, and give colour and life to his walls. I know no more important function of the Architect than the determining of the size and scale of the figures that fill the stained windows or adorn the walls in frescoes or statuary. It is essentially the work of the Architect, and should always be left in his hands. The Artist who paints his pictures in glass or otherwise, the sculptor who has to produce the statuary, are not always the best judges of the proportion these figures should bear towards the building. We are all human, and there is a natural tendency to give undue prominence to our own—sometimes with lamentable results. I know no more striking illustration of this than can be seen in the Great Basilica of St. Peter's, at Rome. The elder PUGIN, who was not only a great Architect, but also a great Art critic, always spoke of it as the "Great Failure," perhaps for this reason. Immediately on entering the Church you take holy water out of a stoup held by an angelic cherub, in marble, if I remember correctly, some 9 or 10 feet high. The visitor is naturally overwhelmed at once, not by the grand dimensions of the Church, but of the cherub, which is out of all proportion with everything; nor is this first impression of disappointment dissipated until, leaving as it were the Church behind, he stands under Michael Angelo's matchless dome, lifting its great height into heaven itself, glowing in its mosaic enrichments of admirably proportioned figures. If the cherub had been where these mosaics were, it would have been about the right size. There have always been, and there are amongst us now, eminent Architects who can draw the cartoons for stained glass and decorations, the details of carvings, hammered iron work, and the Artistic furniture of their own buildings. No doubt this Artistic gift is not given to all in equal degree—but to all is given, more or less, a certain Artistic perception—a knowledge, as it were, of good and evil in Art; and it is this gift, which it is natural to suppose is possessed in a marked degree by those who dedicate themselves to Architecture, which every Architect is bound to develop and encourage in every possible way, and in no better way than by the reverent study of the works of the great men who have gone before us—nay, for the matter of that, by the study of the works of the men of the present day (some of them most beautiful and worthy of study) which spring up around us in all our great cities, and from which lessons are to be learnt as readily as from the works of the middle ages. Therefore, every Architect should be able at least to sketch and control the decorations and adornments of his own buildings. The success of every building depends more or less on the way these are carried out. Where they have been carefully supervised, there is that indefinable sense of completion which gives such satisfaction. More especially is this so in regard to carving. It is not wise to turn a carver, however able, loose into a building, with a general direction that it is to be done in such and such a style. All important carving should be modelled in clay under the direction of the Architect, who should be able, if need be, to take up the tool or use his hands to shape it to his wish. Modelling in clay is both an easy and delightful amusement. There is still one other little thing an Architect must be. He must be an eminently just man. Between client and contractor he occupies a very delicate position, and he is required to hold the scales of justice between the two with the greatest nicety. He may have a client who expects too much, or he may have a contractor who is disposed to give too little. This involves intricate and delicate questions. It is a subject that has been ably dealt with before the Institute of British Architects, and I do not propose, in this paper, to say more than, when such questions arise, which I am pleased to think are not very common, if we are guided by the conscientious conviction of what we think just, irrespective of all other consideration, we shall be right, and may rest satisfied. One word more before I finish. Why are Architects not more thoroughly identified with their works than they are? In other words, why do Architects not sign their work as do painters, sculptors, and engineers? Is not the work of an Architect a picture in stone, marble, or terra-cotta, as the case may be, enduring for long ages? I am not one of those who think it is ill taste for an Architect to allow his name to appear on his building. On the contrary, I am of opinion that both the name of the designer and the date should appear on all the more important buildings. From an historical point of view alone it would be most valuable. The history of many of the finest monumental works of bygone ages would have been better known had this custom obtained. We happen to know who were the Architects of the Parthenon, and the sculptors engaged on that most perfect work; but who can say the name of the Architects of the equally wonderful work of the Baalbek and Nile temples, of which we have spoken? Who conceived that splendid pile of towers and gables crowning the hill at Durham? for there is little doubt, although the Cathedral was built at different periods, the general idea was the conception of one mind. For the matter of that, who designed our own beautiful St. Nicholas? We know who was the generous citizen who paid for it; but who was the Architect who carried out this engineering feat, and, at the same time, clothed it in such graceful form? During my travels in different parts of the world, I have had opportunities of seeing wonderful examples of Architectural Art, but I have observed, I confess with feelings of sadness, how exceedingly rare it is to find any record of the men who produced them—their very names are unknown. The princes in whose reigns they may have been erected are all duly recorded, and occasionally the names of the generous donors are handed down to posterity; but of the great minds that have created these wonderful works which have for ages gone by and will for ages still to come be the delight and astonishment of the world, there is no record. Let us hope that the poor Architect worked for the love of his Art, and not for fame; that he may have reaped to some extent, at all events, a portion of his reward by seeing his dreams realised in imperishable materials. Perhaps in thinking it should be otherwise we expect too much. I do not know, but I think the question as to whether an Architect should sign his work is worthy of consideration.

* We have pleasure in giving prominence to the opening address of Mr. Archibald M. Dunn, President of the Northern Architectural Association. We are able to exclusively publish this interesting paper, with the conclusions of which we are in entire agreement. Indeed, they voice the attitude to Architecture repeatedly expressed in these columns. The Article will be concluded next week.

IT is proposed to extend the Cheyne Hospital for Children by the erection of a double ward at a cost of £1,400.

FOR the convenience of those unable to attend during daytime, the Arts and Crafts Exhibition, at the New Gallery, Regent Street, will be open every evening of this week from 7 to 10, with the exception of Thursday, on which night Mr. Halsey Ricardo will lecture on "Colour in Architecture." The exhibition closes on Saturday.

TRINITY CHURCH, New York, in the Broadway, is said to show signs of impending ruin, and if a total collapse of the Church is to be averted most extensive repairs will have to be effected. Its crumbling condition is distinctly traceable to excavations and blasting operations carried on in its immediate vicinity.

Sir Christopher Wren and his Work.

AN HISTORICAL AND CRITICAL SKETCH.

By ARTHUR STRATTON.

Read before the Liverpool Architectural Society, and published exclusively by the Builders' Journal.

PART II.—THE WORK OF WREN.

(*Concluded.*)

DESIGNS NEVER EXECUTED, SURVEYS, TREATISES, &c.

Designs for the Restoration of St. Paul's, with Cupola, before the Fire.
Do. The Rebuilding of the City of London after the Fire.
Do. Royal Mausoleum at Windsor 1678
Do. Theatre and Library at Trinity College, Cambridge 1678
Do. Winchester Palace. Part only executed.
Do. St. Mary, Warwick. Tower only executed. 1694
Do. Whitehall Palace 1697
Do. Western Towers and Central Spire to Westminster Abbey.
Do. Baldacchino, etc., St. Paul's.
Survey of Salisbury Cathedral 1669
Do. Audley End 1695
Do. Westminster Abbey.
Treatises on Scientific Research, very numerous.
Do. Architecture (incomplete) published in "The Parentalia."

A GENERAL CLASSIFICATION OF THE CHURCHES ERECTED IN THE CITY OF LONDON, AFTER DESIGNS BY SIR CHRISTOPHER WREN.

The names of the Churches in each group are arranged in the order in which they were commenced.

Those printed with an asterisk against them have since been removed or destroyed from various causes.

S. denotes Stone Steeple or Lantern.
L. ,, Lead Spire or Lantern.
T. ,, Tower only.

CENTRAL AREA PLAN.
(Domed.)

S.—St. Stephen, Walbrook.
* T.—St. Benet Fink, Threadneedle Street.
L.—St. Swithin, Cannon Street.
* S.—St. Antholin, Watling Street.
L.—St. Mildred, Bread Street
L.—St. Mary Abchurch, Abchurch Lane.

GREEK CROSS PLAN.
(Intersecting Barrel Vaults.)

T.—St. Mary-at-Hill.
L.—St. Anne and St. Agnes, Aldersgate.
L.—St. Martin, Ludgate Hill.

SIMPLE APARTMENT.—NO AISLES.
(Vaulted or Ceiled throughout.)

* T.—St. Olave, Jewry.
L.—St. Michael, Wood Street.
* T.—St. Mildred, Poultry.
S.—St. Stephen, Coleman Street.
L.—St. Nicholas, Cole Abbey.
* T.—St. Michael, Queenhythe.
* T.—All Hallows, Bread Street.
* S.—St. Mary Magdalen, Knightrider Street.
* L.—St. Benet, Gracechurch Street.
* T.—St. Matthew, Friday Street.
L.—St. Edmund-the-King, Lombard Street.
T.—All Hallows, Lombard Street.
S.—St. Michael, College Hill.
T.—St. Mary, Somerset.

BASILICAN OR AXIAL PLAN WITH SIDE AISLES.
(Vaulted or Ceiled throughout.)

S.—St. Mary-le-Bow, Cheapside.
T.—St. Michael, Cornhill.
* T.—St. Dionis, Backchurch.
S.—St. George, Botolph Lane.
L.—St. Magnus the Martyr, London Bridge.
S.—St. James, Garlick Hithe.
L.—St. Mary, Aldermanbury.
L.—St. Michael, Bassishaw.
* T.—St. Bartholomew-by-the-Exchange.
S.—St. Bride, Fleet Street.
St. Clement Danes, Strand (Apsidal).
L.—St. Peter, Cornhill.
T.—St. Mary, Aldermary.
L.—St. James, Piccadilly.
L.—St. Austin and St. Faith, Watling Street.
S.—Christ Church, Newgate Street.
T.—St. Andrew, Holborn.
T.—St. Andrew Wardrobe.

BASILICAN OR AXIAL PLAN, ONE AISLE ONLY.
(Vaulted or Ceiled throughout.)

L.—St. Lawrence, Jewry.
T.—St. Clement Eastcheap.
* T. All Hallows-the-Great, Upper Thames St.
L.—St. Benet, Paul's Wharf.
L.—St. Margaret Pattens, Rood Lane.
* L.—St. Michael, Crooked Lane.
L.—St. Margaret, Lothbury.
S.—St. Vedast, Foster Lane.

MAIN DRAINAGE SCHEME FOR MANCHESTER.

THE report of Mr. T. de Courcy Mead, the City Surveyor, upon the main drainage scheme, with a description of the works included in the original scheme, those actually executed or in course of construction, and those still required to complete the whole undertaking, bearing date October 19th, has at length been printed and circulated. The report commences with a summary of the proceedings of the committee, and a short chronological account of the schemes for main drainage and flood prevention that have been from time to time under their consideration, and which ultimately led to the adoption and execution of the main drainage works now approaching completion. It was not until 1887 that a scheme was resolved upon, which was the scheme of Mr. Allison, the estimate of the cost being half a million of money. The approval of the Local Government Board was given in March, 1889, subject to certain other modifications and additions, and a month later the City Council instructed the committee to carry out the work. By the incorporation of Blackley, Clayton, Crumpsall, Kirkmanshulme, Newton Heath, Openshaw, and West Gorton, in 1890, an extension of the intercepting system of sewers became necessary, the capacity of the sewers already decided upon being, however, in Mr. Allison's opinion, sufficient for the extra sewage brought into them. To meet the necessary cost of the extension power to borrow a further sum of £100,000 was obtained from the Local Government Board. Mr. Allison died in February, 1894. After giving in minnte detail a description of the works at Davyhulme, and the processes performed there, together with descriptions of the sewers of the city, the City Surveyor says he has endeavoured to prepare a comparative statement, showing the original estimates and the actual cost of the works in detail, but as the contract work was not let in the same sections, as set out in the original estimate, he found it was not possible, with the information available, to make out a statement of the kind indicated. He desires, however, to point out that the original estimates did not include the sums that have necessarily been expended on arbitrations and other contingent expenses. The estimate, amounting to 500,000, was for the main drainage of the city before extension, at a time when the

SHIP CANAL WAS NOT CONSTRUCTED,

nor was the Mersey and Irwell Joint Committee in existence, and the standard of purity which might then have sufficed, would not now meet the altered circumstances of the case. The treasurer's return of the amount spent on sewerage and sewage disposal capital account to the 30th September last, was £636,026 12s. 5d. Mr. Meade estimates that for completing the scheme the following sums will be needed:—Further payments on contracts, £56,265; cost of sewer connections, reversals, renewals, and repair of old sewers, £47,800; wayleaves, easements, and compensations, £10,150; repair of water, gas, and other pipes, and on highways, £2,500; reconstruction and repair of old sewers in the field of new works, £2,000; provision of flush chambers, £5,000; Shooter's and Newton Brooks' reversals, repairs, and reconstruction, £9,270; completion of works at Davyhulme, £21,771; sludge disposal (cost of steamer, £25,000, pumping mains, jetties, tank, and additional machinery, £6,250), £31,250; estimated cost of effluent conduit from Davyhulme to the estuary of the Mersey, £258,000; establishment charges, legal and engineering expenses, and sundries, £10,000; making a total of £454,006, from which is to be subtracted estimated amount payable by the Stretford District Council on capital account, £26,052 8s. 9d., estimated amount payable by the Audenshaw District Council £600, and sale of the plant, material, &c., £1,000, leaving a net total of £426,353 11s. 3d. Summary:—Amount expended upon sewerage and sewage disposal, £636,026 12s. 5d.; required for the completion of the scheme, £426,353 11s. 3d.; total estimated cost of completed scheme, including the estimated cost of the works proposed for effluent disposal and sludge disposal, £1,062,380 3s. 8d. The borrowing powers at present in force amount to £175,750, and further borrowing powers will be required for the completion of the work within the city, and for additional works at Davyhulme, exclusive of the conduit to the estuary, amounting to a total sum of £88,630. In an appendix, dated August 24th, the City Surveyor submits particulars as to the repairs of work under main drainage contracts. In one contract, the work varying from 9 ft. circular to 3 ft. by 2 ft. egg-shaped sewers, a total length of about 6,985 yards, the work was defective in places, and the contractor had made good almost all the defects that were discovered. In a contract for a circular storm overflow and effluent conduit at Davyhulme, a portion of the sewer between the tanks, about 125 yards, partially collapsed and

BECAME DANGEROUS.

This small portion of the work was, therefore, removed and rebuilt at the expense of the Corporation. The remainder of this sewer does not show any appearance of failure. A report on certain contracts for sewers in the City was omitted, as a law-suit is pending between the Corporation and the contractors. Certain works at Davyhulme were reported as complete on the 9th July, 1894, and during the same month the effluent was admitted to the surface of the filters. Within a short time defects became apparent, and large quantities of soil were washed into the pipes. It was then discovered that the portions of the work opened for repair were defectively executed, and after a further trial it was found that the whole of the carriers for drains were most improperly constructed, therefore, the entire work, including the main carriers, with the exception of a small fraction at one end of the ground was re-executed by the contractor and at his expense. The large concrete effluent carrier was also found on examination to be made with much less than the specified quantity of cement, and a proportionate deduction was made from the contract for this omission. The work was executed under the immediate direction of a clerk of the works with two inspectors to assist him. These persons had no other duty to attend to, and as the whole of the work was fully exposed to view from the surface during construction they were dismissed by the committee when the

DEFECTS WERE DISCOVERED.

The works were finally measured by Mr. Jackson, quantity surveyor, and although considerable trouble, inconvenience, and 17 months' delay had been occasioned, the committee had now received the full value of the sum expended. In another of the contracts for sewers in the city, a length of 1,413 yards had to be taken out and reconstructed by the contractor at his cost. Sewers varying from 5 ft. to 2 ft. 6 in. in diameter in another contract in the city had been found defective only to the extent of 1½ per cent. of the whole, and the defects had since been made good by the contractor. In a contract for 4,700 yards' length of sewers about 57 per cent. of the brick sewers were found to be defective, and had been reconstructed by the contractor at his expense. About 5,519 yards of sewering which is still in course of construction in the north of the city has been examined. That portion under the direction of the present staff has been found sound throughout, but some of that previously executed has been found defective, and it has not been practicable to repair the defective parts of the work at present, as the sewer is being used for carrying off the water pumped from the works in progress at the higher levels. When these are completed the contractor will take out the defective work

and make it good at his own cost. This contract will take a much longer time than was anticipated to complete, as it has to be executed for the most part in running sand. The cost will also be consequently increased. Another length of sewering, of 5,392 yards, found the contractor unable to continue the works at his contract prices, and they were therefore taken possession of by the committee's staff. The cost of executing the work by the committee's staff had been in

EXCESS OF THE CONTRACTOR'S PRICE,

but thoroughly sound work has been secured. The work previously executed by the contractor under this contract has been closely examined and found to be of good quality. Every endeavour, says the City Surveyor, is being made to ensure that the works now in progress are being executed in accordance with the contracts. At intervals the work is being cut into by the staff of the Paving and Highways Committee or of the Rivers Committee, and the work is then carefully examined by the engineers or the district surveyors, and the result reported to the City Surveyor. This system ensures, as far as practicable, the execution of good work. By arrangement between the Chairman of the Rivers and Paving Committees the connections between old and new sewers are now being made by the staff of the Paving Department, under the direction of the City Surveyor. The cost of the work will considerably exceed the amount originally estimated, and in many cases the old sewers, when opened, are found to need total or partial construction. An approximate estimate of this work will be submitted by the City Surveyor.

NEW BILLS FOR NEXT SESSION.

WORKS of public interest embodied in private Bills for next session are likely to be numerous, and some of the new schemes affect both the East and the West End of London to an important extent. The leading railway companies are the chief promoters of these schemes, and although the mileage of new lines to be constructed is not large the work proposed to be done in the country is for the most part useful as connecting links between existing systems. Three new schemes in London first attract attention. An underground railway from Piccadilly Circus to South Kensington, to be worked by electricity. Then the Metropolitan District Railway Company are applying for power to construct a deep-level electric railway from Earl's Court to the present Mansion House station in the City, passing under the Savoy, the Strand, the Temple, and St. Bride. Power is also taken to enable the Company to work their existing railway by electric power, and to construct additional works. As to the East End, there is a scheme for the construction of a railway from Whitechapel to Bow, connecting the Metropolitan Railway at Vallance Road with the London, Tilbury, and Southend Railway near Campbell Road, along with subsidiary works, to be carried out by a company to be incorporated for the purpose, in conjunction with the existing companies concerned. In addition to these London schemes a company proposes to construct a "West Suburban Railway," to be worked by electricity, from Praed Street, Paddington, through Kensington and Hammersmith, to Willesden, near the "Grand Junction Arms" public-house. In North London, the present Tramway Company propose to make several extensions and additions to their existing lines in Islington, Hackney, West Ham, Bethnal Green, &c. The Great Northern, Finsbury Park, and City Electric Railway Company are also applying for an extension of time for the construction of their proposed railway.

"BLACK JACK ALLEY," which is famous as the residence of the real original Joe Miller, of Jest Book fame, is likely soon to be abolished, as the Board of Works of St. Giles is about to open up new streets or widen old ones between Lincoln's Inn Fields and the Law Courts.

MESSRS. E. J. RAYBOULD & CO., LIMITED, Workington, have secured a contract for the supply and erection of fencing and gates on commons in the North of London, for the Tottenham Urban District Council. The amount to be laid out by the Council is £1,075.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
December 2nd, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

AT the bottom of the Haymarket the last vestige of the huge block of buildings of which Her Majesty's Opera House formed the central feature will soon have disappeared. The arcade and line of shops on the southern side of the site are being demolished, and there are already great gaps in the once pretentious façade. The clearance of the ground is a preliminary to the erection of another hotel. It may be hoped that the efforts made by private enterprise in this direction will stimulate the authorities to a little activity in removing that other eyesore of central London—the vacant site opposite Dover House in Whitehall. The condition of this ground, with its tumble-down shanties and its heaps of rubbish, is a scandal.

THE lighting of the City by electricity is by no means complete, as there is an enormous area which is still illuminated by gas. The principal thoroughfares have been treated in a lavish manner; indeed, there are many who consider that the scheme is an extravagant one. It is in the smaller streets and byeways that a good supply of light at night is most needed. The members of the Commission of Sewers have, however, been somewhat exercised in their minds as to the precise system of electric lighting they should adopt in the minor streets. It is obvious that anything on an ambitious scale is quite unnecessary, and that it is not imperative that the system to be employed shall be an expensive one; but, at the same time, it must be adequate. With a view to ascertaining the best system of lighting these smaller streets, a series of experiments has been carried out by order of the Streets Committee, under the direction of the electrical engineer to the Commission (Mr. Voysey). In Watling Street, Bow Lane, Bread Street, Friday Street, and Old Change, experiments have been carried out by continuous and alternate current lamps, some partly on brackets fixed against the fronts of houses, and partly by lamps suspended across the centre of the street. The Commission has not yet decided which of these processes is the best.

PROPOSALS for the establishment of no fewer than three new metropolitan theatres have been before the Theatres Committee of the County Council. Mr. F. W. Purcell has secured the approval of the Committee to the plans of the Alexandra Theatre in Stoke Newington Road, between Princess May and Wiesbaden Roads. The Council's regulations are fully complied with, and the new house will accommodate 2,000 persons. Drawings submitted on behalf of Sir Henry Brownrigg for the construction of another, to accommodate an audience of 800, at the corner of Norris Street and St. Alban's Place, Haymarket, have also passed the Committee. To the request for permission to erect a building in the New Cross Road, Deptford, the Theatres Committee, however, offer uncompromising opposition, on the ground that the site is unsuitable. All three applications will come before the Council at an early date.

A CORRESPONDENT, writing to the Daily Graphic on "Vanishing London," says:—"Many of the doomed Churches, such, for instance, as the beautiful edifice ruthlessly destroyed in Regent Street, could surely be re-erected in neighbourhoods where there is a demand for places of worship. I imagine the expense would not be greater than if totally new Churches, of new design and new materials, were built. Historical monuments, whose Artistic merits had successfully passed the test of time, could thus be made to bring interest into otherwise uninteresting neighbourhoods. As to valuable specimens of domestic Architecture, why not re-erect them as a real and permanent "Old London Street," to form an annexe in the grounds of one of the existing museums, or else at some such place as Wembley Park, the Crystal Palace, or Earl's Court? The rooms might be used as a museum of the history of London.

OF the City Churches of the old school, one of the most interesting is St. Nicholas Cole Abbey. The Church stands on the brow of the hill, which was occupied in mediæval times by the City fish market, that extended from Queenhithe, hard by Cannon Street Station, westward. The affix, "Cole Abbey," is somewhat of a mystery. A few authorities derive it from "Cold Harbour," which seems a little far-fetched. Others think it refers to a problematical founder named Nicholas Colbey. The present Church was built by Wren, at a cost of £5,500, its predecessor having been totally destroyed in the Great Fire. It is interesting from an Architectural point of view, as it is the first of the 49 Churches that Christopher Wren built in the City. The building is rectangular, without any defined chancel, the sacrarium being surrounded by a carved oak rail. The reredos is also of oak, and dates back to the building of the Church. It is richly carved, the work being, it is believed, by Grinling Gibbons. The centre is filled by a mosaic representing the Agnus Dei, with the symbols of the four Evangelists in the angles, the panels on either side being occupied by figures depicting the sacrifices of Abel and Melchisedec. Perhaps the most artistic thing in the whole Church is the seventeenth-century brass chandelier, which hangs in the centre of the building.

A MEETING of the executive committee of the "National Trust for Places of Historic Interest or Natural Beauty" was held at Great College Street, S.W., last week, Sir Robert Hunter presiding. It was announced that the whole of the purchase-money for Barras Headland had been received, but that only £160 has been obtained for the preservation of the old pre-reformation clergy house at Alfriston, out of the £350 appealed for. Mr. A. Powell, the Architect, reported that unless further funds were forthcoming the work of repair would have to be suspended, to the imminent danger of the fabric. The committee hoped that the public would prevent such a contingency arising by immediately contributing to the presentation scheme. Sir Robert Hunter and Canon Rawnsley were nominated to represent the Trust upon the committee elected by the London County Council to consider the possibility of scheduling and preserving the historic buildings of London. The resignation of the secretary, Mr. Lawrence W. Chubb, who has been appointed secretary of the Commons Preservation Society, was accepted, and a vote of thanks to Mr. Chubb for his indefatigable efforts in the Trust's work was passed. Mr. A. M. Poynter, son of the President of the Royal Academy, was elected secretary in his place. It was determined to confer with the Open Space Societies regarding a suggested appeal to landowners and local authorities throughout the United Kingdom to dedicate to the public, in commemoration of Her Majesty's sixty years' reign, some open space, footpath, or place of historic interest or natural beauty during the ensuing year. The proposed demolition of the Herber Tower at Newcastle to make room for a bakery was brought before the notice of the Trust, and it was decided to appeal to the Corporation of Newcastle and to the Armourers' Company of Newcastle to do their best to retain this interesting tower upon the western walls of the northern city.

DR. E. W. HOPE recently gave a lecture on Municipal Sanitation, in which he gave a retrospect of the deplorable condition of things in Liverpool prior to the various Public Health Acts, of which Liverpool was the pioneer. He referred to the evolution of sanitation through successive periods, and spoke of the great difficulty the early promoters of the science had to contend with, not only amongst the poor and

ignorant, but also amongst the educated. The importance of water could not be over-estimated, and it was gratifying to know that the magnificent water supplies, instead of flowing to waste over the by-washes, were made use of for flushing the city. Purity of air was the most important requirement. We were satisfied to take in our food three or four times in the 24 hours, but we took in air 16 times every minute. Air of cities was from the nature of it essentially impure, but there were points in which individual attention could do much to mitigate, such as smoke. There was no reason why, in addition to the ordinary products of combustion, a canopy of smoke should always hang over the city. In the course of his lecture, Dr. Hope touched upon many other interesting matters of this widely important subject.

THE old Church at Bow is in so dangerous a condition that it has been found necessary to close the building, and conduct the services in the vestry hall. The question under discussion is whether it shall be pulled down or restored, and there seems some difficulty in coming to a decision. To put it in thorough repair will, it is said, cost £600; and considering that the building has a history extending over nearly 600 years, it would seem at first sight that the best thing to do is to set about the task at once. On the other hand, it is urged that, as the Church stands in the centre of the road, and will have to be pulled down sooner or later to accommodate the traffic, it would be wiser to remove the old building and erect a new Church on another site. The Church was erected in the 14th century as a Chapel of ease to Stepney, and, although not of striking interest Architecturally, it is a picturesque object. Sir Walter Besant says:—"There is not much in the Bow Road, except the beautiful old Church of Bow standing in the middle of the road, crumbling away slowly in the East End fog, with its narrow slip of crowded Churchyard; one hopes that before it has quite crumbled away someone will go and make a picture of it—an etching would be best."

FROM time to time different objects are being placed in show cases of the British Museum, but in no department is the addition so apparent as in that of the department of Egyptian and Assyrian antiquities. Not many days ago we noticed the addition of some very valuable bronze castings and some important works of Art in crystals, and now we have to chronicle the addition of a very important inscription of King Samsitiluna, who reigned over Babylonia in B.C. 2145. This king constructed some of the principal canals of Babylonia, and was a great worshipper of the god Sin, the Moon god of Ur, the ancient city of Abraham, and now marked by the mounds of Tel el Mugheir. There is also a curious object made of granite, which may have served as a gate socket; it is inscribed with a votive inscription of Sid-lam-ta-ud-da about B.C. 2500.

AT Aberdeen University College, Mrs. Lauder Thomson recently delivered the third of her course of lectures on "The Italian Painters, Sculptors, and Architects of the Early Centuries." In the course of a reference to Lorenzo Ghiberti, who died in 1455, the lecturer said that well-known painter gathered many distinguished men around him by his abilities, one of the most prominent being Masaccio, who was born in 1401. Masaccio, from an early age, was wrapped up in his Art, his great object being to give his figures life and animation, and to abandon the formalities of Art. Although he died while still young, Masaccio's frescoes marked an epoch. Speaking of his work, Mrs. Lauder Thomson remarked that he was one of the first that could draw the nude figure. Now he was ranked not only as one of the best painters of his time, but of after years. Up to that period the painters' and sculptors' work dealt chiefly with ecclesiastical subjects; but Fra Filippo Lippo, although proceeding on the same lines as Masaccio, did not attain the same heights, and lost reverence and spirituality in dealing with sacred subjects. Then with Benozzo Gozzoli, who lived between 1420 and 1498, Scripture subjects were the medium for representations of costume, landscape, and animal life. His frescoes were beautiful pictures, full of animation, and his existing works were considered to be very valuable as marking the remains of that particular school. In concluding the lecture Mrs. Lauder Thomson said her hearers could not but be impressed by the wonderful strides Art had taken in the years she had spoken of. At the death of Gozzoli how perfect Art had become. In many instances she thought it would be good if they could go back to the spirituality of design of some of those old pictures, to stand in front of which was a sermon in itself. The splendid lime-light views helped greatly to a true appreciation of Mrs. Lauder Thomson's lecture.

JERUSALEM remained what it was in the middle ages until comparatively a short time ago. The new town outside the walls has destroyed its character as a hill stronghold. Unfortunately changes are taking place within the walls as well as without. Many of the old buildings have been demolished, and the time seems to be approaching when there will be none left at all. The rival Christian bodies are the worst offenders, and the French and Russian missionaries the most active in the work. The former have swept away the fine ruins of the Byzantine Church of St. Stephen to make room for a new one of the order of Architecture favoured by the suburban builder. The ancient Church of St. Anne is being crowded with the tawdry and tasteless ornament of modern Rome. What is called the Pool of Bethesda, a twelfth-century structure, is going to be restored. The Russians disfigured the Valley of Jehoshaphat years ago by a hideous memorial Church. They have built a tower like a factory chimney on the top of the Mount of Olives, and reared a huge barrack for pilgrims on the Jaffa road. In the centre of the city the Germans have cleared away the beautiful ruins of St. Mary's, and a new Lutheran Church is the phœnix arising from the ashes. The mediæval buildings attached to the Holy Sepulchre are disappearing piecemeal.

IN a paper published in the Proceedings of the American Society of Civil Engineers, by Mr. G. S. Morison, the question of the design of suspension bridges is discussed. Mr. Morison holds that for spans up to 800 feet a cantilever or truss bridge will, in general, be more advantageous than a suspension structure, while the latter is best fitted for freeing openings exceeding these limits. For the cables he advocates the use of wire ropes, in place of the straight wires which have been considered best up to the present. The main cables are arranged to terminate at the tops of the towers, which are stayed back to the shore anchorages by special stay cables. In this way the distance between the tower and the anchorage point may be made any desired amount in place of being dependent on the span and dip, as when the cables are continued over the towers. A very similar arrangement was shown in the competitive designs for the great suspension bridge over the Danube, adjudicated on two or three years ago. Here the main cables were made continuous over the piers, and were reinforced by special stay cables between the tops of the piers and the anchorages. Mr. Morison proposes that for a 3,200-feet span the stiffening truss should be 4,100 feet long, thus extending far beyond the towers. The suspenders between this truss and the main cables should only extend over the central seven-eighths of the span. The stiffening girder, he suggests, should be of the cantilever type, the hinges being fixed at points 150 feet distant from each tower.

EVERY archæologist and lover of the picturesque will bitterly oppose the proposal to make serious alterations in the delightful old Hospital of St. Cross, near Winchester. What is suggested involves the destruction of some of the existing buildings to provide a new house for the master, who is himself among the objectors to the scheme. Nothing but the most absolute necessity, which seems in the present case impossible to plead, would excuse any tampering with a group of buildings so uniquely beautiful; and certainly a proposal leading to so much danger to the Hospital needs supporting by very much stronger arguments than have as yet been advanced in its favour. Even the trustees of St. Cross are so far from being unanimous about the need of the additions and alterations that there was, when the scheme was discussed by them, a majority of one only in its favour. It is as well to point out that if increased accommodation in the Hospital is desirable, it can easily be provided by an extension on the western side of the quadrangle, without touching any part of the existing group.

IT is proposed to place a memorial to the late Primate in the Parish Church of Pateley Bridge, the Benson family having been connected with the district for over 500 years. They were originally tenants of Fountains Abbey, and foresters and afterwards freeholders of Knaresborough Forest. Early in the fourteenth century Robert Benson held the lodge of Brighouse, and from him the late Archbishop was descended in a direct line. The parish registers from 1557 to 1806 (when the Archbishop's grandfather was buried) contain many entries relating to the family. The memorial will take the form of a brass lectern and the completion of the chancel, the extent and character of the work depending upon the amount subscribed.

IT has been decided to expend about £1,000 in draining, road-making, and renewing the surface of Dudhope Park, Dundee, the work to be done in three instalments, and the expenditure to be spread over from three to five years. The first instalment is to be proceeded with at once, and consists of excavating of walks, drainage, and forming of walks in that portion of the park lying between Barrack Road on the east, westward to and inclusive of the walk leading from the Hospital buildings to Dudhope Terrace.

AN electric railway for passengers is proposed for Mont Blanc. Up to a certain height it would be on an inclined plane, and the ascent would be completed by a vertical shaft of a depth of 2,539 mètres, through which powerful electrical lifts would convey the passenger to the summit. We predicted it would come. After Pilatus, the Yungfrau; after the Yungfrau, Mont Blanc. If the scheme is ever carried out it will serve at least one useful purpose, inasmuch as it will afford a ready means of access to the observatory which has been established on the top of the monarch of the Alps.

WE are accustomed to regard Italy rather as a field for the remains of highly-developed civilisations than one for the discovery of relics of primitive and pre-historic communities. But of late, both on the mainland and in Sicily, Italian archæologists have been unearthing vestiges so ancient that beside them those of the Etruscans are comparatively modern. An important find of this nature has recently been made near Colunga, in the Emilian Province. The remains of a village and necropolis have been disclosed, and in the latter is a man's skeleton, buried in a squat position.

IN 1898, the city of Turin proposes to celebrate the fiftieth anniversary of the promulgation of the statute of the kingdom by a General Italian Exhibition, which is to illustrate the powers of the country, and of her improvements in every branch of human activity. A large department of the exhibition will be reserved for the works of the Italians abroad and of the Italian colonies. There will be a show of ancient and modern sacred Art. The exhibition of electricity will be international. The buildings of the exhibition are already under construction in the park of the Valentino. The Minister of Finance has granted a temporary free importation into Italy of manufactures coming from abroad addressed to the Exposition of Turin, 1898.

UPON the present "Wardrobe Place," in the parish of St. Andrew-by-the-Wardrobe, in the city of London, which is to be acquired for additions to the Post Office Savings' Bank, originally stood a house built by Sir John Beauchamp some years before he died in 1359. His executors sold it to Edward III., and it was subsequently converted into the office of the Master of the Wardrobe and the repository for the Royal clothes. When Stow wrote his "Survey of London," Sir John Fortescue was lodged in this house as Master of the Wardrobe. Fuller also writes:—"In this place were kept the ancient clothes of our English Kings, which they wore on great festivals, so that this wardrobe was in effect a library for antiquaries therein to read the mode and fashion of garments in all ages." King James,

in the beginning of his reign, gave these ancient clothes to the Earl of Dunbar, by whom they were sold and resold, some gaining vast estates thereby. The house was destroyed in the Great Fire of 1666, and the wardrobe was then removed to the Savoy, and afterwards to Buckingham Street in the Strand. The last Master was Ralph, Duke of Montague, on whose death, in 1709, the office, writes Cunningham, was abolished.

At a meeting of the Aberdeen Ecclesiological Society, on Wednesday last, it was stated that the Council had had under consideration the proposal to admit apprentice Architects as members of the Society without entrance fees and on payment of reduced annual subscriptions, but in view of the calls upon the funds of the Society the Council did not see its way to the adoption of the proposal. Mr. T. S. Robertson, Architect, Dundee, read a paper on the Parish Church of Burntisland. That curious Church, Mr. Robertson stated, was built in 1592-4. It had four central piers connected with semicircular arches for the support of a central tower. Galleries were introduced round the four sides in 1613. The plan of the building was said to have been copied from the North Church in Amsterdam. Mr. Robertson showed a number of plans of the building as illustrative of his remarks.

FOR about six months the joiners of Brussels have been out on strike in support of an application to have their wages increased from 3½*d.* to 5*d.* an hour. The employers, to begin with, offered a small concession, but this the men declined to accept. Some eighty of the smaller firms have granted the advance, and are now working, but a minority of the Employers' Federation, who find employment for the large majority of the men, are holding out. What is somewhat exceptional in continental disputes of this kind is that the men had funds in hand to start with, and also that the joiners at work are subscribing liberally in order to provide those on strike with what, even according to English ideas, would be deemed reasonable pay. But the length to which the dispute has been carried has at last exhausted the men's funds, and they are now appealing to British workers for assistance.

AT Calcutta, Sir Alexander McKenzie, Lieutenant-Governor of Bengal, recently laid the first stone of the drainage extension works, and, in reply to an address, made some strongly-worded observations, pointing out faults on the part of the Corporation, and criticising what he described as the inconsequent debates, the unbusinesslike work, and the petty bullyings to which the executive was subjected. His Excellency, at the same time, gave a clear intimation that unless steps were taken to remedy the appalling state of sanitation which had been revealed by the report of the medical board, the Government would have to act without consulting the municipal authorities.

ONE of the finest virginals in existence, on which the authorities have kept a covetous eye for about eight years past, has been secured for the South Kensington Museum, says the Daily News. It is the famous virginal hitherto belonging to M. Terme, the director of the Museum of Lyons, which created so much sensation when it was exhibited in the Brussels Exhibition of 1881. The fact that the maker's name is not known is of little importance, for the instrument evidently belongs to the finest period, while such renovations as have been necessary here and there, where the mouldings were worm-eaten, make no pretence whatever of being "restorations." In the circumstances, then, the condition must be considered very fine, and the price at which it has been bought, namely £800, is by no means excessive.

IT is understood that the work of transforming the Old High School buildings, Arbroath, into a Library and Picture Gallery for the town will be commenced almost immediately. The plans have been drawn to give effect to what Mr. Corsar has considered the most effective arrangement for securing the best possible accommodation out of the Old High School buildings. The front elevation shows that a porch is to be erected in front of the present door in a style corresponding with the Architecture of the present building. The staircase is to be restored to the old arrangement. The first central flight of steps starts from the middle of the lobby, and half-way up divides into two flights, which conduct to the upper floor. At the landing a new flight of steps will lead up to the rooms to be used as a Reference Library. On the visitor's right hand, as he enters the building, will be the Lending Library, with book-stores, librarian's room, and committee-room behind. The Lending Library will be fitted with counters, book-shelves, library indicators, and all the other modern library appurtenances. The Reading Room is situated to the left of the entrance. It will be a spacious room, measuring some 35 by 36 feet. This extended space has been got by building to the line of Academy Street a side wing one storey high with flat roof. At the east side of the building a screen wall has been erected to correspond with the front wall of the wing on Academy Street side, so as to give a uniform appearance to the frontage. The landing at the top of the stair will be considerably extended by the removal of the small room which was used in the Old High School as a laboratory. The rooms on the right and left measure 25 feet by 35 feet each, and these are to be utilized as Picture Galleries. The present windows will be built up, the front ones being converted into niches suitable for the accommodation of statuary, &c. The height of the galleries will be about 20 feet. This height, which is ample for the effective exhibition of a very large number of pictures, has been secured by raising the walls about 3½ feet, and erecting over them a coved ceiling. The two rooms on the upper floor in the back wing of the building—one 33 feet by 18 feet and the other 16 feet by 18 feet—are to be used as a Reference Library and Ladies' Reading Room. Both provide considerable accommodation for books, and will be well lighted. The Reference Library and Ladies' Reading Room are reached by a short flight of steps running from the first landing in the central staircase. The whole of the outer offices will be cleared away, so that the freest access may be given to light and air around the whole buildings. There will therefore be considerable space at the back of the buildings, which may be utilized some day, when public necessity demands that the Library Buildings shall be extended. The whole of the present dead wall bordering Academy Street, as well as the front parapet, will be taken down, and a uniform parapet with ornamental railing erected.

SOME of the leading aims of the Plumbers' Company were brought under notice at a dinner given on Thursday night in Fishmongers' Hall. National registration of plumbers is intended to elevate, by education, the status of the craft, to give every competent plumber a diploma, which will be recognised throughout the empire, and to ensure by these means the protection of the public health. The Lord Mayor spoke hopefully of the civic authorities getting control of the water. He was happy to think that the sanitation of the City was as nearly perfect as could be.—Mr. Wilkinson spoke of the system of education provided by the Company in technical schools, and of the plan of registration which they had established.

IT has been decided that the memorial of the establishment of submarine telegraphy shall be in two parts—the first doing honour to the late Sir John Pender in particular; the second, the inauguration of which is postponed till 1901, jubilee of the first effective Anglo-French cable, being general. The Company entrusted with the work at a recent meeting decided (1) that a bust of the late Sir John Pender, at a cost not to exceed £500, be erected in the Imperial Institute, or other suitable place; (2) that a sum of not less than £5,000 be placed in trust with the Council of University College, London, to form an endowment fund for the maintenance of the electrical laboratory in that College, on the condition that the Council name the laboratory the "Pender Laboratory," and the existing Chair of Electrical Engineering the "Pender Chair of Electrical Engineering"; (3) to endow a Pender scholarship and medal in connection with electricity at Glasgow. For the part of the scheme now under consideration the Committee hope to receive at least £10,000.

Professional Items.

BLACKPOOL.—By a large majority of the Town Council it has been decided to widen the Promenade. The scheme provides for a 15-ft. footpath on the easterly side, a roadway 55 ft. wide, a 10-ft. island footway, a double line of electric tramways, and a Promenade 42 ft. wide on the outer or westerly side, the whole width being not less than 140 ft. The estimated cost is £300,000.

BRISTOL.—Last year accommodation for 128 girls and 147 infants was provided in St. Michael's Parish and the buildings opened, and now it is intended to build schools for 168 boys. The building is of rather a plain description and of stone, and is on a high and commanding site at the crest of the hill, and adjoining the wall of the fort. It also takes in a peculiar piece of Architecture which is thought to be a huntsman's arbour used in the old days of the chase, and it is thought that several of the freestone heads may be used in the Architecture of the new building. The cost of the site, which was secured from the Tyndall Trustees, was £360, and the contract has been let for £1,275, which, with extras, exclusive of the site, will amount to about £1,400. The contract has been let to M. C. A. Hayes, and the Architect is Mr. W. V. Gough.

BUXTON.—At the Town Hall, Mr. Edmund Pearse Burd, of the Local Government Board, held an inquiry into the application for a Provisional Order to enable the Council to borrow additional moneys for the purposes of their water undertaking. Mr. Winser, the engineer, described the new waterworks. The total amount expended was £13,497 9*s.* 7*d.*, his estimate to complete same was £7,502 10*s.* 5*d.*, total £21,000, with contingencies, £845. The reservoir was about three-parts finished. The capacity was 15,000,000 gallons, and the water was supplied by springs on Stanley Moor, and conveyed in pipes. The daily consumption was about 30 gallons per head per day on the population in summer, which varied from 20,000 to 30,000. The water supply from Otter, Hale, Watford, and Cold Springs was carried into the town by pipes. The new reservoir would equalize the flow of water as much as possible, and he should state that the springs all came from the millstone grit; water, in fact came out in volume from the ground. In his opinion it was absolutely necessary that the reservoir should be constructed.

CARDIFF.—The foundation-stones of the new Chapel, Eldon Road, were laid last week. Messrs. Habershon and Fawckner are the Architects, and the plans show a satisfactory design, considering the limited extent of the land available. The principal elevation faces Eldon Road, its most striking features being two octagonal buttresses, surmounted by Bath stone pinnacles, between which is placed a large window, 15 feet high and 11 feet wide. Beneath this window is the main entrance, opening into a spacious vestibule, from which access is gained to the body of the Chapel, and also to the stairs to the galleries, with a baptistery of Sicilian marble in front. Galleries are provided around three sides of the Chapel, and arrangements have been made for the erection of an organ at some future time. The roof is designed open-timbered, and the seating and rostrum are of pitch pine throughout. The Chapel is designed to seat 314 on the ground floor and 274 in the galleries. The contract, which is for £2,425, includes vestries and seven large class-rooms to be erected over the present school. Messrs. C. Price and Son, 4, Wyndham Road, Canton, are the contractors.

DEWSBURY.—New premises have been erected in the Market Place, for the Lancashire and Yorkshire Bank, Limited. The basement floor is set apart for storage rooms and lavatory accommodation for the bank. The ground floor is to be devoted exclusively to banking purposes, consisting of a banking room, manager's room, and the requisite strong room; whilst the first and second floors are arranged in suites of offices. The building has been designed by Mr. J. Lane Fox, Architect, Bond Street, Dewsbury, and under his supervision the work has been carried out by the following contractors:—excavators, masons, and

bricklayers, Messrs. Chas. Whitehead and Sons, Ravensthorpe; carpenters and joiners, Messrs. John Richardson and Sons, Staincliffe; slater, Mr. Thos. Brear, Dewsbury; plumber and glazier, Mr. Frank Newsome, Dewsbury; painter, Mr. Ned Ramsden, Dewsbury; plasterers, Messrs. Thos. Cordingley and Sons, Bradford; electric lighting, Mr. A. R. Turner, Dewsbury; fittings, Messrs. Carr Bros., Bradford.

PUDSEY.—At a recent meeting of the School Board, the tender of Messrs. Peace and Norquoy, of Manchester, was accepted for dividing the main room in the Greenside Senior School. A deputation, representing the ratepayers of the Richardshaw Lane portion of the Pudsey district, attended the meeting to press the claims of that neighbourhood for the erection of a new school somewhere about the centre of the lane. The matter was discussed, and, whilst of opinion that the Littlemore district had at present a more pressing claim, it was considered that a school might probably be required in the Richardshaw lane district at some future time.

GARTLOCH.—Gartloch Asylum, the property of the City of Glasgow District Lunacy Board, was formally opened on Thursday. The asylum is situated on the estate of Gartloch, about seven miles east of Glasgow. Built to the plans of Messrs. Sandilands and Thomson, Glasgow, the erection is constructed on the pavilion system, and comprises two distinct sections, the asylum and the hospital. The style of Architecture is French of the Francis period, and the outside material is red sandstone. The asylum comprises four blocks, the accommodation for the male and female patients being separate. Each block is connected by covered ways with the central or administrative department, which consists of a large dining hall, kitchen, sculleries and general stores. Over the dining hall there is a commodious recreation hall, where concerts and other entertainments may be given for the benefit of the inmates. The official block is placed at the north, and is flanked by two towers which rise to a height of about 130 feet, and add considerably to the impressive appearance of the building. In this part of the asylum, on the ground floor, are situated the board room, doctor's room, waiting rooms, &c., and, on the upper floors, sleeping accommodation for the attendants. Each block is divided into two wards, with dormitories above, and is equipped with boot and lavatory accommodation and large bath rooms. On the male side workshops have been erected, while a laundry has been placed on the female side. The hospital block has accommodation for five classes of patients—wards for observation, for the old and infirm, for acute and noisy cases, for sick and invalid, and for infectious cases—and in it there is a separate dining hall, kitchen and stores. In addition to the asylum, there is a farm, a Chapel, a gate lodge, and a mortuary, all within the grounds. The cost is expected to be about £150,000. The contractors were Messrs. Herbertson and Son.

GILDERSOME.—A new Church School is being erected on a large site a few yards from the present school, and the estimated costs of the buildings, which have been designed by Mr. J. P. Kay, Leeds, inclusive of the site, is £2,400. Accommodation will be provided for 340 scholars, and a large class-room will accommodate 600 persons when utilized as a public assembly room.

KEIGHLEY.—A new building has been erected, to be called the Keighley Temperance Institute, in North Street, at a cost of £9,000. Built at the junction of North and Albert Streets, the new structure suggests a free handling of the classic style. The Temperance Society have surrendered sufficient of their new accommodation to provide room for five shops in North Street, but in the remainder they have a hall large enough to seat 700 persons. The designs were prepared by Messrs. W. and J. B. Bailey, of Keighley and Bradford, and the contracts have been carried out by district firms.

MAENTWROG.—Considerable restorations have been carried out at St. Twrog's Church. The present edifice can hardly be called a restoration, as the Church has been almost entirely rebuilt. The Architects were Messrs. Douglas and Fordham, of Chester.

Correspondence.

To the Editor of THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

DEAR SIR,—Having read with interest your articles on Perspective, which appeared in the BUILDERS' JOURNAL a week or so ago, I have taken the liberty of asking you if you would kindly make plainer to me how to put in perspective the dome on top of the house you took for your subject. I have studied it for a long while, but could not make anything out of it. I understand everything else very well, and so do my fellow-learners. Hoping, Sir, you will kindly grant my request,

I am,
Yours respectfully,
STUDENT.

Gravesend, Kent,
19th November, 1896.

DEAR SIR,—Put square M, N, O, P, Fig. 1, in Perspective. Draw diagonals N, O, M, P, Fig. 2. Through point L, Fig. 2, draw lines vanishing to right and left, cutting the sides M, N, O, P, M, O, N, P, in four points 1, 2, 3, 4. Take width of circle at base of dome from picture plane, Fig. 1, and set this up on Fig. 2, cutting diagonal O, N, in points 5, 6. Draw ellipse through 6 points 1, 2, 3, 4, 5, 6. Draw line through L to K, Fig. 1. Set up K as height line for top of dome, and perpendicular line through point L, Fig. 2. Take height to top of dome from elevation and set up on height line K, Fig. 2, and vanish to right, cutting centre line of dome in point E. You have now three points, E, 5 and 6; through these describe a semicircle, which is dome in Perspective. If "Student" will carefully follow these directions I think he will have no difficulty in understanding Perspective as applied to domes.

WM. N. CUMMING.

AN APPEAL FROM ABROAD.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—A friend of me was asking me about the laws of English Architectural Association. The matters is that a Dutch Association is newly started, but they are only wanting a good law. Now they propose to make those after some good examples of English clubs, and they were asking me to lend a hand in this. Now I, in my turn, I come to you to ask you if you will be kind enough to send me the Laws of the "Royal Institute of British Architects" and of the "Architectural Association," both of London, or of any other good one. I hope I do not give too much trouble. If there is to make any costs for it I will pay them with most pleasure. With kindest regards,

Yours truly,
A. D. N. VAN GENDT.

10, Plantage Middenlaan,
Amsterdam,
25 November, 1896.

SOCIETY MEETINGS.

Society of Architects.—At St. James's Hall, on Thursday night, Mr. Robert Walker delivered his presidential address to the members. The president confined his remarks almost solely to the question of the interest taken by the society, in common with representative bodies from other professions, in the fortunes of the Education and Registration Bill, which, he explained, had been before Architects who were in practice for some nine or ten years, just a third of the time during which the Medical Act had been struggling for existence. The former measure was a sturdy sessional, and most likely to come on again when Parliament assembled. The scheme which it comprehended was undeniably for the advantage of the public as well as the profession, and the lapse of time had increasingly and abundantly proved the necessity for raising the standard of Art culture and scientific attainments which assuredly would result in the development of the genius and ability of future practitioners. Speaking for himself, as president of that society, he recommended its members never to favour unskilled workmen, for there was an effect due to good workmanship which enhanced the effect of all structures from the plainest to the most Artistic in design, and which effect might be and was in point of fact irrespective of the design, as expression in the human face was not traceable to form and feature. Proceeding, the speaker pointed out that the opponents of the measure under review acknowledged that the evils existed which it was proposed to mitigate and ultimately remove, but in a spirit of pessimism said there was no use trying to provide remedies. He himself insisted, on the contrary, that the only means to accomplish the passing necessity were compulsory education and training, followed by examination to test the results, and these formed up to the standard recorded in a register, that was to say, shortly, by an Education and Registration Act. The speaker then went on to explain that the object of the Education and Registration Committee, and of the 1,300 Architects who had signed the memorial in favour of procuring legal recognition of the profession, was to alter the present state of apathy therein, and to secure a recognised status, to raise the standard of attainments, and to ensure the due qualification of all who practised in their ranks. Legal recognition for members of a profession was a condition precedent to promulgating special education and technical knowledge, and the establishment of examination and diplomas by a central authority. The supporters of the Bill would no doubt be very much pleased to discover unanimity amongst Architectural practitioners in this matter. Unfortunately, the concert of the various societies and institutions was as problematical of attainment as the concert of the Powers.

Glasgow Architectural Association.—At a meeting of the Glasgow Architectural Association, held on Tuesday, 17th November, Mr. Andrew R. Scott, President of the Edinburgh Architectural Society, delivered a lecture, entitled "The Grammar of English Gothic Architecture." The lecturer opened his subject by pointing out, that, notwithstanding the mutilations of time and the hand of man, we had in our mediæval Architecture an inexhaustible store of that which was beautiful and impressive; but how, in modern times, and with all these advantages, excepting a few men like Scott, Bodley, Pearson, and Bentley, the modern Architect had shown himself incapable of grasping the spirit of Artistic and constructional truth which animated the mediæval Artist. Mr. Scott then impressed on his audience the necessity for close and systematic study of the development of mouldings as a key to their comprehension, and the age of the buildings they adorned. Referring to the measuring of old work, he mentioned the different modes for getting the profile of moulded surfaces, such as the cymograph and the use of thin strips of lead, but considered preferable the simple foot-rule, plumb-line, and callipers, always plotting out details, full size, on the spot when practicable. The eye would then get trained to recognize the profile for moulding from a distance. The lecturer then proceeded with a most exhaustive analysis of the development of Gothic mouldings, copiously illustrated by full-size drawings, and closing his remarks by condemning, in modern design, the use of compasses for drawing Gothic forms, instead of a trained eye, as contrary to the usages of the mediæval Artists, and as productive of that stiff cast-iron look, which was the result of all mechanical precision, and the bane of modern Gothic. A discussion followed, at the end of which Mr. Scott was accorded a hearty vote of thanks.

British Archæological Association.—The second meeting of the session was held at the rooms of the Association on Wednesday, the 18th November, Mr. C. H. Compton, Vice-President, in the chair. Miss Turner exhibited a perfect example of an early Christian lamp of terra-cotta, bearing the sacred emblem of a fish. The lamp was found at Rome. Mr. Patrick, Hon. Sec., showed some early Anglo-Saxon coins, one of which was found in the Churchyard of Hexham, in Northumberland, and is of the time of Ethelred. He also exhibited a fine portrait medal in bronze of Queen Caroline, wife of George 4th, issued in 1820. In the author's absence, Mr. Patrick read a paper by Dr. Fryer, on "Christian Emblems found at Trier." These emblems and inscriptions were cut on small marble or stone slabs which were originally let into the lids of stone coffins. In many instances the baptismal name is given, and the sacred symbol employed is placed either

above or below the inscription, which is either "hic iacet" or "hic iacet in pace." These inscriptions mostly date from the end of the fourth and early part of the fifth centuries. The Rev. J. Cave-Browne, Mr. Blashill, who had visited Trier recently, and the Rev. J. H. Dukinfield Astley took part in the discussion which followed the paper.

The Edinburgh Architectural Society.—At the meeting, held on the 18th November, Mr. Alex. McRae read a paper entitled "Hospital Planning," in which he dealt very fully with site, position of wards in reference to exposure, &c., cubic and superficial dimensions relative to size of hospital, heating, ventilation, and drainage. Mr. A. Lorne Campbell gave a very able criticism, which was followed by an interesting debate, in which various members took part. The report on Design Competitions, Nos. 2 and 3, were read, the three placed first for the "Highland Parish Church" being "The Ludger," "Glenlivet," and "Tendimus"; and for the "Lych-Gate": "Tendimus," "The Ludger," and "I ride thro'."

Glasgow Archæological Society.—At the annual meeting of the members of this Society, held in the rooms of the Society, 207, Bath Street, Glasgow, Dr. David Murray, the President, presided. Mr. W. G. Black, Hon. Secretary, read the annual report, which stated that steps were being taken which might lead to an arrangement for the effectual preservation of some of the most interesting sections of the Antonine Wall, and also thought it worthy of mention that, by the terms of a clause in the Light Railways Act of 1896, objections to a light railway, on the ground that it would destroy or injure any building or other object of historical interest, or would injuriously affect any natural scenery, were to be considered by the Board of Trade. The Chairman, in moving the adoption of the report, said that, if rumour were right, application would shortly be made for powers to carry a light railway through one of the most picturesque portions of the country, and they might in that case have an opportunity of testing the value of the clause of the Light Railways Act referred to. The report was adopted. Mr. Hutchison submitted the annual financial statement. Office-bearers were elected, and the proceedings concluded with an interesting paper by Mr. George Neilson, F.S.A., Scot., on the "Annals of the Solway."

West of Scotland Iron and Steel Institute.—At the second meeting of the session of the West of Scotland Iron and Steel Institute, Professor A. H. Sexton delivered his presidential address. After sketching what he thought ought to be the aims of the Institute, he spoke of the necessity of more technical education. The County Councils were, he said, frittering away money on what could do very little good. All the branches of engineering were clamouring for their share; the elementary and secondary schools were calling for more, and the result seemed likely to be that the iron and steel industry, the most important in the West of Scotland, would be left out in the cold. What they wanted in Glasgow was a well-organised school of metallurgy and mining, in which there should be a professor, as at Freiburg and Berlin, giving his entire attention to iron and steel, and another taking general metallurgy, and also a professor of mining, and of course well-equipped laboratories. In the Andersonian College they had a nucleus in which that scheme could be developed, but that was all, for in staff and equipment it was infinitely behind what it ought to be. The practical question was how the scheme could be carried out. Sheffield gave the answer. Sheffield Technical School depended for its existence and support on the practical liberality of the Sheffield steel makers. Surely the Glasgow iron and steel masters were as liberal-minded and as far-seeing as those of Sheffield, and if they would come forward the scheme would soon be an accomplished fact, and Glasgow would be able to take its place at the head of metallurgical education in the country.

Birmingham Master Builders' Association.—The annual meeting of the Birmingham Master Builder's Association was held last week. The report stated that, at the commencement of the year, the notices which had been received from the carpenters and labourers were dealt with. The carpenters met the representatives of the association in conciliation, and the points at issue were promptly settled. The negotiations with the labourers were not so satisfactory, demands being made by the men which could not be acceded to, and the meetings ended without any settlement being arrived at. Ultimately, as the result of correspondence, rules were signed, and they had been in force since April 1. The Standing Committee had been the means of clearing up several minor disputes, though in one case no settlement was arrived at, two branches of the trade claiming the right to do the same work—namely, tile-laying. Notices of alteration in the working rules had been received from the carpenters, stonemasons, bricklayers, plasterers, plumbers, and labourers. The balance-sheet showed the receipts for the year to be £125 10s. 10d., which, with the balance from the previous year, made a total of £222 2s. 4d. The expenditure amounted to £82 3s. 3d., leaving a balance in hand of £139 19s. 1d. The report was adopted. At the annual dinner, held subsequently, Mr. Parkes, M.P., said, the prosperity of a nation or a town was judged by the character of its buildings. In the present utilitarian age they were perhaps known more by the multiplicity of their buildings rather than the character of them, although the general character of them now was decidedly of a higher class than in any preceding age. All great works, such as building, poetry, painting, and statuary must have some great inspiring influence behind them, and unless there was that influence they would fail in the production of any really great work which was to stand the test of time. In a town like Birmingham it was their duty to erect buildings, and especially municipal buildings, not only of an Artistic type, but of such a character that they would stand the test of time. The present prosperity of Birmingham was at the high-water mark, and it might be said that Birmingham was now more prosperous than at any previous period in its history. That prosperity was concurrent with the erection of the public buildings. With the exception of the Town Hall, nearly all the important buildings were erected during the last thirty years. Most of them were of a very Artistic type, and some of them were very durable. It was satisfactory to know that, as a rule, they were built by Birmingham men, and it was equally satisfactory to know that there were no better builders in the country than were to be found in Birmingham.

Trade and Craft.

HAYWARD BROTHERS AND ECKSTEIN, LIMITED.

We understand that Mr. D. W. M'Innes has joined this company as a Director, and this cannot fail to add greatly to the already high position this firm holds in the engineering world. Mr. M'Innes has for the past twelve years occupied the important position of London Manager to the Carron Company, Upper Thames Street. We have on many occasions spoken in terms of high commendation of the patent appliances of Messrs. Hayward Brothers and Eckstein, which include their "semi-prism" pavement lights, patent fireproof steel lath (which is in use at many London theatres), the "Stafford" radiators, &c.

THE DRAINAGE OF A HOUSE.

In the Queen's Bench Division, before Mr. Justice Cave and a special jury, an action was brought by Mrs. Fanny Bazzoni, a widow, against Mr. Robert Pledge Notley, Architect and Surveyor, to recover damages for alleged misrepresentations with respect to the drainage of a house. Defendant denied the misrepresentations. The plaintiff's case was that in January, 1895, she took a house known as Warwick Lodge, Clapham Park, upon the representation of defendant that the drains of the house were comparatively new, and that they were in every way satisfactory. She entered into occupation at the half-quarter, and in March two of her servants became ill with sore throats. Later, the plaintiff, her two daughters, and a sister became ill in a similar way, and consequently a builder was called in to examine the drains. The builder suggested certain alterations, which were executed. The bad smells continued, and the sanitary inspector, who was called in, requested the defendant to execute further alterations. Plaintiff said there was a delay in the execution of these works, and she was obliged to send her daughters away to school. In consequence of the state of the drains she had had to pay doctors' fees and other expenses to the extent of £75. Defendant denied that he had made any misrepresentations. The drains of the house, he said, were reconstructed in 1891, the Norman Shaw system being adopted. The state of the drains in 1895 was due, not to any defect in the drains, but to the fact that they had not been properly flushed with water. Shortly after the plaintiff took possession of the house there was a severe frost, and in consequence water was not so plentiful. The alterations suggested by the sanitary inspector were not in his opinion necessary. The jury found a verdict for the plaintiff, and assessed the damages at £40. Judgment with costs.

THE COST OF TUNNELS.

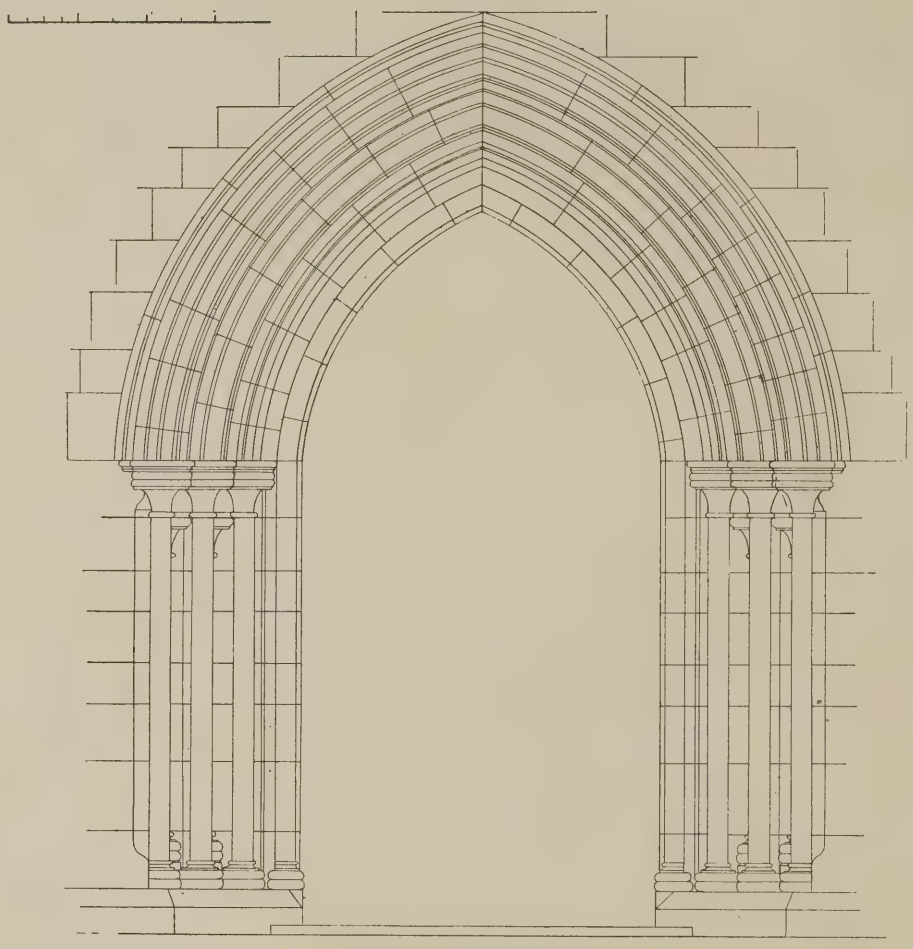
A report just published relative to the comparative cost of the world's four great tunnels, places the cost of the Hoosac Tunnel, in the United States, at £76 a foot; the Mont Cenis Tunnel, the next in date, cost £71; the St. Gothard cost £46; and the Arlberg, the latest in date, £31. This rapid decrease in cost, within comparatively few years, is an indication of the great progress in mechanical methods and improvement in rock excavating tools. A still more striking result exists in the case of a tunnel through the Cascade Mountains, which was completed at the cost of £24 a foot.

THE SLATE SUPPLY.

The continuance of the strike at the Bangor Penrhyn Quarries has possibly occasioned some misunderstanding as to the possibility of supplying the requirements of Architects, contractors and others, an impression appearing to prevail that Welsh slates are almost unobtainable. This is not so, although there is a considerable shortage in supplies. The Dinorwic Bangor Quarries are working as usual, and supplying the more pressing demands on the slate market; Messrs. Roberts, Adlard & Co., and other merchants have stocks both landed and afloat. The Portmadoc Quarries are supporting the trade as freely as supplies permit, but the diminished output in Wales has had the usual result of increasing the cost of slates.

IRON ORE IN SIBERIA.

The Siberian papers announce that an unusually valuable discovery of iron ore has just been made in the neighbourhood of Yeneseisk, in Eastern Siberia. The ore discovered in that district is of remarkable purity, and is said to be even superior to the Swedish in quality. The ore obtained by the aborigines is of three kinds—white, yellow, and black. The best kind is the first mentioned, and the worst the last. Several Englishmen who have visited the ore-yielding district are of opinion that the steel which may be made from Yeneseisk ore cannot be surpassed anywhere.



A NOVEL MATERIAL.

An ingenious novelty in the way of a material to be used for making flooring, wainscotting, &c., has recently been invented in Germany. It is a special preparation of paper pulp sold in the form of a dry powder, which, when desired to be used, is mixed with water like ordinary cement, and spread over the surface which it is intended to cover. It is claimed for it that it not only dries quickly, but that it can be stained or tinted with most colours, thus adapting it for parqueterie work. It presents an additional advantage, according to the claims of the inventor, in that it can be smoothed with a plane as if it were wood, while the method of laying it insures not only that no crevices will be left to harbour dirt and germs, but that its employment tends to deaden noise of feet. It possesses a high degree of electricity and considerable durability, as well as the by no means insignificant advantage of being very incombustible.

The Vacant Place : A Special Word to our Readers.

THIS heading, apparently so pathetic, is, as a matter of fact, just the reverse. In truth, we never thought of a title in a gayer frame of mind. Gaiety, indeed, as our readers have doubtless discovered long since, is one of the leading characteristics of this Journal and its staff, and it is, moreover, a gaiety that is never dimmed. To offend against *that* genial spirit is the one unpardonable sin of the office. It is not permitted on any pretence ; and, to be quite confidential, no one, from the smallest office-boy upwards, ever pretends. The immediate cause for our present merriment, however, to come to the point of an apparently pathetic heading, is the pleasant position, *the vacant place*, to which our new Magazine, the Architectural Review, has attained at one leap. By a consensus of current criticism, which is quite as remarkable as it is unanimous and rare, we have been voted to a place practically without a rival in modern Artistic illustration and literature. It is given to few Magazines, surely, to accomplish that with the first number! We accept gratefully the position together with its responsibilities. We are there not (mark this) entirely by our own exertions, great as they have been, but by the votes, firstly, of our friends the Artists, and, secondly, by outside Press opinions ; by a series of voting papers (counted by the hundreds) amongst which there is never a blank, never an adverse word. We have been told we are practically without a rival ; this is in the main perfectly true, because our Review, appealing as it does principally to the Architectural public, does not compete, except in a subsidiary and friendly way, with such journals as The Studio and The Artist, for which we have nothing but the kindliest feelings and the warmest admiration. In proof of which (and by the way) we heartily commend to our readers the two recent special numbers of each ; the former containing an appreciation of Robert Louis Stevenson as an illustrator (by Joseph Pennell), and the other of Frederick Sandys, an interesting article by Mrs. Esther Wood.

NORMAN DOORWAY, BISHOP STEIGNTON. FROM A PHOTOGRAPH BY MESSRS. PHILIP AND SON.

But to come back to "the Vacant Place." We have nothing in common, and are, therefore, not rivals in any sense with the present professional or trade journals. Our ideas and our aims are higher, and therefore entirely different, except, of course, as regards this our weekly issue, which has met the professional papers on their own grounds with, we cheerfully admit, a most gratifying result to ourselves. And in this respect it is worth while pointing out that our terms of subscription per month, compared with our contemporaries, is exactly in the proportion as 10 is to 16. That is to say, for a monthly subscription of *tenpence* we provide a weekly paper, on which the best known Architectural writers and illustrators of the day are engaged, together with an *edition de luxe* every *four* weeks, which is admittedly without a rival as aforesaid. For the subscription of more than a third as much again our contemporaries have nothing to give but their *one* weekly issue! But to return to the Review. We wish, in the first place, to most heartily thank all those who have given us such warm and enthusiastic support from the first, and without whose united aid, we frankly confess, we should not to-day find ourselves so pleasantly situated. Nor should we be able to contemplate our future prospects in quite so calm and peaceful a manner were it not for the repeated promises we have received of their active help and practical assistance. Their names are, of course, well known to all, and are to be found "writ large" in the many "press opinions" and in the pages of the new Magazine. These names are, in themselves, a sufficient guarantee for future assured success. We have received so many letters of kind and cordial congratulation upon our endeavours that it is a physical impossibility to reply to all separately. We take, therefore, this opportunity of replying generally, and thanking all those of our readers who have taken the trouble to express their opinion and approval. We wish to say, too, in answer to many enquiries, that so far from this our first number being the *best*, we are convinced that at the end of the first volume it will be unanimously voted the *worst*. We shall

improve and amend as we go along. To which end we therefore cordially ask for the candid opinions of our friends the critics.

AN INIGO JONES MEMORIAL.

WITH reference to the fact that the burying-place of Inigo Jones is at this day without a memorial of the great Architect, the City Press says that Inigo Jones was essentially a child of this City. He was born in 1573 within the confines of the parish of St. Bartholomew-the-Less, and christened at the font of his Parish Church on July 19th in that year. The indefatigable antiquary, Peter Cunningham, has elicited from the will of Inigo Jones's father, who is believed to have come from Wales, the fact that before the age of twenty-four Inigo's home was in the parish of St. Benet, Paul's Wharf, where his father was buried in 1597, and where the Architect himself received sepulture. This very Church has been handed over to the Welsh in London. Inigo's family circumstances were not affluent, but, either by the aid of a wealthy patron or otherwise, he made that study of ancient classic Architecture in Italy which may be thanked for much of our City classic Architecture to-day. His first work in England appears to have been in connexion with the Court mosques of the Queen of James I., and in these Inigo had Ben Jonson as a collaborator. In 1613 he made a second journey to Italy. Wherever he went he carried with, him, and annotated, his copy of "Palladio," which is still preserved at Worcester College, Oxford. Two years later he returned to England to take possession of the office of "Surveyor of the Works," the reversion of which had been granted to him by James I. He had no lack of work in connexion with the royal palaces and other places. In 1620 he made ready Ely House, in Holborn, for the reception of the Spanish Ambassador. His

FIRST GREAT WORK,

and also his masterpiece, was the rebuilding of the banqueting chamber at Whitehall in 1619-22. Lindsey House, in Lincoln's Inn Fields, built for the Earl of Lindsey, still stands as a mark of Inigo's genius at this time. In the same neighbourhood is a yet greater memorial of him—the Chapel of Lincoln's Inn, built 1618-1623. This is a good example of classic details applied to a Gothic form. The now destroyed Chapel of the Infanta, at Somerset House, and the beautiful watergate which adorns the lower end of Buckingham Street, Strand, both belong to this period. In 1630 was built the exquisite Church of St. Katherine Cree, which adorns Leadenhall Street, and forms a connecting link between the old Gothic and the latter classical or Palladian styles. In 1633 was erected St. Alban's, Wood Street, another Classico-Gothic building; and the present Church, although rebuilt by Wren after the Great Fire, is thought by Mr. G. H. Birch to retain not only the style, but even much of the work of the former building. A trustworthy, or at least a probable, tradition attributes both these Churches to Inigo Jones's designs. The old Church of St. Paul's, Covent Garden, now rebuilt, was erected by Inigo in 1632. The "Queen's House" at Greenwich, now the Naval School, was completed in 1635. But the work on which Inigo Jones regarded his fame as depending was the

MAGNIFICENT PORTICO

added by him to the western end of St. Paul's. The work of restoring the Cathedral was commenced prior to 1633. The restored western end and the portico are too well known to need description. The entire end measured 161 feet long by 162 feet high; the style being rusticated Corinthian. This front, cumbrous but picturesque, served as a background for the noble portico, whose length was 120 feet, and height 66 feet, and whose stately columns numbered fourteen. For grandeur and extent the portico will ever bear witness to the Architect's taste and skill. That it was not a "magnificent mistake," as those have urged who have dwelt upon the incongruity of adding a classic portico to a Gothic Cathedral, may be contended from the probability that this work was meant to be a first instalment of a rebuilt and classic St. Paul's. But, like the plans for Whitehall, the restoration of the Cathedral was interrupted by the Civil War, and it is said that in his last days the great Architect was to be seen wandering sorrow-stricken in the vicinity of his uncompleted works in Westminster and the City. On June 21st, 1652, at the age of 79, Inigo Jones died at Somerset House, "of grief, misfortune, and old age." Five days later he was buried in the chancel of St. Benet, Paul's Wharf, where a monument was erected on the north wall of the Church. It is a matter for regret that Sir Christopher Wren, when rebuilding St. Benet's after the Fire of 1666, did not take steps to re-erect a tomb to the great Architect whose work he was himself continuing in London.

Views and Reviews.

COTTAGES AND COUNTRY BUILDINGS.

Designed by THOMAS W. CUTLER, F.R.I.B.A.

MR. CUTLER has, in this well-got-up and serviceable volume, shown evidence of the obligation laid on the successful designer in any of the numerous branches of Architecture, to place his methods or their results on record for the benefit, firstly, of his brethren, and, secondly, of the outside world. He has not given us a Preface, preferring no doubt that his book should stand for what it is worth on its own merits; and hence we do not know his motives, but no doubt they are as stated above, being much the same as Professor Kerr's, in his fine epoch-making work, The Gentleman's House.

The present book gives 27 different subjects, shown on 44 plates. It comprises cottages for the seaside, cottages for bailiffs and gardeners, cottages for labourers (singly and in groups of two, three, and four), a village shop, a village school, stables and farm buildings of various sizes, entrance lodges for park and cemetery, country houses of various degrees of pretension, a parsonage, a bungalow, a shooting box, a hospital, and a convalescent home—a collection of subjects which should satisfy the most exacting of requirements.

The work will be useful to estate-owners who desire to provide dwellings for their labourers, as well as to estate-agents who are considering the development of "eligible building land." We do not care for the appeals to the desire for cheapness that appear so often in the book, since every steward or agent knows, without being told, that "they could be built cheaper if necessary," or "the design might be built of simpler materials and then would cost less," or "it could be built much cheaper if desired."

The "notes" preceding the plates are very good and suggestive; and the designs are simple and common-sense, and have a suitable country-like air. The author is best in those intended or executed in what are considered as more especially *country materials*, e.g. tile-hanging, half-timber work, and rough-cast work, which are so pleasant in the landscape and so suggestive of cosinesss and comfort to the English mind. The designs vary in practical merit, but some of them are very well planned, and, from the point of view of the indweller, at any rate, the plan enters largely into the requirements of comfort. The doors are not shown on the small plans; the hanging is consequently not always clear. The positions of the bedsteads in the bedrooms would have been useful if shown on the plan. The titles, if printed on the plates, would have saved reference. The notice at the end of book, that the designs "cannot be copied without the consent of the author," carries a moral with it.

COTTAGES AND COUNTRY BUILDINGS, Designed by Thomas W. Cutler, F.R.I.B.A., &c. London: Horace Cox.

In the recent limited competition for Church Schools, St. George's, Hanover Square, the Assessor, Mr. J. Macvicar Anderson, F.R.I.B.A., has placed first the plans of Mr. Philip Appleby Robson, of Palace Chambers, Westminster. The school is for infants, junior mixed, boys and girls, and is estimated to cost £10,450.

BELFAST COMPETITION.

EXTRAORDINARY REVELATIONS.

AT a recent meeting of the Belfast Corporation, a debate arose on a motion for the adoption of the minutes of the meeting held the previous day respecting the plans for the new City Hall. Some extraordinary facts were disclosed, whereby it appeared that certain members of the Corporation desired to override the decision of Mr. Waterhouse and Mr. J. C. Bretland, city surveyor of Belfast, who had been appointed umpires on the plans. The plans selected by Messrs. Waterhouse and Bretland were No. 30, No. 42, and No. 43. The first-mentioned, which obtained 18 votes at Monday's meeting, was from Mr. James Millar, 223, West George Street, Glasgow; the second was from a London firm; and the third was from Messrs. Malcom Stark and Rowntree, 329, West George Street, Glasgow. The Corporation

ADDED TWO MORE PLANS,

one being No. 22, from Mr. Graeme-Watt, Belfast, and the other being "Bogus." Councillor Masterton considered that some of the parties who had sent in plans had been unfairly treated, and treated in a manner he had never known of any plans sent in by the Corporation. In the first place, they appointed an assessor—who, together with their own burgh surveyor, was to select three plans, to enlighten them, and get them proper plans. The authors of those three plans were to be invited to enter into the final competition. The plans were selected, and one of those they should adopt. There were no names to be given, but those three names were known. It was found that some plans were not there which ought to be there. That was the impression of the outside public, and it was his. It was the first time in this Corporation he had to make an insinuation or charge. All he wanted and sought for was fair play. Two other plans were brought in by the Corporation. What were they? One of them was very fair, but the other no one would look at. He candidly believed the fifth was brought in as a cloak for the fourth. For one of these plans

THE NAME WAS WELL KNOWN.

It had been stated by a councillor that a plan had been sent in by a certain party. The name of that gentleman must have come either from the Town Hall or from his own office. That name obtained circulation and was known. Taking all these circumstances into consideration, he said that these five plans should not be laid before the Council, but that the three should be submitted, and three only. It was exceedingly bad treatment to the three gentlemen remaining. He regretted that one of the names had become known. He hoped that the Corporation would upset this resolution and vote against it. Councillor Young also condemned the methods which had been taken to introduce the local man into the final. One of the terms of the competition prohibited canvassing. He put it to the conscience of those who plumped for Mr. Watt's plan—could they conscientiously vote to-day and say that they were not canvassed? Was it legal for those gentlemen with the conditions in view to open the sealed envelopes attached to the three plans selected by Mr. Waterhouse? And if it was illegal to do so the whole thing would have to be gone into again and submitted to the Council. If they had not opened the envelope attached to those plans they would have been the only three plans submitted to the Council on Monday to send over to Mr. Waterhouse for his selection. They would not have known that one or other of those plans was not by a Belfast Architect. What, he would ask, were they giving £300 to Mr. Waterhouse for? Councillor Harrison said if the two names had been introduced after the names of the three successful competitors, then for his part he thought Councillor Young's speech was accurate, and he retracted his vote of the previous day. After further discussion, Alderman Sir James Haslett moved that the matter be referred back to the Council in committee for further consideration. Alderman Henderson seconded the resolution. After some further discussion the amendment was carried. The matter will consequently come up again in committee.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

Gothic Foliage Carving.*

JOHN L. MYRES, M.A., F.S.A.

THE study of Gothic Architecture, and of the subordinate Arts of Design which accompany, complete, and embellish it, is made peculiarly interesting and instructive by the fact that in this instance the materials are abundantly forthcoming for the study of the whole period during which the new style was coming into being, and during which it was moulding and remodelling, as every great style must, in accordance with its own canons, the motives and the combinations, however antiquated and degenerate, which it found ready to its hand. In the case of the Architectural styles of classical Greece, still more in the case of Oriental and barbaric styles almost without exception, these materials have either wholly disappeared, or are at best so fragmentary that their interpretation will probably always remain a matter of conjecture, however plausible the result may be. In the case of Gothic Architecture, on the other hand, with a few notable exceptions which may be discussed apart, the evidence is very fairly complete, even in spite of great recognisable losses, just for the period in which the decadence and barbarisation of the later Romanesque Art is arrested, almost instantaneously, by the first manifestations of a new spirit; so that from a chronological point, which may be determined with some accuracy, development of the last remnants of the old tradition sets in upon new lines towards a new and wholly different ideal.

But in order to estimate the conversion which

ABACUS. NORMAN STYLE.

CHAPTER HOUSE, DURHAM. FROM A PHOTOGRAPH BY MESSRS. PHILIP AND SON.

results from this creative inspiration, it is necessary to sketch first, briefly, the history of the materials upon which the transfiguration was wrought out. And for this purpose no nearer starting point is satisfactory than that of the origination—for a new creation this was—of the so-called Corinthian capital at the end of the fifth, or the beginning of the fourth century B.C. For the Corinthian capital was the first definite and intentional attempt in European civilisation to adopt carved foliage ornament to an integral member of a building. The Corinthian capital, though its proportions remain more fixed throughout its whole history than those of either of the earlier styles of Greek Architecture, lends itself, in its very nature, to infinitely more varied treatment in detail than they. And it is particularly to be observed that the composite style, though its characteristic developments are to be ascribed to the tasteless and barbaric ostentation of a later age, finds its first suggestion in the earliest Corinthian capitals which have been preserved. Even in the faultless examples from the Tholos of Epidauros the intention of the upward springing scrolls of the acanthus stalks in the angles, and of the delicate flower in the centre of each face, is already clear, and is itself with much probability to be explained as a reminiscence of the volute scheme of the Ionic style.

From the beginning, therefore, and quite clearly from the third century onwards, the struggle between the component elements of this itself essentially composite form, leads to the separation of two distinct types; that in which the basal leaves of the acanthus tend to overwhelm the scrolled stems which surmount them; and that in which exaggerated scrolls, angular and lateral, tend to dwarf almost out of existence the acanthus crown from which they spring.

In Byzantine, and still more in Romanesque foliage capitals the frequent reduction and again the frequent exaggeration of the total height of the capital, makes this struggle and this eventual separation more decisive; and the low square abacus, with the angle volutes and intermediate flower ornaments sheltered beneath it, and more definitely applied to support it, becomes contrasted with a taller and more cylindrical style of capital, in which the original four-squareness is minimised at the expense of the abacus and scrolls, or is disguised by a swelling of the lower part, while the investment of acanthus foliage, often still preserving its original double arrangement of outer and inner leaves, becomes the dominant feature of the conception. This double coronal of leaves persists into the decorated Gothic of Belgium and parts of the north of France, but is not often found in English examples. How, in the west particularly, these two types seem to have co-existed and inter-acted upon one another may best be seen in such large collections of Architectural fragments as that in the museum at Cologne, to take a fairly accessible example. Our own collection of casts hardly begins to be of value till a later time, though we have one fine example of the low, square, volute capital, with accessory foliage, in which the old volutes at the top have almost gone, while a new pair have been added close to the neck, from a Byzantine building.

I have dwelt at length upon the employment of foliage in *capitals*, because it is in this department that our own series is most complete and instructive; but it must not be supposed that this is our only, or even our main, source of evidence for the treatment of foliage during the long age of decadence. The great collection of cases of fictile ivories which is now being arranged in the mediæval room of the Ashmolean Museum, illustrates amply the important class of foliage ornaments which were used during the same decadence, in more or less elaborate mouldings and borders. Here again it is necessary to go back to the architypal Greek motives, and to note that a large number of the most effective and most variable motives consist of alternate pairs, either of different elements, like the lotos and palmette, or of the same element, set alternately upwards and downwards, the basal points being connected by a sinuous band which is commonly treated as their actual stalk. The fact that in all periods the same foliage ornament is commonly repeated on the wall cornice, and on the capitals of pilasters, and so on the intermediate columns of an arcade, should also be noted, as explaining the occurrence of such alternating motives on foliage capitals, especially on the

* A paper read before the Oxford Architectural and Historical Society, as an introduction to the study of the newly-arranged collection of Architectural casts in the Ashmolean Museum.

lower part, and on the rich floral cornices of later decorated and perpendicular buildings. Among the latter, also, *alternate* motives and up-and-down series with a sinuous stalk begin to be characteristic again.

The extent of the degradation at the time when Gothic carving may fairly be said to begin may be estimated from the fact that it is even probable that such wholly unplant-like motives as the zigzag, billet, and dog-tooth mouldings, the beak-heads and spiral beadings of arches and shafts, and the monstrous faces and animals which adorn the angles of Norman cushion capitals, may be

DEDICATION CROSS, EXETER.

traceable back through an almost unbroken series of intermediate substitutions to their floral prototypes in earlier Romanesque Architecture; while such strictly floral ornament as does occur on cushion capitals and wall or arch mouldings is in so low relief, and frequently so rudely modelled, that much of it seems to have been inspired rather by painted than by sculptured ornamentation. How closely, on the other hand, occasional examples recall very much earlier types may be seen in many continental examples, such as the elaborate capitals from Soissons, and, nearer home, by the specimen from St. Aldune's Church at Durham.

The degenerate, though often most elaborate ornament of the convex capital, however, may be left practically out of account in dealing with the beginnings of Gothic foliage capitals; for the latter, almost without exception, take their rise from the concave capital with angular volutes, and more or less unrecognisable acanthus leaves and flowerets upon the faces between them.

The change is first appreciable, naturally, in the neighbourhood of the corner-volutes, and is heralded by a growing fulness and swollen appearance of every surface of the design, which comes into marked contrast with the meagre, metallic rigidity, concave forms, and emphatic edges of the immediately preceding period. This very roundness produces in many cases an impression of careless, confused, and unfinished work; but the change from the mechanical accuracy of the old tradition to the spontaneous and often wayward struggle towards life of the new work is unmistakeable. Especially noteworthy is the inclination to give up exact symmetry of composition in favour of a harmony of proportion between more or less heterogeneous equivalents; though, so long as the design of a capital is confined by the four-square limits of a Norman abacus, any real freedom is almost out of the question.

This restriction once removed, however, nothing remained to regulate the disposition of the now fully vegetable components of the ornamental crown, and accordingly the earliest early English foliage exhibits an exaggerated sparseness and dishevelment, of which the south door of Bicester Church is a fair example. True to their immediate derivation from the bracket-like volutes under the abacus, the free fronds cluster round the upper part of the capital, overhanging, but leaving exposed, the now longer and slenderer neck of the capital.

(To be concluded.)

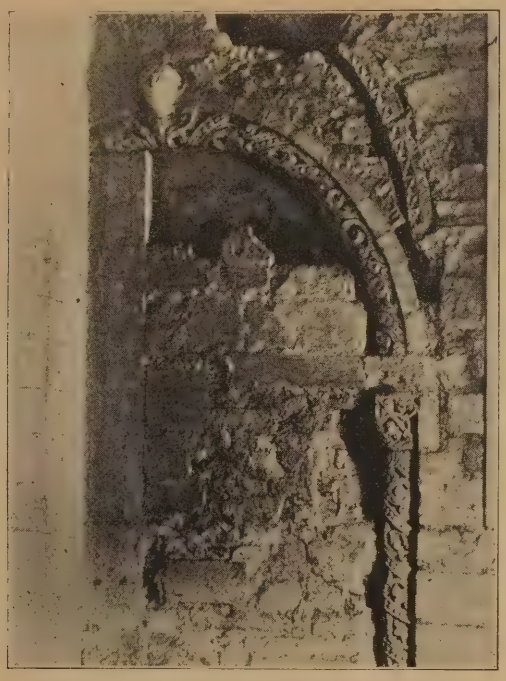
COLOUR IN ARCHITECTURE.

By HALSEY RICARDO.

COLOUR demands large spaces on which to realise itself; in small patches and spots it seems to irritate us. Take, for instance, the coloured window-boxes and blinds in a street—they might as well not be there at all. In considering a scheme for the colouring of a city, one must distinguish between those places where we can employ Nature's palette and where we must use man's. In our parks, squares, and open spaces, we can use trees, turf, and flowers, but in our streets, where the only colour that is not our own making or colouring is the narrow strip of sky above our heads, we must look to the buildings themselves to supply us with colour. This brings up before us the question, on what principle of the application of colour are we to work? The answer is, I think, that just as the city, in its disposition of its forms and features, represents the corporate life of its citizens, so the colouring should be an indication of its corporate life, *i.e.*, the colouring in the main should be heraldic. This has already been felt and acted upon in the instances where colour has been employed by bodies of men, such as vestries, parish councils, railway companies, and the State. In London, each parish colours its lamp-posts in the parish colours, the dust and water-carts carry the proper bearings and legends. Throughout Great Britain the scarlet is the proper distinction of the Post Office; on the sea-coast the eye is gladdened and the landscape relieved by the black and white heraldry of the coastguard stations. If this were carried out systematically a kind of classification of buildings would grow up, each group denoted by some special colour treatment. State buildings, such as the Parliament Houses, Law Courts, Mansion House, Galleries and Museums, let us suppose, would be built, as indeed they are, of stone with wide open spaces all round, and the colour would be supplied by means of broad streaks of turf and evergreens in formal shapes. Our Churches embody associations, tradition of feelings still extant, and so fulfilling the conditions required, they call for no special modification. Of old times, cities had walls, and the gates of the city were its pride. For us of the present day, walls have become unnecessary, and in the expansion of our modes of life, impossible. Our gates of to-day are the railway termini. The stations are, for the most part, marked by hotels, and as long as this system obtains, we must endure the obscuration of what might be an impressive and triumphal expression of our entry into town. But the stations with their cuttings, arches and passages might be lime-whited. That whole streets should be coloured, or built of coloured materials, is perhaps too much to ask for, at least at the beginning; but prominent houses, such as those at the corners of streets, having important information to give, should proclaim their position and knowledge by their easily recognizable colouring. Vestry-halls and public libraries should form the

LANDMARKS OF THEIR RESPECTIVE LOCALITIES.

Buildings of historic interest should also bear some signs that would mark them out of their surroundings, and not only bear an engraved plate; and public bodies such as County Councils and Vestries could do more in this direction than private enterprise. In Venice, when strolling through the market halls, we can discern the pillars and varied tints of the Bocca di Piazza, and then we forget all, for between these pillars there opens a great light, and in the midst of it, as we advance slowly, the vast tower of St. Mark's seems to lift itself visibly forth. We are all aware of the otherwise inexpressible emotions which good music makes in ourselves; or a fine, monumental building. Have we not really experienced the same emotions? There can be no doubt that colour is also to a great extent instrumental in producing certain emotions—and how universal is our hunger for colour? Consider what efforts we make to procure it. The flowers in our parks and window-boxes, the brilliant posters on our hoardings, the trees in our boulevards. For instance, our posters might just as well be done in black and white, but we resort to the more expensive process of colour printing. And the eye is so provident and resourceful. Out of very little actual colour it will construct fields of colour for itself, if only the distribution be helpful. It is quite sufficient, on a mass of black, to plant here and there pieces of blue in quite small quantities, and the whole area becomes one sea of sapphire. Consider for a moment what a valuable quality this is in a place like London. Will there ever come a time when one's pulse is no longer stirred by the notes of the post-horn? Think what we have spent in our galleries and museums, full of treasures of Art. In our city life we foster the impression that such things lie apart from our life, and are only curious examples of men's nightmares, not their aspirations. Art is now collected, shut up in cabinets, divorced from ordinary actual life, and consequently out of contact with it, to be indulged in or not, according as the humour may take us. Let us quit ourselves of such a view. Let us accept the vast accumulations of the past as a storehouse; not to draw therefrom specific examples for our present use, but treating them as the outcome of the spirit actuating the old masters who produced them, to draw from them something of their inspiration. In the picture of St. Mark's Square, at Venice, Gentile Bellini shows Venice as



TRANSITIONAL CROSS AT KELLOE. FROM A PHOTOGRAPH BY MESSRS. PHILIP AND SON.

SUMPTUOUSLY COLOURED AND GILT.

Houses that were not encrusted with marbles and mosaic, sought colour and magnificence in fresco. Here, in England, our Abbeys and Cathedrals spared colour neither outside nor in. Our streets were full of colour, partly from the buildings themselves, but mainly from the gaily-dressed throngs in the lanes. The opulence and extravagance of colour mounted high, and then came the reaction. Colour faded from the Church, for the pictures were removed by the reformers, the stained windows knocked out, and the walls defaced. It fled from the streets, for the nobles who built palaces, built them of stone, and banished colour from their fronts, too wise to waste the painting of their finest Artists by exposure to the inclemencies of wind and rain, and too proud to content themselves with anything less than the masterpieces of painting. Then came the Great Fire, compelling

the use of stone and brick for city Architecture. It fled from the shelf, for the illuminated manuscript gave way to the painted book. To infuse more colour into the aspect of our cities seems so much everyone's wish, that we seem almost within distance of obtaining that measure of self-denial, co-operation, and public spirit necessary for the

NORMAN DOOR IN CLOISTERS, ELY CATHEDRAL.

success of any scheme of civic grandeur, and that we desire colour in our streets, the shop-fronts, and the advertisements on the hoardings, show. The revolt against the grey stucco-fronted house was in part due to the same feeling that followed on the Gothic revival, a desire to avoid anything that might savour of dishonesty in construction; but the red building arose more, I think, as a protest against the monotony of the colourlessness of our streets. Red brick and terra-cotta discolour, and coloured stones and marbles grow dim, and perish in shocking haste. It would seem as if no building material but what had a glass face to it, would be able to contend against the corrosion of the air of a manufacturing city. The use of

PERMANENT COLOURED BUILDING MATERIAL

would involve great changes in the treatment of our buildings. The mere fact that they are permanent comes as a shock, because, till now, we have been in the habit of calling upon time to aid us by softening here, blunting there, creating contrasts by the aid of dust and lichen, and in a measure harmonizing what was discordant, by blending the mass into a whole. We must give up this! But in a city, is the sacrifice a serious one? Before time has begun to spare any attention on the building, the grime and smoke of our fog-laden atmosphere have done their work of degradation, and in the quick passage of its decay we get a harmony, but, it is a harmony of filth. We might make use of colour in place of cornices, &c. It seems almost a pity to do so, but, on the other hand, we have advantages; all those shades and half-tones that we so carefully construct by means of cornice and pillar, architraves and mouldings, we can supply in colour, *i.e.*, we can get their equivalents in contrasts by variety of colour, and then, in our dark and narrow streets, what a boon to be relieved of the pressure of cornices, especially when they appear to be resting on huge areas of plate glass. Trafalgar Square might be converted into the finest open space in Europe. Having some of the statues placed differently, the basins could be decorated with blue tiles, so as to give the water a fringe of colour; we could have trees and shrubs all round, and some of the club-houses, &c., painted white. There is this amiable quality about whitewash, that when you have whitened the building you have coloured it. The white seems to borrow and steal from far and near. It takes blue from the sky, green from the trees, reds and russets from the walls, and sober shadings from the ground. I have spoken of it before, but I repeat it again, that if you use colour, you must use it in

LARGE MASSES.

I must add that it must be *gradated*. There are many methods of achieving that result, but gradated it must be. A piece of ungradated colour is a monstrosity. It does not exist in Nature and though we may oppose Nature in many of the things we do, we may not oppose her in that. Now, except with the paint-pot and machine-made tiles, it is easy to procure uniformity of tint. This appears, at first, to conflict with the use of whitewash, but it is not so really. The colours, lay them as carefully as you will, get gradated by reflected lights and colours impinging on them, but, as a rule, not in sufficient quantity to appease the eye, whereas white is able to accept all the external colour that is available that can satisfy the eye. The sea is blue, the earth is green, and there is plenty of it, but the flowers are few; but the wise application of colour is a matter which we may consider after we have agreed upon *the principle*. *Heraldry* had its roots in war, and from the strife of men against men, their passions, their abilities and hopes; all these furnished the superstructure of colour, charged with history and meaning, fenced round by law. The temple walls, the battlements, the ship's bulwarks, were gay with shields of heroes; from tower and spire waved the pennants and standards, placed there by man's hand, but kept there by man's blood. We, too, have our strife, but it is against want and disease, dirt and disorder. We fortify our city against these enemies, setting our houses in order, summoned by the pity of these latter days, and marshalled by the knowledge their science has given us. Strong and brave, let us go out to our fight, clothed with the distinction that colour can give us, and cheered by the *camaraderie* that such colour confers. When the day's work is done, there is the city, beautiful, firm, stately, and our home. Within its many walls are the hostages we have given to fortune, the treasures our forefathers fought to secure, the monuments to which we are the heirs. Is it too much to hope that some day our children may say to the stranger: "Walk about Zion, and go round about her: tell the towers thereof. Mark ye well her bulwarks, consider her palaces; that ye may tell it to the generation following"?

[The above is an abstract of Mr. Ricarlo's lecture at the Art and Crafts Society's meeting on Thursday last, at the close of which Mr. Walter Crane said, that as this was the last of the course of lectures, he wished to express his sincere thanks on behalf of his colleagues, as well as himself, for the interest shown in them, and for the genuine appreciation which all the lecturers had received. Various suggestions had been made by the different speakers, and it was to be hoped that, sooner or later, at least some of these suggestions would be carried out.]

HEXHAM. CAPITAL IN CHOIR (1200 A.D.). FROM A PHOTOGRAPH BY MESSRS. PHILIP AND SON.

"THE SKY-SCRAPER."

BY ALEX. BLACK.

SOME people may think that the sky-reaching structures of the new world might bear the inscription "Excelsior." Now Excelsior, when inspired by the noble motives typified in song, would then only be appropriate. But in practical building construction, we are not so much interested in the moral motives as in the highest development of the methods of using our material resources. Too often, indeed, we find the ignoble in intimate relation with the noble in this world, with corresponding ignoble results. Little as we are, compared with gigantic nature around us, and be-littling as are our actions, sometimes, nevertheless, like the ant, our achievements are the measure of our ability, mind, and not matter, is the controlling force. The earliest recorded high-reaching structure attempted by the ancients, was nearly 42 centuries ago, in the plains of Shinar, in Chaldea, when they proposed "to build a tower whose top may reach unto heaven." Though this first proposed tall building was frustrated, we are told, and we do not therefore know what the ultimate height of the Tower of Babel would have been, yet it is conjectured that the Tower of Belus, which was built afterwards upon the same site, was a similar structure, and its height was 156 feet. The epoch-making race heaven-ward, is interesting by the characteristic contrasts afforded in the difference of means, materials, and results. In the first epoch it was of burnt brick of seven stories or stages, surmounted by the tabernacle, and each successive story upwards was of dimininished area by being inset all round. The ascent was by inclined planes, from story to story, on one side, where the inset was widened for the purpose.

In the last epoch, the construction is of steel skeleton frame, clad with a veneering of brick terra-cotta, so-called "ashlar" slabs of stone, &c. There are other points of contrast; thus all the stories are continuously vertical throughout the total height of the building. In many cases the height is double that of the ancient structure, and the ascent is vertically to the top, by means of high-speed elevators (lifts). Though we may properly disapprove of such tall buildings in the streets of cities, as practically menacing the value of neigh-

bouring property, and the safety, health, and comfort of the public, they also expose the occupants to exceedingly grave risks, more especially those attending accidental fire and suffocating smoke. There is, however, some interest attaching to the methods of structural treatment of the problems presented in their design. They may indeed contain valuable structural suggestion and tried precedent, in adaptations of means for accomplishing purposes to be attained. Solutions of the kind might be taken advantage of in less tall buildings, where local conditions of site, &c., might require it.

Note.—The yet taller spires, towers, domes, minarets and such like structures, are, of course, here left out of consideration.

The characteristic description of building that has recently come to be prominently known throughout the world as the "sky-scraper," or "sky-raker," is the tall, rigid, steel skeleton structure, ranging from one dozen to two dozen and more stories. These skeleton structures have been built within the last 13 or 14 years in several cities of the United States of America. They originated ostensibly in Chicago, though New York, Philadelphia, and Minneapolis each claim priority of introduction of the masonry-embedded metal column and connected girder structure. This, however, is not the true typical embodiment of the peculiar principle of carrying the entire structure on a carefully balanced and braced metal skeleton frame, protected from fire, and supported throughout upon equilibriated column and pier foundations alone.

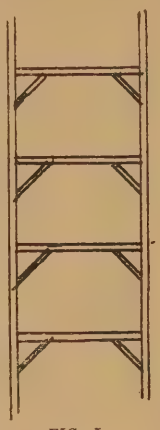


FIG. 1.

In Chicago, too, the necessities imposed by the unfavourable nature of the foundation soil, which consists of a thin, firm, clay crust, with an interstratum of boulder gravel called "hardpan," just above the level of Lake Michigan, required a special solution of the foundation problem. There is about 9 or 10 feet deep of "made ground" overlying the original land surface, and underlying the firm original crust is soft mud and "quicksand," about 60 feet to 100 feet depth. The present street level of Chicago is 14 feet above the lake surface; hence the depth for basement and foundation construction is very limited, and basement accommodation in Chicago is very valuable. The urgent foundation difficulty, upon the economical solution of which depended the realization of the "sky-scraper," was solved by the employment of concrete embedded steel rails or I beams. These, in tiers crossing each other, attained a rapidly wide-spreading footing area within a short height, and thereby utilized the utmost basement space available, when thus freed of cumbrous masonry foundations and walls. The true type of rigid skeleton steel structure was initiated in the "Home Insurance Building," in Chicago, in 1882-3. In the most perfect structural arrangements of the sky-scraper, steel-built columns or staunchions, clad in porous terra-cotta or other fireproof material, form the fenestral piers of the external walls, as well as the interior supports of the floors, roof, &c. The floor and transom, or spandrel girders, between the before-mentioned external piers, have all riveted connections with the columns. The systems of bracing extend vertically in a continuous series of panels throughout all the stories from the foundation upwards. There are four distinct systems of bracing adopted, the simplest of which is the iron-plate gusset and knee-bracing, consisting of web plate and angle iron flange placed in the lower angle between the columns or walls and the girder ends, as represented in Fig. 1. The next system is the portal or arch-bracing, consisting likewise of web plate and flange angle iron, as in Fig. 2. The web is

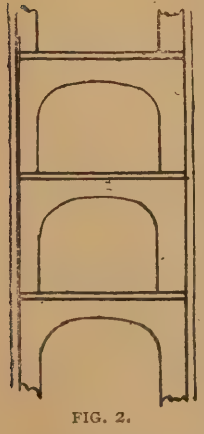

FIG. 2.

riveted to the column and to the floor beam by means of angle irons. The third and fourth systems of bracing consist of intersecting diagonal rods, as in Figs. 3 and 4. These rods are each furnished with a turnbuckle, so that the tension can be adjusted to any change occurring. This form is called indiscriminately sway-bracing and wind-bracing, though they have two different purposes, but both objects may be served by the same bracing. The sway-bracing is introduced simultaneously with the erection of the columns and girders, for the purpose, in the first instance, of staying or gripping the skeleton building to prevent the lateral swaying induced by the operations occurring in the erection; whereas wind-bracing, as the term literally implies, has for its object the resisting of the force of the wind acting externally upon the finished building. The second, third and fourth systems of bracing are usually introduced between two adjacent vertical tiers of columns. The panel points or axes of connection with the horizontal members are varied relatively to both tiers of columns, as shown in Figs. 3, 4 and 5. In the system represented by Fig. 3 the diagonal rods are bolted to the floor girders, which thus act as struts between the bracing panels. On the other hand, the diagonals in the system represented by Fig. 4 are bolted to special horizontal beam-struts, which thus admits of room for a doorway at the side, as shown in Fig. 4. Either of the systems represented by Figs. 3 and 4 may be combined in both single-story and double-story panels, as in Fig. 5. Their distance from the columns at the points of connection with the horizontal beams is regulated by the position and requirements of doorways. It will be observed that the least economical and efficient form of bracing is the angle-knee or gusset system, as it introduces large bending moments in the columns and girders. On the other hand, sway or diagonal rod bracing is the most economical and efficient, and is always preferred where it can be conveniently arranged so as not to interfere with doorways, passages, &c., in any of the numerous floors. The angle of the diagonal bracing rods with the column should not be less than 30°. The portal bracing is not without its advantages, as all parts of it are simultaneously strained either way the wind acts. It is very stiff and its economical construction will compare favourably with the sway-rod counter-bracing, considering the much greater choice which it allows for the disposition of doorways, corridors, passages and other internal arrangements, or future re-arrangements of the floor plans on all or any of the stories. This freedom of arrangement and future re-arrangement in any of the floors in the cases of most of the buildings of one to two dozen stories, which will necessarily differ in requirements from time to time, may prove a consideration of great value. All systems of bracing must be symmetrically situated in the building so as to avoid any tendency to twisting of the main frame. The bracing is required in two directions, that is, longitudinally as well as transversely of the building. When, however, the building is narrow and comparatively deep from front to rear, and having solid party or division walls between it and the adjoining buildings on either side which have sufficient stability to resist the horizontal thrust of wind force against the front or rear walls, then longitudinal bracing is omitted. Massive masonry is seldom introduced into any portion of the very high structures, at least in Chicago. In a few instances in New York and other American cities the foundation piers where they can be economically made to reach, by means of caissons, to the bed rock, are built of solid masonry or concrete.

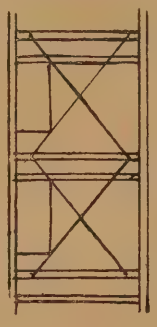

FIG. 3.

FIG. 4.

The limit of attainable height of these tall buildings has been a moot point with the curious. There are two important considerations, apart from those previously alluded to, which of themselves force an inevitable limit to the height. 1. The multiplication of stories requires—(*a*) an increased repetition of high-speed elevators in convenient locations, in order to accommodate the increased number of floors on the higher ascent. The gross elevator space, and the comparative size of the individual elevators varies in accordance with the nature and special requirements of the occupation of each building. The most convenient elevator accommodation for callers is that which provides for the least waiting by the greater number of smaller size elevators. In most of the office buildings, the disposition of the elevators is to group them around the semi-circular end of an elevator hall, convenient to the main entrance. But when the building extends the full depth between two parallel streets, the elevators are grouped convenient to each front, the larger group being at the more important street. Most of the buildings of twelve to sixteen stories on a site area ranging from about 6,000 to 10,000 square feet, have at least four to six elevators. In tall hotel buildings, etc., where a grand staircase is made a special Architectural feature, the elevators are grouped on each side of it. A lady's elevator is usually provided at a minor stairway. Separate "freight" elevators are likewise provided in a convenient place. (*b*) In addition to the encroaching elevator space is likewise that of enlarged area of interior light and air central courts, as well as a distribution of more and larger air wells and ventilating shafts, and enlarged furnace flues. 2. The second consideration which limits the height of tall buildings is the insufficient pressure of the city water supply to reach the higher stories, either for domestic or for fire protection purposes. This insufficiency necessitates the extra provision of special pumping machinery, tanks, and other accessories, cost of working and maintenance, etc.

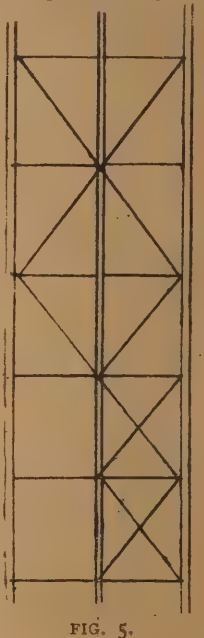

FIG. 5.

The external walls of skeleton buildings vary in materials as well as in characteristics, but they generally serve as a weather-proof Architectural encasing or "veneering" of the skeleton steel frame. In this way the requisite appearance in Architectural features, details, colour, play of light and shade, and other desirable external characteristics is attained. This encasing is accompanied by internal porous tile, brickwork or other furring, and thereby protection is afforded to the steel skeleton and intermediate steel framework against the weather, penetration of moisture, and likewise heat from external and internal sources. In tall buildings, a certain amount of structural weight is necessary in the walls, in addition to the fireproof floors and ceilings, and fireproofing to columns and girders, bressummers to impart stability against the excessive exposure to wind force. For this purpose, brickwork wall backing or spandrel filling, of twelve and sixteen inches thick, is carried on steel girders or bressummers between the fenestral pier columns at each floor level. The veneering and fireproof furring are secured to the steel skeleton by means of clamps, as well as by anchors hooking at the bed-joints, and made fast at their inner ends through holes punched in the intermediate metal framework, or to the brickwork backing or spandrel filling where more accessible. The holes for anchors in the metal framework must be punched at the manufacturing shop, and accordingly their position must be indicated in detail drawings. All internal walls, partitions, stair and elevator cases, etc., are constructed of hollow or porous tile, and are supported by systems of fireproofed girders and columns. As little wood as possible is used internally, even much of the usual wood finish, architraves, etc., are dispensed with. The height above the street level to the top of the coping of these buildings ranges between 200 and 386 ft., or more. The ground floor story ranges from 15 to 20 ft., the first and second stories 13 to 15 ft., the remaining stories about 12 to 13 ft. A fourteen-story building will usually range from 170 to 200 ft. high. A building of sixteen stories

200 to 250 ft., twenty stories about 275 to 300 or more feet above the street level; twenty-nine stories, 386 ft., is the greatest height yet attained in New York, though thirty-two stories is now proposed.

The Scientific American estimates that in New York, by her ninety-four tall buildings of eight stories and upwards, there has been added a floor area, including the eighth story and upwards, to her office accommodation, about 88 acres in the business district. By way of contrasting advantages of steel skeleton foundations, an actual case may be mentioned. A five-story masonry building imposed a load of over two tons per square foot upon the soft Chicago clay. This building was replaced by "The Fair" building, of sixteen stories high, which only imposed two-thirds of the unit weight of the masonry building upon the same soil, which obviated all appreciable subsidence. The problems and calculations involved in these structures are of a more exact and diverse character than is usually required for masonry buildings. The various story-loads, both structural or "dead" and "live," are determined and carried by the columns at the respective floor levels, and all the columns are numbered or lettered for distinction in loading. In order to facilitate the systematic distribution and computation of the various loads on each floor for the several columns, a "column-sheet" ruled form, with printed headings and items, is used. This sheet is divided across into sets of three equal spaces each, for the loads on each column, which are classified as "concentric," "eccentric," and "load on footings." Down the left side of the sheet, the names of the items under which the several parts are grouped are printed in order, beginning with the roof, and then following downwards with the successive stories. These items embrace "load from column above," "floor-loads" (dead-live), which includes weights of partitions, stairs, and all other structural parts imposed or abutting thereon, "masonry piers," "curtain walls," "spandrels," "elevators" (lifts), "water tanks" (in roof), "weight of story column" (fireproofed). To the total of these items is added the vertical load component induced by wind exposure. From the data thus obtained for each story the area (in square inches) corresponding to the resulting load for the requisite metal in the section of the column is computed for each separate story downwards. The cumulative story-loads are thus brought down to, and then to include the weight of, the footings, which gives their area, and accordingly, also, the unit load of the whole structure that is imposed upon the clay or other soil in question. It is obviously only by such systematic procedure that the true loads of buildings can be accurately computed with convenience, and the suitable safe sections of the metal, or other material, for the support of these loads can be properly determined. By similar systematic methods, the sections and dimensions of girders, and of bracing, and their connections and other structural parts and details, are separately determined for each story at a time, with their accumulating stresses downwards, without interruption to the final resultant stress which is transferred by the footings to the underlying soil. The Architect or engineer can only thus have some peace of mind when he can have confidence that the data on which he has based the scantlings and dimensions of his materials has been arrived at by systematic methods of computation.

At a special meeting of the Blackpool Town Council a resolution was adopted authorising the promotion of a Bill in Parliament, in conjunction with the Urban Councils of Lytham, Kirkham, St. Anne's, and Fleetwood, for the purpose of acquiring the Fylde Waterworks Company's undertaking. It is intimated that the amount required to acquire the undertaking will be between £600,000 and £650,000.

The tender of Messrs. Goddard, Massey, and Warner, of Nottingham, to supply and erect a four-cell refuse-destructor, including a chimney 150 ft., and other specified works at Upton for £4,196 10s., was accepted at a recent meeting of the Torquay Town Council, subject to the sanction of the Local Government Board, and it was decided that £2,146 be utilised for the erection of the buildings, fencing, making an inclined roadway, etc., this work to be carried out by contract or by the committee.

MR. H. H. STATHAM, ON STREET ARCHITECTURE, AT THE A.A.

[*Advanced proofs of the papers read at this Association, have always been supplied us by the courtesy of the Authors, but such courtesy not having been extended in this instance, we publish our own reporter's extracts.*—ED.]

MR. STATHAM prefaced his Address by stating that this was one of a series of lectures delivered at the commencement of the last session, but that it was a complete lecture in itself. He said, that it could not escape even the most superficial observer that our street Architecture was, to a great extent, remarkable only for its dullness and monotony, be it in the suburbs, with their stucco houses and porticos, or red brick villas with projecting ground floor windows, all built, more or less, according to one stereotyped pattern, or our residential quarters, interspersed here and there with high and expressionless blocks of flats, or in our main thoroughfares of the business quarters, there were, every now and again, some remarkable fronts to be seen, but, by virtue of their scarcity, they only served to emphasize the great want of variety. Of mediæval street Architecture we possessed very little, partly owing to the havoc wrought by the Great Fire, partly to the march of progress of the age. It was evident that what we wanted in the first place, was *variety*, which could be often achieved by much simpler means than might be imagined, and without, in any way, interfering with the modern beneficial tendency in street Architecture towards symmetry. There was not the slightest reason why all the houses in a street should be of a uniform height. The designer of a street front had, first of all, to take into consideration the width of the street, then the length of his site. This once done, he should make it his business to see how he might utilize the space at his disposal to the best advantage, so as to create a pleasing effect. There were more ways than one for treating a front: for instance, the horizontal and the vertical treatment. To give variety to the fronts in a street, the Architect should, for instance, strive to create a *contrast* in his front with the neighbouring ones. It was very desirable to concentrate the particular expression desired upon one part of the front only, be it horizontally, say, upon the upper floors, or vertically, say down the centre line; the latter mode was adaptable to all kinds of buildings. A building, ornamented with rich work inserted between two plain buildings, would give more effect to those of your neighbours also. A large window, carried all over the ground floor, would render a comparatively plain front rather attractive, and much could, for instance, be done by a judicious distribution of gables and windows. Another important item was to get

VARIETY OF OUTLINE

in a front. In a narrow street, effect such as can be seen can be given, by a broad treatment, to an otherwise exceedingly plain building; in a wider street the same building might be rendered attractive by means of a turret and such like additions. Of course, variety in painting of different fronts was also a thing to be considered. Concrete might also be made use of if properly treated, in small quantities; the all-over concrete house was an abomination. Corners and angles should have strength and solidity. What, for instance, could be more absurd than a large glass pane at an angle on the ground-floor which looks like a huge hole in the wall, and over it a massive wall with sculpture on it, as we sometimes saw it; the modern iron girder building with its huge glass panes was not by any means as yet all that might be desired; especially the large panes were positively ugly; small panes would do a great deal to make the wall and windows appear more a homogeneous whole. It had been suggested here and there to give certain buildings devoted to especial purposes a distinct typical exterior. But in a business street, containing buildings devoted to a variety of trades, such as insurance buildings, office blocks, banks, shops, and so on, it was quite impossible to come to any such arrangement. Variety was absolutely essential. At present, the fronts in certain streets presented one phase only of Architectural treatment, and here was the difficulty. What can one do to produce an Architectural effect in a case where the frontage is only limited? Up to the present, Street Architecture had been allowed to take care of itself. Hence we had become accustomed to see cornices cut off short at the boundary line. But it seems possible to obviate such inartistic features. He would suggest that the real design of the frontage should be confined to the upper stories, so as to leave the ground floor comparatively plain without any projecting Architectural details. Occasionally we saw instances of two such designs side by side, without each interfering with the other. Unfortunately, the use of oak in frontages was forbidden nowadays, and we could therefore not often obtain such picturesque ornamental effects as we notice them on some ancient mediæval structures in such places as Hildesheim for instance. In narrow streets considerable interest could be imparted to a front by a slight projecting out of the first floor; this was a small matter in itself but was very effective, and gave a variety of outline to a front. Skylines have become a kind of shibboleth. Gabled fronts looked picturesque but were not practical, and we must therefore be content to let them go. A gable here and there would be right and heighten the general effect and could do no harm. But this would be setting a bad example. There was another important matter.

FLAT ROOFS

for town houses impressed themselves on the mind of the reflecting Architect. He looked upon it that the flat roof would come more and more into vogue in future City Architecture, although, of course, there would be sure to be an outcry against the general adoption of the flat roof, but, as there was much in habit, we might eventually get to like it. At all events this innovation would prove to be of real, practical use. Balustrades, as now generally used, were an Architectural sham, because at present no one ever went on the house-top except the man who wanted to repair the roof. In the case of flat roofs balustrades would serve a useful purpose, justifying their existence. There were two distinct ways to add interest to a street front as regards the treatment of the surface. The one was the modelled surface and the other the flat surface. According to Mr. Lethaby, modelled surfaces in street fronts were undesirable as Architectural features in a smoky city. In a narrow street projection should rather be avoided. No one could deny that bold cornices made a very fine piece of effect, but it was a question of a wide *versus* a narrow street. In a narrow street a cornice was never seen to advantage. We sometimes saw street buildings in narrow streets clothed with increasing richness towards the upper portion of the design, but all this elaboration was completely lost, there was no reason why in a narrow street the decorative treatment should not be placed where it could be seen, viz., on the ground floor. Terra-cotta lost its effect from its profusion. It had been said that our streets were losing in attractiveness by the abolition of characteristic signs and symbols on shops, and some people seemed to be anxious to revive these, but these good people quite forgot that this mode of decoration originated in a period when people could not read. What would perhaps be more to the purpose, would be to get tradespeople to write their names legibly on the outside of their shops, instead of having monster signs projecting into the street. One of the

DIFFICULTIES OF SHOP ARCHITECTURE

was to get a large window on the ground floor and an entrance by the side of it. Where practicable, one entrance on each side of the window was to be preferred for the sake of symmetry, or, where the frontage was small, one entrance between two small windows. He also thought that we had not yet arrived at a proper Architecture for banks. The ground floor, especially the entrance, should be solid and massive, rather than decorated, so as to suggest at once that it was a stronghold of property. Mr. Statham quoted the entrance to United States Trust, Wall Street, New York, as an example, being very impressive and in exceedingly good taste, and said it conveyed an idea of power; and was, strange to say, designed by an English Architect named Richardson. Whatever might have been people's ideas in past ages, on Street Architecture, mattered little: we had to consider the requirements of the age we live in. One question of great importance was that of grouping the windows, and this led up to the

question whether we should treat the main tiers either as pilasters or whether we should have a solid wall. The chief consideration was, always to give the preference to the stronger construction; æsthetic fitness was an entirely different matter, There was also the most important question as to what

MATERIALS

should be used in the construction of street fronts. As already stated, timber fronts were doomed by law, as timber was too dangerous for city structures. Brick was the favourite at present. It appeared, at first, to lend one's building colour and a certain richness of texture, but it soon turned out to be a soot and dust collector. It would, especially in a smoky city, seem more advisable to use glazed materials for fronts; here and there it looked very well, but what would people say to a street presenting frontages polished and glazed from end to end? Terra-cotta had been used with good effect in a good many of our recent street buildings. He was bound to confess that he had still a weak conservative leaning towards stone, as, after all, the most dignified of materials. But stone should not be carved too much. He wondered that cement was not being used more than it is, because it gave a contrast of tone if used with discretion. The use of stone and glazed material together should not be encouraged, because stone changes its colour, and glazed material looks ever new. What discords of colour we should have! The application of colour in small panels was more feasible. Mosaic work was very good, and it was to be hoped that we should see more of it. There had only been few attempts at it, and a good Artistic mosaic design lent itself remarkably well for mural decoration, and symbolical designs added interest to our streets; but, after all, it was only a few of us who had eyes for such things, and if one decorated one's house, one did so for one's own pleasure. It was quite an illusion to think that the masses appreciated street Architecture to any extent. Anything like mosaic harmonized naturally with Architecture, and was a kind of "pictorial" Architecture in itself. But after all said and done, sculpture was the form of ideal decoration which most of all blended with Architecture.—Numerous illustrations were shown, and also a great number of lantern slide views of street Architecture from almost every part of the globe.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Architectural Association was held on Friday evening. Mr. Beresford Pite said, before asking Mr. Statham to read his paper, he had a duty to perform of an unusually pleasant character. He was old enough, in the history of the Association, to remember with what enthusiasm the work of the Entertainment Committee used to be carried on under the secretaryship of an old friend, who then went by the name of H. D. Appleton. Since then, however, Mr. Searles-Wood had taken upon himself the mantle of Mr. Appleton, and had continued, on behalf of the Association, to carry out the most self-denying and arduous duties of secretary of the committee responsible for the arrangements of the annual excursion. Of late he had been associated in the new work by Mr. Carbutt-Brown, whose absence that evening was enforced through illness. For many years Mr. Searles-Wood had been the life and soul of the annual excursions, and the pleasant business they had undertaken, was to take advantage of his retirement from the Entertainment Committee—for Mr. Searles-Wood was only severing his connection with this committee, and would continue to take an active interest in the Association—was to offer to him, on behalf of those who had taken part in the excursions, a small token of their friendship and esteem. The movement had been generated by the excursionists themselves, but they thought the presentation should not be confined to themselves, but that it should be made in the presence of the Association, and the gift handed from the chair. And although some members might feel some disappointment in not having shared in the interest and kindness of heart which led to the testimonial, it was their own faults for not having attended last year's excursion, as he did. The speaker then handed two silver candelabra to Mr. Searles-Wood. Mr. Searles-Wood, in returning thanks, said: I am so overcome by what you have done to-night, that I cannot really find words to express my gratitude. I have always thought that the Association work was of sufficient interest in itself to be its own reward, for so it has been in my case. Its meetings have been the means of bringing me in contact with men whose friendship I value most deeply, and for this expression of their kindness I am unable to adequately express my feelings. I can only say that if the work I have done has given as much satisfaction to them as it has to me, I feel doubly repaid. I certainly think that the

VALUE OF THE EXCURSIONS

are hardly ever fully appreciated by a great number of the younger members of the Association, and I hope this reference here to-night will have the effect of drawing their attention to the matter. To my mind, the value of the excursions does not lie solely in the fact that it affords a holiday and an opportunity of visiting old and interesting buildings, but is valuable as the means of building up much-valued friendships, and the interchange of ideas during the excursion week is, I am sure, of immense utility, in addition to the work we go to study. I can say no more in appreciation of your kindness.—Mr. E. W. Mountford said he was not going to detain the meeting; he merely wished to say that he had received a number of letters and telegrams from all parts of Great Britain, from persons who would liked to have been present, but who, through various causes, were unable to attend. All expressed what the President had so nicely stated—their feeling of friendship and gratitude towards Mr. Searles-Wood, and as a member of the Excursion Committee for fourteen or fifteen years, he might also be allowed to say how much they owed to Mr. Searles-Wood. He (Mr. Mountford) knew what the secretaryship entailed.—The Chairman then called upon Mr. Statham to read his paper on "Street Architecture," which we give above. A somewhat lengthy discussion followed. The Chairman said they were indebted to Mr. Statham for the great pains and labour he had been at in illustrating his very thoughtful remarks and suggestive criticisms. The subject was so vast that it required a large man, and he ventured to assert that none present felt any doubt as to their having derived valuable lessons from Mr. Statham's generalisations. He (the speaker) could not but feel that a special value attached to the illustrations, because they had not been brought forward as illustrating historical or archæological developments of work; they were brought forward as illustrations of a class of building always with them, and it did not matter whether buildings spoken of were ancient or modern, Queen Anne or classic, whether they were tumble-down, unthought-of erections, or whether they were carefully considered works, with such a paper as they had heard they were enabled to get a broader sense of a subject of their daily work. The subject was of value also, because it would teach them a very important lesson—to look for idea in building; not merely to ask the question "Is this in accordance with the general custom of building?" but rather "what is the idea in erecting this building? Is it erected to impress one with its verticality or horizontality? Does the building exemplify one or more good qualities?" They had got to introduce expression of idea even when they had only a frontage of twenty or thirty feet to deal with, and it would be much more helpful to them than had they simply to make the arrangement of windows in Queen Anne style, and the doors in Gothic, and so on. He would like to emphasize the great value and importance of

A PROPER STUDY OF RECESSSION

in street Architecture, remembering that although they might be prohibited in the construction of projections, they would not be prohibited, as a rule, from recessing, and he thought in the greater number of instances of street Architecture recession was much more valuable than projection; for instance, it was especially so in the case of work in a narrow street. He would therefore advise the student to study shadows, and to observe their effect, not only in sunlight, but throughout all the day. There were a number of other interesting matters associated with this subject which he would like to refer to at length, but which he could only refer to slightly. He could not help feeling very thankful when Regent Street was re-painted, for however interesting some of the work might be, the street became a new street when it received its annual coat of paint. The work was there in its pristime condition of beauty every time the paint brush was brought into operation. Every time the Crown Surveyor ordered it to be repainted, the work was renewed, and he could not help remembering with amusement the American's remark, chronicled in the columns of Punch, that "St. Paul would be all the better for a coat of paint." Respecting the utility and effectiveness of small window panes, they might play with them in their hall windows and in their bay windows, but when the Architect descended from the use of plaster and marble to red putty, he was going to

TOO LOW AN EBB FOR ARTISTIC EFFECT,

and if their buildings failed because the windows looked like gaping holes, it was their fault.—Mr. F. Clarkson wished to supplement the Chairman's remarks with a few comments on the points which had been raised. With reference to the necessity of avoiding anything likely to emphasize the narrowness of a frontage, he wished to call attention to one of the illustrations, where there were four fronts and only two gables. The party wall between each pair of houses was carried up in the centre of the gable, and the manner in which this was done in order to comply with the regulations in force in London for the prevention of the spread of fire from house to house, was by the introduction of fire-extinguishing material and concrete, which were so arranged as to be an effectual preventive of the passage of fire from one building to another. As to the President's remarks respecting the "freshening" of buildings, the speaker did not think it was absolutely necessary to use paint in order to give a building a fresh appearance, for with brick buildings the ground stories, at any rate, were usually kept clean. Mr. Gibson, who might be rightly called, he thought, a distinguished Architect, always aimed at obtaining a very legitimate ending in his carefully-finished fronts, and in this respect he set a very good example—the bringing up of the front, and finishing everything in a neat and perfect manner. And while speaking of Mr. Gibson, he might say that he was the recipient of his confidence respecting the treatment of banks—a subject of which they had heard not a little that evening. Mr. Gibson had had a large experience in the treatment of banks, as large, perhaps, as any man, and he had come to the conclusion that it was very necessary that a bank should have "a large order." The ground floor was necessarily the business part of the premises, and that must, therefore, be of a solid character. Then they had a number of stories not utilized for business purposes at all, and if the stories were small, the building had too much the appearance of an ordinary dwelling-house, and this had to be averted. He proposed a hearty vote of thanks to Mr. Statham for his interesting paper.—Mr. M. B. Adams seconded the vote, remarking that the bait which the President had thrown out for the debate, he accepted, and he very much questioned whether he (the President) was altogether right in his views and use of smaller panes of glass. Unquestionably, if they had a monumental front and a client who would allow them to go to some expense in the matter of sculpture, then they knew exactly how to act, but when they had a utilitarian front, and the majority of our buildings were of this kind, where every foot of space was to be utilized, a degree of scale and continuity was required. In the second specimen of the lower bay windows submitted, where a simple and dignified treatment had been carried out, the work was satisfactory when it was done, and he ventured to think it was satisfactory now. The buildings included in the illustrations were of a very varied character, and he quite recognised that it was difficult to classify them, but no examples of American Architecture were included; none of those huge tower-like buildings, which almost seemed a necessity of the times, were amongst the other specimens. He referred to those buildings in which iron and steel were very largely introduced, and in which the stone-work was merely attached to the iron-work in a very unsatisfactory way. Here, in London, the Building Act would not allow them to build so high, he supposed, but many of our buildings were really higher than they need be, if only the

skylight and other means of advertisement, which seemed to destroy the appearance of buildings in the erection of which Architects had taken a great deal of pains to give refined details, were banished. In Bishopsgate Street, where Mr. Townsend was giving them a most artistically set-out front, cigars or pipes, some of them 20 feet long, were put up to disfigure an otherwise handsome building.]—Mr. Fellows-Prynne said that one of our

GREATEST FAILURES,

however, had been, if it was not at present, street Architecture. Compare the English styles with the streets of Paris and Vienna, and they could not but admit that they had failed particularly in the erection of angle buildings. In this respect they could copy the example of Paris to advantage, but, of course, London could find a set-off. Mr. Statham had wisely mentioned the treatment of cement. They must acknowledge, however, that there were great possibilities in the proper treatment of cement. He did not say it was always to be recommended, but when other materials did not lend themselves to such good treatment, cement was more than desirable. It had been well treated in the past, and if in the past, why not in the present day? As to the use of small panes of glass, he had heard shopkeepers complain of them as being a "regular nuisance." "They don't show our goods off to advantage," many of them said, and therefore Architects must meet them by providing for larger panes. They had heard little of American work that night, and certainly there was a side to street Architecture in America. But there were two buildings at home which had just disheartened him lately, and one building was in a street deserving of something better. He referred to what were called the Artillery Mansions, in Queen Victoria Street. Could anyone consider anything so atrocious? He did not know whose building it was, but it was terrible that in such a street, such a building should be put up. Then again in the street in which the Aquarium is situated, buildings called the Westminster Chambers were being erected. He thought it was a disgrace to London that in the street leading to the finest building in the city, such structures as the Westminster Chambers should be put up. Mr. Thomas having spoken, the President announced that Mr. S. Smith, at the next meeting, would read a paper on "A Plea for National Registration," whilst Mr. Flowers, who was to have given a paper on that evening, would occupy the date originally alloted Mr. Smith.

A LANDSLIP occurred on the Regent's Canal, near St. Pancras, on Thursday last. For the past three weeks there has been a gradual subsidence of a portion of the northern bank of the canal, at a point where the watercourse takes a full bend, between Great College Street and King's Road. The extent of ground affected is about 200 feet, and the sinking has been going on at the rate of from 1 inch to 2 inches a day. The bend occurs at the junction of Prebend Street with a row of cottages named Canal Terrace, and the first-named thoroughfare is separated from the canal embankment by a 9-inch brick wall. As the result of the continuous movement of the ground—which has sunk altogether some 6 feet—the strained wall gave way in one spot, leaving a gap about 12 feet in length. The channelling of the street was also disturbed, and it became necessary to place barricades along that side of the road. Canal Terrace itself has suffered little, though a section of the railings separating it from the canal gave way, owing to an inner stay being drawn downwards by the sinking land. As to the canal, it has been ascertained that the bed of the water at the spot remains sound and solid, while the opposite bank is unaffected. The towing-path, which runs at a lower level than the bank, has given way but little, and is only submerged for a short length. The New River Company has taken the precaution during the past fortnight of turning off the water at ten o'clock every evening. The cause of the subsidence seems at present to be unaccounted for. It is a curious fact that the landslip started about the same time as the work of reconstructing the King's Road Bridge was commenced by the St. Pancras Vestry. But the bridge is some fifty yards from the bend of the canal, and what connection its operations could have with the disturbance of the bank, it is difficult to see.

STEPHEN ADAM, ON STAINED GLASS, ITS HISTORY AND METHODS.

ADDRESSING the members of the Edinburgh Architectural Society, Mr. Stephen Adam, on Wednesday last, in his introductory remarks, said that a considerable experience and study of fragmentary and ancient examples of classic and mediæval Art and craft work, only strengthened his opinion that the preacher was right when he said there was no new thing under the sun. This might seem a pessimistic view; but he strongly felt that all they did now in decorative Art had been done before, and better done. This, however, should not depress but encourage the present efforts made all about them to redeem the past; and there was no more potent factor in their immediate vicinity than their School of Art, or rather that branch of it, the classes for tuition in applied Arts—Art and craft work. All honour to those who established it and worked hard to encourage its students in the truthful and correct rules of decorative Art—rules which could not be impugned with impunity. The fruits of these efforts were clearly evinced by promising blossoms, that would yet by recognition and propagation of national or local talent expand and further adorn and beautify a city already most beautiful in itself. Great was the crime of any who would disfigure, by building or otherwise, its natural magnificence. In this respect there was a splendid rivalry between the Architects and craftsmen of their Scottish cities. He did not use the word "artists"—a word which, from its frequency and abuse of meaning, was made cheap. It was of the work their trained Architects and craftsmen were able to do towards the comfort and education of the masses, in Church and home, in palace and hall, that he spoke. There was an

AFFINITY BETWEEN ALL THE ARTS,

but the true aim of the workers in metal, stone, and wood, of the mural decorator and glass stainer, and the designer of tapestry and decorative materials was distinct, and required a distinct training from that of the man—"the artist"—who painted scenes for enclosure in that perpetual gilt frame. They had noble exceptions among their Scottish painters, Architects, and sculptors; but in all conscience they had surely had a surfeit, at stereotyped seasons, by constant repetition of that everlasting violet hill, that cerulean blue loch, the cluster of trees on one side, a boat lying on a beach, and other commonplace etceteras that taught nothing. He spoke in no spirit of contempt for honest work, but deplored that such individuals, mere photographic copyists, often caricaturists of nature, had by the present arrangement of things such splendid facilities of getting additional letters attached (undeservedly so far as genuine Art was concerned) to the names their honest fathers gave them—while, forsooth, the craftsman, however noble and elevating his work and aims, took a back seat, and was considered ineligible or unworthy of association and recognition by academies, Art clubs, and kindred societies. These remarks applied only to such painters as showed

NO ORIGINALITY

nor individuality in their monotonous exhibits. He emphatically asserted that, with the fraternal aid of his elder brother and natural patron, the Architect, the trained craftsman, by strenuous and intelligent endeavour in the beautifying of all about them, would yet claim his position in the Art world. Mr. Adam gave an interesting sketch of the process of manufacture and history of stained glass, and especially commended the early English glass previous to 1280 A.D. The later *cinque cento* style was referred to as the perfection of picture-painted glass, and it was shown how bad imitation of this method led to a decadence, as the aim of the glass stainer seemed then to be only to imitate oil paintings. The epoch of bad German glass was next commented on. Examples of it were to be found in Glasgow Cathedral, and in Parliament Hall, Edinburgh. In concluding, he said that the development of this Art was rapidly advancing, and would advance if they only kept before them, when designing for or working on glass, that they had in the material lovely iridescent beauties which the painter on canvas had not. Do not by painful mechanism destroy those virtues. Keep the glass glass, and continue to let enriched and subdued light come streaming through it. Let them remember that their window was but a transparent screen. Let the students of the

GLASS-STAINING ART

tenderly cherish and cultivate the purity and principles of the earlier work, which was such a clear expression of the life and times of its producers, and in the practice, by accepting their modern increased scale of pot metal colours (that was, glass through and through) and greater facilities for correct figure drawing, endeavour to increase and emulate its beauties. From the sixteenth century work, though avoiding its architectural and constructive composition, wrong in principle for glass treatment, let them seek to inhale the spirit of poetry, music, and refinement, so palpably mirroring the genius of the time, and, above all, seek to learn the value and grandeur of its colour. In short, with the form and sweet simplicity of the one style unite the colour harmonies of the other, and in those combined virtues find the *ne plus ultra* for the increased development of the Art.

Our Illustrations.

ST. MARTIN'S CHURCH.

FORMERLY called St. Cross, this Church stands near the Town Hall, Leicester. Ever since the time of the Romans there has been a Temple or Church upon the present site. The Church was originally cruciform in plan, with narrow aisles to the nave, north and south transepts, chancel and tower; at the end of the thirteenth century, an additional south aisle was built. In the Perpendicular time the chancel was rebuilt and a small chancel added; this took place probably about 1400–1420. The old tower rose from the centre of the Church on four Norman piers, and was surmounted by a lofty crocketted spire; this was taken down and rebuilt in the early English style in 1861, by Brandon. The south door is an exceptionally fine one, being in the early English style. Some Norman work still remains, consisting of an arch and a small piece of a string course.

ST. GEORGE'S, HANOVER SQUARE.

Apart from Architectural considerations, which are not inconsiderable, it is certainly a matter for congratulation that the historic Church of St. George's, Hanover Square, escaped practically without damage, externally, at least, by the recent fire. The view shown this week, illustrates the turret where most of the internal damage was done. It is assumed that the fire originated by the electric motors, used in the organ-blower, being over-heated and setting fire to the woodwork around. The Church, particularly the interesting turret, is probably one of the happiest efforts in design of Wren's pupil, Hawksmoor. It is not a typical example of his work, inasmuch as it shows less of the usually ponderous hand of the pupil and more of the grace and refinement of the master himself.

A FIRE occurred last week in the salon at Blenheim Palace, a large beam becoming ignited through the overheating of a flue. The damage to the roof was not very serious, and fortunately the beautifully-painted ceiling by Laguerre escaped with little injury.

THE Newcastle Society of Antiquaries is making arrangements to hold an exhibition of local engravings, members being appealed to for the loan of specimens. In May next the Society will hold an exhibition of Newcastle plate, ecclesiastical and secular. Those who possess samples of the same will be asked to lend them. The Newcastle hall-marks were one or three castles.

SIR HENVY IRVING will unveil, at the end of May or beginning of June next, the statue of Mrs. Siddons, which is to adorn Paddington Green, its precise site being in close proximity to Mrs. Siddons' tomb, which is in Paddington cemetery, now a public garden. The design of the statue was approved by the late Lord Leighton, and the statue itself is being executed by M. Chavalliaud, of white Sicilian marble.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
December 9th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gildea ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

IN June last the London County Council, on the recommendation of the Public Health Committee, instructed the Parliamentary Committee to insert clauses in the Council's General Powers or other Bill of next Session enabling the Council to make bye-laws similar to those which can be made by urban authorities outside London under Section 157 of the Public Heath Act, 1875, for the prevention of the occupation of any new dwelling-house until the drainage should have been completed and the dwelling-house certified by a duly authorized officer of the sanitary authority as fit for human habitation. The Public Health Committee states that it has now received from the Parliamentary Committee, a report by the Parliamentary agent pointing out that a bye-law to the above effect would make the letting and occupation of any new dwelling-house dependent entirely upon the individual opinion of an officer of a sanitary authority as to what was and was not fit for human habitation. The agent stated that he did not think that the Council could succeed in justifying an application for powers to make such a bye-law in London, looking to the fact that there were more than 40 sanitary authorities, whose officers might entertain different opinions on the subject of the bye-law, and that what might be regarded as fit for habitation in one district, would perhaps not be certified as such by the officer acting in an adjoining district. The committee states that it has informed the Parliamentary Committee, that it thinks the question of obtaining powers with reference to a certificate that a house is fit for habitation should stand over for the present.

THE Art for Schools Association has opened an exhibition of framed and unframed pictures recommended for school prizes and Christmas presents, at 29, Queen Square, Bloomsbury. The Association, which was founded in 1883, succeeded in making arrangements with the principal Art publishers in the metropolis by which they were enabled to sell, for the purpose of being placed in the class-rooms of elementary schools, good prints and photographs of beautiful and interesting works at rates much below the market prices. A publishing business, supported by annual subscriptions, has also been established. The report of the Committee shows that the operations of the Association have extended to a great many Board and other schools in London and the provinces. The number of pictures sold in 1884 was 2,732, while last year the total reached 3,664. The pictures in the exhibition, which remains open to the public until December 14th, include specimens of photographs, autotypes, and chromolithographs, representing works of famous artists. All the pictures will be on sale during the exhibition.

LORD LEIGHTON'S house, including the priceless Arab hall, is, after all, to be preserved for the nation. Some months ago a movement was set on foot for the purchase of the house, but unfortunately was not attended by the success which might reasonably have been hoped for. We are now able to announce that the hopes of those who wished to preserve the house for the nation will be realised. In spite of the failure of the movement publicly, a small body of friends have never ceased their labours on behalf of the project, and thanks to them and to the generosity of the late P.R.A.'s sisters—Mrs. Sutherland Orr and Mrs. Mathews—the beautiful house in Holland Park Road is to be offered as a gift to the nation, subject only to an assurance that the house will be suitably maintained and that the Arab hall is to be permanently preserved as it was at the time of Lord Leighton's death last January.

ACCORDING to a return issued by the Treasury, there are only 16 buildings of Architectural and historic interest, the structure and fabric of which are under the control of Her Majesty's Commissioners of Woods and Forests. Eight of these are in England, four in Wales, two in the Isle of Man, one in Scotland, and one in Ireland. The buildings in Wales are Harlech Castle in Merionethshire, Denbigh Castle, the Burgess Tower at Denbigh, and part of the ruins of Leicester's Church, all in Denbighshire. In Scotland the old Church and Monastery of Beanly, Inverness-shire, is maintained by the Commissioners; the old fort, near Kinsale, in Ireland; and Castle Rushen and Peel Castle, in the Isle of Man. The English buildings comprise Sandsfoot Castle, near Weymouth; the Castle and Speech-house of St. Briaoels, and the old Preaching Cross near Staunton, in Gloucestershire; the Queen's house and the Verderer's Hall in the New Forest, Hampshire; Eltham Palace in Kent; the ancient wall of the City of London, situated in George Street, Tower Hill; and Lindisfarne Priory, Holy Island, in Northumberland.

A SEMI-OFFICIAL announcement has been made that the Postmaster-General contemplates no interference with Wardrobe Place, which is endangered by the Bill promoted by the Post Office authorities for the extension of the Post Office Savings' Bank. It cannot, however, be too strongly insisted upon that these semi-official explanations are worth absolutely nothing. It is not so very long since the Old Rolls Chapel was, in spite of official promises, razed to the ground before any one could interfere. In the present case, although on the published plan the limit of the site to be acquired is bounded by the frontage of the houses on the east side of Wardrobe Place, the acquisition of this property would carry with it one-half of Wardrobe Place, and with the very extensive powers conferred by the Bill—to acquire land on either side of the proposed site, to extinguish rights of way and of light, and to stop up all passages—there is no doubt that, if the Bill in its present form were to become law, Wardrobe Place would be absolutely at the mercy of the Post Office Department. That this view of the case is not entirely fanciful is shown by the fact that the Post Office authorities have already entered into negotiations for the acquisition of sites on the western side of Wardrobe Place. The only safe course is to obtain the introduction of a clause in the Bill, definitely providing for the preservation of Wardrobe Place as an open space accessible to the public, and at the same time limiting the height of the buildings to be erected around it, so that its usefulness as an open space may remain unimpaired.

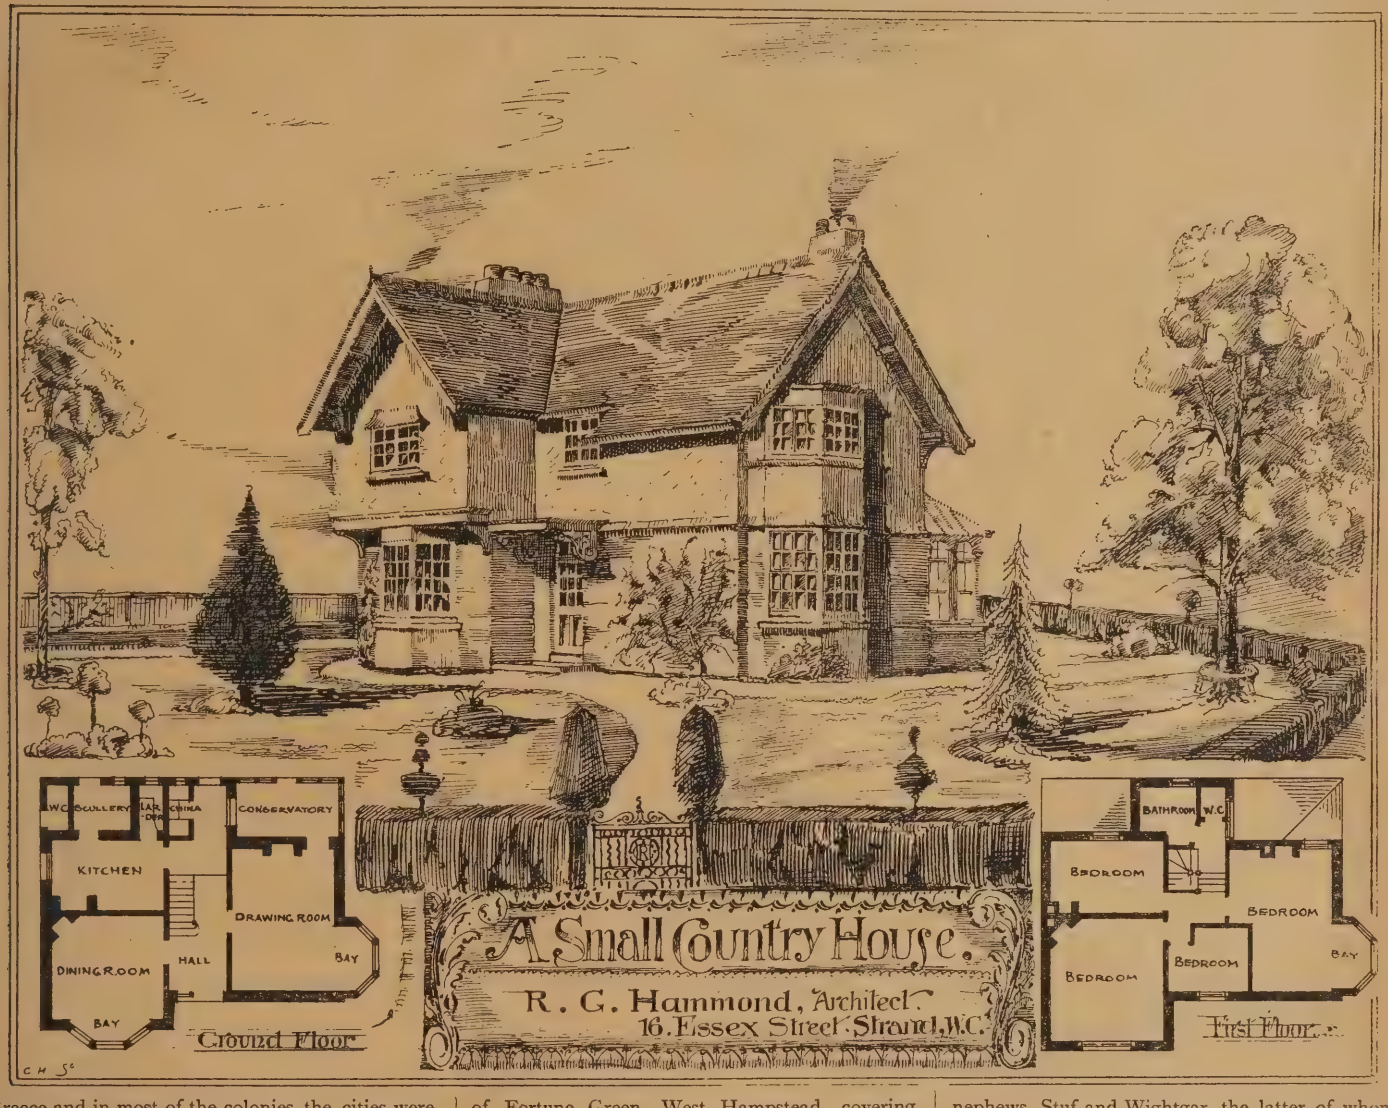
THE recent work of Mr. Harrison upon the Nelson column brings to mind the mechanical means by which Railton, the Architect, set up his granite shaft. Half a century ago the feat was regarded as a triumph of engineering skill. It is recorded that 7,700 cubic feet of timber were used in the scaffolding, the labour of erection costing but £240. A travelling steam-engine lifted the massive blocks of Devon granite, each weighing about six or seven tons, to the successive floors, but so slow was the rate of elevation that they took from four to five hours in reaching the top. About £23,000 was expended on the column, £5,000 on the statue, pedestal, and bas-reliefs, and £2,000 on the Architect. At the last, Government had to come to the rescue with £12,000, and Landseer's lions cost the country, in 1867, something under £1,000 a-piece.

AT a recent meeting of the City Commission of Sewers, it was agreed to adopt an arrangement for setting back No. 89, Fleet Street to the line of improvement for £6,000, to include all interests. It was also agreed to adopt a plan of improvements at the western end of Cheapside, by setting back the railings at the southern end of the old post-office, at a cost of £2,500, which sum is to be devoted to the scheme for acquiring, as an open space, certain vacant land in Little Britain, adjoining the existing public garden, Aldersgate Street, and commonly known as the "Postmen's Park."

ALONG the north side the mosaics which occupy the spandrels of the arches in the choir of St. Paul's Cathedral have now been completed, while those on the south side are being rapidly pushed forward, and it is hoped that by St. Paul's Day all the scaffolding may be removed. The pictures are executed in the rough mosaic work which was so successfully employed by Mr. Richmond in the decoration of the roof and apse. The spandrels are divided by the arches and pillars into six sections, the first two containing an allegorical representation of the Creation of Light. The two following sections show the visit of the Angel Gabriel to the Virgin at the Annunciation, the representation of the Virgin Mary being particularly fine. The last two sections show two guardian angels keeping watch on the walls of the holy city. The whole work is beautifully rich in colour, the tints harmonizing with the surrounding decorations. On the south side the subjects of the mosaics are the Expulsion from the Garden of Eden, the Temptation in the Garden, and the figures of two angels bearing the emblems of the Passion. When the choir is completed the four quarter domes are to be treated, but the subjects have not yet been chosen. The windows in the north and south transepts are to be filled with stained glass, the gift of the Duke of Westminster, and the execution of this work has been entrusted to Messrs. Powell, of Whitefriars. These windows will commemorate the Conversion of England to Christianity, the figures representing the first bishop of each of the kingdoms of the Heptarchy, with the corresponding monarchs. We also understand that Mr. Richmond is designing a large group of statuary in memory of Lord Leighton, to be placed at the eastern end of the south side of the nave.

AN important book sale was held last week. It extended over three days, and consisted of valuable works and manuscripts selected from the library of a gentleman whose identification was kept a profound secret. Record prices were obtained for many of the lots, and the total proceeds amounted within a trifle to the figure of £4,000. The sale furnished additional proof, if that were necessary, of the favour in which early manuscript and printed books are regarded by dealers and collectors. The most interesting work in this category was a history of the Conception of the Blessed Virgin, printed in 1471. The volume, consisting of only twenty-six leaves, was printed in large Gothic letters, and contained forty-five woodcuts. The book, seeing that it is dated ten years after the introduction of printing on the Continent, was regarded as a somewhat rough production, and £320, the price paid for it, was thought to represent rather more than its value. A Basilikon, dated 1592, and embellished with the portrait, armorial bearings, and mottoes of the Emperor Charles V., sold for £100; while the historical Mundi Libri XXXVII., by Plinius Secundus, printed in 1545, was purchased for £160. A similar figure was paid for an original unpublished manuscript, produced for Louis XIV., and entitled "Les Plaisirs de l'Isle Enchantee." The first polyglot Bible, which also contained the first printed text of the New Testament in Greek, realised £100. The catalogues contained a large number of county histories and topographical works, and the prices obtained show a considerable increase upon those which have ruled for the last five or six years. In this series the most noticeable was a large paper copy of Nichols's "History and Antiquities of the County of Leicester" (1795–1811). Such copies of this work are very rare, as many of them were destroyed by fire. At the Gosford sale a copy realised £280, while £300 was obtained for one at the Comerford sale. The present copy, however, was not so fine or perfect as either of these, and it fetched only £172.

IN Professor Baldwin Brown's lecture on "Greek Architecture," in Moffat Academy, Edinburgh, he explained that by classic he meant Greek Architecture, which is striking from its mass, while the ornamentation is always of the best setting and effect. Greek Architecture possessed every element desired but that of mystery. There was nothing suggestive in Greek Architecture. In Gothic



Architecture, on the contrary, there was something that stimulated the fancy. Greek Architecture presented a calm beauty and solemn grandeur, whereas Gothic, with pinnacles, shaft, and spire, aroused imagination. There was nothing like that in classic Architecture, where everything could be explored, and which presented the perfect proportion of each portion to the general effect. The Greeks seemed to like to give effect, size, and mass to their buildings. The column, a prominent feature, was wherever possible made to look as if carved out of one piece of stone, which gave effect and grandeur to the buildings. Dealing in detail with the various parts of the building, he pointed out the contrast between the simplicity of the column and the richness of the frieze. In Greece and in most of the colonies the cities were along the seashores arranged in terraces, and the Greeks being fully aware of the importance of taking advantage of the position of the ground, the severe simple lines of temple contrasted effectively with broken masses of the rocks and the rounded forms of olive trees.

A SERIES of ancient Greek remains has recently been discovered in one of the principal squares of Patras, comprising a mosaic pavement and some marble sculptures. These have latterly been examined by Mr. Cecil Smith and two students of the British School of Archæology at Athens. Among the sculptures has been found a statuette which is undoubtedly a copy of the Athena Parthenos of Pheidias, which stood in the Parthenon. The head and arms are missing, but they may possibly be recovered in the course of further excavations. About two-thirds of the shield are also missing, but the remaining portion displays part of the subject in relief (the battle of the Greeks and Amazons), which, according to Pliny and Pausanias, existed on the original. The figures which have been preserved are those of two Amazons, together with the feet of a Greek warrior. They can be identified with those of the "Lenormant statuette" at Athens, and the Strangford marble in the British Museum, but are of better workmanship than either. The discovery not only supplements the evidence furnished by the "Lenormant statuette" with regard to the subject of the Strangford shield, but conduces to a better appreciation of the lost original of Pheidias than can be derived from the other examples.

THE scheme for the purchase of West End Hall and grounds at West Hampstead, formerly the property of the late General Sir Charles Craufurd Fraser, M.P., for which at least £40,000 was required, has been abandoned, aid from the London County Council not being forthcoming. On the other hand, the purchase of Fortune Green, West Hampstead, covering between two and three acres, as a public recreation ground, at a cost of between £7,000 and £8,000, towards which the London County Council has promised £3,000 and the Hampstead Vestry £3,000, has now been almost accomplished, and it is expected that the contract of sale will be signed within a few days.

ABOUT thirteen years ago crowds of people flocked to the narrow and crooked little street known as Portsmouth Street, leading from Portugal Street to Lincoln's Inn Fields, for a rumour was spread abroad that the house reputed to be the home of Little Nell was about to be demolished by order of the Board of Works. This, however, was a false alarm. The Board had only ordered it to be shored up, as the adjoining house was in danger of collapse. The question of its removal was, however, only a matter of time, and now the time has arrived. Its demolition will very shortly be effected as a part of the wholesale improvements going forward in this neighbourhood, and which have already claimed two historic taverns, the "George the Fourth" and the "Black Jack," and the last of the old bulk shops. Though the loss of all these associations is a matter for much regret, it cannot be doubted that the clearing of this squalid and congested congerie of byways will be a very real improvement. The street, which originally bore the queer name of Louches Buildings, takes its present name from Portsmouth House, built by Inigo Jones for the Earl of Portsmouth, the front of which is still standing, but the interior has been entirely transformed to meet the requirements of modern days.

CARISBROOKE CASTLE is to be fully repaired as a memorial to the late Prince Henry of Battenberg, Governor of the Castle. By some considered to be of Roman, perhaps British, origin, the Castle was captured in 530 by Cedric, who gave it to his nephews, Stuf and Wightgar, the latter of whom rebuilt it. The fort was enlarged by William Fitz-Osborne, first lord of the island, and in Domesday Book it is cited as occupying one virgate of ground. Some Norman masonry remains at the north-west angle and in the Mountjoy tower; the main entrance is supposed to have been built, temp. Edward IV., by Lord Widville, whose arms, between York roses, are on a stone near the top. The Castle assumed its present aspect in the reign of Queen Elizabeth; she built the outworks, with a moat, and repaired the principal gate, above which is "E.R. 1598," employing for engineer the Italian Genebella, who had fortified Antwerp. The keep stands on an artificial mound ascended by seventy steps. One may yet see the ruins of the apartments occupied for some fourteen months, during Colonel Hammond's governorship, by Charles I., from which he twice attempted to escape, and where his children were imprisoned after his death. The Princess Elizabeth's gravestone, inscribed "E.S.," was found, in 1793, near the altar of Newport Parish Church, wherein the Queen erected a monument to her memory forty years ago. St. Nicholas's Chapel was rebuilt in 1738. It belonged once to Quarr Abbey. Near the Castle Hill are

traces of the Cistercian priory, founded by Fitz-Osborne, who built also the Parish Church of what was formerly the Wightgarisburgh.

A SPECIAL meeting of the Belfast Corporation held last week, for the purpose of considering plans for the erection of a new City Hall on the site of the old White Linen Hall, at a probable cost of £200,000. Some time ago prizes were offered for the three best designs, and Mr. Waterhouse was appointed, in conjunction with Mr. J. C. Bretland, C.E., the Belfast City Surveyor, as umpire. The plans were all received a few weeks ago, and displayed at the present municipal buildings. Mr. Waterhouse and Mr. Bretland made their selection, and at this meeting of the Council two other plans were added. A poll was then taken on the five, with the result that two Glasgow competitors and one Belfast were retained. The Glasgow competitors were, it is understood, Messrs. Malcolm, Stark, and Roantree, and Mr. James Millar, and the Belfast competitor Mr. Graeme Watt, C.E. The final selection has been deferred.

BIDEFORD'S old bridge of four-and-twenty arches, a most interesting structure, will, apparently, give a good deal of trouble to its guardians before they are able to widen it. Borings have been made with a view of seeing of what the foundations are really made. There is a legend that they are composed of sacks of wool, and there has also been a belief that the bridge rests upon piles. The truth will soon be made apparent, but, whatever the fact, there seems little doubt that any extension will mean more than a few thousands. Originally the bridge gave passage only to pack-horses, and later the structure was widened. Not only are doubts raised as to its stability, but it is altogether inside the needs of the town. Evidently the Bridge Trust has made up its mind for a substantial structure. The varying sizes and styles adopted in the bridge is explained by the fact that every one of the arches was a gift.

A FOUR-STOREY block of shops and dwelling-houses in course of erection in New City Road, Glasgow, collapsed last week. Fortunately sufficient warning was given to the workmen—the slaters, plumbers, joiners, and plasterers—to quit before the collapse occurred, and the entire range of buildings fell in a heap without a single casualty. The new buildings were situated between West Gardner Street and Seamore Street, and only a few yards from the tramway rails. They were being constructed by Mr. John W. Bruce, C.A., 12, St. Vincent Place. The buildings, which were of red sandstone, were nearing completion, and other similar premises on either side are already occupied. Pieces of plaster were observed to be falling from the roofs and walls. Looking for the cause, the men discovered that one of the central pillars supporting the iron beams on which the masonry rested was bending. About twenty minutes later the pillar snapped at the centre, causing the upper beam to yield, and gradually the whole structure gave way. It is supposed the falling-in was due to the soft nature of the ground.

AT the annual exhibition and distribution of prizes in connection with the Hereford School of Science and Art at the Free Library, Hereford, Mr. John Lambe (Chairman of the Committee) presided, and was supported by the Dean, Canon Williams, the Mayor (Alderman Llanwarne), Alderman Bosley, Mr. J. Gwynne James, Mr. R. Keay, and others. The Hon. Secretary (Mr. Gilbert Davies) presented the annual report, from which it appeared that the school had obtained an award in the national competition of works, and that the grant from the Science and Art Department exceeded that gained last year. The Mayor then distributed the prizes, and congratulated the city upon possessing such an excellent school of Science and Art. He was sure it would prove of the greatest value; for in these days it was necessary that the nation should develop all the resources at its command. The Dean observed that during the reign of Queen Victoria there had been an extraordinary progress made in science, such as was never known in any other period of history, and with regard to Art generally the taste of the people had greatly improved. He thought, however, that there was still much room for improvement in Art so far as it applied to Architecture. There were many houses fitted inside with every luxury that could be wished for, but still, on the outside, they looked more like large asylums or some public institutions than anything else.

A LECTURE on "William Morris, Master Printer," was delivered at St. Bride's Institute, by Mr. F. Colebrook. Mr. Colebrook said that, first, Morris was a poet, a Virgilian poet, a poet whose soul it had been said was filled with sumptuousness; a poet in whose verse the prevailing impressions were of simple peace and beauty. Morris, too, was masterful in prose, too archaic it might be for our liking, but full of its own thought-compelling power. He was a great collector, and a great designer; like Street, the Architect of the Law Courts, to whom Morris was articled, he seemed to see a design on the blank paper, and guide a swift pencil over it. He was a weaver of miles of tapestries; he made wall-papers, which were famous all over the world. But all those things and more only whetted his appetite for onslaught upon different provinces of the kingdom of ugliness. So in due time he became a printer. He designed his own founts, he directed the making of his own paper from materials which he approved, and with water marks which he drew. If his life was spared, he told his comrades, he meant to make his own inks. William Morris's strong personality expressed more than even his masterful performances. He spent his whole life not after all in many efforts, but in one effort, pursued by various means.

AT length Sheffield is beginning to realize that more light is now obtainable without any startling revolution amongst existing fittings, or an uncomfortable addition to the gas bill. A small experiment now being tried on one of the principal roads from the city to the west end, so palpably demonstrates the feasibility of better illumination that there can be very little hesitation in extending the new system throughout the city. A large number of lamps, each containing five ordinary burners, have, in recent years, been erected in Sheffield. Some of these, in Devonshire Street and Glossop Road, have now been fitted each with four incandescent mantles, which give an intensity of light far beyond the five burners previously used. Looking down Glossop Road one sees that the new lights stand out prominently from among the intervening feeble yellow rays of the ordinary gas lamps. In time, as experience has shown, these mantles contract, and the light will then lose something of its present penetrating radiation. But even then they will give at least twice as much light as the ordinary burners. There is an excellent opportunity in Fargate to demonstrate on a really adequate scale the advantages of the new form of illumination. Some dozen or more of big lamps are already fixed in that thoroughfare, in each of which five big burners are placed. To remove these burners, and substitute a group of four incandescent mantles, would more than double the amount of light, while it ought to reduce the gas bill.

IT is proposed to adopt the Workmen's Dwellings Act at Abertillery, and a scheme is to be submitted for the erection of 300 cottages in the district, which for several years past has outgrown at the rate of 1,000 per annum. Dr. W. E. Williams, J.P., the medical officer of health, has reported serious overcrowding, but the Council has taken no practical steps to prevent the evil. In such a state of things houses are now let at nearly double their value. Mr. Williams proposes that the Council should put up convenient houses at about £150 per house, including cost of ground, and the money would be repayable in about 32 years. A large number of the workmen employed at the local collieries have to reside out of the district, and when the pits at Six Bells are opened there will be still greater congestion, and the amount of money earned in the neighbourhood and spent elsewhere will be considerably increased. The scheme will be backed up by deputations from the Abertillery Radical and Labour Union and the Cwmtillery Liberal Association. It is anticipated, however, that the motion will be strenuously opposed.

APROPOS of the attack upon what is called "the builder fraternity" of Devonport, there are some remarks in the British Review which may be studied with interest, and possibly with profit, in that much-divided town. The article in the British Review has no immediate connection with the dispute between the builders of Devonport and the people who are desirous of forwarding the scheme of municipal dwellings, which the builders are accused of attempting to wreck. It is, in fact, an attack upon what is called municipal socialism, with the special purpose of further discrediting the Works Department of the London County Council. Incidentally, however, there is a reference to builders as members of local government bodies which may probably please the builders of Devonport, whatever their opponents may think about it. The contention of our contemporary is that a municipality is, from the very nature of the case, much less fitted than a private person to be a manager of industrial enterprises or a successful employer of labour. The dual reason advanced in support of this proposition is that the municipality, in the first place, does not possess expert knowledge and practical ability; and, in the second, it is not subject to the stimulus of personal interest. Only by mere accident is a practical builder or a keen man of business elected on the controlling committee, and then he is in a hopeless minority, liable at any critical moment to be outvoted by amateurs. Indeed, the advocates of municipal activity "always endeavour to exclude experts, on the ground that they will use their special knowledge against the public." This is undoubtedly the position which has been taken up at Devonport by those who have been foremost in the advocacy of a progressive municipal policy, and it is the cause of a good deal of the bickering which disturbs the harmonious relations of different sections of the Town Council.

ACCORDING to the Dean of Peterborough, the work already carried out at the west front of Peterborough Cathedral has revealed a much more serious condition of the fabric than was at first perceived. At the end of July, Mr. J. L. Pearson, R.A., very reluctantly felt compelled to advise that portions of the gables should be taken down and rebuilt, numbering and marking each stone of the outer surface, so that the whole, or nearly the whole, shall be replaced without alteration. The committee, realising the serious responsibility of deciding upon this step, felt it to be their duty before doing so to obtain a second opinion as to its necessity. They therefore sought the advice of Sir Arthur W. Blomfield, who, after a careful examination of the building, has furnished a report which entirely confirms Mr. Pearson's view. The committee has therefore decided to act upon their recommendations. The foundations of the west front have been made perfectly secure, and the work of the restoration of the gables is to be immediately proceeded with. For the work of the restoration of the fabric, as now contemplated, £11,000 will be needed. The following is the text of Sir Arthur Blomfield's report:—"Under ordinary circumstances the necessary repairs of the upper part of the west front might be proceeded with and satisfactorily carried out without taking down and rebuilding much, if any, of the old work as it stands. But, unfortunately, the initial defects in the foundation have been left so long undealt with, in the only manner that could be permanently effective, that much of the superstructure has in itself become rent and disintegrated in such a manner and to such an extent as to bring the whole into almost dangerous condition, and to render substantial and lasting repair quite impossible without taking down and rebuilding some of the existing work above the caps of the great piers. The alarming nature and extent of many of the fractures and gaping fissures which can now be closely examined from the scaffold, could not be seen or suspected until an enormous mass of débris and rubbish had been removed from the top of the groining of the porch. This has been cleared away, and from what can now be seen, it is not only evident that much more must be done than might have been reasonably hoped or expected, but that the construction and materials of the inner parts of the walls are such as will not permit of their being preserved or successfully dealt with by any of the well-known expedients frequently recommended and sometimes adopted with success in similar cases. If, therefore, the present undertaking is to have any well-assured permanency, it will be necessary to take down and rebuild certain parts of the existing structure above the point I have already named."

Professional Items.

BEAULY, N.B.—The extensive alterations that have for some time been going on in connection with the post-office in Beauly have now been completed.

CRATHIE.—The New Free Church was formally opened on Wednesday last. Built on a site, half-a-mile to the east of the new Parish Church, is a compact little structure in the Gothic style of Architecture. Its exterior appearance is greatly enhanced by the spire which rises at the north-end of the main edifice, and the substantial buttresses that support the walls lend an appearance to the building which is at once massive and effective. The interior has been fitted up in a pleasing and substantial manner. The ceiling and lower parts of the walls are of woodwork, varnished in a quiet tint. The lancet windows—of which there are five in each of the side walls, two in the south gable behind the pulpit, and one in the north gable—are filled with cathedral glass.

EDINBURGH. — The new Broughton Public School, in Broughton Road, has been opened. According to Mr. Robert Wilson, the Architect, the school has been built upon the site of Blandfield House, which was acquired by the School Board in the beginning of 1894. Additional ground to the rear was afterwards obtained, so that the size of the playgrounds might be increased. The entire site contained 5,742 square yards, or about one acre and a fifth. The price, including all expenses of purchase, was £3,372. The infant department was placed on the ground floor, and had seven class-rooms, giving accommodation for 511 pupils at eight square feet for each pupil; the juvenile department had one class-room on the ground floor and thirteen class-rooms on the upper floors, giving accommodation for 847 pupils; the total class-room accommodation was thus 1,358. To this accommodation had to be added a large swimming bath and gymnasium on the basement floor, a practical cookery class-room, a science-room, and a workshop or class-room for manual instruction situated in the boys' playground. Calculating this additional accommodation at ten square feet for each pupil gave 455, bringing the accommodation up to a total of 1,813 pupils. The heating and ventilation of the school had been carried out on the most approved principles. The entire building was heated by steam pipes. It is estimated that the entire cost of the buildings, including janitor's houses, will be about £24,500. The contractor was Mr. William Gerrard.

GLASGOW.—At the University, on December 1st, two memorial tablets were unveiled, the one on the main stair of the University, the other at the head of the stair, in honour of the late Lord Sandford, and Professor Veitch. The memorial tablets have been designed in the style of the Italian Renaissance. They are somewhat alike, both comprising portraits in half-relief, worked in white alabaster with a background of gold mosaic. The medallions are placed in richly carved frames, and are surmounted by entablatures carried by pilasters; the Veitch memorial differing mainly from that to Lord Sandford in the cornice being finished with a pediment, in the middle of which the arms are placed. The Sandford tablet has the arms in the centre of a carved panel below the medallion. The inscriptions are on the pedestals which carry the upper part of each design, and which in their turn are supported by corbels and a rather elaborate central ornament on which much of the success of the designs depends. The tablets are throughout of polished alabaster, the panels in the pilasters, frieze, &c., being filled with Powell's mosaic, chiefly consisting of delicate gold patterns on a red ground. The arms are in the same material, while the inscriptions are cut in slabs of deep-red marble. The use of coloured materials gives much brightness to the designs, and prevents their having too much of a monumental appearance. The designs are by Mr. J. Oldrid Scott, Architect, London, and the work has been executed by Mr. Bridgeman, of Lichfield.

GLASGOW.—In Smith Street a new riding chool has been constructed by the Glasgow Tramway and Omnibus Company, Limited. Among the chief features of the new school are the galleries and promenades, which are so arranged that all that proceeds over the floor space may be seen with ease. The length of the building is 220 feet, width 40 feet, and height fully 40 feet. Situated on the banks of the Kelvin, the building is supported from the river by eight iron columns 22 feet high, made fast to the rock. The flooring of the hall is of pine planks covered with concrete and asphalte, and the top dressing consists of a thick coating of sand and tanned bark. The Architect was Mr. Alexander Petrie, and the contractors as follows:—Engineer and master of works, Mr. John Baird, of the Tramway Company; ironfounders, Messrs. Moses M'Culloch and Sons; iron girders, Messrs. P. and W. M'Lellan; brickwork, Mr. John Porter; joiner, Mr. Thomas Whyte, Cambridge Street; plumbers, Messrs. D. and J. Carrick, Sauchiehall Street; slater, M'Ouatt and Sons.

GLASGOW.—On Saturday last, Mr. D. Bennet Dobson's High School Building Construction Classes visited the new sanitary chambers which are in course of erection there for Mr. Pyfe's Sanitary Department. Mr. A. B. McDonald is the Architect of the building, his assistant, Mr. Lockhead, conducting the students over it, those present numbering between 50 and 60. The building, which is almost completed, is to accommodate the large staff at present housed in the totally inadequate premises in Montrose Street. The Sanitary Staff proper, under Mr. Pyfe, occupies the ground floor, although the District Inspector's rooms are distributed over the whole building. Here also is situated the Vaccinating Department, under Dr. Carmichael, while the Epidemic Staff, controlled by Dr. Russell and Dr. Chalmers, occupy rooms on the first floor. There is a complete system of telephones, there being about 30, in addition to the public ones. The heating and ventilation is very complete, the latter being effected on the extraction system. Electricity is used throughout for lighting purposes. The building also possesses several new features, *i.e.*, a room for investigations of a bacteriological nature, a chemical laboratory, and an exhibition-room for showing the latest sanitary ware and appliances, while, in the courtyard, a refrigerating chamber and inspection-room for detecting diseased food have been erected.

LIVERPOOL.—The Earl of Derby, President of University College, is to open, on the 12th inst., the new "William Gossage" Laboratory, Brownlow Street, built by Messrs. F. H. Gossage and T. Sutton Timmis, at a cost of £7,000, as "a memorial of William Gossage, Chemist and Inventor, 1799–1877." The building just completed is in no sense an afterthought, but a carrying out of the original design by Mr. Waterhouse. Practically the Gossage Laboratory is in the centre of the College. The older part of the building contains the lecture theatre, with a complement of classrooms, a museum, rooms for the study of organic chemistry, water analysis, electro-chemical analysis, and furnace operations, a balance room, and professional apartments. The new part contains, in the first place, the main laboratory, with working benches, each fitted in a complete manner, for 44 advanced students. This spacious apartment has a lofty open-timbered roof, and both side and roof lights. It is ventilated in an unique manner. Over each student's bench is a ventilating hood, and all air entering the laboratory is forced through these ventilators, there being no other means by which it can escape. The hoods are adjustable, and so designed as to carry off all fumes. Opening off the main laboratory is a smaller room, containing a sand bath and other conveniences. Downstairs there is a classroom for technological chemistry, a preparing room, and a gas analysis room. The interior walls of the building are throughout lined with white glazed bricks, which conduces to light and cleanliness. The Gossage Laboratory is joined to the older part of the section by some necessary buildings, erected at a cost of £4,000.

MALDON.—A new Baptist Chapel has been erected in Crown Lane, and was opened last week. The building stands on the site of the old corrugated iron Chapel, which has been in use for 23 years. It is 54 ft. long by 34 ft. wide, and has seating accommodation for 250 worshippers. In the rear are two vestries, and a passage between leads to the schoolroom. The Chapel is built of stock bricks with red quoins, and the roof is covered with patent interlocking tiles laid diamond fashion, the arches to doors and windows are Gothic-shaped and of red brick, on the inside the windows have 4-inch label mouldings and stone linings over them, and all the arches have carved stone blocks at the springings; the windows are glazed with cathedral glass in lead frames. It is lined with white glazed bricks, the floor being composed of white glazed tiles, and is entered by steps on either side, which are covered with patent Silcon treads, laid in one piece on each steps. The work has been entrusted to Messrs. A. Baxter and Son; the contract price was £1,115. Mr. P. M. Beaumont was the Architect.

KEYSTONES.

THE movement to erect a statue to Mr. Cecil Rhodes in Bulawayo has assumed very large proportions in South Africa. It is stated that no less than £6,250 was raised in two hours by subscriptions for the erection of a bronze statue.

IN regard to the workhouse extension at Bridgend, in the rear of the present building, at a cost of £10,000, including land, it is stated that the Local Government Board will not sanction the erection of a new building in front of the present one.

A NEW organ, costing £600, has been placed in Arthuret Parish Church, Longtown, by Mr. J. P. Binns, of Bramley, Leeds, the cost being defrayed by subscription. At the same time alterations have been made in the Church to the extent of some £700 more.

THERE is talk of establishing in Venice a special school of Architecture. The old Venetian Architectural types answer perfectly to the requirements and character of the present day. From the time of the Byzantine, there are numberless and splendid specimens, and the Renaissance is a miracle of grace.

AT Heath Charnock, Lancashire, in the course of an inquiry into a proposal to borrow £500 to build a parish hall, it was stated that although there was a population of 1,100, and a rateable value of £8,000, there was neither Church, Chapel, nor school in the parish. The only public erection was a pillar letter-box.

A NEW gasholder, of 200,000 cubic feet capacity, has been erected at Barnstaple. Mr. J. West, Manchester, designed the new holder of 200,000 cubic feet capacity, and embracing all the latest improvements. Messrs. Willey & Co., Exeter, obtained the contract for the holder, and Mr. W. Sanders, Barnstaple, that for the building work. The cost has been about £5,000.

WORK on the long-projected Hudson River suspension bridge, connecting New York and New Jersey, will probably be commenced next spring. The bridge is to cost twenty-five million dollars, and will be twice the size of the Brooklyn Bridge, and accommodating six railway tracks, besides vehicles and foot-passengers. The bridge will take six years to build, and 3,000 men are to be employed on the work.

A MAN in Germany, accused of stealing motor power from an electric current company, has been acquitted on the ground that only a movable material object can be stolen, and electricity was no such material object. The company appealed against this judgment, but the superior court confirmed it. It therefore seems that in Germany anyone clever enough to tap an electric current for his own use can do so with impunity.

FROM beneath the Peel statue, which has just been removed from the bottom of Park-row, Leeds, a box containing a number of interesting relics has been found. Amongst the articles it contained was a penny, two sixpences, and a large roll of paper about 100 ft. in length, made up of sheets of foolscap gummed together, and containing names of susbcribers towards the £1,500 which the monument cost.

ONE of the greatest events in the history of Russia was the building of Petersburg by Peter the Great. The building of a new port and a new city at a place called Ekatrinograd, situated on the Musman coast of Lapland, between the White Sea and the Norwegian boundary, is likely to prove to be an event of almost equal importance. The work has been commenced under the supervision of the Muscovite Government, and a railway line has likewise been begun to connect the new port and city with Petersburg.

BUILDING TRADE EMPLOYERS' FEDERATION.

IN the Central Hall, Acresfield, on Tuesday of last week, the half-yearly meeting of the Lancashire Federation of Building Trade Employers was held, under the chairmanship of Mr. W. Cunliffe, President. The President delivered an address on "What ought to be the Policy of Employers of Labour in the Building Trade." Reviewing some of the force sand combinations which militate against the interests of the building trade, he referred to the effects of trades unions, which he said had benefitted very largely those who had availed themselves of the opportunity of membership. Wages and the conditions of life among the industrial classes had wonderfully improved during the last quarter of the century. Every skilled man ought to be paid reasonable wages for his labour, so that he and his children might be well clothed and properly fed and equipped for the great struggle of life. Employers in the building trade need not unduly agitate for cheap labour, but pay what the condition of trade would allow, always assuming that a sufficiently long notice for an advance had been given, say six months. Whilst trade unions had been of immense service in bettering the circumstances of the operative classes, and that without inflicting any serious disadvantages on the employers of labour, yet he was compelled to say that the tendency of these unions to-day was in some instances unreasonable and dictatorial, if not

POSITIVELY TYRANNICAL.

The speaker condemned as an infringement of free trade principles the restrictions on ready-worked or imported materials, for he held that it was the builders' prerogative to obtain his materials wherever and however he might think proper. Dealing with the relations of the builders with Architects, he spoke against the unfair use of priced schedules, the habit of tendering unless quantities were given, and the signing of a contract form which does not contain an arbitration and strike clause. What must be regarded as a growing evil was the tendency developed by Corporations to perform their own work, which had hitherto been executed by contractors. It was obviously unjust for a Corporation to use the ratepayers' money to compete with the contractor; yet this was being done, and the works department of the London County Council was now on its trial for mismanagement. The

EMPLOYERS' LIABILITY BILL

had a vital bearing on the building business, and while no employer of any moral character would hesitate for a moment to take every necessary measure for the security of the life and limb of his workmen, the Bill introduced by the late Government and passed through the House of Commons went far beyond that, and the House of Lords rendered a distinct service to the country when it refused to pass the Bill without emendation. He held, moreover, that no contractor should be considered justified in either tendering for or accepting extra work on a building unless the original contractor had completed his contract, and there should be no competition under those circumstances. The President also condemned the system of railway companies charging for cranage and wharfage, and in conclusion he said it had almost become a *sine quâ non* that a builder made no money. Why? Simply because he was in the hands of too many others, who were ever squeezing from him, in one form or another, the fruits of his best labours, and thus he enriched others without himself being enriched. The remedy for the worry and anxiety which seemed to have become the heritage of the trade was in organization—though, comprehensive, and complete, and he urged them to give a loyal and generous support to their Lancashire Federation.

AT the request of the Hackney Vestry, Mr. F. Hastings Medhurst, who acts as consulting engineer to several local authorities, has submitted a draft of a scheme by which the parish can be lighted by electricity by the utilisation of the refuse of the streets. Mr. Medhurst guarantees not only to produce electric light out of the refuse of the streets, but maintains that the vestry will be the recipient of a profit of nearly £2,000.

IMPORTANT NOTICE.

In order to facilitate the business of the

BUILDERS' JOURNAL

AND THE

ARCHITECTURAL REVIEW

large offices have been secured, and notice is given that on and after this date all communications should be addressed to

EFFINGHAM HOUSE,

ARUNDEL STREET, STRAND.

THE RECENT COMPETITION FOR THE CHURCH OF EMMANUEL, EXETER.

FROM the unsuccessful designs we have already seen in this competition, we are quite sure a grave injustice has been done to the majority of competitors. To prove this we intend publishing a selection of the designs in the course of the next few weeks. With a view to making this selection as complete as possible, we appeal to those of our readers who were competitors to send in their drawing at the earliest possible date.

Trade Notes.

MESSRS. CARTER AND CO., POOLE.

We had to-day an opportunity of inspecting the show rooms that have been recently opened by Messrs. Carter, at Essex Street, Strand. Specimens of their fabrics, in tiles, mosaics, and faïence are on every hand. Among productions, intended presumably for such as revel in startling colour, we observed some designs that might fitly satisfy tastes the most refined in grace of outline and harmony of colours, are combined in these examples to produce charming effects. We had also the pleasure of examining a large portfolio of special designs for tile and mosaic decorations, that are in contemplation or present execution. We were greatly pleased with a sketch for hearth and panels in tile work, after a Louis XV. design. We consider that our Architectural clients, when looking round for satisfactory work of this class, would do well to visit, among other firms, the show rooms of Messrs. Carter.

THE ASBESTOS PATENT "SALAMANDER" DECORATIONS.

An instance of the fireproof character of these decorations is given in the following extract from a recent issue of the Irish Times with reference to the decoration of the Burlington Hotel and Restaurant:—"The ceiling in the principal department consists of over 200 ornamental panels of asbestss, beautifully moulded. This portion of the decoration, like all the rest, has been executed by the firm of Martin & Sons, Stephen's Green. The ceiling some weeks ago was subjected to an extraordinary and wholly unforeseen test. When Messrs. Martin's establishment was partially destroyed by fire, the ceiling for the Burlington was in one of the workshops which was burned down. It was found, the day after the fire, that while everything had been completely destroyed by the flames, and that even solid metal pillars had been melted by the tremendous heat, the asbestos ceiling remained absolutely uninjured, and, having thus passed through this extraordinary test, it now looks down severely in all its pride and beauty upon visitors to the Burlington." This is the second case of the kind which has occurred within a short time, and it is not surprising that these new decorations are already finding much favour among Architects and superseding inflammable materials. We understand that the ceilings of the extensive new premises of Harrod's Stores, at Brompton, have been covered with the "Salamander" material, which is highly effective artistically as well as being fire resisting. It has also been adopted for the decoration of cabins in ships of H.M. Navy. The patentees and manufacturers are the United Asbestos Company, Limited, at whose wholesale depôt, Nos. 158 and 160, Charing Cross Road, a large number of designs may be seen.

ARCHITECTS, THEIR RELAXATION.*

BY JAMES SALMON.

IN choosing to speak of this department of Architectural life, you will imagine it to be the one with which I am most acquainted. Not so! It is rather with the object of studying a branch of our existence of which I have little knowledge, that I read this paper here to-night. The simplest living organisms cannot continually remain in a state of tension, still less can the higher forms of animal construction bear continual strain. How much more requiring relief is that most intricate of divine creations, a modern Architect, we, gentlemen only know too well. On the other hand, strong as is our need for relaxation, inevitable as it is that we must perish without it, how few are the opportunities afforded us, and how careless of using these opportunities are we. In these days, from the time a boy is weaned from school and enters the dry-nursing establishment of a practising Architect, to the day when he lies down to die amid the sneers of his fellows, and with his head beneath their flattering gravestone, his life is one of that continual tension which I consider so hurtful to any form of life. But there are exceptions. With some of our profession life is all relaxation; they golf, they shoot, they have been known to fish, and even in their offices they merely caricature Architecture, reducing its noblest features to ridicule or to the level of public appreciation. And now, gentlemen, I would present a claim for a middle course, one in which our life's business would be attended to and in which relaxation would occupy its due place. You will pardon me if I attempt to offer some suggestions as to how our leisure should be employed, the more so, as to many sitting here leisure seems a thing unknown, and the mention of pleasure suggests nothing more recent than their school days, or even those earlier memories of being dandled on their mother's knee. This may be your own fault. You hear one inward voice telling you to enter this or that competition, or study in this or that class, and another voice saying "Don't do these things." One is the voice of the tempter, the other that of conscience. But you may not know which is which. Many people persistently ignore the voice of their conscience. And with certain types of conscience it is the best thing to do. We cannot do more than glance at a few forms of relaxation to-night, but they will, I hope, be sufficient to show that the relaxation of an Architect is excusable, and that the neglect of it will severely handicap him in his work. The proper designing of every building requires an appreciation of certain things which an Architect gains outside his business, and it is to gaining this, that, in his leisure, he should be employed. Before particularizing, I would mention that few Architects have the opportunity of designing all classes of building. They drift on currents, taking advantage of every wind, but endeavouring to steer only to the shores where the gold lies thickest. So that the systematic enjoyment which I am about to outline would, with most of you, be confined to certain branches corresponding to the work which you may have to do. Our work and its corresponding amusements might be roughly classified as follows:—(1) The house, from which evolves the hotel, the restaurant and café (houses for those away from home); also, the clubs and the pub.'s, with their billiard-rooms and skittle-alleys; (2) the theatre and the public hall; (3) the Church, meeting-house, &c.; (4) the school and the college; (5) the shop and office; (6) shelter for the various animals used by man, as beasts of burden, in the chase, for consumption, &c. To design a house properly, you must design it to suit the ideas and habits of the man who is to inhabit it. It is not enough that it would suit you and your notions. To appreciate his habits, you must know him and his customs, and this means social intercourse with many persons. Of course, there are two or three hundred thousand people in Glasgow, who belong to one stock type, who have exactly similar ideas and habits. You only need to know one of these, and that not for long. If you don't happen to know one,

A GOOD RULE IS

* A paper read before the Glasgow Architectural Association, Tuesday, December 1st, 1896.

to give them plenty of plasterwork and raised mouldings. But there are still intelligent people bred in this declining world, and social intercourse with them will form one useful pleasure. To design an hotel, you must be aquainted with the methods of management and the customs of those who use them. Therefore, an Architect should use hotels as much as is necessary, to study the people for whom they are built. There are hotels of many classes, and money spent in an expensive hotel is not necessarily lost if you carefully note the manners of the inmates. If you take longer to your dinner than most, it is to be hoped that you know the height of the table which you sat at, and studied the motion of the waiter who served you, and if you adjourn to a café there are many points of design you can observe. Most Glasgow cafés attempt to outrival the Alhambra in Oriental magnificence, all with $\frac{5}{8}$-inch yellow pine and a common fret saw, and may in time save us a visit to the East. But I do not wish to embarrass Lord Salisbury by any allusion to Constantinople at this time. To understand club-life you must at least have been inside one. And it is as well to be a member of one or two. There are so many clubs for special purposes now-a-days that it would be impossible to be a member of all sorts, but with a town club, a political club, a golf club, a tennis club, and a swimming bath, you might acquire a rough knowledge of the useful particulars. We know that for an Architectural club, a room with a few forms and a lime-light lantern is enough. But there are signs that greater luxury will soon be necessary when we will break our timorous reserve and meet here on more intimate terms. To design a public-house you must have had wide experience, there are so many different kinds. You will find a certain interest attached to it. Billiards is a game extremely useful to an Architect, partly as a study in the ocular estimation of angles, and partly as the simplest way of discovering the requirements of a billiard-room. But, alas! many Architects play billiards who have never measured the length of a cue.

The Architecture of the Theatre

should encourage the sensations produced by the drama, should infuse gaiety or sadness, inspire mirth or tears, should be full of the abandon of the stage, and yet preserve the ancient conventionalities and traditions of the play-house. To do this an Architect must have tasted the excitement of a stage tragedy and joined in the laughter of a stage comedy. Besides the mental effect he produces by his design, he must study the physical comfort of the play-goers and learn their wants from personal observation. Concerts and dances you will also require to attend if you are properly to appreciate the feelings of those using public halls. With a Church it is somewhat different. By studying the remains of ancient ecclesiastical buildings, one feels impressed with what religious ideas once were. But if an Architect is to preserve in his Church any suggestion of holy worship, or to aid by his work any feeling of reverence, the less he knows of modern Churchgoers and the less he yields to their demands the better. When you think, however, that it is almost compulsory for many to attend Church, it should be your desire to mitigate their suffering by beauty combined with comfort.

Acoustics

are not nearly so important in a Church as the ministers seem to imagine. I will say nothing about school, college, shop or office. But the mention of the latter reminds me that in many Architects' offices, the assistants are in the habit of occasionally relaxing themselves. On the broad question of right and wrong let us say nothing; there is no doubt that this form of secret and surreptitious indulgence exists. I was at one time in an office where we sometimes engaged in a crude sort of shinty. The ball was a sample brick. One goal was the fireplace in the public office, the other the fireplace in the private room. We only played when this room was disengaged. Latterly the ball had to be muffled, owing to complaints from the servants' registry below. In C. and B.'s East End branch I have enjoyed a good game of golf. It varies somewhat from the Royal and Ancient, owing to the peculiar nature of the course. A dangerous hazard, in the shape of a lath and standard partition, blocks your first drive. This is now disappearing, and one should, with good sound play, reach the green in three. Do not suppose that I would supply a recreation ground with each office. No! One must design an office for business, and leave it to the resource and ingenuity of the assistants to invent a game suitable to its arrangements. In designing habitations for animals, the same familiar intercourse which I advise in the case of human beings is neither desirable nor necessary. A man could design a kennel without having lived in one and eaten dog-biscuits. At the same time, familiarity with the natures of the various animals you cater for is just as necessary as in the case of man. To illustrate the ignorance in some quarters, I heard an educated Architect say he had erected a house with hot and cold water and stable accommodation for two cows. I have, I think, said enough to show that an Architect must study many things outside his business, and that all time spent by him in various amusements may be adding to his information in a very practical manner, and is in many cases necessary to fit him to undertake with success the various commissions which may be offered him during his career. We are indeed Architects first, but human beings afterwards.

At a cost of £1,400, a new parish room has been erected in connection with St. Paul's Church at Smethwick.

A summary method of restoring pictures is to be put into practice at Salford. At a meeting of the Salford Town Council, it was proposed by a committee to "cut down and restore" the portraits, among a number, of Lord Stanley and Sir Robert Peel. In reply to a question from the Mayor, it was explained that the cutting down of the pictures only related to the removal of surplus legs, chairs, and so on, which were of no interest. These pictures took up a great amount of room, and in many cases the canvases were so badly cracked that it was impossible to restore them It was intended to reduce these pictures to kit-cat size, which would give them portraits down to the waist of these distinguished citizens, and the pictures would have a more agreeable appearance than they had with the present stretches of waste canvas.

PERSPECTIVE.

Answer to Student.

Put square M, N, O, P, Fig. 1, in Perspective. Draw diagonals N, O, M, P, Fig. 2. Through point L, Fig. 2, draw lines vanishing to right and left, cutting the sides M, N, O, P, M, O, N, P, in four points 1, 2, 3, 4. Take width of circle at base of dome from picture plane, Fig. 1, and set this up on Fig. 2, cutting diagonal O, N, in points 5, 6. Draw ellipse through 6 points 1, 2, 3, 4, 5, 6. Draw line through L to K, Fig. 1. Set up K as height line for top of dome, and perpendicular line through point L, Fig. 2. Take height to top of

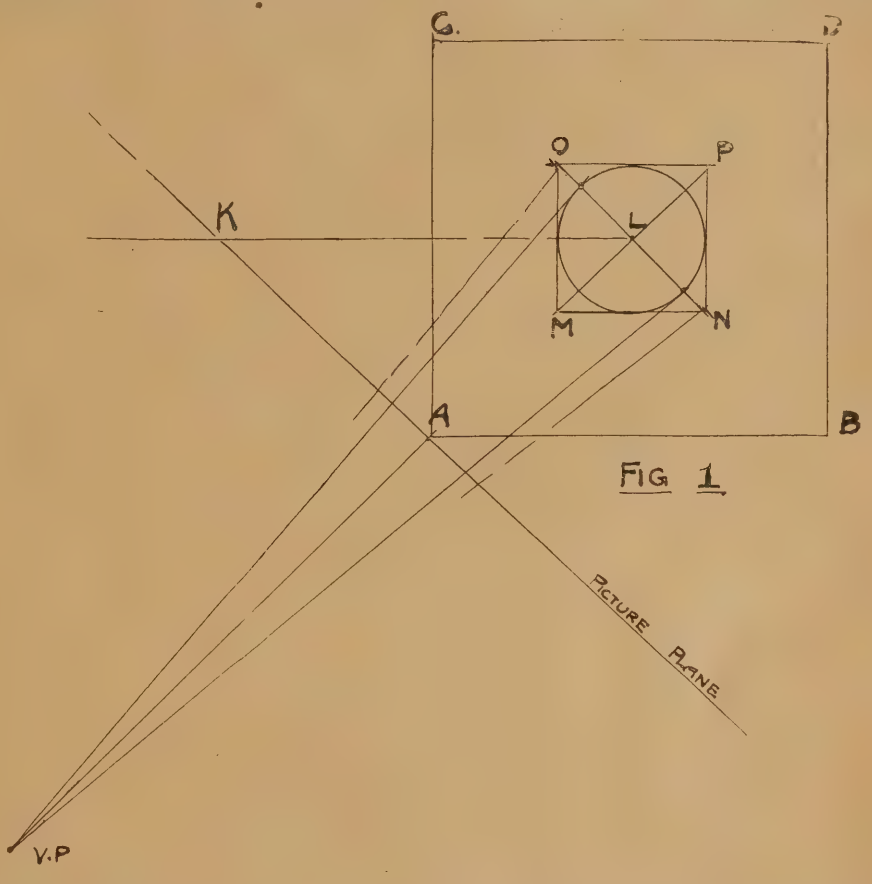


FIG 1

dome from elevation and set up on height line K, Fig. 2, and vanish to right, cutting centre line of dome in point E. You have now three points, E, 5 and 6; through these describe a semicircle, which is dome in Perspective. If "Student"

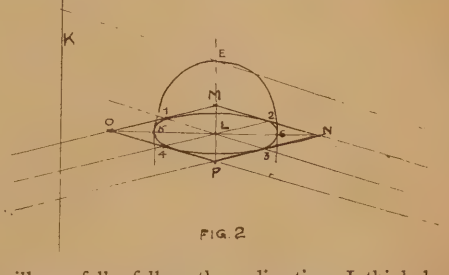

FIG. 2

will carefully follow these directions I think he will have no difficulty in understanding Perspective as applied to domes.

WM. N. CUMMING.

Mr. Alfred Shuttleworth, J.P., of Lincoln, has offered £1,000 towards the fund for the reconstruction of Lincoln Cathedral organ.

Much inconvenience is experienced in finding a railway route to New Orleans along which the covered bridges are high enough to permit the passage of the largest block of granite ever quarried in Vermont. The block is 15 feet square and 3 feet thick. It is intended for the noted Moriarty monument in that city. It was quarried in Barre, and has been moved to the dressing sheds. The weight of the block exceeds 50 tons. Investigations show that most routes have bridges too low for the block to pass through.

SOCIETY MEETINGS.

Birmingham Architectural Association.—In their report of the 22nd session, the Council of this Association states that the new members and associates number 17, and mention the work that is being done for Architecture in the city by the School of Art. A better testimony of the good work being done by the student members of the Association, the report continues, could not be afforded than the results of the national competition. One Queen's prize, four silver and two bronze medals, and two national book prizes, were awarded to students in Birmingham, who were associates of the Association. On the other hand, the educational work which is dependent upon the senior members suffered greatly from lack of interest, and it was even a matter of difficulty to induce members to preside at the meetings of the construction class. The power and willingness of each member to contribute to the work of the Association was, after all, a personal matter, and the secretaries would be exceedingly pleased to receive offers of help from members who are willing to assist. Great assistance would be rendered to the Council by a more punctual payment of subscriptions; for their work was much handicapped by want of funds, which were due but remained outstanding. Owing to this fact, no additions to the library had been possible. The report gives particulars of the various classes, and speaks of the continued interest in the sketching class, and the improvement in the number who join in the sketching visits, although this is not so good as it might have been.

Glasgow Architectural Association.—A meeting of this Associatton was held at the rooms, 187, Pitt Street, on December 1st. William T. Conner occupied the chair, and Mr. C. E. Whitelaw read a paper on French Renaissance. He gave a short historical account, speaking more particularly on the Chateaux, and instanced a number of best examples. He drew a comparison between the French Chateaux and our Scotch Castellated work. The former sumptuous and profusely decorated, the latter oftimes bare and meagre in the extreme. Mr. Salmon afterwards read a paper on "Architects—their relaxation," which we give in another column. The Architect must associate with the inhabitants before he can build a house to suit his clients. To design hotels, churches, theatres, &c., he should frequent these various places in order to fully understand the various requirements to do the work as it should be done. By this means he is not only indulging in necessary recreation, but is also (if he use his opportunities aright) increasing his facilities as an Architect. At the conclusion, a vote of thanks was accorded to both lecturers.

The Architectural Association of Ireland.—The ordinary meeting of this Association was held on the 1st inst., at the Grosvenor Hotel, to consider the rules of the Association and the syllabus for the ensuing year. The rules have been based on the London A.A. rules, and are almost identical with them. Mr. R. Caulfeild Orpen, President, was in the chair. It was resolved that the rules as drafted by the committee be adopted, and that the syllabus outlined by the committee be also adopted, and include the following:—Classes: Elementary and advanced building construction, elementary and advanced class of design, elementary quantities, estimating, and specification writing. Fortnightly lectures, with discussion, at which the following gentlemen have promised a paper:—Mr. T. Drew, "Architecture of Dublin"; Mr. W. G. Doolin, "Early Irish Art and Cotemporary Work on the Continent"; Mr. J. W. Bowcher, "Electric Lighting of Buildings"; Mr. W. Kaye Parry, "Drainage and Sanitary Construction"; Mr. Ald. Maguire, "Heating of Buildings"; Mr. F. Batchelor, "Hospitals, and Hospital Construction"; Mr. J. C. Buckley, "Mediæval Embroidery, and Character of Ancient Vestments"; also Messrs. J. J. O'Callaghan and Howard Pentland. Visits to buildings in progress are being arranged for Saturday afternoons. It was also resolved to admit country members at a reduced fee of 5s. per annum. The presidential address is to be delivered at the Grosvenor Hotel, on Tuesday, the 15th inst. The following prizes have already been offered, and conditions of same will be given in the syllabus shortly to be issued:—The Maguire Travelling Studentship, value ten guineas, for best set of measured drawings, the successful candidate to join the London A.A. Excursion of 1897; the Ashlin Prize of ten guineas, for the best design; the Slevin Prizes, first prize £5, second prize £2 10s., for constructional designs. The Association also intend to offer a prize for the best essay. Full particulars of the above prizes will be given in the syllabus, and will be open to all members both in Dublin and country. Mr. T. Drew has kindly promised to act as one of the judges of the prizes. The committee as elected are: President, Mr. R. Caulfeild Orpen; Vice-Presidents, Messrs. J. Howard Pentland and Joseph Holloway; Committee, Messrs. H. Allberry, F. Batchelor, A. I. McGloughlin, J. F. Macaulay, A. W. Moore, L. O'Callaghan, T. Coleman, M. J. Tighe, and J. H. Webb; Hon. Secretaries, Messrs. William R. Gleave and R. M. Butter; Hon. Treasurer and Librarian, Mr. Fredk. Hicks; Hon. Auditors, Messrs. W. F. Becket and T. F. Slevin.

Society of Antiquaries of Scotland.—The annual meeting of this Society was held at the National Museum of Antiquities, Queen Street, Edinburgh, on December 1st, Dr. James Macdonald, Vice President, in the chair. The office-bearers for the ensuing year were elected. It appeared from the annual report to the board of trustees that the number of objects of antiquity added to the museum during the year has been 613 by donation and 428 by purchase, while 179 volumes of books or pamphlets have been added to the library by donation and 82 by purchase, and the binding of upwards of 200 volumes has been completed. Among the more important of the donations to the museum are the large collection of objects obtained during the excavation by the society of the Roman station of Birrens, in Annandale, including several altars and important inscribed tablets, presented with consent of his Grace the Duke of Buccleuch; a series of casts and moulds of the sculptured stones of Islay, presented by Mr. R. C. Graham, F.S.A. Scot.; a finely-carved slab, with the arms of "William Erle of Gourie, 1587," from the old Gowrie House, Perth, presented by Lord Ruthven; and a series of pottery vessels from the graves of "the new race," recently discovered in Upper Egypt, by Professor W. Flinders Petrie.

THE old mill under Crooksbury Hill, in the hamlet of Waverley, near Farnham, from which Sir Walter Scott named his novels, has been destroyed by fire.

A NEW manager for the Works Department of the London County Council is being advertised for, at a salary of £1,500 a year. Mr. Holloway was paid £700. This is a jump, therefore, which doubles the value of the appointment.

IT is with pleasure we announce that the City of Manchester Corporation have placed with the Naval Construction and Armaments Company, Limited, Barrow, an order for the construction of a sludge vessel. She is to be somewhat similar to the six built by the company for the London County Council, and will be engaged in the conveyance of the sewage sludge from the Corporation's depôt on the Ship Canal to the Irish Sea.

THE committee of the Harris Free Library and Museum has arranged with the authorities at South Kensington for the 300 water-colour drawings which are on view at Southport to be exhibited at Preston for the next three months. The collection s illustrative of the rise and progress of the British school, and is selected for the purpose from the National Gallery of British Art at the South Kensington Museum.

ALTHOUGH Cleopatra's needle does not require annual painting or spring cleaning, it requires every now and then some preservative to enable it to withstand the corroding effects of London fog and smoke. It is fifteen years since it was doctored, and now it is being washed down preparatory to being treated with a patent solution supplied by the Indestructible Paint Company. The work of mounting the obelisk has been done by the London Fire Brigade with one of their fire-escape ladders. The solution has to be applied in three coats, and the operation will take about a week to complete.

Trade and Craft.

NEW DOCKS FOR JAPAN.

It appears that during the late war with China the Japanese Government requisitioned steamships on an extensive scale, and these vessels, used for military transport, will now be employed for commercial purposes. One new line of steamers has been opened between Japan and the United States, and another between Japan and Australia, both of them being under the management of the Japanese Mail Steamship Company. Another line will ply between Niigata and Vladivostock, while a fourth will do service between Hakodate and Korsokoff, the two latter being in private hands. The sailings of all four will be monthly. The opening of several other lines is in contemplation. In connection therewith various navigation companies are in course of formation, with capitals varying from 1,000,000 to 10,000,000 yen. The construction of docks is also being actively proceeded with. The Nagasaki Docks, owned by one of the Japanese companies, are undergoing important extension, and three new steamers are on the stocks. The Yokohama Dock Company is also opening a large new dock this year. Many plans for the construction of new harbours are under consideration. One of them, which is likely to be carried out shortly, is for Osaka, the so-called Manchester of Japan. It will cost about 3,000,000 yen.

SUIT OVER PROOF ENGRAVINGS.

Messrs. Cadbury-Jones and Company, fine art publishers of 60, Haymarket, S.W., sought in Westminster County Court to recover two guineas, the price of an engraving of a picture called "Dawn," by Warne Browne. The case for plaintiffs was that the original picture was exhibited at the gallery of Mr. J. W. Hancox at Seven Sisters Road, Holloway. Persons who went to view the picture were asked to subscribe twelve guineas for artist's proofs, or two guineas for engravings. The proofs were limited to one hundred copies, and the engravings were unlimited. Defendant, although a subscriber, refused to accept the engraving, as it was not ready for two years. Mr. Hancox had said "as far as he could tell" it would be ready in six months. His Honour considered six months was part of the bargain, and the claim failed. Two other actions of a similar nature were then withdrawn.

TRANSFORMATIONS IN THE LOCK TRADE.

At Willenhall, South Staffordshire, the lock trade, which is conducted in 500 workshops, large and small, and which gives employment to 4,000 hands, is undergoing just now some curious and interesting transformations. In all the cheaper classes of door-locks, the component parts—such as the latching and locking bolts—which until recently were made of wrought iron, forged on the anvil, are now almost wholly produced in soft malleable iron. Keys, too, the wards of which were cut by hand, are now almost entirely of cast iron, the wards being inserted in the rough castings with wonderful clearness and accuracy. These changes could never have been effected but for the marvellous improvements made during the last few years in the quality of English ironfoundry, which now compares favourably with the best American productions. One result has, however, been to practically destroy two skilled local industries. The forging of lock fittings and the cutting of wrought keys require considerable ingenuity and skill, and both these handicrafts are now practically extinct. The progress made of late in steel-stamping is leading to the adoption of neat and artistic frames for locks in the place of the old and homely square case. A great improvement has been made recently in the quality of the knobs and spindles put to Willenhall door-locks. The objectionable "small screw" for fastening the knob to the spindle has vanished from the scene, and the screw now in use entirely penetrates the spindle and holds it in tight grip. The motive power of the machinery used in the lock trade is undergoing a radical change. Steam-engines are going out of use, and the number of gas-engines now working in Willenhall is about sixty, with a steady and constant increase.

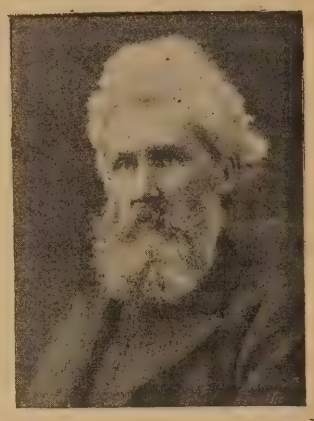
Architects in Competition. Only the week before last, we called attention to the efforts of a certain party in the Southampton County Council to get round their own undertakings, and the decision of an assessor, appointed by themselves, that a local firm of Architects might be entrusted with the carrying out of the new Infectious Diseases Hospital. The matter has now been settled in a manner consistent with the dignity of the township—the award of the assessor has been voted, and the successful firm commissioned to carry out the work ; but within a few weeks has occurred just such another affair at Belfast, under very similar circumstances. The municipal authorities were disappointed that none of the three awards of the assessor should reveal the name of an Irish Architect, and they accordingly took it on themselves to supplement the award of the assessor with two other awards of their own choosing, of which designs, one, it seems, was in some manner known to be the work of the popular Irish candidate. As the conditions of competition were that three designs should be selected, and their submitters invited to compete for the final award, the addition of two other designs was in itself a great and intolerable injustice. Surely, when we view the irregularities of this nature that are so frequent and conspicuous, it would seem only proper and reasonable that Architects should combine to secure for themselves justice and a dignified regard in the processes of Architectural competitions. It is strange that when such treatment as the above is served to them that Architects have not come to look askance upon the whole subject of competition ; and it is strange that Architects should submit themselves to the open capriciousness of an assessing committee, in addition to the large element of pure chance that must always mar competitions in Architectural design. It is clear that a certain disrepute into which the profession has fallen in the public esteem, may be attributed to this condescension and submission of Architects in the matter of competition. It seems a ludicrous disproportion in our balance of life, that a Parish Council in some obscure country town, with a curate in the chair, should be able at a beck to call twenty Architects, or perhaps fifty (the record, as we heard a few weeks ago, is 450), to work gratuitously that the said Parish Council may pick and choose and avail itself of the talent and education of a score of professional men at the same cost as they might procure the local sanitary inspector to draw them a plan and attend to the correct laying of the bricks to the new wing of their parish school. Above and beyond this, the attitude of careless irresponsibility with which corporate bodies everywhere arrange competitions on the most paltry and evanescent occasions, and their high dictatorial tone to Architects, is a public indignity to the profession. Even in any other day than this of labour organisations and strikes, no apology need be rendered that a fixed understanding should be acknowledged mutually in the profession on this matter. As they are now conducted, Architectural competitions are an enormous expense to the profession. Disregarding altogether the value of time, and the pains expended by the competitors, and the long and expensive education by which they have qualified themselves to expend that same gratuitous time and pains, the actual money paid in cash out of the pockets of Architects in the conduct of their competitions amounts yearly to an enormous sum—a sum, indeed, which probably runs from hundreds of thousands of pounds to a million sterling *a year*. When, in the case of any particular competition, the total amounts paid away by the competitors in getting out their drawings exceed the cost of the work for which they are competing (and this, we are to understand, is no very uncommon event), surely it is then time that a general agreement and submittal to some scheme for mutual benefit and economy to the profession at large should be entered upon ! And surely, too, some action should be taken when Architects may see, as lately at Southampton and Belfast, the dignity of the profession trampled publicly under foot, and then hung out like a rag on a pole for public disregard, and the professional advice of Architects of repute beaten down and tabooed, largely by men of inconsiderable education or attainments. If some such active initiative step towards amelioration is to be taken, who is better qualified or equipped for the task than the Royal Institute of British Architects, which has won its established recognition of the profession as being the guardian of professional interests, and whose most reputable members are weekly subjected, as assessors in competition, to the figurative hoots and

CHAPTER HOUSE, DURHAM. FROM A PHOTOGRAPH BY MESSRS. PHILIP AND SON.

cat-calls of retail tradesmen squabbling in council. Let us hope that in the near future something will be done to remedy these evils, and set the profession in popular equality with those of Law and Medicine.

LISKEARD PARISH CHURCH.



WE wish to call attention to a piece of Vandalism that is threatened to the fine old Cornish Church of St. Martin, Liskeard. The committee recently advertised inviting Architects to submit designs for rebuilding the tower. This feature is all that remains of the ancient Church, there is an interesting arch in it and windows of the Norman period. A well-known Church Architect reported on its condition some time ago, and was of opinion that it was quite unnecessary to pull it down, and estimated the cost of reparation at £800. The committee, however, want to spend £3,000 in a fine new tower. We therefore propose to ventilate this question in an illustrated article in the BUILDERS' JOURNAL of December 23rd, and trust we may awaken the authorities at Liskeard to the fact that they are responsible to posterity for the safe keeping of their Church.

PLYMOUTH BUILDING TRADE.

WITH reference to the request of the Carpenters' and Joiners', Plasterers', and Labourers' Associations for an increase of one halfpenny per hour in pay, commencing in May next, and also a revision of the code of rules, the Master Builders' Association has decided to agree to the request in May, 1898, and to allow other matters in dispute to be settled by arbitration. The Association has pointed out that many builders have contracts in hand which cannot be completed for, in some cases, over twelve months, and that a rise of wages in May would thus cause considerable loss to them. The Association also intends to insist that after the rise of wages, in 1898, no further demands shall be made for a period of five years, so that the masters shall not be inconvenienced by such short notice as in the present case.

THE LATE THOMAS GILDARD.

ON the 5th inst., about 60 gentlemen were present at the unveiling of the monument to the memory of the late Mr. Thos. Gildard. Amongst those present were Messrs. David Thomson, Alex. McGibbon, Wm. Tait Conner, John Thomson, John James Burnet, A. B. McDonald, A. Lindsay Miller, John Whyte (Master of Works), Francis T. Barrett (Mitchell Library), John Muirhead, Wm. Young, R.S.A., Jas. F. Dickie, James Biggar, Alex. Muir, R. A. McGillwray, A. B. McIlvride, John James, J. Ethelbert Gildard, Charles Eadie, Jas. S. Gray, Jas. R. Harper, N. McDougall, James Lockhead, Jos. E. Potts, Wm. Thomson, Robt. Campbell, Thos. Graham, Jas. Salmon, J. Holmes Sharp, John Paterson, A. D. Dean, Peter Smith, Jas, Carrick, and James Duthie. The monument was unveiled by Mr. David Thomson (Chairman of Committee), who said, when it was proposed that some suitable memorial of Mr. Gildard should be raised over his grave it was met with a generous and hearty reponse, and no difficulty was felt in obtaining the necessary funds. The Committee, to whom it was entrusted to procure a design and carry out the work, have, I think, discharged their duty in a suitable and satisfactory manner, and I will ask that the monument be now unveiled that you may see the result of their labours to embody your regard for an old friend, to hand down to future generations a record of his good and noble life The design for the monument was made by his nephew, Mr. Gildard; the granite work has been executed by Messrs. Peter Smith and Co.; and the medallion and tablet in bronze has been designed and executed by Mr. Wm. Sherriffs.—Mr. A. B. McDonald, City Engineer, said—I feel it a privilege to speak in eulogy of Mr. Gildard, and I do so with the knowledge that it is derived from the intimate and uninterrupted association of 25 years. During the whole of that long time my acquaintance with him was so close that I had unusual opportunity of seeing all the qualities that made up his interesting and striking personality; and it is no exaggeration to declare that he never exhibited a trait inconsistent with the reverence and affection which true worth inspires. The essential characteristics of his nature were not those which go to make a successful man of the world, but they were such as compelled the admiration of those who knew him best, and make us glad at this hour in the recollection that we possessed his friendship. Living under the burden of imperfect health he was invariably cheerful, and with restricted means he was ever ready to help others with a self-denial such as is seldom heard of. Mr. James Duthie, Secretary of Committee, read the following communication from Mr. Robt. Walker, who was

THOMAS GILDARD.

absent through indisposition:—"Mr. Thomson and friends—It is no melancholy event that is the cause of our assembling together to-day. With the death of a man who has finished and rounded off his life's work, and who leaves behind him an enduring remembrance in the affectionate respect of troops of friends, there are associated many consolations for those who have enjoyed and lost his pleasant companionship. No one did his part better in life than Thomas Gildard. Most of us here knew him intimately, and to know *him* was to know a man cast in a mould different from the mould that fashions much of the humanity of to-day. He belonged to the antique world. The hurly-burly of modern society affected him not at all. He stood aside from all its varied currents, and watched them play with a smile more of indifference than contempt. Contempt for any person, unless it was for meanness, Thomas Gildard never felt. His nature was too philosophic, his heart was too kindly. He was indeed a Nathaniel without guile, who never regulated his actions with any regard to his own interests, but altogether from what he believed to be the right or wrong of the course before him. His sympathies with Art and literature were strong and deep, they were a part of his very nature. He had cherished ideals, and these ideals had nothing in common with this decadent age. He wandered in fancy ever beside the Parthenon of Athens, or through the pleasant shades of Arden, Greek Art, Shakespeare, the Elizabethan dramatists, the English writers of the Augustan age of our literature; with them and in them he lived and moved and had his being. Of their inspiration he drank deep, and the frivolities and the badinage and the restlessness of modern literature left his heart and his brain untouched. In ignoring his younger contemporaries he may have been right or he may have been wrong, or partly right and partly wrong, as we all usually are in our judgment, but just because he was Thomas Gildard he had his own views and knew well how to defend them. In a quiet unostentatious way, that the outside public little dreamt of, Mr. Gildard was closely associated with the literary life of Glasgow of many years past. I may safely say that with every important club started here during the last fifty years with a serious literary purpose our friend was more or less intimately identified, and was always ready to undertake his share of the work, and to do it thoroughly. He wrote prose well, he had the accomplishment of verse. He was a contributor to the Weekly Citizen in its earlier days. He was the companion of all the men who were the literary lights of Glasgow forty years ago, and some of these lights shine steadily yet, in spite of the glare of all the meteor fires of to-day. While he could not sympathize with the modern movements, the ever-shifting theories regarding Art and literature, that, week by week, lay claim with strident voice and unblushing effrontery, each one of them on its own account, to be the final solution of the difficulties that have puzzled Artists and philosophers since the world began, Mr. Gildard was no bigot. He never refused to listen to a younger man's argument—it might not move him, but he gave it courteous attention. His outlook may have been called old-fashioned by some whose opinions, representing only the transient and surface estimate of things, will be old-fashioned to-morrow, but it was sane, healthy and dignified. With young men he had keen sympathies, and his courteous genial nature, with a certain pawky humour of his own, made him a favourite in every circle he entered. He belonged to a type of men of whom we have too few remaining. As I have already said, he was of the antique world—and the antique world, in courtesy, in tone and culture, in a knowledge of the graces and the right value of life, can give many a lesson to the present age, with its pessimism, its affected sentiments, and its dreary reiteration of weariness of the world and all the world contains that does not savour of the flesh and the devil."

Mr. A. Lindsay Miller proposed a vote of thanks to the Architect and Sculptor of the memorial stone, the Architect being Mr. R. J. Gildard, and the Sculptor Mr. Sherriffs, and said, the materials employed and their arrangement were the best adapted to resist the action of the weather, and in that way give the memorial stone permanence. There was great originality in the design. Mr. J. Ethelbert Gildard also spoke as the eldest representative of the family.

The monument is of Peterhead granite with bronze bas-relief.

It is most satisfactory to know that the committee had no difficulty in collecting over £100 in a very short time. About £50 has been spent on the monument, and a meeting will be called soon to decide as to the fittest way of disposing of the surplus.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

Gothic Foliage Carving.*

JOHN L. MYRES, M.A., F.S.A.

(*Concluded.*)

AN exactly similar series of changes may be noted in the foliage of brackets, corbels, and other carved members of the building, of which the most exaggerated example is afforded by the foliage equivalents of the thick-set dog-tooth ornament in the hollow mouldings. The dog-tooth elements grow larger and more prominent; they stand separate from each other, and become thoroughly undercut; then each begins to acquire serrated edges and a leaf-like structure; and, finally, they are replaced, either by an unsymmetrical crocket-like motive, or by a complete wisp of foliage which in the supreme examples from Lincoln Cathedral, retains still, in spite of its spiral arrangement, traces of the original fourfold symmetry of its dog-tooth prototype.

The types of foliage hitherto discussed are all derived immediately from the traditional forms of the capital itself, however much they eventually depart from it. But the comparative grace of the fully-grown early English convention could not but suggest the experiment of a really naturalistic study from actual leaves. Consequently in the latter part of the thirteenth century, and alongside of the conventional foliage of the earlier period, we find a fresh series of forms which are probably to be kept quite distinct. Of this naturalistic school we have a severe and early but most typical specimen in the fragments of the Shrine of St. Frideswide; it reaches perhaps its climax in the chapter-house of Southwell Minster; and persists, though with decreasing originality, and less constant appeal to nature in much of the woodwork, and some of the better stonework of the fifteenth century. Both capitals and finials of this natural foliage carving are well represented among the Ashmolean casts.

The zoomorphic instinct of the northern Romanesque carvers leaves its trace in the occasional appearance, in early English capitals, of human or animal faces peering out among the foliage, and in very rare examples of animal forms as accessories. This tradition could not but be amplified, and made full use of by the decorated naturalism: and not only faces and busts, as in St. Frideswide's shrine and the capital from Bridlington, but also birds, serpents, snails and insects are introduced to add verisimilitude to the foliage. The use of the snail almost as a naturalistic volute is well shown on a capital in our collection, and on a fine decorated miserere on the central stand.

The employment of flower and fruit forms, which becomes common about the same time, is of course more nearly related to the grand idea of the foliage itself.

But the conventional foliage of the early English, as already hinted, does not disappear before this naturalistic work; the loose and elaborate compositions of leaves and flowers were obviously unfitted for many positions in which foliage of the conventional kind was in common use; and the latter continued to be usual where it was a question of filling a confined space, or where, as in the case of crockets, the repeated ornaments were too conspicuous architecturally to allow full scope to the student of natural forms. The series of crockets in our collection does not include one really naturalistic example, though some of our finest examples of plant portraiture are in the form of finials. In the same way, though maple and oak patterns are not uncommon on diaper backgrounds or panellings, they are only admitted because of all the plant portraits in vogue they lend themselves most readily to a symmetrical arrangement. The result is that these flat-leaved plants demand and create a flat-leaved canon of foliage, while the necessity of securing an evenly filled and superficially compact surface leads to the adaptation of the leaf to the space which it is to adorn, in a way which precludes really naturalistic treatment. Consequently, in the later part of the decorated style, even in capitals and detached masses of foliage, a compact and garland-like treatment of the details sets in, and is accompanied by a meagre, angular, and hard-edged treatment of the constituents of the design, and on a much lower gauge of relief, wholly analogous to that which has been noted already in the later stages of the classical decadence. And this treatment comes in almost together with the relapse from flowing tracery into the rectangular spacing of window openings and wall faces which marks the beginning of the perpendicular decline.

NATURAL FOLIAGE, HEXHAM.

Thus even before the list of identifiable plants has reached its fullest, and at the very time when foliage cornices and borders begin to be characteristic, the rendering loses its vigour, and only produces its best work when it treats flattened and close-clinging subjects, like the vine and the hop, which remain characteristic of stone and wood foliage of the fifteenth century. In the same way, the ball flower, which itself probably represents an afterthought of the dogtooth, opens only in time to become either a flat, square four-petalled flower of conventional proportions, or later, a merely heraldic rose which might equally well stand for a dahlia or a paper favour.

It is true, of course, that a part of this decadence is due to the diversion of the sculptor's attention to more ambitious subjects; on the misereres, certainly the relapse of foliage into conventional and merely decorative forms coincides very nearly with the full development of animal and human figures and groups; but though this may explain, it does not alter the fact that from the end of the decorated onwards, Gothic foliage carving, if not by any means extinct, has ceased to be a living Art, and has relapsed into an accessory and mechanical routine.

This survey has been short and diagrammatic, because it has only been intended to be introductory to a close individual study of the collection of casts in the mediæval room and I propose, at the end of such discussion as may profitably be carried on in this room, and without the examples before us, to transfer this meeting to the mediæval room, where there is ample material for suggestive criticism.

NORTH PORCH, BRIDLINGTON, FOLIAGE CAPITAL. FROM A PHOTOGRAPH BY MESSRS. PHILIP AND SON.

[Through the courtesy of Messrs. Philip & Son, of Fleet Street, London, we have been enabled to reproduce many of the illustrations used by Mr. Myres.—ED.]

* A paper read before the Oxford Architectural and Historical Society, as an introduction to the study of the newly-arranged collection of Architectural casts in the Ashmolean Museum.

IN the case of the Hull engineers' dispute the Board of Trade has been successful in bringing about a settlement of a struggle which had aroused very bitter feeling, and which threatened to affect many more than the 600 workmen immediately concerned at the works of Earle's Shipbuilding and Engineering Company (Limited).

DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.

PRESIDENTIAL ADDRESS BY LESLIE OWER, F.R.I.B.A.

IT is set forth in the constitution of this Institute, that the opening meeting of each session shall be a conversazione and exhibition of drawings. Fortunately, the framers of those rules did not fix any dimensions for the address, neither in length nor depth, and to-night I hope to bring before your notice some points of importance to the welfare of the Institute, and, above all, I earnestly desire to enlist your sympathies in its work, and to invite your hearty co-operation in carrying out the objects it has in view. "The object of the Institute is to afford facilities for the study of Architecture, the applied Sciences, and the fine Arts, by means of papers and discussions, sectional meetings, classes for study, prizes, visits to public works and buildings —ancient and modern, excursions for sketching, and such other means as the Council may determine." To show to what extent our Institute is endeavouring to carry out this pretty extensive programme, I crave your indulgence for a few minutes to recapitulate the work of the past session, and I hope, in doing so, to influence some who have not taken advantage of the lectures and excursions, to avail themselves of the opportunities in the coming session. I feel sure that they will find them most enjoyable, and I may also say that their presence and appreciation would be some reward for the considerable trouble which the organising of these lectures and excursions causes to the office-bearers, and especially to our indefatigable honorary secretary, Mr. J. J. Henderson. There were two lectures delivered during the session: one by Mr. Harry W. Chubb, on "Locks and Safes," and one by Dr. Templeman, on "Sunlight, in its Relation to Sanitation." As to the educational side of our work, the prize drawings sent down from the Royal Institute formed a most instructive exhibition, and the advantage to the students of Dundee and district of seeing those works can hardly be over-estimated. Our Institute has also charge of the Royal Institute district examinations for students, and eleven candidates were registered as probationers. We also offered prizes for drawings in six different subjects, and I am glad to say that a greatly increased number of competitors came forward. Many of the works were of high merit, and it is satisfactory to the Council to believe that those competitions have a stimulating effect on the young men studying Architecture and Art in Dundee and district. In June, a most enjoyable excursion was held to Aberdour and Inchcolm, Donibristle House and the ancient Priory of Inchcolm forming the chief objects of interest. A matter of some importance has engaged the attention of your Council and a small committee for some time past, and that is the revision of the rules for the measurement of building work, as desired to be amended by the Master-Builders' Association. On the whole, I may say that the points of material difference between the Architects and tradesmen are not very numerous, and, I have no doubt, will be arranged amicably. The rules have now been revised, and returned to the Master-Builders' Association for their reconsideration.

CAPITAL FROM BISHOP ALDUNE'S CHURCH, DURHAM.

BYLAND ABBEY.

OFFICIALS DOING PRIVATE WORK.

Another point which engaged our attention was the amount of private work being done by salaried servants in the municipal offices. It was felt that those servants, in order that they should hold a fair and impartial position in the discharge of their duties, should not entangle themselves with private interests, and use their positions to gain an unfair advantage over the private practitioner. Thanks to ex-Lord Provost Hunter, this has, to some extent, been remedied, at least for the present, but it would be a most desirable rule as well in the interests of the public as of the profession, and one which might be embraced in the new Corporation Bill, that all plans presented for the approval of the Council should bear the signature of the Architect, engineer, or other person who has prepared them, so that the Council may know whether or not they are the production of a man of repute and skill in his profession. A sad accident lately showed the necessity of such a regulation. Thus you will see that our Institute is working away, quietly it may be, but we hope steadily, so far as its means and opportunities will allow. It is there ready to represent the interests of Architecture and Art when occasion requires, and as it has proved its power of usefulness in the past so we feel sure it will do in the future, for from time to time questions will arise and are now in view, requiring the united voice of those interested in the profession, and I appeal to the members of this Institute not to stand indifferent to its ordinary work, but to support it in all its efforts, so that when an important question has to be faced, the Institute may be found strong, vigorous, and united. In union there is strength, in jealousy and separation there will be loss and oppression. The question of a general union of the practising Architects of the kingdom, is one which affects the welfare of the profession very deeply, and a movement is now going on in the large centres of England—Liverpool, Manchester, and Birmingham, in particular—which it is to be hoped will prove productive of some step towards the attainment of that very desirable end. It is to the R.I.B.A., in London, that we all naturally look for light and leading in this matter, but while not finding fault or imputing blame to anyone, the fact remains that the result of the policy and management of that body has been that only a tithe of the practising Architects are within its membership, and that in the whole of Scotland, there are only this year sixteen Fellows of the Royal Institute and thirty-eight Associates. It is much to be desired that the pressure now being brought to bear upon the Royal Institute may result in the opening of its doors to admit all reputable practitioners who have been in practice for not less than seven years. Thus would be brought about what would practically be

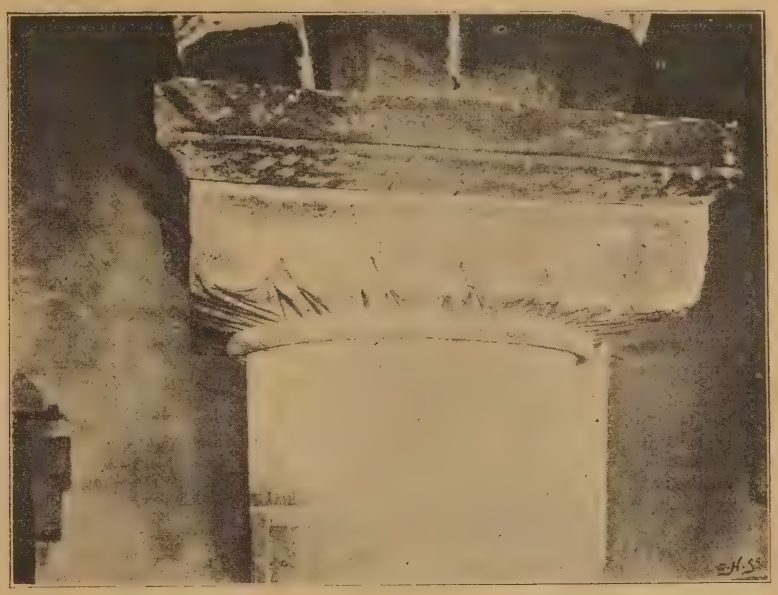
A SYSTEM OF REGISTRATION,

for no Architect worthy of the name would be found outside the Royal Institute. All professions are united for purposes of advancement and protection, and it is not creditable to the Architectural profession that it should be behind in this matter. We ought to take a hint from our friends the plumbers and not rest until the whole profession is welded into one body, with local branches in the more important centres. Thus united, the profession would be able to make its influence felt for good in many ways, but until this union is accomplished it cannot hope to attain that position where it would command the respect and confidence which its importance warrants. Had the Royal Institute espoused the bill for registration of Architects instead of opposing it, the profession would have been, even by this time, in a very much stronger position than it is. As to the influence of our local institute I think possibly we have been remiss in not making our voice more heard in matters affecting the Architecture and the amenity of our city as well as in other professional questions. We have from time to time tried, I am sorry to say as yet with not much result, to get committees who issued conditions for competition plans to make those conditions more fair and in accordance with the suggestions of the Royal Institute. In municipal matters, this Institute must regard with pleasure the laying out of the Barrack Park so far as it has gone, and anticipate the proposed improvements at Sea Braes and at the west end of the Magdalen Green, as matters affecting the beauty and amenity of the city. Such improvements repay their cost indirectly by

FOUNTAIN ABBEY, NARTHEX, CUSHION CAPITAL.

inducing people to build and to reside in the improved localities. Our municipal rulers could help forward the cause of Architecture by encouraging building in the suburbs through extensions of the tramway system and by the formation of new streets. A subject of importance to all interested in building in Dundee, and one to which your Council would invite your closest attention, is the proposed Municipal Bill which the Town Council have now resolved to proceed with. It seems to me very undesirable that this Bill should be rushed through in the limited time now left for its consideration. Such an important measure should be drafted and published for the consideration of the citizens before it is lodged in Parliament at all, and time should be given for its consideration and for the Councillors to meet with their constituents and hear their views. No private citizen is likely to bear the expense of opposing any clauses in the Bill once it is lodged, and laws may be made which may bear harshly and unjustly on certain of the citizens. As an instance of what I mean, in a former Bill it was proposed that not only the building owner should be responsible for carrying out his building to the satisfaction of the Police Commissioners, but that his agent who represented him, such as his lawyer or Architect, should become personally responsible to the Commissioners as well. This absurdly unjust clause was withdrawn, thanks to the action of a few of our leading lawyers, but what was attempted before may be again. I think we are justified in believing that the wider diffusion of education and wealth is causing a more general

APPRECIATION OF BEAUTY



and fitness in Architecture, and that Architects and Artists will be permitted greater scope for the exercise of their Arts as time goes on. Even as a commercial speculation people are beginning to find that a little money laid out judiciously to enhance the appearance of a building, be it church, dwelling-house, or business premises, is not thrown away. The same applies to cities, towns, and villages. The more attractive they are made the better for the locality and for the prosperity of those interested in it. The tastes and manners of the people mould their Architecture and Art, and they again by a reflex action influence the tastes of the people. But men must be fired with noble enthusiasm before Architecture can arrive at its greatest perfection amongst them. It was during the War of Independence in Scotland, about 1300, when Wallace fought and died, and Bruce led his armies to victory and his country to freedom, when he had the courage to send his spirit-stirring message to the Pope, "It is not glory, it is not riches, neither is it honour, but it is liberty alone that we fight and contend for, which no honest man will lose but with his life"; it was in times like these and by men like these that Arbroath Abbey, Kelso Abbey, Glasgow Cathedral, St. Andrew's, and Holyrood were built, through the piety of the people, purified and stimulated by hardship and struggle. Religion has always been the foster-mother of Art, for it has been when men were deeply stirred by religious zeal and noble purpose that the highest Art has had opportunity to find expression in noble works. It does not fall to the lot of many of us to erect such buildings as I have mentioned, with "cloud-capped towers and lofty pinnacles," but let us strive in all our works to be enthusiastic and zealous to carry on our Art in a devoted and humble spirit. As a preacher to reach the hearts of his hearers must forget himself and only proclaim his message, so must the Architect to reach the perfection of his Art have no thought of self, but only of his work. By this means only can he attain the highest, for "nearest the throne of God must be the footstool of humility." In all our Architectural efforts, while endeavouring to the utmost of our ability to be original, let us beware of the danger of becoming eccentric. It is a poor spectacle to see an Architect deliberately sacrifice beauty and proportion in his design for the sole purpose of proclaiming his own little individuality. Better a pleasing, if somewhat common-place, design, than one which will only call forth a half-contemptuous remark on its extraordinary appearance. Ruskin says, "All great nations write their autobiographies in three manuscripts - the book of their deeds, the book of their words, and the book of their Art." It is our privilege, as it is also our responsibility, to bear a part in writing the history of our nation—the greatest nation of the earth—in the book of her Art. Let us take care what we write and how we write it. The buildings we are erecting will live long after we have passed "to where beyond these voices there is peace," and they will influence the coming generations for good or evil. By

THE KIND OF BUILDINGS

we erect future generations will judge of the spirit of our age, they will learn our pursuits and gauge our aspirations, our ambitions, our hopes, our fears, our religious beliefs, as we may read the character of a man in his countenance. By the skill shown in their construction they will judge of our knowledge, and from their beauty and fitness they will estimate the level of our Art. Let us, therefore, strive in writing our little page in the book of our nation's Art to "Design with Beauty and Build with Truth," so that those coming after us may read it with pleasure and, it may be, with profit, and we shall have the satisfaction of thinking that we have laid a stepping-stone in that great staircase up which the Arts are ever climbing, and whose top is only to be reached at the throne of Him who has made "all things beautiful in His time."

SOME ENGLISH CATHEDRALS.

IN the large Lecture Theatre of the Birmingham and Midland Institute, a lecture, illustrated by limelight views, was recently delivered by Mr. A. Darbyshire, upon the subject of "Some English Cathedrals." The remarks of the lecturer explained a set of magnificent views Mr. Copland had photographed, in the majority of cases, to represent some detail or constructive feature peculiar to Gothic Architecture. Mr. Darbyshire, before explaining the large number of lantern pictures, made a few observations upon the Architecture of the world anterior to the Gothic Ecclesiastical Architecture. He passed over the Art of archaic ages, and commenced with that of Egypt; and, after giving illustrations of the early Architectural Art, and speaking of the edifices representative of the Art and civilization of great historic epochs, he dealt with Cathedrals in various parts of England. There was not to be found in England, or scarcely in the world, he said, an Architectural picture so beautiful as the view of Durham Cathedral from the river. There it stood, on its rocky eminence, a monument of the early phase of Christain Art in this country, and it might well be chosen as an illustration of the Norman work which constituted the foundation of English Gothic Architecture. After giving the history of this cathedral, Mr. Darbyshire turned to the Cathedral Close of Salisbury, and described the building as the gem of the Early English period of Gothic Architecture, and to the Cathedral of Lincoln, remarking, after giving many details of the building, that one of the finest poems ever written in stone was the Lady Chapel, which formed the entire east end of the Cathedral, and which was a grand example of the transition from Early English to Decorated Gothic. This lovely work was the medium through which English Ecclesiastical Architecture glided, so to speak, into that glorious Edwardian Gothic in which our national Architecture reached the acme of beauty and the meridian of its truth. The characteristic features of many other well-known Cathedrals were explained, and the lecturer concluded by saying that there was nothing in the history of Art so beautiful, so truthful, and so majestic as a Gothic Cathedral, and let it be borne in mind always, he said, that the Gothic Architecture of the Cathedrals of England had an individuality distinct from the Gothic of other countries. It had maintained that individuality from the moment it took root in the soil. It was pure in thought and refined in conception, it was truthful and beautiful. Truly, the old mediæval builders had left a legacy rich in honesty, truth, and beauty.

STONEGRAVE, CUSHION CAPITAL. FROM A PHOTOGRAPH BY MESSRS. PHILIP AND SON.

AT the monthly meeting of the Perth Town Council, a memorial signed by 243 ratepayers, against the proposed new bridge was read, and excited a stormy discussion. In the end, the opposition memorial was defeated.

FROM Dublin we learn that a large portion of the College of St. Columba, Rathfarnham, has been destroyed by fire. The old dormitory, the warden's residence, and the Chapel were saved. It is supposed that the fire was caused by the over-heating of a flue.

THE fire which broke out in the tower of St. George's Church, Hanover Square, and the water used to quench the flames, had the effect of ruining the organ, so a new Hope-Jones electric instrument, at a cost of £1,816, is to be built on the same principle as the one just destroyed.

THE Liverpool and Lancashire Transport Company instructed their surveyor to report as to using Liverpool and Manchester highways for motor traffic from the ship's side to the warehouses in Manchester. The surveyors have just completed their task, and report the suitability of these roads for motor traffic. It is calculated that merchandise can be carried between the two cities at one-third the present railway rates.

To meet the heavy expenditure of the proposed new pavilion at the Oval, the Surrey Cricket Club will utilize their invested capital of £12,000, and they propose to raise the remaining £8,000 by means of debentures, which will be paid off during the term of the new lease. The Surrey committee long ago decided to build a new pavilion as soon as they secured a fresh lease, and with this object in view they have for years put aside as much money as possible.

ECCLESIOLOGICAL NOTES FROM NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

(Continued.)

THE work on the exterior of the aisles of the Dom at Halberstadt is excellent, ranking with that at Strasburg, Freiburg-in-Breisgau, and the choir at Cologne; but a weakness is noticeable in the clerestory, where the windows, unprovided with drip-stones, and the unenriched wall space which they pierce, have a bald appearance hardly redeemed by the flying buttresses.

The boldly projecting transepts have a light flêche at their junction with the nave and choir, which latter terminates in an apse, having a procession path with a solitary Chapel projecting from its eastern side. Such an arrangement is a particularly interesting departure from the usual German one of a tall aisleless apse in a district remote from French influence. Inside, the Dom at Halberstadt is most elegant, and although it has been in Lutheran hands since the middle of the sixteenth century, has retained, in great completeness, such of its mediæval furniture as the magnificent rood-screen, the choir stalls (upon which still rest the old office books), the episcopal throne, stationed, as is the one at Naumburg, with its back to the rood-screen, several fine old standard candlesticks of three branches each, and much fine tapestry on the walls behind the altar and choir stalls; while, in the sacristy, a long gallery forming an outer south aisle to the nave, is perhaps one of the most superb collections of vestments and plate (unused here since the Reformation) in northern Europe.

The absence of triforium in this great Church at Halberstadt, as well as in several other German Churches of the "Transitional"* and Complete Gothic epochs, is somewhat unpleasantly conspicuous. It is curious that, while the Architects of the Rhenish provinces should have lavished so much constructive skill and ornamentation upon their Männerchöre, this beautiful adjunct to a Middle Pointed Church should, in other districts of Germany, have been omitted altogether or else made quite a subordinate feature of. The bare expanse of wall between the pier arches and the clerestory in the "Transitional" naves of Osnabrück and Naumburg; in the Early Pointed naves of Magdeburg and Freiburg-in-Breisgau; and in the Complete Gothic ones of St. Laurence at Nuremburg, the Minster at Ulm, the Minorite Church at Cologne, and St. Foilan at Aix-la-Chapelle, is very displeasing to the eye accustomed to the richness and importance of such triforia as Durham, Lichfield, Lincoln, Westminster, Amiens, Rheims and other great examples of the thirteenth and fourteenth centuries in England and France. Sometimes in Germany we find the triforium a continuation of the clerestory, as, for instance, in the Cathedral at Ratisbon and the Stadt Kirche at München Gladbach. The best and most developed triforia are those in Cologne and Strasburg Cathedrals.

Although the blank wall space over the pier arches at Halberstadt is not quite so disagreeably forced upon the observer as in the examples above quoted, it cannot be denied that an interval of arcade work, blind or pierced, would have imparted additional elegance to the elevation. Here the arches spring from slender attached shafts placed in triplets, with their capitals delicately carved in foliage. In the later Complete Gothic of Germany these elegant clusters of shafts gave way either to others exhibiting much clumsiness and poverty of detail, or to tall octagonal piers from which, without the intervention of a capital, the mouldings of the arches, and, in unclerestoried Churches, the groining ribs, spring. Such a type of pier occurs in the great Marien Kirche, overlooking the markets at Halle, in St. Martin at Hildesheim, and in the Churches of the Franciscans and Dominicans at Halberstadt. St. Martin at Hildesheim, now a museum, is one of those splendid middle-pointed Churches which the monastic orders were so fond of rearing in the great German cities during the fourteenth century. It consists of an unclerestoried nave with a north aisle only, which is contained beneath the same long slope of tiled roof, and lighted by windows whose tracery is among the best and most pleasing of its epoch. The two great Churches built by the Franciscans and Dominicans at Halberstadt, although of the unclerestoried type, are far more satisfactory than the Westphalian examples of the same class, on account of their moderation in height and to the greater depth given to their aisleless choirs. A light flêche for the bell at the commencement of the choir alone breaks the long line of roof in these Churches. In each instance the proportions of the apse are of the greatest elegance, but unfortunately the general effect is marred by their windows, which, as well as those in the choir of St. Martin in the same town, exhibit tracery of so eccentric a character that one cannot think without difficulty how a people who invented such a grand style as the Rhenish one, and who gave us such Churches as Neuss, Bonn, and Gelnhausen could have perpetrated such vagaries in stone as rectangular tracery and rectangular heads to the lights, to say nothing of the introduction of an untraceried circle into the whole width of the window, and cutting into the mullion at rather more than half its height. The outline of St. Martin's, one of the Churches at Halberstadt in which these absurdities occur, is a curious combination of the "hall" and clerestoried type. Nave and aisles are contained beneath a continuous slope of heavy roof. Then comes a transept, with, beyond, a chancel having clerestory, lean-to aisles, and regulation apse containing the windows just animadverted upon. There is perhaps a certain Teutonic picturesqueness about the *ensemble*, but the heavy mass of leaden roof at the junction of the transepts and choir, dictated of course by the combination of plan alluded to above, is very offensive, and revolts completely against English canons of taste in such matters. The western towers surmounted by spires of unequal height, and connected by one of those wooden bridges of which examples existed not so very long ago at Boppart and Limburg, are picturesque, and the stilting up of the western gable far above the line of the nave roof to give greater dignity to the façade, is curious if not quite beautiful. Between Halberstadt and Erfurt is the highly interesting Church of Naumburg, the seat of a Bishop until the town, like Halberstadt, accepted the Reformation in the middle of the sixteenth century. The Lutherans, however, in whose hands the Church now is, have restored it very judiciously, and it is regarded with much pride by its custodians, who, by the way are intelligent, and not at all officious or obtrusive. In its original "transitional" form —the nave and transepts* date from c. 1200, the great Church-building age in Germany as elsewhere—Naumburg Cathedral must have borne a considerable resemblance to the double-apsed Churches of the Rhineland. The western apse seems to have been rebuilt during the later part of the same century (c. 1260) in a very elegant geometrical style, its lofty windows having no cusps to their lights, but traceried, like those at Westminster and Rheims, with a large foliated circle.

OSNABRÜCK CATHEDRAL. SKETCHED BY W. A. HANSON.

Perhaps half a century later the eastern choir was rebuilt upon the same place as we now see it, the three-light windows of its apse having tracery composed of small trefoils, and the capitals of its vaulting shafts delicately foliaged. On the whole this eastern choir at Naumburg bears a striking resemblance to the Lady Chapel at Lichfield, but instead of terminating hexagonally it does so triangularly, that is to say, in the centre portion there are only two windows instead of three ordinarily seen. Describing this eastern choir internally, it would, perhaps, be more correct to state that it has an oval termination.† Naumburg Cathedral is the possessor of two Lettner or Rood screens—a Romanesque one dividing the nave and transept from the eastern choir, while a First-Pointed one, exhibiting much beautiful carving of that epoch, encloses the western choir. The eastern choir is much raised above the nave. Like those at Paderborn and Hildesheim, it is approached at the sides by flights of steps in the transepts, across which, in the manner usual in Germany, the chorus cantorum is carried. The crypt, which renders this arrangement of steps

* This term is rather a misnomer, as that mingling of Pointed and Romanesque so prevalent in Germany, did not, like our Transition of Canterbury choir and the round of the Temple Church, lead to a perfected and complete style. It has been used here more for convenience sake.

* This part of the Church seems to have been inserted between two apses of a date much anterior; the crypt below the east choir testifies this.

† The late Mr. G. E. Street visited Naumburg (when the Church was in its unrestored state) in 1854, and has recorded his impressions of this, one of the most extraordinary German buildings of its kind, in "The Ecclesiologist" of that year. Mr. Street seems to have been much struck with the oval shape of the eastern apse, for he reproduced it, with modifications, in his Church of St. Saviour, Eastbourne, finished about 1870.

necessary, although not very extensive, abounds in much fine Romanesque detail.

At Erfurt, the work in the majority of its 16 Churches, about equally divided between the Catholics and Protestants, is Middle-Pointed of the fourteenth century. The Catholics retain the grandly situated Dom* and St. Severus, besides some six others in the lower part of the town, while the three noble Churches of the Dominicans, Franciscans, and Augustinians, are held by the Lutherans, as well as some smaller ones of less interest. Clerestories are frequently met with, and the square eastern termination, lighted by tripled lancets, quite in the English fashion, is not uncommon; but the transept is curiously absent.

The Dom and its next-door neighbour, St. Severus, have between the nave and choir a species of elongated tower surmounted by a triplet of spires, while the great Churches of the Orders have their tiled roofs unbroken, the bell turret in every instance being located against the wall of the clerestory, in which position it marks the commencement of the choir. The Dominican Church (Prediger Kirche), and the Franciscan Church (Barfüsser Kirche), have many points in common, notably the clerestory, and the lofty, but somewhat narrow, lean-to aisles. In the former the aisles are carried along the choir as far as the commencement of the apse, while in the latter they are limited to the junction of the nave and choir. The Dominican Church has its octagonal bell turret against the southern clerestory, that of the Franciscans being on the opposite side, and somewhat more highly enriched. The doorway opening from the street into the aisle of either Church is carried up very high, the superimposed space between the head of the arch and the lintel of the doorway being filled in with perpendicularising tracery in lieu of sculpture. Both these vast structures are about 220 feet long. That of the Dominicans is in 15 rather narrow bays; the columns supporting the arches are tall octagons, and to each arch corresponds one clerestory window and one aisle window. In the Franciscan Church the arches are of wider span, two windows in aisle and clerestory lighting each bay.

(*To be continued.*)

* Erfurt is not, nor was it ever a Bishop's see, being included in the Diocese of Paderborn. The term Dom, as applied to its grandly situated head Church, is therefore somewhat erroneous—a Dom being, strictly speaking, a Cathedral Church with a large body of clergy attached to it. But the word seems to be used in Germany to denote the chief Church of a town.

IMPORTANT WORKS ON THE THAMES.

SEVERAL important works have been undertaken by the Thames Conservators which will materially assist the navigation of the river, and tend to the prevention of floods in the valley of the Thames. The first of the new works is at Teddington, where a relief channel is to be constructed to permit the water more freely to escape at the weir in time of flood. This channel will be 80 ft. wide, and it will come into practical operation shortly after the river above rises higher than the head-water level, which has to be maintained for purposes of navigation. It will add materially to the water-carrying capacity of the river at this point, and the work of construction, which is to be carried out forthwith by the Conservancy staff, under the superintendence of Mr. C. J. More, the engineer, will be completed early in 1897. Penton Hook, about a mile from Staines, is the next place where the flow is arrested by the eccentric course followed by the river, and there the obstruction caused by a sharp bend is so marked that during floods a difference of between two and three feet is noticeable in the levels above and below the lock. A valuable improvement has here been rendered possible by the powers of the Staines Reservoirs Act of last session, under which the sum of £5,000 has, within three months of the passing of that Act, to be paid to the Conservators by three of the London water companies towards the costs of works necessitated by their proposals to take a larger, but limited, supply of water from the river above Staines. Under the same Act a further contribution of a like amount has to be paid annually when any part of the additional supply thus sanctioned is taken. The money so obtained by the Conservators is to be expended on the

CONSTRUCTION OF A WEIR,

with the necessary tumbling-bay over the neck of land now forming the "Hook." This new weir will be so designed as to create a much larger sectional area for the discharge of flood water, and thus one of the most serious hindrances to the free passage of floods will be removed. Between Staines and Oxford extensive dredging work has simultaneously been undertaken, and very shortly the Conservators will enter upon further improvements which have been suggested at Bray, Caversham, and other places—all likely to have the same effect of improving the flow of the river, and thus giving flood relief. But when all these changes have been carried out, there will still remain many obstacles to the free flow of flood-water with which at present the Thames Conservancy has no power to cope. Quite apart from the impediment offered by the restricted waterways existing at many of the bridges, there are no fewer than eight bridges between Reading and Staines where the flood openings which were originally provided are now rendered

ABSOLUTELY USELESS

for that purpose, either by reason that they have been blocked up, and used for various private commercial purposes, or in consequence of the ground near them having been raised to such an extent as to prevent flood water reaching the openings. Again, a great deal of the flooding in the valley of the Thames is due to the neglect of the side streams and other drainage channels, which have been allowed to silt up and become obstructed by all sorts of impediments to the free flow of the water. The Conservators are exerting themselves to induce the various local authorities immediately concerned to use their influence to secure the removal, or at any rate the lessening, of these several obstructions. Eel-bucks constitute another impediment to the rapid escape of flood water, and over these the Conservancy has no control whatever. They represent private fishery rights, and only two years ago Parliament emphatically refused to grant any powers authorizing their compulsory removal. During the present autumn beneficial results have attended additional precautions which have been taken with the intention of providing for sudden rises of the river after heavy rainfall. The success of these new safeguards has led the Conservators to consider favourably the suggestion that telephonic or telegraphic communication should be established, so as to enable weir tackle to be drawn when there is reason to apprehend a sudden increase in the volume of water passing through a particular reach; and it is proposed that such communication shall be provided, as an experiment, between Cookham and the Bell Weir at Staines—a section of the river which in times of flood has always been most seriously affected.

NORTH SIDE OF ST. JOHN'S CHURCH, OSNABRÜCK. FROM A SKETCH BY W. A. HANSON.

Bricks and Mortar.

TALBOT HOUSE, ARUNDEL STREET,
December 16th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Picture Gallery for British Art that is being built near the Thames, a little beyond the Houses of Parliament, will, it is expected, be ready for opening about next June. This is good news and should be appreciated. The National Gallery Trustees, whose rooms will, it is to be hoped, be freed from their congested state by the removal of the pictures of the British School. It is hoped that Mr. Tate's new gallery will act the part of an English Luxemburg, in which the candidates for a place among the immortals shall endure a period of purgation. We have only one or two Gainsborough's, Constable's, or Millaises in a generation, and it takes time to determine finally who are deserving of these places of eminence.

LORD ROSEBERY'S friendly disputation with Sir Walter Besant, as to the beauty of London, does not leave him with the best of the argument. It was a surprise that Sir Walter, who knows his East End a great deal better than Lord Rosebery knows even the West End, should have taken the side of the beautiful, while Lord Rosebery, brought up in purple surroundings, is disposed to sneer even at the beauty of London. There is no doubt that London has considerably improved within recent years, and, in some respects, it is more Parisian than Paris. There is probably no street in Paris to equal the irregular beauty of Piccadilly and Regent Street. Improvements in the parks, in the roadways, and in the outer decoration of houses and shops have wrought a great change; but the lack of sunshine must always mar the beauty of London as compared with rival cities.

PLANS for the internal structural alterations at the Dublin Custom House have recently received the sanction of the Treasury, and, no doubt, the extensive work that the scheme will involve will be commenced in a short time. Nothing seems yet to be known as to whether the work will be contracted for or be carried out by the Board of Works staff. The expenditure will be about £4,000 pounds. The object of the alterations is to convert the entire of the interior of the northern section of the building, facing Gardiner Street and Store Street, into one long room to be occupied by the staff, and the roof to be propped with iron pillars. Other portions of the building will, we understand, be taken for the purposes of a board room and apartments for the Board of Works.

A SPECIAL meeting of the Commission of Sewers was recently held at the Guildhall. The meeting was convened for the purpose of discussing the following resolution, notice of which was given by Mr. Deputy Johnson at the last meeting: "That the Finance and Improvement Committee be empowered to proceed with the building of the new offices on amended plans, by other contractors, if, in their opinion, it be found necessary or desirable." The debate was proceed with *in camera*, and the discussion lasted over an hour. After hearing an official explanation of the position of affairs, and inspecting the modified plans of the new offices, Mr. Deputy Johnson, with the permission of the court, withdrew his resolution.

THE modern system of building large blocks of buildings with lift shafts leading from the basement to the top floor, convenient as it may be, possesses also certain elements of danger. In the event of a fire occurring below, a tremendous draught is at once created, and if there is sufficient woodwork no mortal power can stop the upward rush of the flames. In cases in which the fittings are all fireproof the danger is, of course, diminished; but, at the same time, the shaft would act as a chimney and increase the power of the flames below. It was entirely due to such a shaft that a fire that originated in the basement of a hotel in London Wall recently, burnt out the top floor without doing much damnge to the rest of the building. A fireproof shutter, capable of being readily closed across the shaft, would, to a large extent, obviate the risk of the shaft being temporarily converted into a chimney.

FOR the ensuing year the Council of the Royal Academy has just been constituted. Five of the old members and five appointed last week make the ten over whom Sir Edward Poynter presides. The old five are four painters and a sculptor—Mr. Tadema, Mr. Stone, Mr. Fildes, Mr. Waterhouse, and Mr. Onslow Ford. The new five are Mr. Thornycroft, Mr. Pearson, Mr. Armistead, with Mr. Boughton and Mr. Richmond. The latter two, who combine with their duties on the Council the unenviable function of hangers, have their seats at the board in virtue of their recent election to full Academic honours. It is noticeable that in this list of ten R.A.'s there is not one landscape painter. There is an Architect, and there are three sculptors—which is a liberal allowance for a branch of Art in which our English Academy does not shine. Of course, this combination is quite accidental—the Academicians take their places on the Council by rotation, not by election.

A PARAGRAPH recently appeared in a contemporary complaining of the constant breaking up of the streets of the metropolis, and suggesting the construction of subways for the accommodation of gas and water pipes as was now done "in some parts of the Continent." This suggestion is by no means new. The evil complained of is as great now as it was forty years ago, though the plan has been adopted in some of the thoroughfares since made. It would be an immense convenience if subways could be constructed under all our main thoroughfares, but the expense would be immense also. The minimum cost has been officially estimated at £46,000 per mile, which would make a very sensible addition to the rates—more than would be agreeable, especially as there are a number of costly improvements to be commenced as soon as the necessary powers have been obtained from Parliament.

THE proposal to purchase a site on the Thames Embankment for new offices for the Metropolitan Asylums Board has been refused by the Local Government Board. So much was to be expected from the recent communications on the subject. The reason hitherto stated was the costly nature of the entire scheme; it now appears, however, that the question has been raised whether the Managers are empowered by law to borrow money for the purpose of erecting offices for the transaction of their general business, and the Board say they are now advised that the Managers are not so authorised. This puts an end not only to the particular scheme under consideration, but to any modification of it. The assertion comes as an unpleasant surprise.

CONSIDERABLE success has attended the installation of a meteorological observatory on the summit of Mont Blanc and this has stimulated Italian men of science to crown Monte Rosa with a similar edifice. It is intended to utilise the hut on the Gniffetti Peak, built three years ago as a shelter for climbers. Situated at a height of about 14,000 ft. above sea level, it will, as regards elevation, rank fourth among the twenty-seven mountain observatories of the world, being surpassed in altitude only by those of Arequipa, Mont Blanc, and Pike's Peak.

IN Crutched Friars all the houses are severely modern, save one. What its exact age may be no one knows, but it is probably Tudor, and if so it was standing when the house of the Crutched or Crossed Friars existed, and gave visible reason for the name which the street still bears. Again, in that case, it witnessed the down-pulling of the friars' house and Church, and the building in their stead of the mansion which Sir Thomas Wyall erected for himself on receiving the grant of the friary from Henry VIII. Lastly, it was a silent spectator of the destruction of the mansion-house and of the building on that historic site of the East and West India Dock Company's great pile of warehouses. Mr. Alfred Shepherd is the present tenant of this relic of bygone London. It has been in the same family for over one hundred years. In the little room behind the shop is a window-pane upon which is scratched the date 1805, and another pane marked "1800" has been accidentally destroyed. Outside, the quaint plaster-covered upper stories projecting over the old-world shop on the ground floor, and the bottle-glass in the top windows, endear it, for a picturesque old place, to the heart of every antiquary.

IT is proposed by the London County Council to form a Special Committee to undertake the task of preparing a register of buildings of historic and Architectural interest. Had such a register been in existence, many of the historic buildings that have been destroyed during the past ten years would undoubtedly be still with us as links binding the past with the present. Happily, however, there is still a wide range of work before the committee, and much good will undoubtedly result from their labours as regards the preservation of buildings that otherwise might fall in what is termed the march of progress.

AT the forty-ninth annual dinner of the Builders' Benevolent Institution at Carpenters' Hall, London Wall, the chairman said that the charity was founded to provide a small allowance for builders and their widows, who, after the age of sixty years, had need of help, so as to keep them out of the workhouse. Forty-nine years had passed since the institution was established, and during that time 270 cases had been relieved. The allowance was not large, being 15*s.* a week to each male, and 10*s.* to each female pensioner. A sum of £2,000 per annum was required to keep the institution going; of that amount under £700 came by way of subscriptions, the remainder being raised in connexion with the annual gathering, with a small income from investments. During the evening donations were announced amounting to £929.

THE Hull electric light question seems little nearer a solution: for the second time the committee's recommendations for the extension of the system have been referred back by the Council. Applications for the light come in every day, but they cannot be met owing to the present works being utilised to their fullest extent. The North Eastern Railway Company has asked the cost of 700 sixteen-candle power lamps to light the station hotel.—Mr. Crook, at a recent meeting, said the action of the Council simply indicated that there was no confidence in the committee; and the only dignified course the chairman and committee could take was to send in their resignations.—It was decided that the scheme recommended to the Council was the best from every point of view, and that the committee could not be parties to recommend any scheme which fell short of their previous recommendation.

A SKETCH-MODEL of the equestrian statue which it is proposed should form the central object in the plan adopted by the Council for the laying-out and ornamentation of City Square has been on view at the Leeds Art Gallery. The main features of the general plan—for which the town is indebted to Alderman Harding and Mr. Bakewell, Architect—consist of a raised circular platform, 100 feet in diameter, surrounded by a balustrade of polished granite, and of two triangular spaces on the Post Office side, also surrounded by granite balustrades, and giving access to the underground lavatories, while leaving room for statuary, drinking fountain, or flower beds. Alderman Harding offered at his own expense to provide the equestrian statue which is proposed for the centre of the circular balustrade, and commissioned Mr. Thomas Brock, R.A., to prepare the model. It was considered essential that the subject should permit of decorative treatment, and, in the absence of any heroic figure connected with the history of Leeds, the subject selected is a national hero, Edward the Black Prince. Alfred Drury, of London, the sculptor of the "Circe" and St. Agnes," now in the Queen's Room of the Art Gallery, and whose bronze bust, "Griselda," was exhibited at the last

exhibition of the Royal Academy, was commissioned to prepare models for the life-size bronze figure lamps which are to be placed on the pedestals of the circular balustrade, two of them flanking each of the entrances to the raised platform. Mr. Drury has likewise prepared models of two figures, emblematical of "Dawn" and "Twilight," and these, too, are on view at the Art Gallery. It is proposed to repeat this pair of figures at each of the four entrances, so that they will be eight in number. They will carry electric lamps, and the present gas lamps around the causeway will be dispensed with. The execution of these works, if approved by the Corporation, will probably occupy nearly two years, but it is anticipated that the Architectural work to be carried out by the Corporation will be completed in about nine months.

AFTER having been exhibited in several provincial towns, the National Competition Works of Schools of Art and Art Classes have now been re-arranged at South Kensington, in the same place in which they were exhibited last August. The works to which gold and silver medals were awarded during the previous eleven years are shown in an adjacent room. A collection of drawings from elementary schools is also exhibited, each school being represented by the whole number of drawings executed at this examination. In selecting the schools consideration has been given to the desirability of showing the drawings from small and only partially equipped schools, as well as from those which are large and well equipped. Besides the above is shown a representative series of the exercises worked by candidates sitting at the annual local Art examinations in 1896. These, which are done within strict limits of time, are, perhaps, even more full of meaning and interest than the more finished drawings and models executed during the school year which are entered for the national competition. With each set of worked papers the paper of questions is given, as well as the number of candidates who sat for examination and the awards. The premium works of this year's national competition come from 104 towns in all parts of the kingdom. An opportunity is thus afforded for studying the outcome of the grants for Art teaching made by the Department in a more complete manner than has ever occurred before. The exhibition will remain on view until the 10th January, 1897, and is open free, daily, from 10 to 4 in the galleries to the south of Imperial Institute Road.

THE new street indicators, which have recently been put up in several thoroughfares in London, seem to be useful contrivances. Their iron frames are so constructed as to contain a chart of the names and addresses, arranged alphabetically and numerically, of all the shops and business premises in each street, with the street sub-sections clearly shown. They thus constitute a kind of open-air directory, which should be very serviceable to the public. Particulars are also given of the nearest fire station, police station, post office, hospital, &c. We understand that some of these indicators will be put up in provincial towns early next year.

IT is now claimed that the Caledonian early morning train from Carlisle to Aberdeen is the fastest train in the world. An expert in speed who made the trip says that for twenty miles the average was 72·8 miles an hour, and for two miles 81·6. The whole performance is described as the ordinary work now on the Caledonian, and far in excess of English times. The engine, in addition to large cylinders, has the largest boiler of any locomotive in this country. In ten years the Caledonian have reduced the time from Carlisle to Aberdeen from seven hours twenty-two minutes to four hours thirty-one minutes.

THE death is announced of the Spanish painter, Señor Luis Falero, at the age of forty-five. Señor Falero was a native of Toledo. He resided for some time in Paris, but came to London several years ago and took up his permanent abode here. Among his numerous works may be mentioned "Double Stars," "Le Cauchemar," "Marriage of a Comet," "The Dream of Faust," and "Unto a Better World." Many of his pictures, most of which have been reproduced, are in the United States, and especially in New York. He was very learned and particularly well versed in astronomy. Flammarion's Popular Works on Astronomy are adorned by Señor Falero's illustrations. He made a considerable reputation by allegorical pictures of the stars. He exhibited frequently at the Royal Academy.

ANCIENT BRASS FONT IN MÜNSTER CATHEDRAL. FROM A DRAWING BY W. A. HANSON.

OF the series of fortnightly lectures on Art subjects the fourth was delivered in the Glasgow Corporation Art Galleries by Mr. James L. Caw, Curator of the Scottish National Portrait Gallery, Edinburgh. Mr. Caw began by pointing out that a true understanding of the aims and limitations of pictorial Art was essential to an intelligent appreciation of pictures. All the Arts drew inspiration from life and Nature, and all strove to give expression to the emotion awakened in the Artist, but the concrete form of each Art was determined by the limitations of the medium of expression. The Art of painting was primarily related to the eye, and all it could express must be done by means of form, colour, and light and shade. Technique did not exist for itself, but without it ideas could not be expressed. A subject could be approached in several ways, of which the academic, the realistic, and the personal were chief, but the last was alone of importance in Art. But in whichever way a subject was looked at, it must be suited to pictorial treatment, and what that involved in portraiture, the subject-picture, and landscape was dealt with. The great problem in portrait painting was to combine likeness and decorative beauty. Abstraction was essential, for without it portraiture was vulgar and commonplace; but, on the other hand, an excess of abstraction was a weakness. The use and history of the subject-picture was next traced and illustrated, and it was pointed out how contemporary circumstances influenced Art. There was a tendency to confuse the functions of literature, or of the theatre, with those of painting. But one touched a limitation in any Art whenever other means would express the idea more vividly and beautifully. Vital Art was the result of personal contact with Nature and life. The mental process through which any subject passed in taking pictorial form was indicated, and the lecturer concluded by briefly summarising the principal conditions to which pictorial Art should conform.

A SPECIAL sub-committee was recently appointed by the Road and Improvement Committee of the Birkenhead Town Council to approach Mr. Vyner, the owner of the Halfpenny Bridge at Poulton, with a view to negotiating the purchase of the bridge and its freedom from toll. At the last meeting of the committee, the deputation, who had seen Mr. Vyner, reported that there were two alternative schemes:—(1) To purchase the free om of the bridge and construct certain improvements, which would practically take the form of a new high-level bridge; (2) or to build an entirely new bridge at another point. For the former scheme the sum of £50,000 was named, of which £30,000 or £35,000 would go to Mr. Vyner as purchase money, and the remainder towards the cost of the alterations and improvements. The other scheme would involve an expenditure of about £60,000, according to the plan estimates of the borough surveyor. After considering the schemes, the committee expressed the opinion that Mr. Vyner's terms were far too high, and authorised the sub-committee to spend £30,000 as an inclusive sum. Failing acceptance of the reduced offer by Mr. Vyner, there is a feeling that a new bridge should be built, as it could be done at a point more convenient to both Birkenhead and the Wallasey district, between which improved communications are sought. It may be added that Mr. Vyner recently doubled the tolls on the bridge, and foot-passengers have now to pay a penny, instead of a halfpenny as formerly.

AT a recent meeting of the London County Council, attention was called to a curious clerical blunder on the part of a contractor to whom a few weeks ago the contract for certain work at the Heath Asylum was given. One item was extended at a farthing instead of one shilling and fourpence, the result being a loss to the contractor of close upon £1,000. The Council, on the recommendation of the committee, agreed to allow the contract to be amended.

IT has been decided by the committee of the Shropshire Horticultural Society to entrust the commission to execute the statue of Charles Darwin, to be erected at Shrewsbury, to Mr. Horace Montford, a native of the city. The statue will be a seated figure in bronze, 6 ft. 6 in. high, mounted on a granite

pedestal 4 ft. 4 in. in height, with steps 1 ft. 2 in., making in all a monument 12 ft. high, at a cost of £1,000. It is proposed to erect the statute in a prominent position in front of the Public Free Library, formerly the free school building where Darwin received a portion of his education. The Shropshire Horticultural Society has undertaken to defray the entire cost of the statue.

The late Lord Saville's large estates in Notts and Derbyshire (which were worth over £40,000 a year at one time) have probably suffered more severely than any other property in the country from the succession duties. The estates have changed hands three times in fifteen years, through the deaths of Mr. Henry Savile, Mr. Augustus Savile, and Lord Savile, and on each occasion the heaviest rate of duty has been payable, owing to the fact that they were illegitimate, and not legally related to their successors. Besides this, Mr. Henry Saville had the same duties to pay on the death of his putative father, the eighth Earl of Scarborough. On the present occasion the duties will amount to £208,000. Rufford is a grand old house, and in admirable order, with a splendidly timbered park of 500 acres.

An order has been published in the Gazette directing the removal of all the human remains lying beneath the floor of St. Mildred, Bread Street, London, and their reburial in Ilford Cemetery. The present Church of St. Mildred was rebuilt by Wren, in the year 1683, on the site of the original Church destroyed in the great fire. It measures but 62 ft. in length by 36 ft. in breadth, and is crowned by a richly-decorated cupola. The woodwork in the Church is exceedingly handsome, especially the oak "altar-piece" and the massive oak pulpit with its magnificent sounding board. The carvings on the "altar-piece" and pulpit are attributed to Grinling Gibbons. The old pews still remain, including the spacious corporation pew, which is adorned at the ends with figures of the lion and unicorn, and contains a fine sword-rest. These pews will have to be removed *pro tem.*, but it is to be hoped that care will be taken to replace the pews and all other pieces of woodwork in their original positions. In the vestry-room, which is situated to the south-east of the Church, there is a large antique chest containing the parish registers from the year 1559.

Hall Barn, Beaconsfield, the country seat at which Sir Edward Lawson has been entertaining the Prince of Wales, contains many treasures connected with Edmund Burke. One of the features outside the mansion is the long avenue of beeches by which it is approached. At the extreme end of the avenue stands a fine obelisk, erected by the poet Waller, to commemorate the grove being finished. About the grounds and gardens are quaint temples and obelisks and sundials. In the adjoining village of Beaconsfield is a fine Church, in a vault of which rests Edmund Burke, though there is no monument, but only a modern brass to his memory. Waller, however, has a handsome tomb in the churchyard to mark his grave.

It is often matter of much conjecture as to how the vast estates of the ducal owners in London are conducted. Many believe that the sole business is in the hands of the agent, and that with the Architect he does pretty much as he likes. This, however, is not the case. The Duke of Westminster, for instance, manages his estate in the most methodical and business-like manner. No alteration is made on the estate without his personal consent, and no innovation projected without full and detailed discussion. Periodical meetings, presided over by the Duke himself, are held, at which the solicitor, the agent, the Architect, and the surveyor attend. The minutes are taken as at an ordinary board meeting, and resolutions and decisions arrived at only after the most careful inquiry. The Duke of Bedford, we believe, adopts similar methods.

Professor J. O. Arnold, of the Sheffield Technical School, in the third of his series of Brightside Extension Lectures on "The Properties of Steel," devoted himself to annealing, hardening, and tempering. He said that the mechanical tests of hard, annealed steels showed that as far as tenacity and ductility were concerned, the process of annealing actually injured the steel, but for the purpose of file-cutting the steel was much improved. In unannealed steels, the carbide of iron being finely diffused, presented great resistance to the chisel, but in annealed steels the crystallised carbide was in particles well divided by spaces of soft iron, and amongst these the chisel readily penetrated. To explain in a popular lecture the actions of hardening and tempering was a very difficult task, because it had been necessary to employ very intricate physical apparatus, the object of which was to accurately measure that which seemed a ridiculous paradox, namely, how much hotter a piece of steel became on cooling and how much cooler it became on heating. In the next and final lecture the important subject of steel castings will be dealt with.

At Felsham Church, the nave has recently been re-roofed to its original height, replacing an old queen-post design of the last century, which had become much decayed. The nave belongs to the decorated period of Architecture, with a beautiful porch of the Perpendicular period on the north side, and the original pitch of the roof could be clearly discerned on the tower by the line of the old string-course. The inside dimensions of the nave are 47 feet long and 26 feet broad. The new roof is constructed of English oak, consisting of eight hammerbeam principals, with curved ribs and moulded wall pieces, and massive rafters, purlins, and ridge, all framed and pinned with oak pins. Externally it is covered with copper, to reduce weight, replacing a heavy lead roof. The walls being slightly out of upright and somewhat weakened by damp at the base, iron tie-rods were inserted to each principal. The parapets have been rebuilt in panelled flint work, and the east wall over the chancel arch heightened and finished, with a cross to match the one on the chancel. In addition to this, two ungainly brick buttresses on the south side have been rebuilt in flint and freestone, to match others on the same side. The porch has been re-roofed in copper. The work has been carried out by Mr. Fred. Bennett, of Ipswich; Messrs. Ewart, of King's Cross, have done the copper roof, and the whole has been executed under the superintendence of Mr. John S. Corder, Architect, Ipswich.

A beautiful west nave window has just been put into St. Nicholas' Church, Whiston, by Messrs. Morris & Co., of Merton Abbey, Surrey. The subject is "Paradise," and the rose window at the uppermost, and most probably the most important and striking, part of the window, is the figure of our Lord in glory, enthroned among the angels, whilst below, in the long lancet lights, is a verdant landscape with paths around and among the flowers and foliage. Ascending and descending these paths are angels of praise, "Paradise" angels, each robed in silvery white, and with an instrument of music. The effect of these angels, with their ruby to pink wings, upon the varied greens of the landscape is very satisfactory, and the whole effect is greatly enhanced by the bits of sky which appear at the horizon, as it were, of the landscape. The varied blue of this sky is produced by hundreds of little bits of changing tone. The window was designed by Sir Edward Burne-Jones.

At Dieppe last week a serious landslip took place, three large masses of cliff sliding in succession, carrying with them the Châlet Bamberger. There was fortunately no loss of life or injury to person. The damage done is estimated at 120,000 francs, including the furniture of the châlet. The disaster is attributed to water percolating through the clay soil. Large fissures are to be seen in other parts of the cliffs, and further landslips are feared. The châlet was situated nearly two hundred feet from the edge of the cliff. Great excitement was occasioned by the event in Dieppe, the crash of the falling earth being heard over the town.

At the last meeting of the Bradford Town Council a member moved an alteration of the resolution passed on January 12th, 1892, so as to require each person submitting a tender for a Corporation contract to give an assurance that he has paid for three months preceding the tender not less than the minimum standard rate of wages in each branch of his trade, together with an undertaking that he will continue to pay, during the contract, to his workmen the said rate of wages; and instructing the Town Clerk to insert in future contracts a penalty clause providing that in the event of a contractor giving a false assurance, or committing any breach of his undertaking, he shall forfeit and pay as damages to the Corporation, or the Corporation may deduct from any sum due to him under this contract, a sum equal to 5 per cent. on the value of the work completed, and that the Corporation, if they think fit, may also cancel their agreement with the contractor. Past experience, he said, had proved the inefficacy of the old resolution, which was due to the absence of a penalty clause. It might be urged the penalty clause was not a legal one. But already, in the scavenging contract, such a clause was embodied. The Town Clerk said that there was no general provision in law to prevent such a clause being enforced, but owing to the unreasonable and extraordinary penalties which it was found were inserted in contracts the Courts adopted a policy of granting relief. The resolution submitted spoke of what might be termed "agreed damages," which might be recoverable. He could not, however, shut his eyes to the fact that a case might arise in which a Court might grant relief. If the Council were so disposed, there was nothing to prevent them from taking the maximum of power and enforcing it afterwards as they might be disposed.

There is just now, at the Palaise de l'Industrie, in Paris, a model, in clay, of a projected statue of Carême, the renowned cook. In lieu of the soldier's gun-carriage or the sailor's anchor and cable, he has at his side a roaster with a couple of fowls on the spit. It is a new departure, but in France, where statues have sprung up like mushrooms, to perpetuate the memory of persons whose celebrity is in many instances strictly parochial, there is no reason why a great cook should not have one. And Carême was devoted to his art, and upheld its dignity.

A company is to be formed for utilising the Liverpool and Manchester highways for motor traffic from the docks to the Manchester warehouses, based on the calculation that goods will be carried at one-third of the railway rates. Enthusiasts who believe in the motor car may hail this as the beginning of the end; but a glance at the railway maps of England will suffice to convince any one that, even if the locomotive were abolished, the railroads must for ever remain the chief arteries of long-distance traffic, probably with light motor feeder lines on every high road.

The Thames (Western) Improvement Committee, the organisation which has been formed to promote the agitation for the construction of a new lock upon the River Thames below Richmond, has decided to obtain from an expert a comprehensive report upon the condition of the river in the lower reaches, and the best position in which to place the lock. This decision arose out of a conference of representatives of local authorities. The formulation of the report will necessitate a survey of the river, and will cost about £500.

It is proposed by the Swiss Government to the Federal Assembly to ratifiy the Convention with Italy for the piercing of the Simplon tunnel. As the difficulties which have hitherto frustrated this great engineering project have always come from the Italian side, this presumably means that the Simplon route to Rome will figure in European time tables at no distant date. It need not disfigure the landscape to any appreciable extent, but its construction will probably be the immediate cause of an extension upon which the lovers of scenery will look with a less favourable eye. This extension, of which the Swiss railway kings have long been talking, is nothing less than a tunnel under the Gemmi. By this means Thun will be directly connected with the Rhone Valley at a spot not many miles from the foot of the Simplon, and Swiss and German tourists will have a new and convenient way of getting to the Riviera. That the Jura-Simplon dividends will thereby be swelled is hardly doubtful, but the narrow and beautiful Kandersteg Valley will as surely be spoiled.

Events in connection with the demolition of property in Aberdeen to make way for the extension of the south wing of Marischal College have forced upon the notice of the authorities the insufficiency of housing accomodation for the

class of people who have been displaced. The work of pulling down the tenements, ten in number—accommodating about 40 families, or in all about 100 persons—had not proceeded far when the tenants in the house from which the slates were first removed made a forcible protest against the demolition of their dwelling. The workmen refused to desist, and told the occupants that they had been warned to remove at Whitsunday. The tenants denied this, and declared that they could not find suitable accommodation elsewhere; but their protestations were unheeded by the workmen, who continued the operation of dismantling the house. The work was discontinued by order of the University authorities, and in the meantime the tenants were advised to look out for other quarters. It seems that they paid no rent after the expiry of their twelve months' occupancy, and that they were simply allowed to remain in the house on sufferance. Several suggestions have been made with a view of getting over the difficulty meantime, but they are only temporary measures, and the question of housing the working classes will have to be dealt with very soon by the Aberdeen authorities.

IN distributing the prizes at the Sheffield Technical School, last week, the Duke of Norfolk and the other speakers had something more than the current platitudes to utter on the subject of technical education. It was pointed out that in Berlin the Germans have spent over £400,000 upon technical colleges, and have over 3,000 students in training. It was stated recently at a public meeting in the Staffordshire iron district that the Sheffield School had done more valuable work than all the colleges put together with regard to the iron and steel industries. The attendances at the school show that full advantage is being taken of several of the departments. The accommodation in the metallurgical department is taxed to the utmost. Many attending this department held valuable positions in local works, and some had attended the school five or six years. A sum of £2,000 is now being spent in extending the microscopic laboratories. By the aid of the microscope much had been done in Sheffield to extend the knowledge of steel and iron.

FOR four hundred years it has been known that gold could be obtained in Crawford Moor, in which Leadhills and Wanlockhead, the two highest villages in Scotland, and the site of the lead mining industry, are situated. The gold for more than three hundred years has not been got in paying quantities, and has only been procured for special purposes, from beds of streams and alluvial deposits. According to an old record and to tradition, nearly four hundred years ago a stamping-machine was used to crush quartz containing gold, and it is known that mines were sunk. The fact that detached pieces of quartz with gold grains were not infrequently found strengthened the belief that the precious metal existed in the rock. That belief has now been verified by the discovery of veins of gold in the quartz rock. Mr. Paull, the manager of the mines, states that two veins of gold-bearing quartz have been discovered. The metal has not as yet been found in sufficient quantity to pay for working, but it is hoped that a paying lode may ere long be found.

AMERICANS are at last getting uneasy about their tall buildings. The highest "sky-scraper" in the States was, until recently, about thirty stories; but a writer in the North American Review looked forward with curious complacency to a day when buildings of fifty and even sixty stories would be the rule. It is, strangely enough, the doings of an English syndicate which have brought about the New York crusade against these monstrosities. The people in question propose to erect a fifty-nine-story office, at a cost of seven million pounds, in the heart of New York City, and the authorities have announced that in consequence of this they will present a bill next session limiting the height of new buildings to six stories. The Press is on the side of the syndicate, which is not surprising, since most of the New York newspapers belong to large capitalists, wishful of becoming millionaires, and these huge buildings pay enormous dividends. The common toilers, who, for health's sake, need as much light and air as they can get, are not being considered at all. But there is not the slightest doubt that a city of huge buildings would be a city of a largely increased death-rate among the poorer inhabitants. To a certain extent, also, the more fortunate people having houses in the suburbs would be balefully affected. The experience of ancient Rome would, we believe, amply corroborate this. High buildings are not a modern idea. Under the early Roman Empire they were in great favour, but, gradually, experience and some stray glimmerings of sanitary science led to their decrease.

AT a meeting of the Improvement Committee of the Birmingham City Council, held last week, the principal question discussed was the proposed erection of workmen's dwellings in Milk Street. The idea of the committee is to provide buildings on the dual system, but this scheme is viewed with disfavour by the members of the Birmingham Trades Council, on behalf of which body Councillor Stevens and Messrs. S. G. Middleton and A. Keegan waited upon the committee as a deputation. Their chief objections are that the system is altogether unsuitable; that the area is too overcrowded for such an improvement; that there would not be sufficient air space to be healthy; that most of the rooms at the back of the buildings would be permanently dark; that the water-closets and other offices would be too close to the bedroom windows, and would prevent the free flow of air absolutely necessary for health; that there would be no provision of a playground for children, or for storing food, which was a very important matter, especially in the summer time; that the provision of one small scullery would be wholly inadequate for two families; that no provision was proposed for the dwellers in the upper houses to dry clothes; that the bedrooms would be inadequate for a man with a family, if only of two children of different sexes, to conduct his household decently; and that the houses proposed are wholly inadequate for the isolation of a sick person. The committee decided to submit the scheme in its present form to the City Council.

AT the last meeting of the Athy Town Commissioners a letter from the Chief Secretary's office was read in reference to a request that he would receive a deputation regarding the proposed Barrow drainage. The letter said:—"The evidence in the matter of the proposed drainage has been already carefully looked into by the Irish Government, with expert aid, and they are satisfied that the cost of the work would be largely in excess of the estimate formed by the Allport Commissioners. The Irish Government have been, accordingly, compelled to come to the conclusion that even if the Treasury were willing to ask Parliament to provide the large sum necessary it could be applied to more useful purposes in Ireland. In these circumstances it is not considered that any advantage could be gained by troubling the proposed deputation to come to Dublin."

MUCH indignation has been caused among those interested in the preservation of existing memorials of a past age by the recent discovery of Exeter antiquarians that a number of the interesting Druidical remains on and around Dartmoor have been destroyed, notably on what was known as the Stone Avenue at Bel Tor Corner on Sherberton Common. Investigation being made, it was found that the demolition of this relic, as well as the partial destruction of some of the "hut-circles" which abound on Dartmoor, was the work of contractors of the Newton Rural District Council, who had smashed the stones into fragments for the purpose of repairing the surface of the roads. It was subsequently ascertained that "hut-circles" and "menhirs" in other places had also completely disappeared, the loss of these monuments of early British life being, of course, irreparable. The matter was taken up by various societies and representations were made to the Newton Council, with the result that the chairman of that body has now intimated to one of the correspondents that the surveyor to the Council has been instructed to see that nothing of the kind shall be again allowed to occur.

THE ULTIMATE PURIFICATION OF SEWAGE.*

BY GEORGE THUDICHUM, F.C.S.

A WIDESPREAD interest in the question of the ultimate purification of sewage by means of filtration, conducted on biological lines, has recently been aroused by the publication of the results of the experiments carried out under the auspices of the Main Drainage Committee of the London County Council, at the Barking outfall, during the years 1892-3-4-5 6. Since that publication so many enquiries have been received respecting the experiments from local authorities, engineers and others concerned in sewage disposal, that it may not be inopportune to bring before this Society some of the more important features of the new method. At the same time it will be of interest to institute a comparison between the two principal means of biological purification, viz.:—artificial filtration (bacteriolysis) and irrigation. One principal result of twelve years' research by the Metropolitan Board of Works and the London County Council is the complete demonstration of the fact, which was foretold by Mr. Dibdin and advocated by Dr. Dupré, that all processes applied for the purification of sewage must be subordinated to the requirements of the micro-organisms, by which alone that purification can be completed. This was already shown very early in the inquiry, when it was proved that sterilizing agents, such as chloride of lime, produced an ultimate, effect the opposite of that which was intended. The organisms in the sewage were destroyed and the offensive odour largely removed; but as soon as the diluent action of the river water was sufficient to nullify the antiseptic action, the putrefactive organisms, introduced from the river, multiplied enormously, and the whole mass of sewage underwent putrescent fermentation, bringing about the condition of the Thames in 1884, and again in 1887, which aroused such an expression of public feeling at the time. When, however, an agent, such as manganate of soda, in moderate quantities, was employed, it was found that the oxidation of the sewage could be effected without putrefaction, not directly by the oxygen furnished, but because a certain amount of manganate prevented the increase of the putrefactive organisms, whilst producing the conditions necessary for the well-being of those through whose agency the organic matters were oxidised, without at any time passing through a stage capable of producing a nuisance. Thus early it was clearly recognised that sterilization was a mistake, and that efforts should rather be made towards fostering one class of organisms by whose aid the work was finally accomplished. In the year 1889 the author made a number of experiments with a view to ascertaining if the oxidation could not be accelerated by supplying the sewage with the necessary organisms. These experiments failed, since a free supply of oxygen, intermittent with the food, is necessary for the well-being of the organisms, and this could not be arranged under the conditions then obtaining. Putrefaction, accompanied by the usual offensive odour, could indeed be hastened very considerably; but oxidation without putrefaction was not effected. Further proof of the absolute necessity for the presence of micro-organisms was obtained as a result of experiments upon the effects produced by aëration. That the solution of the problems relating to the purification of sewage effluent by filtration would be of the utmost importance, not to London alone, but to the country and the world at large, is seen at once on the most cursory view being taken of the position of the sewage disposal question. The impossibility of effecting the ultimate purification by means of chemical treatment has led to the adoption, all over the country, of sewage farms, as, apart from economic considerations, it was found that the oxidation effected by passage through the soil, even under bad conditions, was greater than that produced by any precipitant that could reasonably be used. The Commissioners appointed to enquire into the distributing and utilization of the sewage of towns, in their third and final report of March, 1865, expressed a unanimous opinion that "the right way to dispose of town sewage is to apply it continuously to land, and that it is only by such application that the pollution of rivers may be avoided."

* A paper read before the Society of Engineers, on December 7th, 1896.

The Rivers Pollution Commissioners, in their report of March, 1866, fully concur in this opinion, stating that all other expedients for the disposal of town sewage are, on one ground or another, objectionable. They state that disinfectants and filtration have been tried in many forms, and they arrive at the remarkable conclusion that "As applied to sewage, disinfectants do not disinfect, and filter-beds do not filter." With the first portion of this statement, regarding disinfectants, the author is not at present concerned; perhaps the real reason for this conclusion may be found in the behaviour already indicated, of antiseptically treated sewage when it becomes diluted. But as regards the second portion, that relating to filters, all the evidence obtained during the Barking outfall experiments, and those carried out by the Massachusetts State Board of Health, shows that sewage can be successfully filtered; a contention which is strengthened and supported daily, as others start experiments on the same lines. It is presumably this dictum of the Rivers Commissioners, founded on the knowledge of 30 years ago, that will account for the present attitude of the Inspectors of the Local Government Board, who apparently decline in all cases to recommend the granting to a local authority permission to borrow money for the erection of sewage disposal works, unless the scheme presented include provision for land irrigation. That sewage farms, taken as a whole, have proved highly unsatisfactory, is evidenced by the number of attempts that have been made to find some other solution of the sewage disposal problem. Amongst these, filters of all sorts and materials have been tried. The most important of these experiments were those carried out by the State Board of Health of Massachusetts, at their experimental station at Lawrence. Valuable as the results of these experiments are, they still left unsettled the question of purification on a practical scale. The quantity of sewage that could be treated with continuous success apparently did not exceed 60,000 gallons per acre per day; a quantity so small as to be

QUITE USELESS FOR LARGE TOWNS.

The sewage of the metropolis, for instance, would, at this rate, require about 3,300 acres of filters constantly in work, without making any allowance for storm, breakdown, or even ordinary repairs. It was at this point that the Main Drainage Committee of the London County Council took up the question, with a view to ascertaining whether work on the biological lines already established, could not be so extended as to have a really practical as well as a theoretical value. An account of these experiments is given in the chemist's report, dated the 26th September, 1895, and also in a paper read by the chemist, Mr. Dibdin, before the Society of Chemical Industry, in November of the same year. Under these circumstances it is needless to repeat in detail the information that is already so attainable and so widely spread. The conditions obtaining in an irrigation farm differ entirely from those of the artificial filter. The power of control is wanting. If the land be sufficiently porous and well drained to prevent its becoming water-logged and to permit of the free passage of the effluent during wet seasons, it will not retain the effluent for a sufficient time during dry periods to admit of the work of purification being completed; whilst if it be sufficiently retentive to effect this, it will be useless during heavy rains. The time of contact, instead of being just sufficiently long to cause the oxidation to take place to any required degree, whilst avoiding killing the micro-organisms through want of air, must of necessity vary, and the quality of the filtrate will vary accordingly. The area required for filtration by irrigation is also very large as compared with that needed for artificial bacteriolysis. The Rivers Pollution Commissioners recommend not less than one acre for each 150 of the population; a figure which, if worked out for the metropolis, gives a sewage farm of some 40,000 acres in extent, or over 60 square miles. The final and chief objection to the irrigation method of sewage disposal lies in the fact that the sewage must be delivered on to the land quite irrespective of the requirements of the latter and without regard to seasons and to the condition of crops. The author would again refer to the attitude of the Local Government Board towards local authorities seeking power to borrow money for the purposes of sewage disposal works. Judging from recent cases in which the authorities concerned have been definitely informed that the inclusion in their scheme of land filtration is a *sine quâ non* to the granting of permission, no other attitude is likely to be adopted until the force of opinion amongst experts in sewage treatment actually compels a change. This action of the Local Government Board officials is certainly very extraordinary. That filtration by biological means produces an excellent and controllable result admits of easy proof. At the Barking outfall a million gallons per diem of an inferior effluent are successfully treated, and have been for some time throughout all the changes of season incidental to this climate, including an exceptional frost, such as that of February, 1895. At Wolverhampton, a filter, made of coal but worked on similar lines, deals with sewage effluent at the rate of a million gallons per acre per day, and produces an admirable result. At Sutton, Surrey, the farm is practically neglected, and the work is done by filters of various materials, but worked with due regard to biological conditions, the effluent being in all respects satisfactory. At Aylesbury, where, just recently, permission to borrow money for sewage disposal purposes was refused unless the acquisition of land for irrigation purposes were included in the scheme, the authorities have for some time been carrying out experiments on biological filtration, and with every success. At Exeter the final purification of a portion of the sewage is satisfactorily accomplished by means of a coke-breeze filter. The continuance of the work at Barking during the present year is in a large measure due to the belief in well-informed quarters that an opportunity of inspection and study would probably assist the towns in the valley of the Thames to comply easily with the demands made upon them by the Conservancy; and the chemist to that body has reported favourably upon the results obtained. On the other hand, the fact that local authorities appear to dread the large expenditure that must attend the establishment of an irrigation farm, and to be fully alive to the great probability of failure when established, should surely have some weight with the advisers of the Local Government Board, whose attitude at present is simply one of obstruction to progress in sanitary science.

IT is proposed to carry out considerable extensions at Chelmsford Market at a cost of £550.

THE designs of Mr. Paull, 6, Quality Court, Chancery Lane, have been adopted for a new post office about to be erected at Epsom.

THE Dundee Town Council has made preliminary arrangements with a view to the erection in a public position in the city of a statue to the Queen to mark the 60th year of her Majesty's reign.

AT the general meeting of the Art Workers' Guild, Mr. Lewis F. Day was unaminously elected Master in succession to Mr. E. Anslow Ford, R.A.

THE Corporation of Salford has decided to apply for power in the next session of Parliament to construct and work a grain silo on the Salford docks.

A FULL-LENGTH portrait of Mrs. John Lobb is being painted by Mr. J. Mordecai. The same Artist, it will be remembered, recently painted a portrait of Mr. Lobb.

WE understand that the contributions for the Benson Memorial, not counting what may be given by the members of the Royal Family, are now over £2,000.

ACCORDING to the designs of Mr. Thomas Wilson, Architect, 34, New Bridge Street, the stables, shops, and chambers owned by Mr. H. F. Gidden, in Ormond Yard, Queen's Square, are about to be rebuilt.

IN addition to the ships now being built in England for Japan, one firm holds an order for seventy-two locomotives for that country. The bulk of the rails used in Japanese railways also come from Great Britain, and the demand is increasing.

THE improvement in the Hotel Cecil approach and the Strand thoroughfare will be commenced almost immediately, the various properties and Parliamentary powers having been acquired. The frontage will be set back, the street being widened at this point, and it will consist of shops under the hotel extension above, and a central *porte cochère*, as at the Grand Hotel, Paris, with an "in" and "out" carriage way.

BRICKWORK TESTS.

REPORT ON THE SECOND SERIES OF EXPERIMENTS.

A MEETING of the Royal Institute of British Architects was held on Monday evening, under the presidency of Professor Aitchison. The routine business included an announcement that Mr. John Messop, who had ceased to be a member of the Institute in 1891, had been reinstated as an associate, and that Mr. Frederick J. Kingsley, Mr. Brackenbury Oliphant, and Mr. W. A. Williams, had ceased to be members under the terms of bye-law 20.

Mr. Street was then called upon to read the Science and Standing Committee's report on the second series of brickwork experiments, which, he stated, had been conducted on the same side of the West India Docks as the first series. They were held last June. Owing to the very unsatisfactory manner in which some of the piers experimented upon in December last year had been built, duplicates had been decided upon, and these were the piers first operated upon in June. They were three months old, having been built in March. The other piers—eight in lime-mortar, and eight in cement-mortar, were ten months old, with the exception of the one used in the last experiment, which, on the suggestion of Professor Unwin, was laid in sand and experimented upon in the same way as the others. Then the report went on to mention those who had taken part in the experiments, the principals being Professor Unwin and Messrs. Street, Max-Clarke, Carbutt, and Dicksee, the latter four members of the sub-committee; but, in addition, Mr. Burrows, Mr. Creighton, the foreman of the docks, and Mr. Adie, had also assisted, the latter having satisfactorily made the compression observations by means of a gauge. As had already been stated in the Journal, the committee are preparing for a third series of experiments upon short lengths of walling built with closers, and of a more perfect bond than could be obtained with piers, 18 inches square. The work of cutting closers with brickwork was so difficult that the workmen, when building some of the first lots of piers, committed the sin of inserting closers of soft bricks inside, while the members of the committee were absent. The lengths of wall now waiting the period of crushing have been carefully watched during building, and whatever results might be, there was little fear of bad workmanship. Another, and

FINAL REPORT,

will be presented when the experiments are complete, and the whole of the series will then be dealt with. From the *data* derived from the experiments, they expected to be able to establish reliable rules as to the safe loads for the various kinds of brickwork which they had to build. It was interesting, meantime, to note the great differences in the strength of bricks and of brickwork, the enormous disproportion being due to the quality of the material interwoven with the bricks, as a means of keeping the mass together. The effect upon the different kinds of bricks is variable, some bricks being more sensible to adhesion than others. Again, if the mortar is imperfectly mixed, or the joints of the brickwork imperfectly filled up, the injurious effect on strength was incalculable. It introduced unequal pressures in different parts, and if the work failed in detail, very much of the whole was destroyed. And, therefore, it was an obvious lesson for everyone—too much care could not be exercised in the selection, proportion, and application of mortar. There was one pleasing reflection. If a building was likely to collapse from want of strength it was more likely to do so when the mortar was fresh and green than at a later date. The diagram representing the last experiment—that upon a brickwork pier, built in sand, gave them a good idea of the way in which brickwork would fall, if exposed to fresh or additional loads, after the mortar had become thoroughly disintegrated. Mr. Max Clarke then explained the illustrations of the experimental operations. The piers

VARIED CONSIDERABLY

in sustaining the pressure—roughly from five tons to ninety-five—though a good many had collapsed when a pressure of between twenty and thirty tons had been reached. The experiment having been thus explained, Professor Unwin offered a few supplementary remarks. It occurred to him during the experiments, he said, to try one experi-

ment on the influence of the form of crushing, and the result had convinced him that the resistance of a pier depended very largely upon the form of crushing. One of their great difficulties was to obtain material of a uniform quality so that there were no discrepancies. Ordinary red brick was fairly uniform in quality, and he had carried out a small research on a piece of red rubber brick. But he would not go into that very fully just then; he merely wished to make it clear that the greater the space of brick the more influence the form of crush had upon the structure. A half-a-brick was weaker than a whole brick, and he called attention to the point to emphasize the fact, that, in crushing, the question of form came in just as well as the question of material. The tests were not completed, but the tests in square piers practically were, and although he was not going to give a final judgment, yet there were one or two points to which he might call attention. If they looked at the tests they would see that they furnished two great anomalies. The first one was this:—a few piers which had been built at a later date than others, and built under conditions of very much greater care, often carried more, always as much, as those of the earlier date. The piers of Gault bricks, for instance, built latterly, had sustained a pressure of forty-five tons, whilst the earlier erections gave way beneath eighteen tons. And the same thing applied in the case where the Leicester red brick or the Staffordshire bricks were used. This was an anomaly which required some explanation, for its elucidation would be of some importance. The improved conditions under which one lot of the piers had been erected had been specially pointed out to them. But there was another cause of the discrepancy in results, and that was the materials used in the manufacture of the mortar. He was very much inclined to think that nearly the whole of the difference was due to the varying kinds of sand used in making mortar. There could be no doubt that the quality of the sand was all important, and the inferiority of the sand used in the latter series of experiments accounted largely for the disparity in result. This was the first anomaly; the second was this:—if they took the tests in order, they would find that in far the greater number of cases – and there were eight altogether, four qualities of bricks in lime and four qualities of bricks in cement—three of the piers of the latter date carried more than the piers which had been standing for ten months. This was a very curious anomaly, for which he could not in any way account; the older erections ought certainly to have shown much more strength. They were actually weaker than those of earlier date, when they ought to have been appreciably stronger. He would have been inclined to attribute that fact to frost, but they had had no frost. The speaker went on to refer to the experiment which he had suggested, viz., a pier without mortar. He was glad the committee had carried out his suggestion, for

THE RESULT WAS INSTRUCTIVE.

They had there a pier in which there was no collateral adhesion at all. When the experiment had been carried out, he asked Mr. Street how it had gone, and was told that it did not carry anything at all. He was disappointed, but not so when he learned the actual result, for he thought the pier had behaved very commendably. No sand carried a greater load than the average of the London stocks, which, in lime for 18 weeks or 43 weeks, carried a load not very much less than the Gault bricks in lime for 18 or 43 weeks, whose load was only half that of the Leicester red bricks in lime. The load was greater than that of the London stocks in lime for 21 weeks, and about one half of the Leicester red bricks after 21 weeks. And without any collateral adhesion the pier had, as he had said, behaved commendably. But now came another point. A great deal attached to the experiments and to the question of the joint in the piers in which there were some closers. Here was a pier of all closers! The question of closers, he thought, had not that significance which many Architects attached to it. If they had a pier built with mortar so that there was no lack of adhesion it was a bad thing to have joinings. It was all a question of the amount and quality of the mortar used.—Mr. W. Woodward said it seemed to him that the result of these experiments was something astounding. Did he understand from Professor Unwin that, given two piers built at different periods, with the same quality of brick, the enormous discrepancies he had informed them of was due entirely to the joint. If so the question was one of more than paramount importance. Then again, his assertion that a pier standing for ten months was weaker than one standing for four months was an astounding theory to him. The results of these experiments must lead them to think that there was something radically wrong with the system of the experiments themselves – that the pressure had been applied in a manner which was not at all a fair test. The Professor's theories seemed to him to be of the weakest description, and he thought Mr. Max Clarke ought to supply the Institute with a little more definite information, for if what had been said was true, it upset the whole course of their experience in brickwork.—Mr. W. White could entirely endorse what Prof. Unwin had said respecting the necessity of good sand; the great importance of its quality for brickwork. He instanced a case in which a vestry at a country Church had called for attention after completion, on account of the mortar used in its structure. And as to the closers, he agreed that they created joints, and thus tended to weaken a building, and he would very much like to see some experiments made on this point, for they had already an instance in which a structure without closers was stronger than a structure with closers.—Mr. Gordon Smith said it was very gratifying to the committee to find that a provincial Society, the Sheffield Society, were taking a keen interest in their experiments, and had requested to be furnished with a set of bricks used in the operations at the West India Docks. The Sheffield Society had prepared a table of results which differed slightly from their's. The Sheffield results showed the difference there was in the Sheffield stock bricks and the London stock bricks, the superior strength of the bricks in the cutlery town, compared to those of the metropolis. When the results of the last experiments were announced, he had said something as to the money necessary to

CARRY ON THE EXPERIMENTS,

and he should just like to give the members of the Institute some idea as to what money was required. It was first of all necessary to lay down 50 yards of rails and to construct cylinders for the removal to and fro of the piers; then 15,000 bricks of different sorts were required, four tons of cement, and so on. He asked the meeting before concluding, to acknowledge the kind assistance of Sir William Arrol, Prof. Unwin, Dr. Longstaff, Mr. Donaldson, the engineer of the Dock Company, and of other gentlemen who had rendered assistance in the carrying out of the experiments.—Mr. Slater, in continuing the discussion, remarked that one of Professor Unwin's most interesting remarks referred to the subject of compression. Hitherto they had been accustomed to regard certain columns or staunchions as the best, but it now appeared, if the Professor's experiments were to be relied upon, and he saw no reason why they were not, that they were making a great mistake if they increased the thickness of a post which had to carry a weight beyond a certain extent. And it had occurred to him, referring to another matter dealt with by Mr. Unwin, that the fact that closers had no beneficial effect upon piers was due to their being considerably higher, compared to their areas, than the rest of the bricks. He thought the Professor was quite right respecting piers without mortar, and he agreed with him that his experiment, considering the structure had no collateral adhesion at all, was very successful. There had been enormous discrepancies in the weights carried in the various experiments made, and he was sure Professor Unwin would agree with him that it was not wise to attach the utmost importance to the results as they at present stood, discrepid as they were. But he thought they had at last found out that brickwork, in mortar and cement, would, if properly treated, stand a good deal more than they thought. He had great pleasure in seconding the vote of thanks to Sir William Arrol and the other gentlemen mentioned—a vote of thanks which, by the bye, was not put to the meeting. — Mr. Hugh Leonard said these were the only experiments on such a scale which had ever been carried out, and there could be no doubt that a great deal of useful knowledge could be derived from them. The sub-committee who had carried out the arrangements were, therefore, deserving of the warmest thanks of the Institute. He differed from Mr. Slater in that they were not to regard the experiments as important at present, and proceeded to assert that the London stock brick was a misnomer. There was no such a thing as the London stock brick. He knew from experience that the bricks known as the London stocks were, for the most part, made in Kent, and, if they looked at the results of the experiments, they would find that these bricks did not bear much more than five tons per square foot before they began to crack seriously, and were crushed altogether at about 22 tons. If real London stocks were obtained, the difference would become most palpable.—Mr. Dawson asked Professor Unwin for further information as to the specification of sand. It seemed that so much depended upon the sand that the fullest information on this point ought to be accorded. May they hope to be delivered from the Rule of the Thumb? They wanted an efficient and satisfactory rule to guide them.—Mr. Beresford Pite wished to know if the committee took any note of

THE DIFFERENCES OF THE GRINDING,

if the bricks were with frogs or without frogs, etc. Would it not have some effect in the result, he asked, if the pressure on the ten-months old piers was suddenly brought to bear upon the structure instead of a gradual increase.—Mr. W. Emerson continued the debate with illustrations of his point in instances from Liverpool and London, and asked the meeting to come to the conclusion that it was impossible to give too much attention, not only to the building of the piers themselves, but to the staunchions, etc. He was followed by a gentleman unknown at the Institute, who suggested the possibility of a protracted pressure gradually bringing about the destruction of a pier. He had attended some of the experiments, and found that long before there was any sign of failure, a strange indescribable sound could be heard inside the pier, and it had occurred to him that the structure was gradually being destroyed by the pressure.—In winding up the discussion, the Chairman expressed gratitude towards the committee and to Prof. Unwin. Of course, it was very unpleasant, he went on to say, to realise that the ideas which they had worked on for years were no longer tenable, yet still they must move apace with scientific investigation. There were many points about their experiments which required a little elucidation. In the first place the number of bricks with which each pier was built, ought to be furnished to ascertain the average. Then again, bricks were not of a uniform quality—the London stock, the Leicester red brick, and blue-and-black Staffordshire, were, no doubt, of varying capacity—and this ought certainly to be taken into consideration. They wanted to know also the proportion with which the sand was mixed with the lime, for this was essentially material. They had, therefore, numerous considerations to take into account in dealing with the results of the experiments – the effect of time and hardening of the mortar, and whether there were any other things of which they knew little, permitting of the introduction of a certain proportion of carbonic gas for instance. These things and many others went to show that the process of crushing must almost of necessity

VARY IN EVERY EXPERIMENT.

Then again he was not at all prepared to say that a perfectly level surface of solution was not the best surface for laying brickwork on, for if the surface was not perfectly smooth they got the solution at a point. It was a matter for the utmost care. And there were many matters which they took for granted which experiment and investigation proved to be wrong, and there could exist little doubt as to the utility of the experiments the Institute promoted.—Professor Unwin, in replying to his questioners, gave it as his opinion that the longer the pressure was gaining its full force, the slower would be the breaking up.—The announcement from the Chairman that the next meeting will be held on 11th January, 1897, for the election of officers and general business, concluded the meeting.

MR. E. A. ABBEY has been commissioned to paint a picture to fill one of the panels in the Royal Exchange. Mr. Seymour Lucas, commissioned by the Corporation, is also at work upon another panel; and Mr. Solómon J. Solomon upon a third.

DURABILITY OF BUILDING STONES AND BRICKS.

BY DR. H. C. SORBY, F.S.A.

AT the monthly meeting of the Sheffield Society of Architects and Surveyors, Mr. R. W. Fowler occupied the chair. There was a large attendance of members and visitors, among those present being Messrs. F. Fowler, C. J. Innocent, E. M. Gibbs, T. Winder, Joseph Smith, W. F. Hemsoll, J. R. Wigful, H. L. Paterson, C. B. Flockton, T. H. Waterhouse, C. Castle, W. J. Hall, J. E. Benton, C. Gibson, Elmund Winder, jun., T. H. Firth, J. Spink, J. T. Cook and others. A lecture on "The Structure and Durability of Building Stones and Bricks" was delivered by Dr. H. C. Sorby, who is an honorary member of the Society. The lecturer called attention to the great importance of this question, and said that its extreme difficulty and the knowledge of such various subjects were probably the reason why so little is known, and why few, if any, specimens illustrating it can be seen in any public museum. Judging from the excellence of much of the work of the Romans in this country more attention seems to have been given to this subject by them than by us now. The decomposition of a stone depends mainly on its chemical composition and mechanical structure. Some rocks contain little or nothing that can be dissolved out or chemically changed by the action of the air and rainwater, and are so solid that the freezing of what little water they can absorb does no harm. Some, indeed, become harder and better. Others, on the contrary, lose certain constituents, which are dissolved out or are broken up by chemical changes, whilst others have

NOT SUFFICIENT COHESION

to resist the disruptive effect of the freezing of the water contained in microscopical cavities. A number of lantern slides were exhibited, some of which were from the very first microscopical sections of rocks ever prepared. These illustrated some of those microscopical characters which play an important part in resisting or favouring decomposition. About four years ago the lecturer made many experiments in order to determine the relative volume of the internal microscopical cavities in various building stones. Some rocks are almost quite solid, whereas others contain one-third of their volume of cavities which can absorb water. Though certain special circumstances may completely alter the result, yet, other things being the same, a relatively large volume of cavities seems to lead to a more rapid breaking up by the repeated freezing of absorbed water. The tensile strength of various kinds of stone probably has received little attention, but has great influence on the disruptive action of repeated freezing and thawing. This variation in tensile strength is quite sufficient to explain the effect of the direction of the bedding in relation to an exposed surface. In some cases the stone itself resists well, but readily breaks up into angular fragments when the carbonate of lime has been dissolved out by the rainwater from the numerous microscopical veins. There are, however, so many peculiarities in different rocks that almost each kind requires special consideration, and some years of difficult research would be required before a better plan could be found than that recommended by Vitruvius, more than 1,900 years ago, viz., to expose the stone to the weather through a summer and winter, and reject as unfit for use any that show sign of change, a plan that would

NOT SUIT CHEAP BUILDERS.

The lecturer then considered the case of special building stones of remarkable durability, used in various parts of the country, illustrating the subject by specimens or lantern slides of well-preserved constructions of early date. Unfortunately, many of these stones were used up and exhausted some hundreds of years ago. He then remarked on the difference between modern mortar and that made by the Romans with fresh slaked lime and pounded well-burnt bricks, which, in many cases, is as good now as when new, some 1,800 years ago. This led to the consideration of bricks, many of those of Roman make being as good as new, whereas so many

MODERN BRICKS ARE WORTHLESS

after a comparatively few years. The explanation of this is probably because the Romans, following the advice of Vitruvius, tempered their clay through a period of from three to five years, whereas, according to what some practical brickmakers say, many are now made from clay that has never been tempered at all. The result is that the soluble salts are included in the bricks and break them up by efflorescence and by destroying the cohesion. The result is seen in Cambridge, where the bricks in the oldest work are still in good condition, whereas the modern bricks, though more uniform in colour and shape, are sometimes much decomposed, though not one-tenth the age of the others.—At the close of the lecture it was announced that Mr. William Denton and Mr. Benjamin Powell were elected associates of the society; that the following has been elected by the council as lay members, viz.: Messrs. Henry Longden, B. D. Wrangham, C. Castle, T. H. Firth, and W. W. Skelton. A statement was made to the effect that Mr. C. S. Sandford had passed the fellowship examination of the Surveyor's Institution, that Mr. C. F. Innocent had recently passed the final examination of the Royal Institute of British Architects, that Messrs. Frank Wilson (placed third), T. H. Robinson, and C. W. Clarke had passed the intermediate, and Mr. R. B. Brook-Greaves had passed the preliminary.

KEYSTONES.

THERE are two vacancies for surveyors in the land agents' department of the London, Brighton, and South Coast Railway Company. The candidates must be between 20 and 30 years of age, and the salaries offered are £180 and £100 respectively.

ADDITIONAL help for the decoration of St. Paul's is needed. A sum of £3,000 has to be expended on repairing and improving the organ, and a further substantial amount is required for decorating the dome. Subscriptions will be thankfully received by the treasurer, the Dean; or by the hon. secretary, Mr. G. J. Murray, at the Chapter House, St. Paul's Churchyard.

AT the Church of St. Sepulchre, a curious old relic was discovered a few days ago, in an old chest that had remained hidden away in the vestry for years. The treasure that has thus been brought to light is the bell that the crier, in the Stuart period, used to ring outside the condemned cell at Newgate on the night prior to the execution of the poor felon who was its tenant.

THERE will be a new "clou" at the Paris World Exhibition in 1900. Two Parisian stonemasons have been working fifteen years at a stone model of the Montmartre Basilica, which will be one-twenty-fifth of the size of the real edifice. The smallest details of the cathedral will be reproduced. The work is now 12 ft. in height, and is complete with the exception of the dome and tower, which have yet to be finished.

A FEW minutes after ten o'clock the other night an explosion occurred in the telegraph wire connection box on the pavement in the Strand, immediately opposite Charing Cross Railway Station. The iron frame, as well as the stone cover, both of considerable weight, were forced out and thrown across the pavement, the stone being smashed to pieces. The report of the explosion was heard for some distance, and caused great excitement. Fortunately no one was injured.

IT seems that the institution of a third-class Pullman by the South-Eastern Railway does not, after all, mark a "new epoch" in railway travelling. "I well remember," writes Mr. John Place, of 188, Fleet Street, "third class Pullman carriages running on the Midland Railway twenty years ago. If my memory serves me right, it was in 1875 or 1876 that the late Sir John Allport introduced this class of coach after his return from America. The train ran from Manchester to London and back, and was eventually taken off on account of small patronage."

AT Gateshead a meeting was recently held with the object of taking action to support the scheme for raising a fund for the erection of a new infirmary in Newcastle-on-Tyne. It is hoped to get a good round sum from Gateshead, say from £15,000 to £20,000. As to the site for the new infirmary, the present site will probably be decided upon, as it is the most convenient and the most suitable for the purpose. Up to the present the fund reaches something over £70,000.

Professional Items.

BANGOR.—At the last meeting of the Guardians of Bangor and Beaumaris Union, attention was drawn to the overcrowded and insanitary state of several houses within the borough, referred to by Mr. Bircham, Local Government Board inspector, in his address to the guardians on the 6th ult. It was decided to bring the matter before the Bangor Corporation.

BELFAST.—An agitation is on foot to secure a new hospital in that city. According to a statement signed by the staff of the Royal Hospital, Belfast, there has for some years existed an urgent need of additional hospital accommodation in Belfast. The present accommodation is not deficient in quantity alone; it is defective also in point of quality. Hospital construction has made great progress in recent years, and it is not to be expected that an institution so old as the Royal Hospital should satisfy modern requirements. The main block of the present buildings was erected in 1817, when Belfast was a small town of about 30,000 inhabitants, and is now quite antiquated. The staff is unanimously of opinion that a large new general hospital on a new site is urgently required. It should be erected according to the best and most scientific plans, equipped with every appliance for the relief of the suffering, provided with the most perfect sanitary arrangements, and having a site spacious enough to give opportunities for suitable open-air exercise to such patients as could avail themselves of it, and large enough to admit of future extensions.

BIRMINGHAM.—A new prison-gate mission house and hall has been erected opposite the gaol at Winson Green. The club room or hall is capable of seating 180 men, and with the ante-room about 230. There are 10 rooms above the ground floor, and in those the organising secretary and the prison-gate missioner and his wife will reside. There is, moreover, accommodation to take in two or three cases as need arises. The building has been erected from the designs of Mr. W. H. Bidlake, and has cost about £1,500.

CORK.—In connection with the burning of Wesley Chapel, it was at first feared that the rebuilding and renovation rendered necessary by the fire would not be completed in time for the assembling of the annual Conference in Cork next June, but it is now hoped that the Church will be ready for reopening before that time.

DARLINGTON.—The result of the competition for the laying out of the Southend Estate, as a residential building estate is that the first prize has been awarded to Mr. Robert E. Brinkworth, Architect, Surveyor and Land Agent, of Chippenham, Wilts; and the second to Mr. S. E. Burgess, C.E., of Stoke Newington, London. There were a good number of competitors.

DUNDEE.—Mr. George C. Buchanan, the Harbour Engineer, has prepared a report regarding the low-level outfall sewer at the Harbour. The sewer, he says, is constructed of masonry and brickwork of varying internal dimensions up to a certain point, from whence it consists of two iron pipes, 4 feet in diameter, laid parallel to each other. The last 60 feet of the pipe, which is outside the river wall, has subsided somewhat, in consequence of the constant dredging necessary to keep the outfall free from obstruction. The settlement has probably been gradual, and does not materially affect the discharge of the sewer, but increases considerably the cost of dredging, as it necessitates the bottom being kept dredged deeper than would be necessary if the pipes were kept upon a higher level. The flooding of premises in the town he believes to be in a great measure due to the difficulty there is in obtaining a free discharge from the sewer, however clear the mouths of the pipes are kept. For about ten days in every month the greater portion of the sewer is continuously tide-locked, and the sewage can only get out by backing up until a sufficient head has accumulated to discharge against whatever level the tide may be. During high spring tides, should there happen to be simultaneously a heavy rainfall, the sewage and storm water must necessarily accumulate in the sewer and finally enter the lower parts of adjacent premises. It is usual in

the case of a tide-locked sewer to keep out the tidal water by means of flap valves, but in the present case these would be practically useless, as the large volume of storm water brought down after heavy rains would gather behind the valves as fast as the tide rose. During the last ten years 56,568 tons of material have been dredged from the mouth of the pipes, at an average annual cost of £200, the greater part of this material being causeway sand and refuse brought down the sewer.

MERTHYR.—A new Sunday School in connection with Elim Baptist Chapel, Penydarren, Merthyr, is now in course of erection and ten memorial stones were recently laid in the building, which is to cost about £1,000. The Architects are Messrs. Johnson and Williams, Merthyr and Abergavenny, and the contractor, Mr. John Jenkins, Canal Wharf, Merthyr.

MUNDESLEY.—A site having been purhased for the new Wesleyan Chapel, plans of a commodious building have been prepared by Messrs. Eade and Johns, Architects, of Ipswich. Tenders have been sent in, and that of Mr. R. Eastoe of North, Walsham, for £680, has been accepted. The work will probably be commenced early in the new year, and it is hoped to have it completed by the end of June next.

NEWARK.— Extensive alterations are contemplated at the Wesleyan Chapel, Newark, which when carried out will probably involve an expenditure of upwards of £3,000. The proposed scheme provides for the partial reseating of the chapel and other improvements in the interior, as well as extending the school premises. With a view of meeting these requirements, an adjacent building known as the "Volunteer Inn," has been purchased.

PLYMOUTH.—By the opening of the New Higher Grade School in Regent Street, Plymouth, which is expected to take place early in the spring of next year, a larger organised science teaching scheme will come into operation. The new building, unfortunately, stands on a site which is so hemmed in as to obscure much of its size and Architectural beauty. The contract price was about £12,000. The building is constructed of local limestone, with Hamhill stone dressings. It is English in style, the windows being surmounted by gables, and the roof by a flêche, which serves the purpose of a ventilator. Messrs. Westlake and Waldron are the contractors, and Mr. Snell is the Architect. The building will accommodate 648 scholars—boys and girls—and an arched entrance has been provided for each department. The structure covers an area of 120 ft. by 60 ft.; and consists of three stories 16 ft. high, and a basement. The fittings throughout are of pitch pine. On the basement floor are a boys' workshop, the caretaker's rooms, and the heating apparatus on one side of a passage, and a manual instruction room, measuring 51 ft. 10 in. by 24 ft. 9 in. on the other side. The ground floor, which will be the boys' department, has five well-lighted class-rooms from 20 ft. to 30 ft. by 20 ft., each capable of accommodating 50 to 70 scholars; a central hall and gymnasium, 45 ft. by 29 ft.; hat and cloak rooms, and the head master's office. The first floor is designed in precisely the same way, and a storage room has also been provided. Mezzanines have been fixed between each story. The top floor will be confined to the work of the elementary science teaching. The accommodation here includes on the one side of the passage a chemical laboratory (40 ft. by 25 ft.), a room for the chemical master, a preparation and balance-room, and store-rooms and library; and on the other side there are a lecture-room (30 ft. by 25 ft.), with gallery and platform, and two Art-rooms—one for flat drawing and the other for casting and modelling.

SHEFFIELD.—The M. S. and L. Railway Company has commenced an extensive scheme for enlarging the Victoria Station, and the Sheffield Daily Telegraph says that when the work is completed there will be ample accommodation for dealing with the ever-increasing passenger traffic. The station is built on a long viaduct. The extension commences on the north side of the station, where Lumley Street—called Blast Lane by many—passes underneath the railway line. This bridge is being widened to the extent of 28 feet on the one side, and 3 feet on the Sheffield side, though the latter addition does not extend very far, the object being to fill up a corner. On the 28 ft. side a girder bridge will be placed, stretching across to the works of Messrs. Thomas Turton and Sons, Limited. The workshops will be bridged over, and a girder bridge will be erected over the canal. The dam for the foundations is already being sunk, and care has been taken not to interfere with the navigation. The addition means widening the whole length of the station by 28 feet. At present there are three sets of rails, and at the back of the station, and hidden by a wall, is the goods line. The wall will be pulled down, and the platform made an island one, thus giving an additional set of rails for "up" passenger traffic.

SUNDERLAND.—At a meeting of the Sunderland Town Council last week, the following motion was submitted—"That the requirements of the borough and immediate district necessitate the erection of a bridge over the River Wear, westward of the existing Wearmouth Bridge, and that the subject be referred to the Bridge and Ferries and the Highways Committees jointly, with instructions to report their recommendations for carrying into effect the foregoing resolution." It was stated that the population of the district was about 65,876, whereas the population at the time of the erection of the Wearmouth Bridge was only 24,444. The latter was opened in 1796, and it had cost £32,444. In 1858 the total tolls ran to £2,463 6*s.* 7½*d.*, whereas when tney were taken off the amount for that year amounted to £4,394 18*s.* 10*d.* If the Sunderland Corporation would not build the bridge a number of the townpeople were prepared to bring forward a scheme; but it was the duty of the Corporation to construct one. Assuming the cost to be £100,000, the interest and sinking fund would annually amount to £4,479 3*s.* 4*d.*, the expense of collecting tolls would be £200, repairs, paintin', &c., £200; lighting, £20; cleansing and watering, £100; establishment charges, insurance, &c., £100; or a total of £5,399. The income would be something like:—From foot passengers, £4,875; from horses and carriages, £1,000; or a total of £5,875. Thus there would be an annual profit of £476 3*s.* 4*d.*—The motion was carried

SWANSEA.—A committee of the Corporation has under discussion the necessity of providing additional accommodation for the borough engineer's and borough accountant's departments at the Guildhall. The intended buildings, which are estimated to cost about £5,000, will consist of three floors, where provision will not only be made for the departments named, but for improvements required in the Assize accommodation.

WAKEFIELD.—A new Infirmary is to be erected at the Wakefield Union Workhouse, and the foundation stone was recently laid. Mr. William Watson, Architect, Wakefield, has prepared plans and estimates of cost, and the buildings comprise accommodation for 150 inmates, and provision is made for future extension if required. The new buildings, two stories in height, will be erected on a site of about three acres at the rear of the workhouse. The infirmary will consist of two pavilions, about 186 ft. by 28 ft., with an administrative block mid-way between them, and communicating with them by open corridors. The distance of the pavilions from one another will be 130 ft., and from the administrative block 42 ft. The front of the building will face due south, in which direction there is an uninterrupted view across country of several miles, and provision is made for a future extension of two pavilions on the east and west respectively. The buildings are planned to accommodate 70 male and 78 female patients, a total of 148, and there will be large day-rooms, which could be used as sick wards when required, thus materially increasing the accommodation. The administrative block will contain rooms for the surgeon and nurses, and waiting-rooms for males and females. A mortuary and disinfecting station will be erected on the eastern portion of the site, and a new laundry near the eastern boundary. The total estimated cost of the whole scheme, including the purchase of land, the erection of boundary walls, electric lighting, engine and boiler houses, furnishing, &c., is £36,000.

SOCIETY MEETINGS.

British Archæological Association.—The third meeting of the session was held on December 2nd, at the rooms in Sackville Street, Mr. Thomas Blashill, Hon. Treasurer, in the chair. Mrs. Marshall exhibited a silver sixpence of the reign of Elizabeth. Mr. Collier submitted two interesting terra-cotta figures from Egypt, one supposed to represent "Thoth." Mr. Earle Way exhibited a collection of silver thimbles, dating from the seventeenth century, found in Southwark, and reminded the meeting that thimbles were originally called "thumb bells" by the sailors who used them in sail-making, and on old London Bridge there was a shop specially for the sale of them. Mr. Way also exhibited the following articles:—a silver coin of James I. (one of a collection of about 2,000 coins, ranging from Elizabeth to Charles I., recently discovered in Devon), a very beautiful alabaster vase or bottle, called a "box," found at Thebes by Professor Petrie, of the date of about 3000 B.C., and supposed to be similar to the Scriptural "alabaster box of precious ointment," also a Roman lamp having Greek characters on the under side, from the collection of the late Mr. E. G. Loftus Brock, F.S.A. Rev. J. Cave Browne read a paper upon "the Fraternity of Corpus Christi at Maidstone." The buildings of the Fraternity, which still exist, were visited by the Association during the recent congress. The Guild of Corpus Christi was constituted by Pope Urban IV., in 1261, and was confirmed by Pope John XXII., in 1318, and was under the Benedictine rule. The establishment of guilds or brotherhoods in England dates from a very early period; they were formed for the protection of some trade or industry and the general interests of their members, and the provision of pecuniary assistance in time of need. The Guild of "Corpus Christi," however, differed from these in having more of an ecclesiastical, if not strictly religious, character. The first Thursday after Trinity Sunday was the day fixed for the observance of the festival. The "Fraternity of Corpus Christi of Maidstone" was in existence in the early part of the fifteenth century, as there is extant a will of one Richard William, which was proved in the year 1438, containing a bequest to the "Brethren of Corpus Christi" of ten shillings, a sum equivalent to as many pounds sterling of our money. The old hall or refectory of the Fraternity still remains, and retains its original proportions and much of its original character.—Mr. Patrick, in the absence of the author, read Mr. Park Harrison's paper on "English Romanesque Architecture," which dealt with the pre-Norman date of the two Churches at Lincoln, respectively, St. Peter's-at-Grotto, and St. Mary-le-Wigford. The paper elicited considerable discussion, in which Mr. Chas. Lynam, Mr. Compton, Mr. Patrick, and the chairman took part.

Sanitary Inspectors' Association.—At a general meeting of this Association, held at Carpenters' Hall, London-wall, a vote of condolence with the family of the late President of the Association, Sir Benjamin Ward Richardson, whose death had taken place since the last meeting, was unanimously passed. The election took place of twenty-eight members, two associates, and one honorary member—namely, Mr. W. F. Higgins, J.P., President of the Northamptonshire branch of the Association. A paper was read by Mr. T. F. Strutt (Strand Board) on the "Influence of Our Surroundings." In the course of the paper the great improvement which had taken place in the Strand district was mentioned, the improvement being attributed to the plentiful use of water—first, for washing the streets, and, secondly, for flushing the sewers—and he advocated the application of the same remedy to all other districts.

The Sanitary Institute.—At the Parkes Museum, Margaret Street, W., an Examination for Inspectors of Nuisances was held on Friday and Saturday, December 4th and 5th, 1896. 134 Candidates presented themselves. Questions were set to be answered in writing on the 4th, and the Candidates were examined *viva voce* on the 5th. 83 Candidates were certified, as regards their sanitary knowledge, competent to discharge the duties of Inspectors of Nuisances.

Correspondence.

To the Editor of THE BUILDERS' JOURNAL

EXETER COMPETITION.

SIR,—Allow me to express my entire concurrence with the remarks in this week's BUILDERS' JOURNAL, on the subject of the recent competition for the Church of Emmanuel at Exeter. From what I can gather it appears that the committee themselves selected from amongst the 405 designs sent in, three which seemed to them in their unexpert wisdom suitable. They then went through the farce of appointing an assessor to select the best from the three. This is an insult added to the original injustice meted out to the competitors. The committee were of course quite within their legal rights, according to the conditions issued, to act as they did; but the only way in which they could have shown their good faith towards the competitors, would have been to submit the whole of the designs received, without discrimination, to a professional assessor. This is, without doubt, what every competitor naturally expected would be done or he would not have competed. The only thing that could be done by the unsuccessful men, doubtful though it might be of any real use, would be to formulate a joint protest and forward it to the committee. One would have thought that nothing of this kind could have occurred in connection with a building of this character. Your suggestion as to publishing a selection of the unsuccessful designs will no doubt be favourably considered by the majority of the competitors, as it will give all of them an opportunity of comparing one another's with the successful design, which has already been published in one of the professional journals. It would be interesting to take the votes of the unsuccessful men at the completion of the series, as to which they would have selected had they been in an assessor's position. If you would care to place my design amongst those from which you will make your selection I shall be pleased to send it to you.

Before closing, permit me to offer my congratulations upon the production of the fine new monthly, "The Architectural Review." It is worthy of all praise and support, and makes one look forward with anticipatory pleasure to the appearance of the next number. I wish it every success, which it deserves.

Yours truly,
CHARLES V. JOHNSON.

14, Keston Road,
East Dulwich, S.E.
10th December, 1896.

To the Editor of THE BUILDERS' JOURNAL.

IS A PROFESSIONAL ARBITRATOR AN UNMIXED BLESSING?

SIR,—I enclose herewith a cutting from an Exeter evening journal, which forms a sequel to the competition lately decided for the pavilion on Torquay Pier, and in relation to which I ask the above question, my reasons being as follows:—

1st. The stipulated amount the job was to cost was £5,000. Now, as an unsuccessful competitor, I took the trouble to go down to Torquay to see the successful designs which were on view in the Town Hall. What was my disgust to find, as the enclosed cutting proves, that the selected design could not possibly be done for anything like the money stipulated. Surely we have a right to expect otherwise when a vice-president of the Institute is the assessor.

2nd. As a *design* (meaning the elevations), in my humble opinion, this first premeditated design shows no Architectural ability whatever, whereas the second design shows both thought and ability.

Why, if plan only is to be considered, should we be asked to submit elevations at all? It seems to me it would be better for all concerned, including the building, to assume that the man who can make the best plan will have ability enough, when the time comes, to make a presentable elevation. Of course it may be that the author of the design placed first was aware from experience that the elevation did not matter, and so did not trouble. However, the final throwing over of the undertaking will also be a little useful experience, I trust, to the arbitrator as well as the competitor.

"Alderman Bovey, at yesterday's adjourned meeting of Torquay Town Council, called attention to matters of urgent importance relating to the proposed pier pavilion, and moved that in consequence of the very large expenditure required to prepare the site, &c., for the erection of the pavilion, instructions be given to the Architect to proceed no further, pending a reconsideration of of the whole scheme. The preparation of the site alone, said Mr. Bovey, would cost £4,300, and, as Chairman of the Harbour Committee, he entirely disassociated himself from all responsibility if they went on with the scheme.—Mr. R. Crocker seconded, and said they would have shown more wisdom if they had looked before they leapt with such a big undertaking.—Mr. Beavis said the pavilion would cost nearer £14,000; and, after further discussion, the motion was unanimously carried. Poor old pavilion! It was taken up and thrust forward so keenly, and now has been dropped like a hot potato."

I am, Sir,
Your obedient servant,
DISGUSTED COMPETITOR.

Trade and Craft.

SWANSEA STEEL WORKS TO BE ENLARGED.

The Mannesman works at Landore are to be further enlarged. The British Government had decided to use nothing but steel, and the Mannesman Company had recently received large orders from the English, Russian, and Chinese Governments. It is intended, therefore, immediately to increase the accommodation at the works to carry out these orders and to prepare for other big contracts which are expected. This meant the employment of a large number of additional hands.

STRIKE OF YORKSHIRE ENGINEERS.

The engineers employed by several firms at Cleckheaton, near Leeds, have come out on strike owing to the refusal of the 2*s.* a-week advance applied for, with a demand for a working week of 53 hours. The men allege that they have not had an increase of wages for 24 years, and that even with the advance now demanded, they would be receiving 2*s.* a week less than those working outside the town.

THE LONDON BUILDING TRADE.

The President of the Central Association of Master Builders of London has issued a statement in which he says, "It is generally known that differences and disputes have prevailed during the present year in this trade. Agreements were eventually arrived at which it was hoped would be the means of eusuring a period of contentment and quietude for some time to come. Up to the present no trouble has arisen except with the members of the Plasterers' Association. The members of the N.A.O.P. abstain from taking employment in certain firms, and, in cases where decoration work is required for contracts undertaken by them, and which, as a rule, has to be obtained from specialists, the body influences the workmen so as to prevent the work being supplied. This must be assumed to be an organised interference on the part of the Plasterers' Association, and its individual members have little freedom of action. It must be apparent that no association of employers can quietly submit to any of their members being subjected to such a system of persecution and annoyance, especially as it is undoubtedly in direct violation of the agreement."

HEAVY COMPENSATION CLAIM.

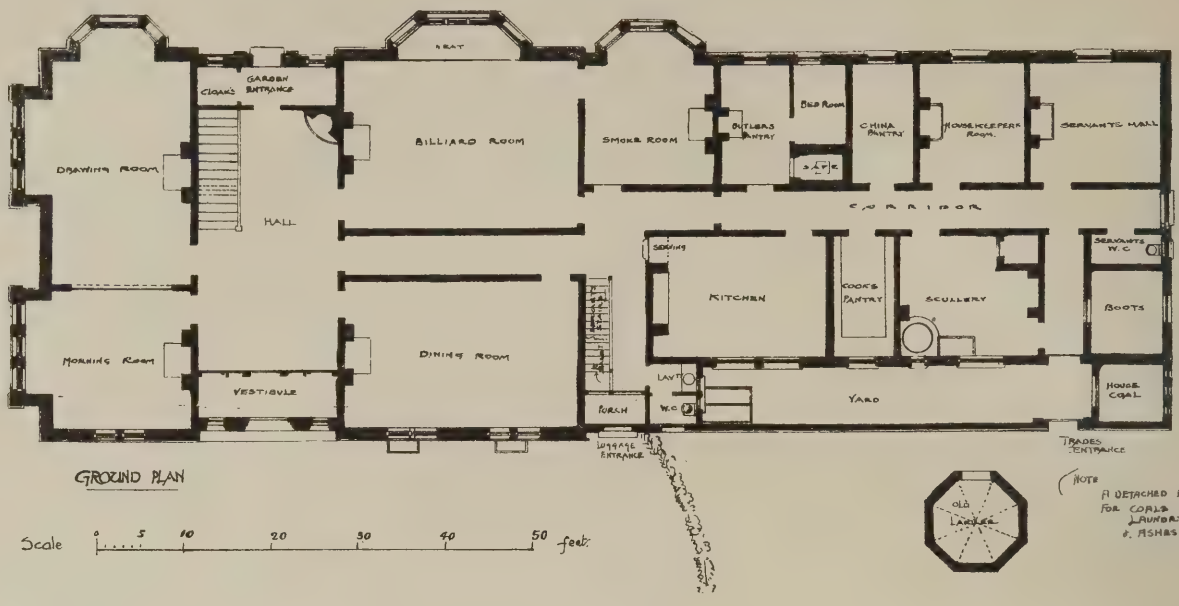
At the London Sheriff's Court, the case of Messrs. Richardson *v.* the Central London Railway Company (Limited), was recently heard. It was an action to recover the sum of £16,000 as compensation for the compulsory acquirement of four acres of land at Wood-lane, Shepherd's Bush, by the railway company, in connexion with their line from the City to Shepherd's Bush. Messrs. Richardson claimed as compensation £8,000 as the value of the land, and £8,000 as depreciation of the remaining twelve acres by reason of the nature of the works and premises to be constructed by the railway company. The jury returned a verdict for £7,010. Amongst the witnesses called on behalf of the claimants was Sir J. Whittaker Ellis, who pointed out that the estate was capable of important development, and was extremely valuable as building land for residential purposes. On the other hand, Mr. Freeman, Q.C., on behalf of the company, stated that the land was practically valueless in consequence of its having been condemned by the London County Council for the purpose of building dwellings by reason of its peculiar situation.

NEW BATTLESHIPS.

The Thames Ironworks and Shipbuilding Company, Limited, of Blackwall, have secured the order for another battleship, 14,500 tons displacement, for the Imperial Japanese Government The same firm launched last March, and is now completing, the first-class battleship "Fuji," for the same Government, and still more recently they laid the keel of the new first-class battleship "Albion," for the British Government. It is quite without parallel for one firm, and that a Thames firm, to have on hand at one time three first-class battleships of the collective displacement of 40,000 tons.

A NEW FORCED DRAUGHT FURNACE.

The Gosling forced draught furnace has been on trial at the Phœnix Brick Works, Cardiff, which are owned by Mr. J. W. Courtis, of Cardiff, with very satisfactory results. The Gosling patent forced draught furnace claims the advantage of raising a greater amount of steam in comparison with the amount of fuel used, than is the case with some half dozen other patents with which it was tested. Another advantage is that it permits of the use of small coal. The chairman of the furnace syndicate states that at a certain collier in the Midlands, after careful tests, the company decided to use Gosling's system only, and Prof Galloway said in his opinion there must be a saving of 10 or 12 per cent. of coal effected in using the system, and he was of opinion, from the tests he had made and from his observations, that a saving of fuel would be effected in conjunction with a saving in capital outlay. Forced draught furnaces would, he thought, in future take a very important place amongst colliery appliance. Mr. Courtis' testimony was short and to the point. Before he used the system he could not raise the necessary amount of steam even with large coal, and he was thinking about putting down another boiler. Now he had no difficulty with the steam, and he could use small coal.



WIRED GLASS.

Some experiments were recently made to determine the fire-resisting qualities of wired glass, that is, glass containing in its texture woven wire netting, the results of which proved that glass of this kind is capable of withstanding a high temperature, very much higher than ordinary glass, without melting or losing its continuity, even when suddenly drenched in a heated state in cold water. The conclusions drawn from the test are that wired glass can be safely used in skylights, and in such situations will stand a severe fire, and not give way when water is thrown upon it. The capability of the wired glass to withstand a temperature beyond the melting point of glass appears to be due to the fact that the network of wire in the glass acts as a good conductor of heat and thereby prevents the accumulation of sufficient heat to melt the glass.

IRON WORKS IN SUSSEX.

In view of the development of the coalfield at Dover, arrangments are being made with a view of re-establishing ironworks on a large scale in Sussex. Iron ore is found plentifully in Sussex, which, until the year 1728, was the principal centre of iron manufacture in England. The iron rails that used to surround St. Paul's Cathedral were cast in Sussex. The last furnace in Sussex was extinguished at Ashburnham in the year 1828. The fuel used for the smelting was wood, but the county became so denuded of timber in consequence, that Acts of Parliament were passed prohibiting the furnace, and the manufacture of iron went northwards to the coal centres. It has mainly been the question of the price of coal which has prevented the iron ore being worked in Sussex.

Peterborough West Front.—The Architectural Review and the Daily Chronicle.

"RESTORATION," which has been so well defined as an unreasoning lust for destroying the beautiful, has, you will be glad to know, recently received an unmistakable check at Peterborough. A pleasant rumour, although it is a rumour only, reaches me from that city, to the effect that the work of rebuilding is stayed, at all events for the time being. This will be good news to all Art lovers, and especially to those who have been so active in opposition to the proposals of the Dean and Chapter. Of these surely the Daily Chronicle, among newspapers, the Societies for the Protection of Ancient Buildings and of the Antiquaries, deserve the most praise. But for their prompt and energetic action one of the loveliest works of Art in the world would by now, in all probability, have been nearly ruined. For it is well to bear in mind that it was not restoration—bad as that would have been—but entire rebuilding that was proposed. It is true that there was, in the original appeal for funds, a slippery sort of saving clause, to the effect that all the stones would be numbered and replaced in their original position; but those who have had experience in such matters know perfectly well that once the old stones are removed from their beds not two in ten would be fit to go back again. Therefore, it is clear, from that appeal, and from the Architect's report, that what would actually reappear after the scaffolding was removed, at the completion of the work, would be an entirely new front, as sharp, as clear, and as "new" as the north transept of Westminster Abbey. It would have been learned, scholarly, correct, without a doubt—Mr. Pearson could give us nothing which did not include all these qualities; but with all due respect, that would not have been a sufficient recompense for the loss of one of the few masterpieces of the Art of Architecture in mediæval times. In our entire Artistic possessions there is nothing so valuable as this Gothic front of Peterborough in England to-day. We wonder what would be thought if a professional picture-restorer were allowed to have his own way unchecked, upon, for example, the £70,000 Madonna, by Raphael, in the National Gallery. Yet the West Front of Peterborough is worth all the masterpieces Raphael ever painted, or anyone else, for the matter of that. As touching this question of restoration I know well there is a wide difference of opinion, even among Artists, upon it. But I think, in the main, they will agree with Mr. Henry James, when he says, "I prefer, in every case, the ruined, however ruined, to the reconstructed, however splendid. What is left is more precious than what is added. The one is history, the other fiction. One is positive, so far as it goes, the other fills up the void with things more dead than the void itself, inasmuch as they never had life." That, I think, expresses exactly the attitude all Artists take towards restoration. With regard to the West Front, two things should be emphasized—first, that it is incomparably the finest in England; there is nothing in this country to equal it in point of beauty, in masculine strength and originality of design, and there is nothing to beat it in point of delicacy and refinement of detail. Secondly, it is not, as some superficial Art critics have called it, a mask and a sham, hiding and not expressing the plan. From a careful and complete study recently made on the spot, it is quite clear to me that this West Front is, in reality, the termination of a magnificent conception, for the entire rebuilding of the Church in the perfection of early English Architecture. Judging from what now remains of that daring scheme, if it had been carried out in its entirety there

THE NORTH AISLE OF CAMPTON CHURCH, BEDFORD. REBUILT BY J. P. WHITE. FROM A PENCIL DRAWING BY C. E. MALLOWS.

would have been nothing comparable to it in the history of Gothic Architecture. As it is, this fragment compares to-day with such west fronts as Amiens, or Nôtre Dame of Paris, and most certainly does not lose, but gains, by the comparison. As the west front to the completed design, it would have been equally as logical and expressive a work as either of these. Now as to the saving of this glorious work. There are two main causes which are responsible for most of the present and past troubles to the Cathedral generally. One is due to the draining of the Fen district, which has caused the land around Peterborough to become drier, and has resulted in the compression of the clay, through the water leaving it. This has been going on for many years, and is supposed by some authorities to be the primary cause of the original settling of the Cathedral foundations. The other cause is really owing, not to the bad construction of the design, but from the want of satisfactory foundations. After the unfortunate manner of many mediæval builders, those of Peterborough concerned themselves very little about the foundations of their work. So little, indeed, that with the rock within a few feet of the ground level, they did not even trouble to go down to it to start their footings, but built them directly upon the shifting layer of clay which covers the rock, with the result that the whole of the West Front, in its entire height, has been thrown outwards 2 ft. from the perpendicular. In order to obtain the necessary stability for the Front the Society for the Protection of Ancient Buildings consider it necessary that the foundations should be carried down to the solid rock by under-pinning, and is of opinion that the movement of the West Front is entirely due to the foundations having been placed on the clay which overlies the rock as just described. This seems so obvious that it surely admits of no argument. Yet the Architect, in his report of February, 1896, said "that the conditon of the masonry above the great arches is not so much due to any settlement as to the effects of time!" "Not so much due to settlement," when the building is placed on shifting clay! To remedy, therefore, one of the fundamental dangers, it is necessary that the work of under-pinning should be proceeded with as soon as possible, and in the thorough manner proposed by the Society. But, in justice to Mr. Pearson, there is a valuable suggestion made by him which is worth careful consideration. He has cut back the ground under the piers for 3 ft. and built a 3-ft. wall from the rock upwards on the two front sides, leaving the back and the whole of the centre resting on clay. This has been done, I believe, with the end in view of bringing the Front back to the perpendicular again. I understand Mr. Pearson thinks, if the outer (or western) part of the foundations is made firm in this way, and the inner (or eastern) part left still resting on clay, what may occur will really be the reversal of what has already happened. That is, the Front will be tilted back eastwards into its original right position. But it is difficult to see how the Front could go back again to the upright without clearing away everything between it and the main building, and this could not be done without great destruction of valuable work. Why, however, try and get it back to the upright at all? It is perfectly safe as it is, provided the foundations are treated in such a manner to prevent it going further. The difference between the proposals of Mr. Pearson, on behalf of the Dean and Chapter, and those by Mr. Philip Webb, on behalf of the Society, briefly put, is this:—The first means entirely rebuilding—that is to say, the ultimate result would be a modern West Front, in which there would be but few, if any, of the old stones left. The second means putting the building *as we see it to-day* into sound and secure repair, and that can be done entirely from the inside, the outside being *practically left untouched.* Who among Artists will say that this latter is not the better of the two, leaving, as it does, to us and to posterity the exterior work as it left the hands of the original builders. As to the practical side of the question, the opinions of an eminent engineer and of a builder of large and varied experience in Church repair agree that the scheme the Society suggest is a wholly practical and feasible one, both in principle and in detail.

THE ART EDITOR OF
THE ARCHITECTURAL REVIEW.*

* The above was written in the form of a letter, at the request of the Editor of the Daily Chronicle, and appeared in that paper on Saturday last.

ART IN WALES.

MR. LISTER JONES presided over a meeting of the Cardiff Impartial Society last week, at which Mr. E. Seward, R.C.A., Cardiff, read a paper on "Some Popular Uses of Art." Mr. Seward urged that Art had an insufficient place in the national life of the country. What was needed, he said, was that Art should be better known among the masses. A yet greater study of design, and the cultivation of a power of drawing, would greatly increase the national usefulness. He hoped that Welsh Art would especially benefit from the great interest taken in it by Professor Herkomer; he (Mr. Seward) believed that nothing would so readily lead to progress as the personal influence which a well-recognised artist of worth and strong individuality might exercise by his enthusiasm. Perhaps, for this reason, the native strength of Wales might develop latent freshness, but whether Professor Herkomer found an aid to continuity and permanence through the Eisteddfod or no, his efforts could not fail to do something for a subject which badly needed popularising in Wales. The benefits of the Art gallery, Mr. Seward said, had been insufferably thought out by their good friends who insisted that Public Art Galleries and libraries must remain rigidly shut up on Sundays. He regarded them as Sunday Schools, where grand object-lessons of humanity and of that great guide and teacher, nature herself, were being taught, and he therefore strongly advocated Sunday opening - part of the day at least—of all public Art galleries and libraries.

LISKEARD CHURCH, FROM THE SOUTH-WEST.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

PROPOSED REBUILDING OF LISKEARD CHURCH TOWER.

A PROTEST.

BY JOHN E. NEWBERRY.

I WISH to draw the attention of all interested in the preservation of ancient historic buildings to the interesting Norman tower of Liskeard Church.—In October last, a committee invited Architects to make designs for rebuilding this feature, and the drawings are to be sent in on the 1st of January next. The instructions issued are quite insufficient, and have been evidently drawn up with an entire lack of knowledge of the method of conducting a competition. On enquiry, the committee states that it is intended to obtain a professional assessor, "but we cannot guarantee it." The first stipulation is that the tower shall be built of granite; introducing as far as possible the Architectural features of the present tower, *consistent with the Architecture of the Church*. This excludes the local stone, used for the walling of the Church, which is of beautiful and varied colour, and also precludes the possibility of building in the Norman features, as the Church is in the Cornish phase of the Perpendicular manner. In fact, it is evident that a tower of an entirely new design is wanted, with "a floor of wrought-iron joists and concrete" to the ringing chamber —the whole expense not exceeding £3,000, "except the bells." No plans or measurements of the Church are supplied, and anyone who makes a design must obtain such information for himself. This competition is therefore unlikely to attract Architects of reputation. Most of the following particulars are derived from an interesting pamphlet, entitled "Historical and Architectural Notices of the Parish Church of St. Martin, Liskeard, Cornwall," by W. T. Hancock (Liskeard, 1879). I am also indebted to a London Architect for researches made on the spot a few days ago.

The earliest mention of Liskeard, and incidentally of its Church, is to be found on the margin of an ancient MS. copy of the Gospels, formerly belonging to Bodmin Priory, and now in the British Museum. Here is an entry, made between A.D. 940–1042, relating the liberation of a female serf named Ælgyth, the town being referred to as "Lyscerruyt." There is no evidence that this early Church occupied the site of the present one, but it is obvious that the existing fifteenth-century building replaced one of Norman times, the tower of which still remains. This feature demands particular attention, as it is the earliest part of the Church. The lower stages and the arch leading into the nave are of the late Norman period. The north side shows most of the original work, the west and south being patched up with granite and plaster. The arch into the nave is of Pentnan stone. Externally the tower is divided into four stages: it has an interesting western doorway, with the date 1627 upon it, in which year there are records of certain restorations; on the north side are two circular beaded windows, with the well-known Norman label mould of a slight hollow with a nick in the fillet. In the upper stage are single-light belfry openings, with pointed-arch heads, and the tower is finished with a battlemented parapet and a corbel course under of grotesque heads.

There is preserved in the British Museum a large chart of the south coast of England, temp. Henry VIII., MSS. Cotton, and Liskeard Church is represented thereon with two towers. C. S. Gilbert, in his "Historical Survey of Cornwall," says:—"Liskeard Church is one of the most spacious religious edifices belonging to the county of Cornwall, excepting that of Bodmin. It had two square towers in the time of Henry VIII., one on each side, but it appears that they were both taken down in 1627, and one erected at the west end, which is rather low and crowned with battlements." Mr. C. S. Gilbert is evidently mistaken in supposing that *both* towers were taken down, as the present tower is certainly original Norman work. This view is supported by the fact that the Church at St. Germans, in the early Norman style, was enlarged in later Norman times by the Canons of the Augustinian order. This Church then consisted of a chancel, nave, and two narrow aisles, each of which terminated with a tower. The north aisle was taken down in 1803, but both the towers still remain. These same Canons of St. Germans held the patronage of the vicarage of Liskeard, and as the Church must have been built with their approval, it is probable that the mother Church was taken as a model. Which of the towers was pulled down there appears to be no means of ascertaining, but Mr. Hancock says that after a careful examination of the old chart, and a comparison with the present tower, he is inclined to think that it was the southern one which was removed. During the restorations in 1878–79, a small Norman window was discovered in the eastern wall below the roof, and underneath which the line of the previous roof was distinctly visible. There are similar windows in both towers at St. Germans.

The present Church is of the "Perpendicular" period, and consists of a chancel, nave, north and south aisles, south chancel aisle or lady-chapel, and vestry, and contains many interesting features. The south porch with its three niches and parvise over is very fine. The rood screen was removed in 1793, but the stairs that lead to the rood loft still remain.

The Church was restored in 1878–79, by Mr. Coad, a London Architect, who put new roofs, restored many of the windows, underpinned the arcades, and rebuilt the north-east angle of the north aisle. The total cost of this restoration amounted to some £3,700.

The tower has been patched up from time to time, and there are some bad cracks in it, but there is no reason at all why it should not be restored. I understand that a well-known Church Architect has been consulted, and reports that it could be restored for £800. The committee will not accept his advice, as it prefers a "nice new tower." The plea that the existing tower is in itself an ugly feature attached to the second finest Church in Cornwall, cannot be for a moment sustained. Reference to the illustrations will show that it has a well-proportioned outline, and forms a charmingly picturesque feature in a group of buildings of which the inhabitants of Liskeard may well be proud.

It is difficult to believe that such an act of vandalism as that contemplated by this committee should be allowed, and I sincerely hope that the local antiquarian societies, as well as those in London, will take the matter up and awaken the Liskeard authorities to their responsibilities. The mischief is partly owing, I understand, to a somewhat curious bequest of £1,000, left for the express purpose of rebuilding this tower—if it is not applied to this purpose within a certain time, it goes to the Truro Cathedral Fund. A tower 150 feet high has been mentioned, the present one being only 56 feet high! If the committee could only be induced to spend the money in erecting a detached campanile, arranged so as to group with the rest of the Church, everybody would be satisfied and the old tower saved. There are many English examples of this treatment, such as Chichester, Evesham, West Walton, and others.

LISKEARD CHURCH FROM THE NORTH-EAST.

SLATES AND SLATING.*

BY W. E. BECK.

IN this Paper I shall endeavour to give you as it were an historical discription of the subject. I shall therefore divide my remarks under three heads. In the first place, I shall touch on the geological features of slate rock. I shall then endeavour to give you a description of slate quarries and quarrying, and will conclude with some observations on the practical application of slates with their accessories to buildings. For much of the information contained in the opening chapters of this paper I am indebted to the works of Mr. D. C. Davies, and other well-known authorities. To be as concise in my remarks as possible I shall only deal at length with the rock formations of North Wales, Cumberland, and Westmoreland, as these are the only localities which, in a practical sense, we have to deal with. The slate rock deposits of North Wales extend over a large area, commencing in the neighbourhood of Bangor and running in a south-south-east direction, terminating, as far as good workable stone is concerned, in the vicinity of Port Madoc. They are of sedimentary origin, that is to say, composed of materials which have been disintegrated and washed down from pre-existing rocks and lands. These materials were then carried down to the sea by streams and thence deposited on ocean floors as fine mud. The even deposition of these materials would be affected by currents and tides as well as by storms. The heavy coarse material would be deposited first, near the shores, the finer matter would be carried farther out to sea, and spreading itself over a larger area would be quietly precipitated to the bottom in deeper water. The colour would be influenced by the presence and decomposition of any mineral ore over which such waters flowed. This will explain the reason of the variability in colour, quality, and texture displayed in rock belonging to the same formation. Two quarries may be situated close together, but the rock, in a commercial sense, may be very dissimilar in character. The muddy deposit would then be compressed, hardened, and altered into compact rock. Slate rock is composed of a variety of colours—green, grey, purple, blue, and black. The iron less largely enters and in combination with magnesia gives them their greenish hue. In soft black slates there is a good deal of carbonaceous matter and sulphide of iron in a decomposed state.

The original position of the strata has been horizontal, but by a variety of forces the different beds have been tilted up, and are now lying in various angles approaching the vertical. The cleavage structure of slate rock is perhaps its most remarkable and unique feature. It is supposed to be the result of a combination of intense forces, principally lateral pressure acting at right angles to the planes of cleavage. The direction of the planes of cleavage is independent of that of the rock bed, and occurs at almost all angles to it. This, as I will afterwards show you, causes many difficulties in the quarrying of slate even when the rock is suitable for that purpose. This peculiar cleavage, by enabling the rock to be split into thin plates, gives it its commercial value. When we consider that rock, capable of being split into such thin slates, and able to resist all atmospheric influences from one to two hundred years without showing scarcely any signs of decay, we cannot but imagine what enormous forces nature has at her command to produce such results. The analysis of blue Welsh slates, given by Professor Hall, is as follows:—

Silica	60·50.
Alumina	19·70.
Iron protoxide	7·83.
Lime	1·12.
Magnesia	2·20.
Potash	3·18.
Soda	2·20.
Water	3·30.

The presence of soda and potash in slate deposits is the record of the saltness of those seas wherein they first were bedded. There are of course foreign matters generally deleterious which occur in the stone, iron pyrites being the most common, although a superabundance of carbonate of lime is found in faulty rock.

With regard to the slate deposits of Cumberland and Westmoreland, the foregoing remarks regarding the origin and strata formation of the Welsh beds is in the main applicable to these. These deposits are about 25 miles in length, and average about 13 in breadth, although only a small portion of this is workable rock. Their direction is N.N.W. by S.S.W. and extends from the neighbourhood of Keswick and ending at Furness. This direction is similar to the Welsh deposits, and one rather remarkable coincidence I have noted is that at the southern end of both the Welsh and Westmoreland deposits the stone changes into a dark blue colour, as at the Festiniog quarries in Wales, and the Burlington and other quarries near Furness. The cleavage differs from that of the Welsh rock in being more of a granular than of a leafy nature.

The stone cannot therefore be split into such thin slates as in the case of the Welsh quarries. The cleavage, however, varies a good deal, as some of the rock, especially in the Buttermere district, is capable of being split much thinner than that found in other districts of the same formation. In the Cumberland and Westmoreland rock I have found it particularly free from any foreign material, and with the exception of bands of discolouring matter cropping out here and there, there is not that variability, both in quality and durability, found in the stone of the Welsh formation. The colour of the Westmoreland rock is invariably green of different shades, with the exception of the southern end of the formation, where it changes to shades of dark blue. With this brief description of the geological features of slate rock I will now ask you to follow me while I endeavour to describe to you the chief characteristics of slate quarrying and the production of roofing slates.

SLATERS AT WORK.

VIEW OF QUARRY WORKING.

The early history of slate quarrying is somewhat obscure. It is stated that the earliest indication of the use of slates for covering buildings is found in the twelfth century. The castles of Carnarvon and Conway, which belong to that period, were covered with slates found in their vicinity. The date of the origin of the Penrhyn quarry, which is one of the most ancient, is 1500, and the first distinct mention of it on record appears in an ode by a Welsh bard in 1570.

In these olden times the manner of quarrying was of the most primitive description. Small parts of the rock on the hillsides were quarried by one or two men who paid a small rent for the concession. The slates were rough and heavy, being obtained with little trouble where the slate cropped out. These were carried down in baskets by men, or dragged down by means of sledges. Afterwards ponies were used as a means of transport. Now all this is changed: steam locomotives, tramways, hydraulic machinery, and all scientific appliances possible are now employed in raising the slates from the quarries and getting them down to the places of shipment.

The total output of slates in England and Wales is, I should say, roughly speaking, over half a million tons, worth about two millions sterling. Both Welsh and Westmoreland slates are now being exported to all parts of the world, which, at least, is an indication of the value placed upon them abroad.

For comparative purposes, I shall divide the slate quarries of North Wales into three groups.

In the first group I shall place the Penrhyn and Dinorwic quarries, the slates of which differences in colour are principally caused by the varying proportions of iron contained in their composition. Thus the blue colour of slate is derived from the presence of protoxide of iron. The red and purple varieties take their colour from iron in the form of peroxide. Into the green slates

* A Paper read at a meeting of the Northern Architectural Association at Newcastle-on-Tyne, Dec. 2nd, 1896.

are shipped at Port Penrhyn and Port Dinorwic respectively. Then we have a number of quarries in the second group, situated in the Vale of Nantlle and shipped at Carnarvon. The Festiniog quarries belong to the third group, Port Madoc being the place of shipment. These quarries are not developed and worked by any uniform system. For instance, the Penrhyn and Dinorwic are open quarries worked in galleries on the mountain side. The Nantlle Vale quarries are open and worked below the level of a flat country. The Festiniog are mostly underground quarries, worked by means of shafts and adits, or levels. The rock, where suitable, is drilled and blasted. The workmen then proceed to select from the débris such blocks as they consider will yield the greatest quantity of larger sized slates; the lesser blocks are then selected in sizeable order and afterwards converted into slates of decreasing sizes. This will explain the difficulty of supplying large orders of slates in any given size. Hence the merchant is only able to secure the proportion of the sizes yielded by the rock, which frequently necessitates his having to ask the favour of being allowed to substitute other than the size which may have been specified by the Architect.

With regard to slates which are designated as Seconds. These are not split to order but are made out of blocks, which, by reason of their texture and cleavage, cannot be split so fine as those from which the Best, or thinner, slates are obtained. You will notice by the accompanying illustrations one or two of the various ways in which the different quarries are being worked.

TIPPING WASTE DÉBRIS.

These will, perhaps, give you a better idea than any words of mine can convey. While I am upon the subject, I would take the opportunity to acknowledge my very great indebtedness to Mr. James Townsley, of Hull, the editor of the Slate Trade Gazette; with the exception of two or three, these views have been taken and prepared by himself.

I will now close my paper with the practical side of the subject before us. You will, no doubt, have observed that although there have been many changes and improvements in most or all departments in the building trade, yet the slating of roofs has for the past 30 or 40 years undergone little or no change. From thatch to grey or stone slates and tiles was evidently the first step; then, as railroads were opened out, slates gradually superseded the older methods of roof-covering. From my observation of many of the old buildings in this district, Scotch slates from, probably, Ballhoolish, seem to have been extensively used, and very durable they have been, as even now they appear little the worse for wear.

The grey stone slabs were at first hung on laths by the means of sheep's bones and oak pegs. The joints were filled up with moss, which is probably the origin of pointing the roofs with lime. In the opinion of some, the oak peg employed in primitive times for securing slates is preferable to the present style of fastening by nails. One curious fact I may mention with regard to the labour. There are still living in our district old slaters who distinctly remember having women as labourers, who used to carry the slates on to the roofs, and many are the humorous anecdotes related anent this old custom, which, happily, is a thing of the past. I will now make a few observations on that part of our subject in which you are more particularly interested, that is, slating specifications.

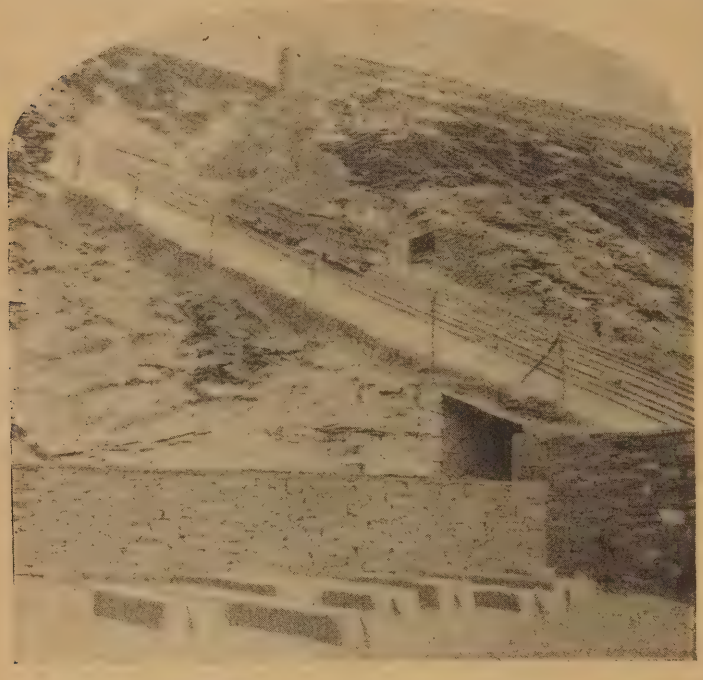
I presume that it will be expected of me to give you my opinion as to what constitutes an ideal specification, and to support the same by quoting my reasons for any arguments I may adduce. So far as I am able I will do this. There are many important factors that should be weighed when preparing a slater's specification.

The specifications have, for many years, been of a stereotyped nature, although latterly I have noted some improvement in this respect. I cannot, however, overlook one important fact in my experience, and that is the great similarity which runs through the specifications for slater's work, no matter by whom drawn, or for what class of work it is intended to apply them. I am convinced that too little attention is paid to the important branch of the building trade which I, as a slating contractor, represent. It is often said that a good foundation and a good roof are essential features of a sound structure, and, if that be so, too much care cannot well be bestowed upon these items. It might be retorted that the slating contractor has also a responsibility in seeing that the public receive from him only that class of work which is of the highest standard of excellence in every department. In this I fully concur, and am persuaded that, with an improved system of contracting, coupled with a more complete knowledge of the slate trade, and with a more punctilious observance of detail, which is to-day conspicuously absent, a much higher standard of excellence in slating work would be attainable.

What is it then that should determine the quality, size, or colour of a slate to be used? No Architect, I take it, would specifiy 9 by 3 joists for every building he had to erect, irrespective of the purpose for which the floors were required, nor in any other important feature of a building would he adopt one uniform rule, without regard to the nature of the structure and its intended use, but in respect to slating how little variety do we meet with?

How little attention appears to be given to discovering the most suitable slate for the particular work in hand? If we take any 50 specifications from north of England offices (say north of the River Humber) we shall find, I venture to say, 48 of the same requiring 16 or 18 by 10 slates, and of Bangor quality, while further south you will find 20 by 10 and larger sizes predominating and of varying qualities. Now after what I have said in regard to the difficulty of securing large consignments of any particular size, and remembering that the causes answerable for such difficulty cannot well be overcome, it will be obvious to you that the slater must, at times, ask permission to substitute other sizes than those specified. Where a slate covering is required, the Architect should consider the pitch it is intended to give the roof, and the length of spars, also whether mitred or close-cut hips are to form any portion of the roof. If the pitch is a good one, say 90° or square pitch, then a 12 by 6 or larger size would be equally safe in turning the wet, and the lap might with safety be reduced.

With a spar of say 25 to 40 feet, a larger slate should be used and of good width, as in consequence of the larger volume of water which must of necessity gather as it nears the eaves, there should be as few joints as possible, and it is a wise precaution to give about one-third of a deep spar, from the eave upwards, an extra lap. In the event of mitreing or close-cut work, it is important that the sides of the roof forming the mitre should be exactly of the same pitch, and here it is very desirable, in order to obtain good workmanship, to specify a narrower slate for the roof in order that the broader slate may be utilized for mitreing; thus, a 16 by 8 slate for the surface slating would give the slating contractor 16 by 9, 10, or 12 with which to form the mitred hips, and in this way narrow or cut slates with only one nail to secure them would be practically unnecessary.



In exposed situations, I would suggest, as an additional precaution, the use of small slate rolls screwed down to the hip rafter and covering the edges of the slates.

I have already said that in almost every north country specification, *i.e.*, from the Humber to the Tyne, Bangor slates, in size 16 by 10 or 18 by 10, are named, and why should this be? The question has many times been put to Architects, but I know of no satisfactory answer having been given.

QUARRY WORKING.

Who then should decide the question as to what is the best quality of slate and the best size to use? The Architect may draw his conclusions from the fact that he has specified the same slate for many years past and never known them to fail, or he may have sought the advice of one in the trade and acted accordingly, but in each case the knowledge is of a local nature and does not go far enough. In the south and east coast of England is adopted, often, the blue Port Madoc slate of much larger size than used in the north, and the Architect and trade alike of the south may claim to be using *the* best slate in the market, while in Lancashire and Scotland, a slate of an entirely different class is in general use, therefore, you might argue, that it is a matter of opinion as to the best slate for use, but I do not consider it to be a matter of opinion myself, but rather does it show that all or any sizes are equally effectual in attaining the object for which they are made, viz., to keep out the wet.

BRINGING SLATES DOWN FROM TOP GALLERY.

As a further argument in favour of a more general adoption of slates of various sizes, let us take a retrospective view and carry our minds back to pre-Welsh slating times, or the times before Welsh slating became so popular as we find it to-day, and we shall find that Westmoreland slates were in demand, and in some districts these slates are much favoured to-day, and with the removal of some of the engineering difficulties in producing this particular stone, and conveying it to the nearest railway station, would follow a reduction in the cost of procuring the slates, and with a corresponding abatement in the quarry price list, there is little doubt but that the Westmoreland slate would be specified more generally than it now is. Westmoreland slates, as you all know, are of promiscuous sizes, scarcely two slates of the same size are to be found on one roof, and yet this class of slating is most effectual, and requires far more skill to lay the same than that of Welsh slating.

Were you to ask me what is the best slate I can possibly use, I should hesitate before giving you my reply, for, apart from my responsibility as a tradesman in appearing prejudiced in favour of any special make, I should in turn have to put a series of questions to you, *e.g.*, what do you mean by the word "*Best*"? What do you mean by the word Seconds? What would you have me understand by the terms—Best Seconds, Redslates, Blue slates, Grey slates, &c.? Upon these apparently simple points there is probably a greater lack of knowledge displayed by Architects in framing their specifications than upon any other part of the slater's business.

When you require that *Best* slates shall be used, do you mean that the slater shall provide the thinnest slate possible, or the thickest? or would you have him supply you with what *he* might consider the best *metal* slate, or do you wish to convey by the word "*best*" that the slate shall be the "best" from an analytical aspect. Whatever you may or may not mean, it does appear to me that the wording of the majority of specifications of to-day leaves much to be desired, if the slater is to place an intelligent construction upon the same. In the slate world a "Best" slate has only reference to its combination of qualities, such as its straightness, uniformity in cleavage, its freeness from spots, &c., and a "second" slate is distinguishable by its thickness and irregular cleavage, and not as many suppose, because it is inferior in metal or lacks points of endurance. Again a "Best" slate is produced by almost every quarry in Wales, but it does not necessarily follow that every quarry produces a "Best" of equal merit. Further, if the definition of the word "Best" is to be left with the slater, I am afraid, that with so many renderings of the word, unpleasantness would often be likely to follow.

Although I have every confidence in the durability of good slates, I think the medium by which they are fastened is not by any means satisfactory. Long before the slate becomes weathered, the nails invariably decay, the slates slide down or are blown off, and are thus often undeservedly condemned as bad.

The nails used in this district are usually of two kinds, copper and zinc. The copper nail is in itself very lasting, but it does not seem to have much affinity for wood. It seems to have a damaging effect on the laths or boards in which it is bedded, and in progress of time becomes loose. The zinc nail, on the other hand, seems to grip the wood very tenaciously, and in country places I am inclined to think it the better nail of the two. In any case, I think there is room for improvement, and a more lasting fastening for slates is very much needed. It does not follow that a leaky roof is the fault of the slating, as the same is often traceable to skylights, lead work, &c., to which proper attention has not been given. I could, if time permitted, have dealt with many other points of interest in connection with slate covering for roofs, such as sinking, felting, bedding in lime, lathing open or space slating, iron roofs, &c., but as these occur under special and peculiar circumstances, I do not feel that I could satisfactorily deal with the same in this paper. In conclusion, as to the future of the slate industry, there is a good deal of reason for believing it is still in its infancy. I, however, believe that with a continuation of the large increase in the building trade in England and other countries, the demand for slates will exceed the supply.

The developments of the different quarries cannot of necessity keep pace with the demand as at present, however much the proprietors may desire to do so.

OPENING OF THE GLASGOW DISTRICT SUBWAY.

ON Monday, the Glasgow District Subway was opened to the public. The subway, which has cost a million and a half sterling to construct, circles Glasgow, taking in both sides of the Clyde, and gives the third underground means of locomotion in the city. It is to all intents and purposes an underground cable railway or tramway, and is unique in respect of the fact that it is the first cable underground railway in the United Kingdom. It is about seven miles in length, and passes twice under the Clyde. It consists of two subways or tunnels, the cars going in different directions, travelling in different tunnels, and joining at each station. It has taken nearly six years to construct. One power station supplies the means of haulage, which is provided by two Carlos's horizontal single-cylinder non-condensing engines, each developing from 1,000 to 1,500 horse-power, with a speed of 55 revolutions per minute. Double sets of steel cables are used. The cars used will each seat forty-two passengers, and resemble tramcars to a certain extent, but are stronger in build, and the platforms of the fifteen stations are all built so as to make them level with the steps of the carriages. All the carriages are lit by electricity, and the ventilation of the tunnels is good. The engineers were Messrs. Simpson and Wilson, of Glasgow.

CARNARVON CASTLE AND SHIPPING WHARF.

THE Plymouth, Stonehouse, and Devonport, and South-Western Junction Railway Company has accepted the tender of A. R. Lethbridge and Son, Plymouth, for the construction of the new station at Tamerton, at a cost of nearly £3,000.

Pictorial Architecture.

BY MR. R. SHEKLETON BALFOUR, A.R.I.B.A.

"That you shall fairly Streets and Buildings trace,
"And all that give distinction to the place,
"It cannot be . . . . . .
"A part I paint; let fancy form the rest."

HERE is the creed of the Artist who honestly takes upon himself the responsibility of depicting Architecture in his pictures, and indeed we cannot over-estimate the advantages Art has gained, that some painters—I dare not say the majority of them—have followed in some degree this precept, and have studied their Architecture conscientiously, and from an *Architectural* and not only from a *pictorial* point of view. I take it, that it will be at once conceded by us all, that when a painter merely suggests Architecture in his pictures, and suggests it correctly, permitting us to fill in its details from our imagination, that his work, or rather the suggestive character of his work, is far more to be appreciated than when he forces upon us compositions full of ill-designed buildings, of impossible construction, inappropriate, ill-proportioned, and frequently—worse than all—badly drawn. But it must not be assumed that a painter can "suggest" his Architecture without a comprehension of his subject, for the Art of true suggestion consists not in incomplete delineation, but in the knowledge of what may be omitted without impairing our understanding of the whole work. The proper *suggestion* then of Architecture rather than its elaborate drawing in detail is entirely fitting, and this custom should rightly be followed by painters; unless indeed his subject be purely an Architectural one (which is but seldom the case). Otherwise, it would be impossible and futile to endeavour to treat his Architecture as subsidiary and accessory to his main theme. Now the treatment of Architecture pictorially may be looked at from two very broadly divergent aspects, viz.:—those of a painter on the one hand, and the Architect on the other, or—what I fear may be regarded as almost synonymous—the pictorial point of view, and the Architectural point of view. And yet, this should not be so, for each branch of Art demands for its perfection, reciprocal obligations and commensurate teaching. There are, I think, but comparatively few painters for whom Architecture ranks as more than a subsidiary element in their compositions, for with the evolution of pseudo-impressionism, now so popular with a public always ready to grasp at something new, the depiction of Architecture can but become more vague, due to the inadaptability of the line, the pure curve and the symmetrical form, to the nebulous and indefinite focus of the pictures of the most modern schools. But even here the Artist has possibilities—would that they were more frequently recognised—as a rule beyond the reach of the Architect, except perhaps when he may have the satisfaction of contemplating his buildings enfolded in the seductive embrace of a London fog, which concedes to our great edifices such mysterious magnificence, and reveals to each individual picturesque imagination such possibilities of things great and beautiful, and conceals, at the same time, bad proportion and poor detail, the sordid horrors of stackpipes and ventilators, and all the other unsightly objects of nineteenth-century utilitarian civilization.

THE EARLY DEPICTION OF ARCHITECTURE IN PAINTING CHARACTERIZED BY FAITHFUL MINUTENESS.

It is no new-fangled theory that discrimination is necessary for the proper rendering of Architecture pictorially, and there is no occasion for us to doubt of this fact if we think for a moment of its early forms in the hieroglyphical palimpsests of almost prehistoric times, in the Grecian frescoes of Pompeii and the later decorative paintings of ancient Rome. Let us consider the attentive care and study bestowed by the early Italian painters on their contemporary Architecture and its collaborative Arts. Observe how it takes its place as a necessary essential for the perfecting of their great works, just in the same way as do their conventional landscapes, formal trees, and delicate birds and flowers; and then leap over the artistic hills and valleys of intervening centuries. Compare all this with their modern equivalents. Conjure up in your minds visions of all the photographer's accessories, the appalling complexities of the colonnaded background, the delights of the paste-board balustrade, the noble realism of the cork-built rockery and rustic arbor, the grass mat, the artificial flowers, and all the other splendours with which the photographer used and even still continues to surround us, in order to produce what he considers a work of Art. Think of the unrivalled opportunities bestowed upon these so-called photographic Artists by an intelligent public, delighting to behold their features and forms sanctified and perpetuated in the fleeting idiosyncrasies of a passing fashion of dress, and callous to the hilarious ridicule with which they compel their descendants to hallow and honour their memories. But my subject is Pictorial Architecture. As I have said, we find this conscientious regard for the faithful depiction of Architecture in all ages and on all occasions, for we note its naïve fidelity on Oriental plate and vase, and it evinces itself with a subdued and reverent persistency on the panels and triptychs of Fra Angelico, of Cimabue, of Perugino, and Boticelli, and their disciples.

FROM THE RENASCENCE ONWARDS.

Then came the renascence, unfettering not only Architecture, but all the kindred Arts, from the thraldom of a mediæval sentimentalism, revealing interminable vistas, religious and secular, to the master-minds of the painters to whom its advent was so largely due. The sentient rays of the great revival spread to countries far and near, developing in each a *môtif* characteristic of its inhabitants; the superbly dignified portraiture of a Velasquez in Spain, on the one hand, or the quaint *genre* work of a Wouvermann in the Netherlands, on the other. But let us follow the existent sympathy between the Architectural reality and its semblance on canvas, still continuing onward. Do we not all know well, from our studies of Architectural history, of the gradual increasing love of refinement, of proportion and detail, and the loss of robustness, of mass and dignity, and light and shade? Do we not know, too, how these sublime qualities were usurped in course of time by the shallow pilaster and the meagre cornices of the later developments, and compare, as a synthetic corollary, the grand treatment on canvas of the Architectural compositions of Raphael, of Tintoretto, or Michael Angelo, and mark, through its many phases, the gradual decline into the dreary efforts at exactitude and photographic accuracy practised by Canaletto and his many followers, in that innumerable series of views of Church and palace, all sharply outlined by their fenestration and hard wiry cornices, to the exclusion of all depth, light, shade, and atmosphere? It is indeed unfortunate that a painter of such great abilities, and so cognisant of the legitimate form and proper disposition of Architecture, should be overwhelmed by the persistency of his definition and pictorial exactness, yet, throughout his entire career, so confident of his manner of drawing and colouring that his works need no catalogue number to attribute them to their true author.

TURNER, THE TRUE IDEALIST.

We have no time to review the works of so many masters, but we are impelled to pause to think of that great painter who was the idealistic poet of pictorial Architecture. It was Turner who could see the Architect's work as he longs to behold it himself; it was he who could transpose the ethereal visions of his brain to comparative permanency, through the medium of his inspired hand, and who could, while retaining in his work a sufficiency of that regard of absolute accuracy, blend the most uncompromising features into a group of incomparable beauty. It was Turner who could also bring to his aid all the most beautiful phenomena of nature, the cumulus and the cirrus, the rainbow and the shower, the sunbeam and the mist, for the perfect compassing of his delightful works. Truly, Turner revealed his Architecture as he beheld it, with mystery, with truth, and with idealized beauty, while Canaletto gave us instead the mechanical Architecture of the drawing-board, the set-square and the compass: *he* presents it to us as he knew it to be.

THE WORK OF CONTEMPORARY PAINTERS.

In the work of contemporary Artists, it is not a far cry to seek subjects for criticism, for do not the Academy, and the other yearly exhibitions, the modern collections at South Kensington or Bethnal Green, give us, as a rule, more subject for regret than approval? Here we see the apathy of some painters whom we are accustomed to hear called Artists, for the greatest of all Arts, and here too, in some cases, we Architects will find much to learn from compeers in a kindred branch of Art, who work untrammelled by the limitations of planning and those numerous restrictions imposed on the Architect in actual work, who contrive in their pictures those beautiful schemes of colour and decorations, and give us those truer principles of proportion which we can never gain from dead sheets of elevations and sections. For it is furniture and those many other touches needful to render complete the habitations where mankind dwells, which alone can demonstrate these principles, and we Architects find it very difficult to grasp them. And how pleasant it is to us when we find a painter who takes some particular period of work and makes it his own! How glad we are of the classical compositions of Alma Tadema, or the charming Dutch scenes painted by his wife; the late French interiors, with their tones of pale greens and yellows, salmon and brown, which so well become an Orchardson; or those elegant Georgian rooms and old-world gardens with all their courtly accompaniments of a Dendy Sadler. And when, as sometimes happens, we are called on to design things other than what may be legitimately called "Architecture," may we not gain the greatest assistance in our work from these men, whom we know have spared no pains to make their pictures correct as well as complete? If, therefore, our painters would only give a little of their time to acquiring even a rudimentary knowledge of the principles governing Architecture: if only each would cultivate, if he will, an individual eclecticism from the great masters of our Art, how much mutual assistance we should have in furthering that one great ultimate object for which we all should be striving—the making of our life more good, more true, and more noble, the restoring in some degree to nature the beauties of which our civilisation has deprived her, not indeed her own, but the best our feeble intellects are capable of! And the difficulties which the Artist has to encounter in mastering the elementary doctrines of Architecture are but trifling when compared with the pleasure and profit which are ready to reward him for his pains; a little thought, a little searching for the reasons of the why and wherefore of things, a little more attention and consideration of the construction of the buildings he sees around and the house in which he lives, the easy familiarity to be gained with the best Architecture which countless books place now-a-days within the grasp of all. Why does he deck his studio with the nick-nacks and trophies of his travels in distant lands, and yet care not for the Architecture of his house, or for the design of its fittings and furniture? If this habit of carelessness obtains with painters, then they are not Artists, for if Artists, then they will adore all Art; there is but one shrine at which they worship, otherwise they will not be true to their calling or themselves, and, if not true to themselves, their work will not live, for do we not all know the precept: "Wheresoever the search after truth begins, there life begins; wheresover that search ceases, there life ceases"? I know it is true that the Artist has not the same inducements to study the correctness of his Architecture as he has the anatomy of his figures, the lines of his draperies, the atmosphere of his distance, the breed of his sheep and cattle, or the species of his trees. The public profess to know what is correct and proper in these matters, and hesitates not to criticise the painter who transgresses on their credulity, or infringes the limits of their knowledge of these things; but it cares not, it passes by with ignorant indifference, it raises no protest against the Architectural solecisms in which some painters revel, and of which the veriest tyro in our Architectural Classes of Design would scorn to be guilty, for the public neither knows or cares for these things.

THE BENEFICIAL INFLUENCE OF THE PRE-RAPHAELISM OF THE NEW RENASCENCE.

But the public is arousing itself by slow degrees; the dawning light of our new Renascence is filtering itself gradually into their gloomy abodes, our schools of Art, our needlework guilds, our exhibitions of Arts and crafts, all traceable, indirectly perhaps, but still traceable to that great historic Oxford movement of half a century ago, whose consequences were diffused infinitely more widely than its most sanguine leaders could have anticipated

in other than purely religious circles. Our whole Artistic life has been metamorphosed by it. First, there was the pause; the Artist stood aghast at what had formerly contented him. Then came the flight back to the early springs of pure Art, and the endeavour for honest simplicity and truth and conscientious work, led by a Rosetti, a Morris, a Burne-Jones, a Ruskin, and a band of other disciples, whose numbers are always increasing. Still, we are but started, retarded by careless money-grabbers, who advertise themselves in our exhibition galleries with paintings which appeal not to our highest conception of the divine and beautiful and decorative (for it is vanity to call anything which is not decorative a "picture," since the reason for which we have pictures in our houses is to decorate them) but rather to the less worthy feelings. For it is astonishment which is aroused by the dramatic intensity of their subjects, or the exciting incidents they depict, the daring scheme of colour or some *tour de force* of technique, or the depicting of motion or other effect of realism, which leads our thought away to the flimsy contrivances of the scene-painter or the peep-show work of the cheap illustrator. And that is the true reason why those among us who are striving to realize the doctrines which great Art ever aims at inculcating, cannot be brought to see any beauties in the canvases of those men who endeavour to rival the coloured photograph in the realism of nature, adapted to one plane. Are we not repelled by the imitation *in media*, entirely inadequate, of the sunset-sky, or the foam-flecked rocks of the wind-driven sea, and such-like efforts on the part of a unit of puny humanity to emulate inimitable nature within the margins of a gilt frame, lacking, as it must, the roar of the ocean, the twitter of the swallow, or the perfume of the fields, and all that infinity of resources with which nature appeals to each of our senses, the music, in short, of Pan's pipes, combining all to make each scene complete? Yet this coloured landscape-photography, and this rendering of exciting scenes or display of astounding technique, is the type of work which the ordinary visitor to our exhibitions prefers, for it is ever the full-flavoured dish which appeals to the uneducated palate. This, also, is why the dramatic and realistic music of Handel's oratorios draws crowded audiences, while the great works of Beethoven, or Chopin, or Wagner, are only appreciated by a small section of mankind. For the same reason the majority of visitors to Italy really prefer the theatrical cenotaphs of the new cemetery at Genoa to the noble monuments of the ancient Pisa Campo Santo. My argument holds good, too, in all branches of Art, for it is the same in poetry and literature. The mission of the painter is a great and responsible one, for it is his to receive all these impressions so bountifully bestowed upon his brain. He is the medium between mankind and nature, it is *his* to interpret this combined entirety, with all the power of idealism which providence has blessed him with; and if he gives us as it were himself, in his pictures, if he paints with honesty of purpose and with sincerity of intention, then, indeed, his works are worth possessing. But when he paints the works accomplished by *man*, the case is modified and realism is more legitimate, for the fabrics raised by the hand of man are comprehensible to his intellect, for here there is no struggle of the finite against the infinite. And so it seems to me, the painter must be differently disposed when he gives us his translations to canvas of the works of God, which it is impossible for him to fully realize, to the occasions when he presents his rendering of the works of his fellow-creatures, which he can understand. And this is why his Architecture should be represented with a practical knowledge of the principles which govern it, just as the portrait painter must be educated in the limitations of his draperies.

THE PAINTER'S VIEW AS TO ARCHITECTS' DRAWINGS.

"But," says the painter (and he says it truly), "why do you Architects, who give us views of your works as we shall see them, why do you not study even the most rudimentary facts of nature? Surely, if you think it is desirable we should know something of your Architecture—which is only, after all, the outcome of poor humanity's requirements—why don't you in turn study infinite nature, which you fondly imagine you are treating as an accessory, as a background on which to exhibit in raw perspective, frequently from impossible points of view, the glories of your designs? That the buildings themselves may be correctly drawn and the shadows legitimately traced upon them by scientific rules, is the best that can be said of them, almost without exception. Where is the effect that atmosphere would give? Where is that *chiaroscuro*, that mystery, without which no picture exists? There is but one mystery about your work, and that is the interpretation of the wooden dolls you call figures, and the Noah's Ark structures you call trees! Why do you not treat them after the manner of the theatrical manager in olden times, whose resources in stage propertes were limited, by substituting on a label the notice 'A tree here,' 'A figure here,' or 'A waggon there?' It would be less ludicrous, and would tend to preserve the dignity of your Art." This is all very true, but let the painter remember that the drawing is for the Architect only the *means* to the end; let him go to the building itself before he opens his mouth to criticize. We say your canvas is the definite and ultimate motive for which you have contended. Our trees and figures will not be as we have shown them in our drawings, that we know. Nature will place the figures and design the trees for us, but if your pictures have their Architecture wrong nothing will alter *that*, it will always be a source of discontent wherever they hang, and they cannot be tolerated. No painter, I venture to think, who has even the slightest information of the history of Architectural draughtsmanship, will be inclined to cavil if I say it has improved in an astonishing degree in the last quarter of a century, and it is not, I think, wholly confined to the mere depiction of our buildings pure and simple, though we can never hope to become equally proficient with the painter who devotes his life to the study of visible creation. Still we shall all long to improve our feeble attempts to catch the truths of nature, and so add immeasurably to the value of our Architectural drawings. Our opportunities are limited, the task is hard, our hands are cramped by the compass and the straight-edge; we have been trained to draw in wire-like lines with pencils whose qualities are usually estimated by their ability to retain for the longest time a fine point; our eyesight (unless destroyed by over-strain) is microscopic, and is never satisfied unless the uttermost detail is indicated on our drawings, no matter of what scale. Why *must* we go out to sketch, armed with our opera-glasses wherewith to count the dentils in shadow of the cornice, or to search for the exact form of the patera in the gloomy hollows of the Gothic archmould? Why cannot we bring ourselves to draw what we really see? Why are we never satisfied till we have drawn all that is really there? It is because we so continually lose ourselves in trivial details and are oblivious to all the power and dignity of mass and outline, that our Architecture so often savours more of the cabinet-maker's bench than the Architect's studio. Now the sketching of mass and outline has been almost entirely neglected by Architects, and yet its value cannot be over-estimated in our training, for the value of our detailed sketches should consist in indicating the nature of our measured drawings in perspective.

A PLEA FOR DRAWING FROM LIFE.

Let us therefore extend our radius of subjects, let us in the small amount of our leisure moments, cast to the winds those hard pencils, those scales, squares or compasses, let us take our largest sheets of paper, our chalks or charcoals, and draw, as large as we can, things as we see them, not confining our efforts to Architecture alone. Let us spend our summer days in the sunny meadows wrestling with the forms of trees and flowers and cattle and birds, or else with the craggy masses of the mountain, or with the subtle curves of the waves breaking on the sea-shore. Let us pass our winter evenings drawing from the life at our excellent schools, or in modelling in wax or in clay, or in beating and twisting into delicious curves our wrought-iron, and then, perchance, shall come again an insight into a knowledge, more wide and pleasurable, more useful and appreciative of qualities which are essential for the proper treatment of pictorial Architecture. And for the delineation of our buildings themselves, how much we shall acquire from this wider field of study! How difficult it is for the beginner to choose the right position for his subject. See how carefully and laboriously he tries to draw each line correctly, and having done so, how unsatisfactory appears the result. Why is this? Is it not because he forgets the entirety of his subject, he is dominated by each detail in turn? Let me quote from the preface of "Modern Painters":—"The Artist," says Ruskin, "frequently separates, as chief enemies, the details and the whole, which an Artist cannot be great unless he reconciles; and because details alone, and unreferred to a final purpose, are the sign of a tyro's work, he loses sight of the remoter truth, that details, perfect in unity and contributing to a final purpose, are the sign of the production of a consummate master." Yet for the satisfactory accomplishment of this work, he durst not be careless in the indicating of his detail. He must gain that intuitive knowledge where to place the sharp line as well as the soft broad stroke; he must be on his guard against the indiscriminate use, when drawing new work as well as old, of the blandishments of pernicious insincerity, so easily assimilated, of those little dots and scratches, wavy and broken lines, and the hundred other tricks which are adopted to produce effect at the expense of truth. True, sometimes, we are justified in the use of some of these devices, as, for instance, when we draw old work, for time has produced these effects for us, and we should not be true to smooth them out. But these broken stones and wavy string-courses and broken plaster, do not occur in new work, and they are false, for have we not all experienced the disappointment of being brought face to face with the original of one of these misleading drawings which we so frequently see? And we are impelled to draw with truth, or else of what advantage is there to us in that inestimable gift which Providence has bestowed upon us - the means of seeing the effect of our buildings before they become realities? Since we have lost the art of building successfully by the haphazard methods of mediæval times, how we must nurture this gift, which, in countless instances, has proved our salvation!

A PARALLEL OF THE PAINTER'S WORK AND THE ARCHITECT'S WORK.

Just for the moment let us compare our work with that of the painter. See with what ease he may modify, alter, amplify or simplify each portion of his composition; consider the facility with which he may retune the discordant note in form or colour which was not obvious till the whole chord was struck. Or, when he feels within him that his completed work is unsatisfactory, he may still efface its surface and begin again, or should his conscience tell him that his conception is unable to soar to the sublime altitude of his subject, or that his intellect is unable to grasp it in ideal beauty, when he knows that having done his uttermost, and been vanquished, he may still rend his canvas in twain, and burn its fragments before the world knows of his failure, and loses confidence in his abilities, and, he will emerge duly chastened in spirit, perchance, to a fresh start, on a theme less ambitious perhaps, and more within the horizon of his imagination, of which, when accomplished, mankind will say—"This is the greatest work he has accomplished!" But how different with the Architect, whose scope so mightily eclipses that of the painter, in that his work is a necessity for our welfare, while it would be possible to dispense with pictures, and music and poetry, though how rugged, to be sure, would our existence be without them. Our Architecture is almost as essential to us as our food. When we take upon ourselves the responsibility of using the most durable and everlasting materials which this globe contains, when we cement them together with the most tenacious compounds at our disposal, and use the most powerful agents science has given us the use of, to draw and bind our structures into a homogeneous mass, when we make it proof against fire, and cover it to prevent the disintegrating forces of nature, before we thus strive for its permanency, let us consider well, for fear that even before our work is complete, and before it be unveiled from its network of scaffolding, lest we may afterwards long to alter or modify its design, or even obliterate it altogether. But no—once there, it must remain, we must see it each day we live, and hear the comments of a heartless community, always ready to criticize, or the still more poignant darts of our brothers in our profession. We may even lose thus the esteem of our clients, and we may not be given another chance of repairing our errors. Thus it is, that whether we be painters, treating of impressions, or Architects, treating of facts, the faithful expression of our Architecture, pictorially,

is of value to our work beyond price, therefore let us cherish it, let us never slur over it, or think it not worth while. Our buildings or our pictures, which are the lasting records of our time, which mark the epoch of our lives and manners, which illustrate our national history, demand that, as Architects, we raise no edifice without the most careful previous consideration and the drawing of its mass and details, and, as painters, that you acquire that sufficient knowledge of Architecture which will enable you to escape those treacherous pitfalls of Architectural solecism, which continually destroy the lasting worth of your paintings. For it is on this true and faithful expression of your work that your own reputation will depend, and, more than all, it is on this also that your country's reputation depends; for each individual work helps to make or mar the place your country takes in the record of the world's Art.

[For want of space the discussion in which Mr. Joseph Pennell, Mr. Brewer, and Mr. C. G. Mallows took part is held over until next week.–Ed.]

THE INSTITUTE OF BUILDERS AND THE NEW CONTRACT.

WE have received from the Secretary of this Institute a circular letter, as follows:—"During the last few months, several inquiries have been made at this Institute with reference to the new form of contract recently issued by the Royal Institute of British Architects, and I am directed to give you the following information on the subject. In the year 1890 the Royal Institute of British Architects desired to arrange with this Institute a new form of contract, to supersede the form settled between the Architects and builders in 1871, and which has since that time been in constant use. The builders were not anxious for any alteration in the old form, as it was well understood by both Architects and builders, but at the instance of the Architects they discussed the form of contract submitted to them, and the negotiations extended over a period of some four or five years. This Institute, with a desire to meet the views of the Architects, reluctantly assented to adopt the phraseology upon which the Architects laid great stress in various portions of the contract, expressly on the condition that the arbitration clause should be framed in a mode approved by this Institute; and on this footing the negotiations proceeded. When the time came for settling the arbitration clause, this Institute as advised by Sir Richard Webster and Mr. A. A. Hudson, that the form of arbitration clause which the Architects after long discussion required the builders to accept, would not give the builders the protection they required, and that they should, therefore, decline to adopt it. The Architects, however, were equally determined not to adopt the arbitration clause in the form the builders were advised was necessary for their protection, and thereupon the negotiations were broken off. The Architects have since issued a new form of contract without the approval of the Institute of Builders, and which, indeed, the builders are advised, if used at all, should only be with an arbitration clause in the form the builders were willing to agree to. This Institute, therefore, repeats the advice and recommendation given after the negotiations had broken off in 1895, viz., that the old form of conditions agreed between the Architects and builders, in 1871, and which are so well known in the trade, should be used as the standard form is not recommended. The use of the new form of contract put forward by the Architects, except with the arbitration clause in the form the builders are advised is effectual."

THERE appears to be an opening for builders at Kingsteignton. At last week's meeting of the Parish Council, Mr. Freestone, on behalf of the committee appointed to make inquiry about the erection of workmen's dwellings, presented a report in which it was stated that the committee most emphatically recognised the great need there was for additional cottage accommodation at Kingsteignton. The committee believed that a limited number of houses built in Kingsteignton would remunerate the builder as well as supply a great want of the working people. If considered that the houses might be built and offered for sale to the tenants, some of whom would doubtless purchase their houses if facilities were offered for their so doing.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
December 23rd, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gildea ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE proposed Watford Railway has excited great opposition from the Artistic colony of Bushey. Professor Herkomer was sounded on the point the other day, and said, "If a railway is put entirely out of sight of my house it cannot injure me, and it will not injure my college." The opposition to the railway going through Bushey cost the Professor a large sum of money. "My presence here," he said, "means £10,000 a-year to the place, and the rural aspect would be entirely changed." So far as communication with London is concerned, the Professor added, the only difficulty was getting to Bushey Heath or from Bushey to the station, and soon, he thought, there would be motor-cars running down to join the trains, and this at cheap rates. As an Artist, of course, and as one whose particular work has undoubtedly been "the making of Bushey," Professor Herkomer would view with displeasure the close approach of a railway, and, as he remarked to his interviewer, "You ruin too much in order to produce nothing. The ruin to the rural aspect would be great, whatever the other side has to say. I am not vindictive; I want to save myself and my colony, because it is to me a vital thing. It is no profit to me—the students are children to me, and I feel it greatly. It would be done by people who do not consider others sufficiently. I do not want to interfere with trade, but I don't want my life interfered with. I do not think there is any village like Bushey, and I have said what my presence means to it."

MR. GEORGE C. HAITÉ has accepted the office of President of the Nicholson Institute at Leek, and succeeds Sir Owen Roberts, M.A., D.C.L. Mr. Haité will deliver his presidential address to the students of the School of Art, Science, and Technology in January, and will also distribute the prizes and certificates.

AN interesting enterprise has been started at Birkenhead by Mr. Harold Rathbone, a well-known Artist, in conjunction with Mr. Conrad Dressler and others, for the production of high-class pottery, adapted both for ordinary use and for decorative purposes, both external and internal. The company, directed by Mr. Rathbone, took as its model the famous fifteenth-century work of Donatello and of Luca Della Robbia, and in order to emphasize its allegiance to this particular school it adopted the designation of the Della Robbia Company for its Artistic and its trade name. Examples of its productions have been shown at the Arts and Crafts and other exhibitions, where they received high commendation, amongst others, from the late Lord Leighton, Mr. Holman Hunt, and Mr. Walter Crane. The new industry should have an important future before it, the more so as Mr. Rathbone and his associates are creating a school of young designers and potters, many of whom show a high degree of inventive faculty and technical skill. One commendable feature of the display is that each work bears the signature of the designer.

GROOTE SCHUUR, the country seat of Mr. Cecil Rhodes, was destroyed by fire last week. The house is situated at Rondebosch, seven miles from Capetown, and the building was an old Dutch structure, one of the finest specimens in South Africa, with a picturesque thatched roof, and surrounded by large grounds, one portion of which was devoted to a zoological garden. Happily, the buildings in that part of the ground are uninjured. It appears that some books, papers, and curios were saved, but many priceless relics were destroyed, including the Zimbabye collection. Several of the rooms were panelled from floor to ceiling in plain teak panels. Antique Dutch furniture, in excellent preservation, was obtained for the various rooms. Rich old tapestries, old prints, and old paintings, including a Sir Joshua Reynolds and an early view of Capetown and Table Mountain, attributed to Richard Wilson, R.A., decorated the walls. Mr. Rhodes's library had about 2,000 volumes, said to be mainly historical works and translations from the classics. But it was chiefly remarkable for its collection of curios. Lobengula's rifle, bearing the arms of the South African Government, the famous silver elephant found among the ashes of Bulawayo, the Matabele chief's drinking-cup (which held two quarts), and the royal elephant seal, were among these curiosities. The treasures found in the Zimbabye ruins were also kept in this library—a wooden bowl (with carvings representing the signs of the Zodiac and the sacred crocodile), a Roman coin (Emperor Antoninus Pius), blue pottery, and parts of a slave-chain.

AN account was recently given by Mr. George E. R. Thomas before the Western Society of Engineers (Chicago), of putting down a shaft at the Chapin Mines, Iron Mountain, Michigan, U.S.A., by the freezing method. This is the only instance in America of a shaft being lowered by the Poetsch system, although in Europe the system has been applied in several cases. By this method, one can defy the flowing quicksand, water-bearing materials, or even water, and hold it absolutely rigid until such time as the work is completed. Ten-inch pipes were, in this case, lowered to the depth of 104 feet, so as to form a circle proportionate to the size of the shaft, by using a jet of water under high-pressure on the inside of the pipe. The lower end of each pipe was toothed with steel, like a trepanning instrument, and the upper end attached to a toothed wheel, into which two pinions were geared and driven by a steam-engine. When these pipes were in position, a smaller pipe, 8 inches in diameter, was placed within the larger pipe, which was then withdrawn, and again another pipe, 1½ inches in diameter, open at the bottom, was placed inside the 8-inch pipe for introducing the circulating freezing fluid, chloride of calcium in solution at a temperature of —35° Cent. or—31° Fahr. This fluid was cooled by means of a Linde refrigerator, in which anhydrous ammonia was employed, and was then forced by a circulating pump into the 1½-inch pipe, out of which it flowed into the 8-inch pipe, whence it rose to the cooling tank. Fifteen thousand gallons of this fluid were circulated through the entire system every 33 minutes, the flow being directed into the standpipes by a system of valves. When the frozen portion of the ground between the pipes had become frozen together into a solid mass, it took the form of a cone, owing to the fact that the fluid on emerging from the 1½-inch pipe was of a lower temperature than it was at the surface of the ground, and after it had done its work. When the work was completed the ground took several weeks to thaw and to return to its normal temperature.

UNDER the auspices of the Eastbourne Technical Instruction Committee, the first of a series of lectures on Domestic Architecture was recently delivered at the Town Hall, the lecturer being Mr. F. R. Farrow. The lecture was of a popular character, elementary enough to be easily appreciated, and yet sufficiently technical to make the observations of value to an advanced student of the science. Domestic Architecture, was, Mr. Farrow remarked, a subject in which every one who had to live in or have anything to do with a house, was interested. The special idiosyncrasies and tastes of the occupier should be studied, and for that reason the ready-made house was necessarily a sort of compromise, because it was impossible in such a house to do this thoroughly. It was therefore better that they should own the house they lived in and, if possible, have their house built to order under the advice of an Architect, for in that way they could more readily insure that their homes would be comfortable and beautiful. With many so cheap as at present there was scarcely a safer or

more remunerative investment than becoming the owner of one's house, the risk in such a case being practically reduced to a minimum. Proceeding, he went on to speak in general terms as to the position of a house with respect to the important consideration of aspect, which had to do with the weather and the light, and of the prospect, which was solely a question of view. Having regard to the invariable practice of having windows in the back and front in town houses, he suggested that the best aspect was west and east instead of south and north. With regard to the apartments of the house, he especially emphasized the value of a spacious and decorated entrance hall. The characteristics of the dining-room, drawing-room, boudoir, the morning-room, library, and bedrooms were also dealt with in detail, the object of the observations on each of the apartments being to point out the arrangements that were most satisfactory as to effect and convenience for the ordinary life of the home as well as for the purposes of entertainment.

UP to the present no one has been able to dispute the boast of the proprietor of the "Fighting Cocks," at St. Albans, who claims that his is the oldest inhabited house in England. The "Fighting Cocks" is a building chiefly octagonal, and the rest of an indescribable shape. Inside it is a ramshackle collection of rooms carefully unadapted to the purposes for which they are used. The upper part is wooden and reasonably modern, the oak joists, for instance, not being much more than six centuries old. Its claim to age rests chiefly on the foundations, which are part of a bastion which once formed the corner of the Abbey orchard, and in this bastion is the cellar, said to be unequalled in St. Albans for keeping qualities. As the Abbey wall was commenced about 1080, this would give the "Fighting Cocks" the respectable antiquity of 900 years or so. But there is a possibility, almost a probability, of greater antiquity. Just in front of the inn, only now hidden by one of the very few silk mills left in England, flows the Ver, the river that gave its name to Verulamium, once the Roman capital of England, and by the side of the mill is the old ford, now spanned by a footbridge. Just across this ford are the remains of the walls of the Roman camp, fast disappearing through the fondness of excursionists for brick and flint relics. The walls of the "Fighting Cocks" are built of brick and flint derived from the Roman camp. But that says little, for having so glorious a mine of building material free, gratis, and for nothing, the mediæval inhabitants of St. Albans, not having the fear of the Act for the Preservation of Ancient Monuments before their eyes, stole all they could carry away. Consequently Roman tiles crop up in every direction except in and about the camp.

A WESLEYAN committee has been formed to commemorate the sixtieth year of the Queen's reign by raising a fund of £10,000 to assist in the erection and maintenance of soldiers' and sailors' homes in this country and in various parts of the Empire. There are already twenty-eight such homes held on trust or by special regulations for the use of all members of Her Majesty's sea and land forces, irrespective of religious denomination. These have been acquired at a cost of £34,024, and maintained at an annual expenditure of over £12,000. It is proposed by the new effort further to extend them, and remove any pressing indebtedness on the premises already in use. Particular attention will be given to the Soldiers' Home in Buckingham Palace Road.

ST. MARY'S CHURCH is to be excluded from the Bill to be promoted in the forthcoming session of Parliament, to obtain power to remove certain Churches in the centre of the city, with a view to providing for the wants of more densely populated districts in other parts of the city. The Commission recommended, after careful consideration, the removal of Christ Church, St. Mary's, and St. Peter's. St. Mary's, we believe, was included with a certain amount of reluctance, but was not of any very great value for the purpose of Church extension. A new roof for the Church will be an absolute necessity at a very early date, and unless this and other repairs and renovations are carried out the question of the removal of the Church will settle itself. Something like £2,000 or £2,500 is required. The parishioners are willing to do what they can, but that cannot be much. Apart from the Church, one of the schools will have to be closed at an early date, as the building has been condemned by the Education Department. We may venture to express the hope that those who have been so anxious for the retention of St. Mary's, will now come forward and assist in meeting the very heavy expenses above referred to, which will have to be met in consequence of the decision to leave the Church in its present position.

AT a recent meeting of the Society of Antiquaries of Scotland, the first paper was a notice by Mr. J. W. Morkill, M.A., of a human hand and forearm pierced with nail holes, and a basket-hilted sword, formerly preserved in the family of Graham of Woodhall, Yorkshire, and considered as relics of the famous Marquis of Montrose. The second paper was a notice of a sculptured cross, with the crucifix on the obverse, recently discovered at Lamlash, Arran. This monolith of white sandstone, six feet in length, was discovered in digging a grave near the east end of the old Church, in the burying-ground at Lamlash. It shows a convex surface on front and back, with square-cut sides, and bears on the obverse a representation of the crucifixion in high relief, with a star above each of the arms of the crucified figure. The lower part of the figure is not seen, but the upper part seems to emerge from a cup-shaped calix, or blossom, on the summit of a stalk which undulates from the base of the shaft, somewhat resembling a Jesse tree. At the lower part is the figure of a nude child, from which the stem seems to rise. The reverse bears a cross with an open square head, enclosing a diamond-shaped form, in the centre of which is a star. The square has crosses projecting from the middle of the sides, and *fleurs-de-lis* at the corners. Up one side of the shaft is a wavy scroll of foliageous ornament. The sides are also sculptured with foliageous scrolls. A drawing of this curious cross, by Mr. T. Smellie, Architect, was exhibited. In the third paper Dr. Joseph Anderson communicated notices of some recently discovered inscribed and sculptured stones. The first was a cross bearing a Runic inscription, discovered near the east end of the old Church of St. Peter's, in Thurso, which was sent for exhibition by the directors of the Thurso Museum. It is interesting as being the only Runic inscription hitherto discovered on the northern mainland within the old Norse earldom of Caithness. The second was an incised slab, with symbols and an Ogham inscription, found on the links of the Bay of Keiss, Caithness, and preserved at Keiss Castle by Mr. Barry, M.P. It bears on the upper part the symbol of the fish, beneath it an ornamented symbol like a book-cover, and at one side an Ogham inscription consisting of a few letters only, which Lord Southesk and Rev. Dr. Joass agree in reading as probably a proper name, but the concluding part of the inscription is wanting. The third was a portion of a sculptured slab with part of an ornamented cross-shaft found in digging a grave in the churchyard of Murroes, Forfarshire. It bears an elaborately executed panel of interlaced work of serpents in relief and a figure of an animal such as usually appears on the sculptured stones of Scotland.

AT a meeting of Truro Cathedral Committee recently held at Truro, the Bishop said it would be remembered that some time ago he was offered £1,000, on condition that the building of the Cathedral was at once commenced, but he feared this had been lost owing to the delay. The Earl of Mount Edgcumbe had promised £1,000, Lord Robartes would give £2,000—spread over three years. Mr. J. L. Pearson, the Cathedral Architect, sent the following estimate of the cost of completion of the Cathedral, in sections, as desired:—Completion of the two eastern bays of the nave and aisles and the erection of four additional bays, £16,500; two additional bays of the nave and aisles £7,500 (the cost of these two bays would be greater in proportion than that of the other bays of the nave and aisles, because the eastern piers of the western towers and the arch across the nave connecting them are necessarily included); completion of the nave and aisles, including the western narthex and the western towers up to the height of the aisles, £10,000; north and south porches, £1,500; a further portion of the western towers from the level of the aisle roofs up to the eaves of the nave roof, being a height of 44 feet, £5,000; completion of the western towers, £5,500; spires of the western towers, £4,000; completion of the central tower and spire, £10,000; chapter-house, with the vestibule leading to it, £6,000; cloisters (with groined ceilings), £5,000; total, £71,000. The following has already been spent on the Cathedral:—For building choir, transept, baptistry, and part of the two bays of the nave, £96,180; for clock tower, £1,971; internal fittings fund, including, reredos, stalls, &c., £16,150; special objects, including carving, stained glass, &c., £1,204, making the total amount already expended £115,507.

AN interesting paper has been brought to our notice, the joint production of Mr. W. B. Cook, C.E., and Mr. F. Willoughby, upon a new method of utilizing canals for traffic, with special reference to the canals of Lancashire and Yorkshire. It was proposed to draw off the water from the long-distance canals and lay down on the bed of them a standard main line of 4 ft. 3½ in. gauge railway, constructed with stone foundations, timber sleepers, cast-iron chairs, and a single line of 90 lb. to the yard steel rails, with gradients in the place of locks, retaining as waterways such portions as might be required to connect the rails with other canals which were not transformed or with canalised or other rivers. A single line of rails with sidings and turnouts would be sufficient to transport ten times the amount of traffic at present carried over the canals, but there was ample room on all canals for a double line, which could be laid down when required.

AT the meeting of the Halifax Town Council, held on the 2nd inst., the question of adapting the old infirmary buildings to serve the purposes of a police station and a court-house was deferred at the request of the magistrates. Since then the members of the Town Council have met the borough engineer, Mr. Escott, at the old infirmary. Mr. Escott stated that some of the suggestions made by the magistrates could be easily accepted. The prevailing opinion was that the adaptation scheme should be proceeded with, and subsequently, at the monthly meeting of the Watch Committee, a resolution favourable to that scheme was adopted, and it was also agreed to recommend that application be made to the Local Government Board for sanction to borrow £9,000 for carrying out the necessary alterations to the old infirmary buildings.

LONDONERS are generally indifferent to the adornment of the metropolis of the Empire. They have now an opportunity, to some extent, of removing this well-merited reproach. Last year the London County Council was offered the equestrian group of "Boadicea Heading a Charge of Chariots," which it took the late Mr. Thomas Thornycroft fifteen years to model. The only condition attached to the offer was that the Council should defray the cost of casting the group in bronze. The Council at first accepted the gift, but subsequently relinquished it on finding that it would cost £6,000 to cast the group. It was felt that the opportunity thus afforded of enriching the decorations of London ought not to be lost, and after the decision of the London County Council was made known the project was taken up by a committee consisting of members of Parliament, members of the Royal Academy, and of the County Council. They have ascertained that the original estimate for casting the group was altogether too high, and two offers have now been made to them to carry out the work for £2,000. Mainly through the exertions of Mr. W. J. Bull, the secretary of the committee, the larger part of the money required has been collected, and he hopes the balance of the £2,000 will be provided by the Council. If these hopes should prove to be well founded, there is every reason to expect that Thornycroft's representation of the British warrior-Queen will be eventually erected on the Embankment, or some appropriate site.

THE exhibition in the Art Gallery of the Guildhall, of a hundred water-colour drawings by masters of the early English school, is valuable both historically and artistically. The drawings, which are all from the collection of Sir Charles Robinson, are representative enough, and include examples of most of the Artists by whom one of the most individual branches of our national Art practice was created. The earliest productions are those of Cozens and Girtin, and the progression is continued through Prout, Barret,

J. S. Cotman, and Pugin, to Turner, Bonington, and David Cox, and ends with De Wint. Within its comparatively small limits, the collection is admirably complete.

MR. E. A. ABBEY has been commissioned to fill some of the bare panels round the atrium of the Royal Exchange with mural paintings, and the Artist's work of a similar nature for the Boston Library proves the wisdom of the choice on the part of the Merchant Taylors' and Skinners' Companies, who are making the gift. One panel is already filled by the late Lord Leighton's picture of "Phœnician merchants trading with the natives of Britain." When all are similarly treated, the aspect of the now cold interior will be altogether changed.

IN Dover Street, a few doors from Piccadilly, has been opened the "house" for the Arts Club. A marble staircase, reconstructed, makes the entrance hall larger and gives it more light, but the old and elaborate balustrade, with the arms of the Stanleys introduced, has wisely been retained, and the mouldings and decorations on the beautiful ceilings throughout the reception rooms also recall the original ownership of the house. A large brass chandelier, designed for many lights, is the principal feature of the inner hall, and came in for great commendation. It bears the date 1720, and is supposed to have come from some city Church when candles were the only illuminants. The alteration has been carried out under the direction of Mr. Watson.

PARIS will soon rejoice in the possession of an underground railway. The project has received official approval, and will consist of six principal lines with narrow gauge, and worked by electrical engines. One line will run by a zigzag route from the Porte de Clignancourt to the Porte d'Orléans, another along the Champs Elysées and the Rue de Rivoli, a third makes the circle of the outer Boulevards, a fourth runs east and west from the Porte Maillot to Père Lachaise, the fifth is a short line uniting the Boulevard de Strasbourg to the Pont d'Austerlitz, and the sixth leads from the Boulevard de la Charonne to the Place d'Italie. Another line will eventually be undertaken from the Gare d'Orléans to the Quai Conti, but it will not be put in hand just yet. In fact, of the lines which are already traced, it is not yet decided which will be begun first, as the Municipal Council will not settle that until the question of the money which will be required has been got rid of.

THE Duke of Cambridge presided at the meeting of the committee of advice in connection with the Victorian Era Exhibition. Mr. Paul Crèmieu-Javal spoke on the advantages of the site and buildings at Earl's Court for such an exhibition. The site consisted of 22 acres; and upon it the company had spent £100,000 in putting up entirely new buildings especially for an exhibition of this sort. Sir S. Northcote, as chairman of the Commercial and Industrial Section, said the object of that section was to provide an exhibition showing the present position of the leading trades and industries of the country as contrasted with what they were at the time of the Queen's accession, showing the immense progress and development made in all sections during those 60 years. Mr. MacWhirter, as chairman of the Fine Arts Section, said he would do his best to see that this exhibition was representative of the era of Victorian art. He intended to be present at the selection of the works of Art, and he should see that nothing that was meretricious or common would enter into his department. Sir George Birdwood said his department intended to appeal to the public for commemorative and historic objects illustrating the Queen's reign, and he thought they would receive a great deal more than they had room for. He suggested the establishment of a Victorian garden and an Elizabethan garden to show the contrast between the two eras. There would also be wax figures showing the development of costumes. Other speakers were Mr. Charles Wyndham and Mr. W. H. Cumming.

AMONG the numerous curiosities to be found in Abyssinia the most unique are its monolithic Churches. Much light has been thrown on the subject by M. A. Raffray, a French explorer. He was the first European in modern times to penetrate into the interior of this territory, and in the course of his investigations he has made many important discoveries. He found altogether no fewer than two hundred monolithic Churches, widely varying in age, but almost all identical in style. Abyssinian villages are, as a rule, situated on the slopes of small hills, and the Churches are constructed at their base, where a single huge stone can be found. When the stone has been selected the Architect superintends the excavation about it, taking care that one side is attached to the hill. The workmen afterwards with their pick and chisel shape the front, and so skilful are they that they can simulate walls and even porticoes with colonnades on the block. The interior is divided by columns, and by lateral and transversal vaults joined together by ornamental arches. There are altogether five small naves and eight small galleries which are separated from one another by rectangular columns, capped with beautifully-designed capitals. There are windows at both ends and at one side. They consist of a large circular hole in the middle, with a large cross below it, and above it smaller circular openings in the form of stars and Grecian crosses, all of which are covered with coloured glass. The colonnade on the outside supports a number of galleries, which are only used by the worshippers during certain festive seasons in the year. In front of the Church two fairly large yards have been excavated, and these are connected with subterranean tunnels which surround the Church, and are only used by officials and the most important potentates in the town.

GREAT improvements have been carried out at Rutherford Free Church, and, although the decorative work of the interior is not finished, the north gable gives an idea of the finished effect. The heightening of the walls and proportionate gables and intersecting roof of the new transepts have taken completely away the somewhat squat appearance of the old Church. The main idea by which increased accommodation has been secured is the building of side transepts and the addition of side galleries. The front elevation is improved by the building of a corner pinnacle, and the whole front and tower have been re-pointed. Both transepts and galleries are lighted by Gothic windows glazed with leaded cathedral glass, and the two rose windows in the east and west transepts are filled in with stained glass. In the interior, instead of the single-end gallery, there are now new galleries round three sides of the Church, giving additional accommodation for 200, while the ground floor transepts accommodate 60. The sitting accommodation of the Church is thus increased by 260 places.

MR. ROBERT HAMMOND, Consulting Electrical Engineer to the Hull Town Council, has just given the Council some very interesting statistics regarding electricity supply works in this country operating under statutory powers. There are 115 in all, 68 in the hands of local authorities, and 47 in the hands of companies, the respective capitals being £3,150,000 for local authorities, and £5,650,000 for companies. Thus, besides twenty works now in course of construction, upwards of nine million sterling is invested in the industry.

THE bill to be introduced into Parliament by the city Corporation for the transfer to itself of the powers and duties of the Commissioners of Sewers has been printed and circulated. The object apparently aimed at is a distinction without a difference, at any rate without very much difference, and such proposals as are made will be thought by many to be all to the good. The court now elects the Commission, which is thereafter quite independent to carry out its large lighting, paving, and other contracts just as it pleases. If this Bill passes, the court will appoint a committee, which will report their proceedings for approval, like the other committees of the court.

AN important report on the damage caused by the recent gales on the shore at Brighton has been drawn up by the borough engineer and surveyor. For the protection of the front, the surveyor submits a scheme comprising a sea-wall extending from near the Aquarium to the western side of Royal Crescent, Kemp Town, a distance of 1,700 feet, also four concrete groynes. The cost of the work, if carried out, he estimates at £27,800. As an alternative scheme, which he has not fully prepared, the surveyor suggests the construction of the sea-wall further southward, which would allow of the extension of the eastern lawns. In proof of the denudation of the beach, it is pointed out that two groynes which had been buried for some years have now become uncovered to a considerable extent.

The justices of Brentford have decided that the Grand Junction Waterworks Company cannot include in their assessment for domestic supply the value of a garden as well as charge a special garden rate—it would be monstrous if they were at liberty so to do. The case was raised in an appeal against the company by a Mr. H. P. Davies, of Ealing, who has so far succeeded in obtaining a reduction of £20 on his assessment, that being the value of the land. The company, however, gave notice of their intention to take it to a higher court.

THE Exhibition of the studies of the late Lord Leighton, at the Fine Art Society closes the old year and begins the new. It is a marvellous assemblage of the studies of a lifetime, beginning with an "Allegorical Study in Pencil and Wash," dated 1847, and ending with "Studies for the Decoration of the Rylands Library at Manchester," done only three days before his death. The only large picture shown is that of "Clytie," on which the Artist was at work the Sunday before his death, when he remarked to a well-known critic that he thought he had "never done better." Especially should be mentioned "Study of an Arm," notable for its soft flesh-like quality, "Study of Hands," and "Drawing of a Well." Full of interest, too, is the *gouache* sketch for "Cimabue's celebrated Madonna is carried in procession through the Streets of Florence," as well as the pencil studies of "Roses and Pigeons," "Bay Tree," "Fig Tree," and "Vine." In the Nelson room the works belong to a later date. There are no fewer than ten sets of studies for the "Daphnephoria," full of variety and subtle beauty; we have elaborate studies of drapery in "Cymon and Iphigenia," in "Captive Andromache" "The Ball Players," and "The Phœnicians bartering with the Britons." Three studies for "Clytie" are wondrously beautiful for their grace of design and delicacy of treatment. The numerous nude studies are remarkable for their beauty and grace. Fine examples of these may be found in "Nude and Draped Figures" (139). Among other examples that should claim the earnest attention of the visitor may be mentioned "Music," "Figures at a Doorway," "Kitten," "The Last Watch of Hero," "Sybil," "Return of Persephone," "Perseus and Andromeda," "Bacchante," and "Fatidica."

UP to the present there are five schemes for the new Cardiff Town Hall, indicating different methods of dealing with the site in St. Mary Street. They have been prepared for "certain clients" by Messrs. J. P. Jones, Richards and Bugden, but it is no secret that chief among the certain clients is Mr. James Howell. That known as scheme A. is the most in favour at the moment. This scheme contemplates utilizing the present and extended site to Quay Street and widening the latter. The area to deal with is 9,545 square yards or thereabouts, and after allowing for the widening of Quay Street to 50 feet, the road adjoining the London and Provincial Bank to 45 feet, and setting back the frontage of the suggested new building so as to make St. Mary Street at this point 111 feet wide, there is a space left of 5,084 square yards or thereabouts. The building would include Assize Courts, Police Courts, and Assembly Room. It is stated that the arrangement, sizes of rooms, and spaces allotted to the different departments have been laid down as nearly as possible to those adopted in the most approved municipal buildings erected of late date. The majority of the rooms face the main streets, access being given to them by a corridor 8 feet wide, which runs completely round the inner side of the building; and at four different points in the corridor lifts are provided to give easy access from floor to floor, and also five staircases. Thus all the departments could be reached expeditiously and without confusion. If the building is erected with elevations in the best Bath stone it is estimated that it could be erected for about £124,000, but if in Portland stone, which would be more durable, the cost would be about £147,000.

"A PLEA FOR THE USE OF NATURAL FORMS REVEALED BY THE MICROSCOPE, AS SUGGESTIONS FOR ARCHITECTURAL ENRICHMENT."

BY W. HOWARD SETH-SMITH.

(*A Paper read at the A.A. on Friday last.*)

IN this paper my remarks must be interpreted to apply especially to the enrichment of Architectural features as distinguished from the work of the decorator or ornamentalist, and I will ask you moreover to discuss my arguments and statements by the light of those examples of European Architecture which have, by the universal consent of experts in all ages, been regarded as making the zenith of their particular style. Such examples, for instance, as the best Grecian, Gothic, and Rennaissance periods furnish. The plethora of theories as to the origin of the best Architectural ornament is the strongest evidence of its obscurity. One school traces its genealogy back to a specific flower or leaf, another assures us that it originated in scroll, zigzag, or other more geometrical forms, that any similarities to the characteristics of natural foliage are super-added refinements, and that in ages of decadence only do we find literal rendering of natural forms. This last statement I accept as beyond dispute. Interesting as all such theories are, I prefer to adopt—rather than to rush in on such sacred ground of controversy—a broader, yet sufficiently definite ground, this namely: that in the best periods, Architectural enrichment, while retaining the characteristic beauties of nature, is so highly idealized as generally to baffle the attempt to identify it with the specific natural forms which originally suggested it, or have contributed to its evolution. This applies to statuary as well as to Architectural ornament, and I would suggest that in this ideal character lies the secret of their enduring appeal to the æsthetic sentiment of all ages. We must, however, never lose sight of the fact that these artificial forms which have lived so long are the outcome of the improvements of many generations of Architects and sculptors. The pleasures we now derive from these ancient forms are probably largely those of the antiquary; the degree of pleasure, therefore, depends essentially upon "correctness" in every particular; whereas living Architecture has in the past and will in the future depend on the amount of tasteful invention Architects are able to import into their work, consistently with non-violation of the laws of limits of strictly constructional Art. For this reason I have always strongly advocated a close study of the best contemporary work, and I do not hesitate to affirm that it is the most important study the young practising Architect has to pursue. Not, however, to the exclusion of that of the antique. Our taste is formed and refined by such study, to say nothing of the fact that we are constantly called upon to undertake the restoration or alteration of classic buildings, and are then bound to work more in the spirit of scholars than of designers. The human mind, however, is happily so constituted as to weary of the ceaseless recitation of even the most beautiful forms. The true Artist rebels against reiteration, and great as are the possibilities of fresh combination of the best details by thoughtful and clever Architects, I am safe in saying we are weary to death with the "Orders" of Architecture, both classic and Gothic, and with their ornament. Its interest is gone! It is a dead language! There is an outcry for something fresh, and this yearning is at the bottom of the movement just now so popular with our younger men to become actual builders and craftsmen rather than mere draughtsmen and overseers. A most healthy movement this, as healthy as that of fifty years ago among painters, under the inspiration of Ruskin's teachings. This movement is

BASED ON COMMON SENSE,

inasmuch as it admits that Architecture is not pure poetry, but insists, nevertheless, that it shall be poetical. Our Art is fettered by constructional cost and many other prosaic and inexorable conditions (but ought I to say fettered? is not the solution of the constitutional problem almost as great a joy as that of the detail?). There is, however, enough poetry left to sweeten the Architect's life, and woe be to the budding Architect who, led too far into the Arcadia of the Fine Arts, neglects those limitations, his will probably be a rude awakening when his first patron comes along. I do not understand this movement to bar the use of all ornamental forms of the past, but to encourage the thought and invention in its use as in everything else we do. In other words it is not a revolutionary school of thought. Revolution attempts what the history of mankind has proved to be impossible, a sudden act of creation. Revolution is the destruction of first principles and is consequently fatal to reform. Reform is the destruction of abuse and harks back to first principles. It is reform we need, determination to work in future on the *principles* which evolved the enrichment of Athenian, Greek, and thirteenth-century Gothic. If this be the teaching of the school I refer to, and if we be true to it, nothing but good can result to us, and we may give it our support ungrudgingly. Will you pardon me if I digress with the object of most humbly offering one piece of advice, not new I am well aware, but worth emphasising? It is this—to shun pessimism and to face unalterable facts, cheerfully trying to discover in the characteristics of our own age new motives for invention, the new foundation from which to evolve the style of the twentieth century. Depend upon it our times provide ample compensation (even for Artists) for the loss of the advantages, too often imaginary, of the romantic ages. It is ours to discover them, certainly not to indulge in raillery against the unchangeable in our environment, but to make the most of it. My object to-night is to point out what strikes me as being one of these advantages as affecting our own craft. The natural forms I shall show you were for the most part unknown to the human eye fifty years ago. Twenty years since many of them were discovered by the scientific experts of the celebrated "Challenger" Expedition by the aid of the microscope. Among this new world of wonderful forms are many so original and so beautiful that I thought it worth while calling your attention to them as singularly suggestive for

STONE-CARVING OR PLASTIC DECORATION.

In doing so I am perfectly aware that it would be unreasonably sanguine on my part to imagine that you will get workable suggestions from all of them. Suggestions from natural forms are our alphabet. We may coin many novel words by their aid, but all will not live and grow to be part of the lithic language of generations to come, as has for instance the beautiful egg and dart enrichment, the resultant, remember, of many Artistic minds. I merely aim to enlarge your vocabulary by introducing these forms to your notice. In making my selection from them, I have as far as possible chosen a few typical ones in each class. Nor have I by any means exhausted the classes. If the geological and botanical libraries and museums were searched, many works would be found to yield astonishing and most usefully suggestive forms. The microscope has enabled the human eye to extend its vision to an almost unlimited range, embracing myriads of new forms, and marvellous herein, that the higher power we apply, the more intricate, suggestive, and admirable are the forms revealed. This fact would alone constitute an apology, were one needed, for my theme. If it be true that without constant inspiration from nature our work must deteriorate, let us welcome every new light science sheds on nature. The fact that the Renaissance styles have been devolutionary rather than evolutionary, is surely to be accounted for by their designers borrowing their ornament from ancient Architecture without consulting either nature or science. Nor let us fold our hands because we believe a genius is wanted to effect a massive adaptation of a new element of design to Architecture, no such wholesale or sudden creation of forms has ever yet taken place, and never will. The average man cannot be a great reformer. Original composers are rare, while recitative talent is common. Let the standard of our criticisms of all contemporary detail be this—does it contain true feeling for beauty combined with rational construction, or as Mr. Albert Goodman puts it, "Our enrichments must be as much the product of our brains as the other parts of the work." Have we, however, no creators among us? There are, I am bold to say, as many men doing original work of a higher order as there ever were before, and in Architecture too. I will go further, and say I believe that the last 20 years of English Architecture showed a more rapid origination of really beautiful forms than any previous period of the same duration. The scientific discoveries of this century are at the root of its characteristic civilisation, and are Artists to be debarred from the new forms science has given them, and the use of which can make their Art progressive and accommodative? I have a strong conviction that we have greatly lost touch with the public, because we rather plume ourselves upon being non-scientific. Architecture must never be conservative, she will always find static forces in the affections of the public for old familiar forms and in the restraints of ecclesiasticism to express exuberance. She must be Nature's mistress, and if so will perforce ever be fresh and original enough. How many of us are found more often in the Natural History Museum than in the Archæological Museum over the way! The latter is

THE PLACE FOR THE STUDENT,

but not so much for the practising Architect. In this connection it is interesting to know that the details of many of the terra-cotta shafts designed by Mr. Alfred Waterhouse in this natural history museum are so similar to some of the Polyzoa shown you to-night that I asked him whether they were suggested by them. He tells me that is not the case, but by the forms which you will find in the cases illustrating the coal measure in the Fossil Corals room. I think, when you have examined these shafts you will agree with me that they strongly support my arguments in favour of working on these lines and in this newly-opened field of nature. They are not only original but beautiful, and harmonize wonderfully with the more historic forms around them. At the same time, let us be analytical students of past Architectural ornament. Tennyson was, as a poet, a great student of nature; he lived and breathed in it, but I believe his pre-eminence in his day was due to his adding to this great principle of work an extraordinary knowledge of the origin and character of the language in which he expressed nature's inspiration and of the best poetry which had been composed in it before. Any new forms or systems of ornament must at first be supplemental and not suddenly substituted for those with which the public are familiar, and of which they are fond. If my proposition of the hidden origin of the most beautiful and enduring types of Architectural sculpture approves itself to your minds then perhaps you will agree with me in believing that suggestions borrowed from these microscopic forms will appeal none the less strongly to the public on account of the obscurity of their origin; that they combine sufficient rarity and originality in detail with a certain approximation to many forms of Architectural detail which have established themselves in the affections of civilized mankind; that a large proportion of them are of the nature of shells or silicale cases once protecting a living cellular creature; that they are much more adaptable to Architectural carving than foliage or flowers in that they are already lithic in character. If the committee and the honorary visitors to the studio of the Association approve of the proposal and are willing to set the necessary subjects. I shall be happy to offer a prize of ten guineas in the next session for the best design based upon the subjects of this paper.

In opening the discussion, the Chairman said, he was sure they would all feel that Mr. Seth-Smith had been tackling a very difficult subject—a subject, the difficulty of which would especially appeal to every practical designer. There were few things more difficult to define than beauty and ornament. He had not a moment's doubt that they were all wrong in thinking those objects were beautiful which they liked, or those objects ornamental which appeared to them to be beautiful. They wanted some philosopher, not of a humorous sort, but of a steadier cast of mind, to guide them in the very first principles of the doctrine of designs. As Mr. Seth-Smith had pointed out the world went astray in the matter of ornaments; none of them knew what they were about. Mr. Ruskin had been exercising a strong influence upon the world into which they had been born; our forefathers believed in him, and regarded him as a prophet, but we saw the fallacy of what our forefathers regarded as so much Architectural principle. But he was afraid that we were in this position: we saw fallacies in everything. Mr. Seth-Smith had pointed out that the following of natural forms in ornamental designs was to be deprecated—at least he had deprecated it as a sign of diffidence in Art, and, to a certain extent, they agreed with him. But to what extent, it was very difficult to decide, simply

because they had not seen any really good naturalistic ornament in their time. Naturalistic stone-carving was an anomaly, and naturalistic roses were as great an anomaly as naturalistic carving in stone. They were in a fog; they did not know where they were in the matter of ornament and beauty. For a long time he cherished the enjoyable reflection that Ruskin's definition of beauty as being an expression of the delight that an Artist took in his work, was a working hypothesis, but unfortunately they found a great number of men who took a great delight in their work with the most unfortunate results. Indeed, how often was it that the more delight a man took in work the more wilful and woeful was the result? They had to assume when a man took a great delight in his work that he was acting in accordance with principles which would ensure the acceptance of his work by his fellowmen. Did it come to this: that no work was beautiful unless it was beautiful in the eyes of others as well as in their own? He was afraid it did. He was puzzled once by John Stuart Mills' suggestion that the time would probably come when all possible combinations in sound would be exhausted. He (Mr. Pite) supposed Mills had beforehand made a mathematical calculation as to the number of sounds which could possibly be evolved out of an octave of notes, or a series of octaves, and found that, however wide the range, there must be a limit, and that the limit would be reached after a century or two of music. They were accustomed to talk about the infinity of geometrical forms, and recognised that there was an eternity of possible combinations of geometrical figures. One wished that it was an absolute fact, for they were led to the interesting suggestion that the combinations of geometrical forms might some day be exhausted. But passing from these generalisations, he came to Mr. Seth-Smith's assertion that new ornaments were required. He (the speaker) ventured to suggest that new ornaments had nothing to do with the Orders as had been indicated, but agreed as to the desirability of new ornaments. They might have a building very beautiful in its arrangements, but unutterably wearisome in its ornaments —a fact which was strikingly exemplified in the case of the Architect for the building constituting the riding school in Buckingham Palace and for the London University, the sole Architectural beauty of which was derived from its sculpture. Take a delight in your ornaments most decidedly! They should never copy ornaments however. The moment they copied ornaments they ceased to be ornamental; they had fallen into the mechanical and geometrical part of the scheme of designers, and became merely part of the scientific framework of their buildings. When they copied their mind was not free. As to Mr. Waterhouse's natural history museum, whilst acknowledging its great interest, he disputed its beauty. A first-rate locomotive was beautiful in the eyes of an engineer, and in that sense some claim could be made out for the museum. But it was designed in such a way that it failed to elevate one; it rather had the effect of drawing one down. In looking at the building they thought of the terra-cotta, and of the great intellect and skill which had marshalled such a multitude of forms. They wanted elevating and lifting up. If they looked across the road at the Science School, where every ornament in the smallest moulding and decorative panel was beautiful in the extreme, they got above the limits of definable Art; they simply said it was beautiful, the reason why they could not tell. Mr. Seth-Smith had made use of two expressions, which he (the speaker) wished to object to. The first was as to suggestions borrowed for natural forms; suggestions borrowed for natural forms could never make beautiful ornaments. They might make propositions very suggestive for discussion, but to borrow from natural forms suggestions which would lead to beautiful ornaments was impossible. They might paint the rose beautifully, bnt he very much questioned whether there was an Artist living who could embroider the rose. They had not the eyes which enabled them to see the beauty in these things apart from the indefinable Art. Then another of Mr. Seth-Smith's expressions, which was open to criticism, was in what he had said as to obscurity of design. Obscurity of design, the speaker ventured to say, was altogether destructive of interest and beauty. If they had beauty, it must be capable of being revealed to the intellectual observer. It would never do to design an ornament, and say "this is beautiful because it is a copy of a form revealed by the microscope." The scientist might say "how interesting to see this man copy a natural form thus," but there the interest ceased, and the design could not, therefore, be successful. Such a design might look well at a distance, but when the veil was lifted they would feel disappointed. The pessimism he had indulged in would not, he hoped, have the effect of damping the discussion. It was quite novel and refreshing to have something new to debate.—Mr. Alfred Goodman said he did not think Mr. Seth-Smith advised them, as the Chairman had said, to copy exactly a natural form, but merely that they should make a natural form the basis of their design. Many of the suggestions in the paper, he thought, were very good and some of the forms which had been put upon the screen appealed very strongly to them. But if in the execution of a design every part was embodied the effect would be to lessen the beauty. It was emphatically true as the Chairman had said, that things which appealed to them alone were not necessarily beautiful but their opinions as to what was beautiful did not widely differ.—The discussion continued and a vote of thanks to the Chairman was supported by Mr. Wallace Rimmington, the well-known painter, who said the Chairman had touched upon a point of interest to them all—whether there was any law underlying beauty, and whether that law was in any way ascertainable. He did not agree with him that such a law was altogether unascertainable. In nature there was a general agreement among those who love nature as to the beauty of some forms. And if such an agreement did exist surely there was some underlying law which existed also. Some time ago he had endeavoured to set down in an article laws which he thought were applicable to the beauty of painting, and similar laws could possibly be discovered relating to the building of Architecture. If any system, such as that suggested by the paper, was adopted, however, they would lose one of the great charms of Architectural ornament, *i.e.*, the charm of association. They would do away with the associative side of Architecture by stepping into the field of natural forms, which was of course a purely scientific field. The illustrations which had been given suggested a principle which he might call the radiative principle underlying beauty. Any combination of lines which followed a radiative principle had a tendency to become beautiful. For instance, there was no beauty in a heap of hay, but if they saw the grass growing which produced the hay, they would note a radiative beauty. As to the Chairman's remarks as to the necessity of there being nothing indefinite in Architecture, he (the speaker) believed that, as in a picture, Architecture ought not only to be positive in its statement of fact but also ought to contain a suggestive element. Otherwise he doubted it being very fine Art. A few of the forms which had appeared upon the screen were indescribably beautiful, possessing a subtility of outline which might be used with comparatively little alteration. He quite agreed as to the danger of going too far in this naturalistic direction.—The Chairman replied to Mr. Remmington, urging that every natural form was in itself beautiful, but they had to analyse the forms before they could fully appreciate them. As to the degree of definiteness required in Architecture, he emphasized what he had previously said, and went on to repeat that they could not borrow suggestions for natural forms. If they did borrow a suggestion, the ornament must be bad. The vote of thanks to Mr. Seth-Smith and to Mr. Richards and Mr. Wannacott, who had assisted Mr. Seth-Smith, was carried, and acknowledged by the reader of the paper. The next meeting, the Chairman announced, will be held on the 15th of January, when Mr. Prioleau Warren will read a paper on "Decorative plaster-work."

AT a recent meeting of the Wolverhampton Town Council, the Public Works Committee again submitted a large number of building plans for approval, and it was stated that 885 plans were approved in the past year, as compared with 379 in 1891. A further analysis had been prepared showing that a floor-space for warehouses and store-places, equal to about five acres, had been built upon, the value of the buildings being about £65,000.

TELEGRAPHY WITHOUT WIRES.

MR. W. H. PREECE, the telegraphic expert of the Post Office, at Toynbee Hall, recently lectured on "Telegraphy Without Wires." There is, of course, nothing new in the fact of being able to communicate without wires, but towards the close of his lecture Mr. Preece announced that a new invention, which might have the widest possible influence not only on the future of telegraphy, but on the safe navigation of ships, had lately been brought before the department, and no expense would be spared to thoroughly test it. Mr. Preece stated that, in 1884, he was very astonished to learn that the operators in the Telephone Exchange in the city of London, were able to read messages that were going through London to Bradford by telegraph wires. The wires belonging to the Post Office were underground, and those belonging to the Telephone Company overground, and by dint of careful experiments this very fact was found to be the reason why the messages going to Bradford were read by the Telephone Company. Further experiments showed that the same effects could be traced on wires separated by as great a distance

AS TEN MILES.

Last year the cable connecting the island of Mull with the mainland broke, and while the cable ship was getting ready to repair it he sent the apparatus down to Oban, and it was rigged up so as to maintain communication between the two places. It had seemed to them that it might be useful for another purpose—that of communicating with lightships and lighthouses, and experiments were carried out in this direction, and the Goodwin Lightship, off Ramsgate, was chosen for them. Unfortunately, they found that it was quite impossible to get a message on board. The intervening sea-water performed much the same function as an iron plate—the electric waves were intercepted, and did not reach the ship. Mr. Marconi, a young Italian electrician, came to him recently, Mr. Preece said, with a system of telegraphy without wires, depending not on electro-magnetic but on electro-static effects—that is to say, on electric waves set up of a much higher rate of vibration, 250,000,000 a second in fact. These vibrations were projected through space in straight lines, and could be reflected and refracted like light—indeed, they were capable of all the phenomena which light was allowed to go through. The invention—which dealt with the method of receiving and sending messages by this means was first experimented with on the roof of the Post Office, and then for three-quarters of a mile on Salisbury Plain. The great difference between the system which had already been tried and Mr. Marconi's system was that in the former a wire on each side was necessary, and in the latter

NO WIRE WAS REQUIRED.

Vibrations were simply set up by one apparatus and received by the other—the secret being that the receiver must respond to the number of vibrations of the sender. The apparatus was exhibited. What appeared to be just two ordinary boxes were stationed at each end of the room, the current was set in motion at one and a bell was immediately rung in the other. Mr. Marconi held the receiver and carried it about, the bell ringing whenever the vibrations at the other box were set up. Continuing, Mr. Preece said he had had the greatest possible pleasure in telling Mr. Marconi that day that the Post Office had decided to spare no expense in experimenting with the apparatus, and one of the first trials would be from Penarth to an island in the Channel. He might add that he had the greatest faith in the apparatus. The curious thing about it was that there was no new principle introduced. The first man who taught us how to generate these waves was Hertz, the German physicist, and they had been developed by others. But in making practical use of these waves Mr. Marconi had invented devices which were highly novel and very beautiful, and when they were patented and could be made public, he thought they would be admired by everybody.

MR. JOHN GALLOWAY, a son of the late Mr. William Galloway, one of the founders of the engineering firm of W. and J. Galloway, the Knott Mill Ironworks, died last week.

Professional Items.

ARDLAMONT, KYLES OF BUTE.—There is to be a new pier erected near the Point, Ardlamont, Kyles of Bute, and the pier at Kames is to be renewed. The new proprietor, Mr. Robert Watson, intends to feu at Blindman's Bay, which is a beautiful situation, and no doubt the feus will be rapidly taken up when the new pier is erected. Mr. W. Burns Stewart, Architect, Glasgow, has been appointed engineer, and has already made a preliminary survey, and settled on the site.

BARNSLEY.—At a meeting of the School Board, last week, tenders for the alteration of the Harvey premises for offices, &c. were accepted. The total cost of the alterations, including Architects' fees, would be £3,500. The site had cost £3,100, making £6,600 altogether.

BELFAST.—New premises have been erected for Messrs. Barr and Truesdale's in North Street. The buildings have a frontage of thirty-two feet to North Street, and are four stories high. The contractor was Mr. W. G. Callen, Peter's Hill, the Architect being Mr. T. Pentland, High Street, Belfast.

BIRMINGHAM.—A new building is being erected in Dean Street for the purpose of a school, by Messrs. J. Barnsley and Sons, from the plans of Mr. J. H. Hawkes, Architect, Temple Row. A plot of land has been acquired in close proximity to Sherlock Street, and the plans provide for a suitable structure externally, and one which will provide all that is needful in the shape of accommodation and convenience. The building will be in late Gothic style, and free from elaboration, the front being composed of red brick, with dressing of Horsley Castle stone. Accommodation is to be provided for 300 scholars.

BRADFORD.—New additions have been made to the St. Michael's Day and Sunday schools, City Road. The additions have been necessitated by the hitherto inadequate accommodation in the day schools, and comprise two large class rooms, with lavatories and so forth, in the mixed department, and another class room in the infants' school. The work has been carried out from the plans of Mr. W. K. Shaw. The Rev. J. E. Perkins V(icar) presided at the opening ceremony, and amongst many others present were Mrs. Armitage, Mr. Norman Armitage, the Rev. R. Ross, and the Rev. H. Stapleton. The pupils in the mixed department, conducted by Mr. Lindsay (head master), sang several hymns and part-songs.—The Vicar read apologies for non-attendance from the Vicar of Bradford and others, and stated that the cost of the additions, including furnishing, will amount to about £700.

BRAINTREE.—The new post-office building, opened last week, stands upon the site of the old office, and has a frontage of 33 feet of white brick, ornamented with panels of fancy red brickwork. The Architect was Mr. J. W. Clarke, of Coggleshall, and the builders were Messrs. Smith and Son, of Witham.

BRISTOL.—Old premises at the corner of Clare Street and Marsh Street are being demolished, and will soon give place to the new offices for the Law Union and Crown Fire and Life Insurance Company. The design combines with stability considerable ornamentation of a quiet and effectual character. There are three entrances to the premises. The corner or main entrance, which leads direct to the company's office, is massive and thoroughly ornamental, surmounted by a richly-carved pediment supported on full-length carved figures resting in moulded bases. The various offices over the ground floor will be approached by an entrance from Clare Street. There will be another entrance in Marsh Street, which will lead to the ground floor offices in the rear. The Architect is Mr. Henry Williams, of Clare Street, and the builder is Mr. John Perrott, of Bristol.

EDINBURGH.—For months the Directors of the British Linen Company have had under consideration the extension of their branch premises in St. Catherine Street. The Edinburgh Architect of the Bank some time ago made a practical survey of the buildings, and it was surmised at first that a complete reconstruction of the internal accommodation would be amply sufficient for all the recent requirements. After mature deliberation, however, it has been resolved to effect more thorough alterations, and to expend a sum that will make the Bank one of the most imposing public buildings in the county town. The internal arrangements are to be entirely altered, and the office, as well as private consulting rooms, are to be fitted up with every modern convenience. The front wall is to be brought forward three feet, and will then be in line with the County Treasurer's offices on the west. The Bank building will in addition be increased in height several feet, so that it may be in conformity with the western offices.

GREENOCK.—The Ardgowan School, erected at the junction of Brisbane Street and Nelson Street (West), has been built to plans prepared by Mr. James Stewart, Architect, Greenock, at a cost, including land, of about £14,000, and will accommodate about 900 scholars, and is to be devoted entirely for the purposes of elementary education. The exterior of the structure is somewhat plain in character, but the interior is quite up to that of the more expensive and higher-class schools. The principal contractors were:—Mason and brickwork, Messrs. R. Aitkenhead & Son; carpenter and joiner work, Mr. James Agnew; iron and steel work, Messrs. Bladen & Co.; slater work, Messrs. Peter Mackay & Sons; plumber work, Messrs. Crawford & Kerr; gas-fitter work, Mr. Henry Carson; plaster work, Mr. James M'Creadie; painter work, Mr. Wm. Melville.

LEEDS.—The Church of the Sacred Heart, in Burley Road, Leeds, has been reopened after having been enlarged. Originally 50 ft. long, and 28 ft. wide internally, the Church has been enlarged to 87 ft. long and 46 ft. wide, by the addition of three bays to the nave and an aisle 87 ft. long by 18 ft. wide. An arcade of seven moulded arches, carried by columns having moulded caps and bases, divides the aisle from the nave. The Church is well lighted by traceried windows. The roof of the nave is panelled and boarded, and the aisle roof has wrought framed rafters and boarding, the roof beams having traceried spandrels. The entrances are by a wide central door and a door into the aisle, each having screens with swing doors to prevent draughts. The sanctuary has been lengthened by about 10 ft. The Church will seat over 600 persons. Under the Church are new infant schools, with class rooms, having accommodation for 200 infants. The contract for the school and Church amounted to £2,518. The Architect was Mr. John Kelly, of Leeds, and the chief contractors Messrs. Wade Bros. Brick and mason's work, Mr. Benj. Wood; carpenter and joiner's work, Messrs. J. W. Atkinson & Son; slater's, Mr. Moore; plasterer, Mr. Talbot; plumber, glazier and painter, Mr. Tankard; the heating, Mr. Macfarlane.

MILNGAVIE, N.B.—A new Free Church was formally opened last week. The Church is on a simple rectangular plan, with a tower, 48 feet high, at the south-east corner, with a bell chamber in the upper part. The style is Gothic of the early pointed Scottish character. The area is seated for 384 and the gallery for 92, being a total of 476. The estimated cost of the Church and hall is about £3,000.

PERTH.—A large extension of Perth Academy, involving an expenditure of £8,000, was recently opened by Mr. Struthers, the newly-appointed Government Inspector of Schools for Perthshire. Regarding the development of educational facilities in Perth since the passing of the Act of 1872, it was stated that, in 1891, provision was made for the instruction of Science and Art by the erection of chemical laboratories, &c., and the present extensions, which consisted of remodelling the existing departments, also include the establishment of a physical laboratory, as well as of improved workshops for instruction in technical education.

RHYL.—For carrying out the West Promenade extension, and the erection of a sea-wall towards Foryd, the Rhyl District Council have received tenders, the lowest of which is that of Mr. Jacob Biggs, amounting to £2,959. If it is decided to carry out the whole scheme, it will cost the ratepayers £1,250; the adjoining owners contributing the remainder.

SHEFFIELD.—The foundation stone of a new building, which is to be erected on a site next the Scotland Street Methodist New Connection Chapel, and which is to be known as "The Littlewood Memorial," was laid last week. The site was formerly occupied by some old buildings, and Mr. Littlewood promised that if these were demolished he would put a new building in their place, which should be useful for Church purposes. From that time the matter has been under consideration, and now the old buildings have disappeared, and the new block has been begun. It will include a café, a congregational hall to hold about 250 people, a ladies' vestry, and a caretaker's house, and the cost of it will be about £3,400. Messrs. Flockton, Gibbs and Flockton are the Architects, and the contract is in the hands of Mr. William May, builder, of Crookes.

SHEPLEY.—New Board Schools have been erected in this village. The schools are substantially built of stone, with dark Westmoreland slate cover for part of the roof, and a grey stone slate cover for the remainder. The general plan of the building is a parallelogram, with central hall with two class-rooms on each side, and one in front, which is intended to be used as a mixed school for boys and girls. The Architect was Mr. Hanstock. The following were the contractors:—Masons, Mr. H. Wood, Shepley; joiners, Mr. H. Noble, Shepley; plumbers, Mr. G. Lindley, Shepley; plasterers, Messrs. A. Jessop and Son, Shepley; slaters, Messrs. Pickles Bros., Leeds; painters, Mr. G. Lindley, Shepley; engineers, Messrs. Hargreaves and Dewhurst, Bradford. The total cost, including site, has been £5,400. The mixed school for boys and girls has accommodation for 348 children, and the infant school for 160 children, or a total accommodation for 508 children, which is thus provided at a cost of £10 2s. 6d. per head.

THE Labour Department of the Board of Trade reports that in all the more important industries the upward tendency of the labour market continued during November. The trade union returns shows a diminished proportion of unemployed, both when compared with October and the corresponding period of last year, the percentage being lower than at any period since June, 1891. All the changes of wages recorded during the month were in an upward direction.

THE Directors of the Great Eastern recently met a deputation of the Lowestoft Town Council in reference to measures for preventing the blocking of the harbour through a formation of a sandbank. The Great Eastern Company are willing, it was stated, to spend £50,000 on a scheme which would double the water space in the harbour, widen its entrance, construct a new pier, and lengthen the south pier, so as to make it the finest promenade in the United Kingdom.

A LETTER was read from the Local Government Board, at a recent meeting of the Town Hall Committee, stating that with reference to the application of the Mansfield Town Council for sanction to borrow £6,000 for additions and alterations to the Town Hall buildings, the reasons alleged at the inquiry for the proposed works did not apper to the Board to be sufficient to justify them in sanctioning a loan. It is proposed that a deputation should wait upon the Board to obtain a re-consideration of the matter.

THE Arts and Crafts Society of Ireland, we are glad to learn, have organized a series of lectures for December, January, and February, the first being on the 9th inst. at the University Buildings, Earlsfort Terrace, by the Earl of Mayo, on "Modern Irish Furniture." Other subjects to follow are most interesting, and the lecturers include such admirable exponents as Sir Edward Sullivan, Mr. James Brenan, R.H.A., Colonel Plunket, Sir Arthur Vicars, Mr. Walter Armstrong, and Mr. George Coffey. This is an effort greatly to be commended, and Lord Mayo's energy and self-sacrifice in promoting instruction in such industrial directions are of real advantage to the country.

ART AND ATHLETICS.

BY MR. E. LEES, M.P.

AT the Birkenhead Literary and Scientific Society, in the course of an address on "Modern Art," Mr. Lees said that though neither an Artist nor critic he was entitled like anyone else to give an opinion upon Art, which was a matter of taste. There had been an enormous advance of Artistic feeling in recent days in this country, a more widespread desire to make homes beautiful as well as comfortable. For this he thought Ruskin's writings were largely responsible, and that great prose writer had done more than any other one man to kindle a love for Art in the English. The æsthetic craze of some years ago soon died, but the good it did lived after it, and one was sometimes inclined to think we were running to the other extreme in fostering too much contempt for bright hues and primary colours. Japanese Art had also done much good to English taste, but they must not judge of Japanese Art by the cheap fans and vases they saw. It must be judged from its masterpieces, from the works done for the noble and princely patrons of Japanese Artists in their own land. In addition to Decorative Art, there was an

ADVANCE IN THE HIGHER FORMS,

And many municipalities had fostered Art by its collection of fine paintings and sculptures, of which the most conspicuous, and, he thought, the most beautiful collection was that in the Walker Art Gallery. Speaking nationally, we had not the originality or fancy of the French, but our great Artists had done magnificent work, although our Academy always contained too many pictures painted to catch the public eye, and not to elevate the public taste. The two late Presidents of the Academy had done splendid work. Leighton, with his almost Greek beauty of design, harmonious colour, and splendid finish, but in at least one picture, "Wedded," he touched the heart as well as the intellect. Millais went straight to the heart whenever he tried to do so, and no modern of the present day had such power of painting. His early pre-Raphaelite work and some of his later subject pieces would live as long as English Art endured. Among other Artists he named Watts, Burne-Jones, Dicksee, Holman Hunt, and Luke Fildes, whose "Doctor" he thought perhaps the finest picture of the day, and some of Orchardson's portraits might have been the work of Titian himself. After dealing in detail with the work of several landscape painters, Mr. Lees said there was a great and virgin field before the Artists of to-day,

A FIELD UNTOUCHED

for the last 1,800 years. The Greeks, by their perfect system of physical and mental training, developed the perfection of human form, and that perfection was reflected and reproduced in their wondrous statuary. Now-a-days the English were pre-eminent in the world of athletics, and he could not see why our modern Artists should not draw their inspirations from the physical excellencies of our cricketers, football players, and athletes generally—graceful forms, sturdy, well-shaped limbs and earnest faces. Then we had the finest horses in the world, and why did not our Artists give us great scenes of the great horse races—leaving out, of course, the objectionable features of the crowds and followers of the sport. The athletic revival in England was a fine opportunity for our great artists, who should not leave this side of modern life to our small fry. Such objects had inspired the greatest Artists of the ancient world, why should they not inspire great Artists now-a-days to give us something which, like Greek Art, shall be worthy of a nation of cultured athletes.

"THE SKY-SCRAPER."

IN our issue of the 9th instant, by an error, Figs. 3 and 4 were transposed and also placed upside down, so we take this early opportunity of rectifying the mistake.

WE understand that the designs for the new post office to be erected at Epsom, mentioned in our last issue were not by Mr. Paull, who only prepared the quantities.

SIR E. J. POYNTER AND THE ACADEMY STUDENTS.

AT the distribution of the prizes won by students of the Academy in the year lately closed, the first public speech by Sir E. J. Poynter, since his appointment to the Presidency of the Royal Academy, was made on Thursday last. The President, admitting that it was not customary in the year when no gold medal was given by the Academy to give an address at the annual prize meeting, nevertheless asked leave to say a few words. After referring to the unexpected chain of events which had led to his election, Sir E. Poynter said that he hoped to follow the steps of his predecessors in advancing the Arts of this country and the usefulness and prosperity of the Academy and its schools. His knowledge of Millais began with an acquaintanceship only formed after his (Sir E. Poynter's) election as associate. It grew into a warm and, on his side, most respectful friendship. Millais was ever ready to bring his clear judgment and his unerring eye to the help of a friend in difficulty. Sir E. Poynter owed to him many a valuable hint as to how to right some weak point in drawing an uncertainty of effect. His most remarkable faculty was that as a draughtsman he was always right, seeing everything in its true place and proportion, and never losing sight of his leading idea. His figures and faces consequently lived as those of no other Artist of our time lived. As a man he was universally beloved. His friendship with Lord Leighton was of earlier date. In 1853, when Sir E. Poynter, then a youth, spent a winter in Rome, Leighton encouraged him in his desire to become an Artist. Many of those now present could testify to the pains Lord Leighton took to personally guide them in their work. One of the mainsprings of his life was a desire to encourage young Artists. He was twenty-three years old when Sir E. Poynter first knew him in Rome, and was making studies for that picture of "Cimabue carried through the streets of Florence," which first brought him fame, and which, by the gracious consent of the Queen, would be one of the chief ornaments of the Academy's Winter Exhibition this year. The beauty and perfection of his drawing was a revelation to the present speaker. Seeing his intense interest in them Leighton treated him exactly as if he were an accredited pupil. Under those happy auspices he increased his natural love for painting, and imbibed the principle which Leighton, with his untiring energy and patience, put into practice to the end of his life. He took that principle to be that however great an Artist a man was naturally, he would never do his best without preparatory studies which would enable him to arrange his ideas before putting them on canvas. The works of Leighton would be within the walls of the Academy before many weeks were out, and the public would have an opportunity of judging to what heights the life-work of a devoted and genuine Artist could rise. The President concluded with a compliment to students on their works.

SOCIETY MEETINGS.

Architectural Association.—A meeting of the Architectural Association was held on Friday night. Mr. Bereford Pite was in the chair, and a paper was read by Mr. W. Howard Seth-Smith, entitled, "A plea for the use of natural forms revealed by the microscope, as suggestions for Architectural enrichment," which we give in another column. The routine business comprised the election of four new members—Messrs. L. Cabuche, W. S. Huxley, R. McDermott, and C. E. Power. The President made an important announcement in connection with the School of Design. The Committee had resolved to issue a new syllabus from the 1st of January, and the effect of it would be to constitute a half-section class at half the usual fee. The subjects to be treated would be similar to those set last section, and would embrace village club, country bank, metal font, &c., each subject being complete, and would be taken by the visitors as already announced. The Committee hoped that this class would be a success. It was practically a new experiment.

The Edinburgh Architectural Society. The second annual business meeting was held on the 16th inst., the President in the chair. The report on the drawings submitted in Design Competition, No. 4, "A Golf Club House," was read, the three first being, "Quedo," "The Ludger," "I ride thro'." The hon. secretaries' and treasurer's reports for the session 1896 were submitted and approved. The past session has been a most successful one, there were six lectures, seven members' papers, and numerous visits to buildings in the course of erection, or lately completed. The attendance has been excellent, averaging 40, and the membership has increased from 44 to 106. The following office-bearers were elected for the ensuing session:—Hon. President, Mr. R. M. Cameron; President, Mr. J. A. Williamson, A.R.I.B.A.; Vice-President, Mr. W. N. Cumming, A.R.I.B.A.; Hon. Secretaries, Messrs. T. R. Patterson and Ramsey Traquair; Hon. Treasurer, Mr. J. F. Matthew; Hon. Librarian, Mr. G. Murray Wilson. Committee—Messrs. A. R. Scott, A. Lorne Campbell, J. Murray, J. N. Scott, A. Greig, and A. Muirhead. Sketch Book Committee—Messrs. J. Stewart, C. S. Burgess, A.R.I.B.A., and J. Jerdan. Syllabus Committee—Messrs. J. Traill, W. A. Mellon, and Fred Wilson. The Hon. President for the past session, Mr. Sydney Mitchell was elected an hon. member.

The first annual dinner of the Edinburgh Architectural Society was recently held in the Imperial Hotel, Market Street. The chair was occupied by Mr. Sydney Mitchell, the Honorary President of the Society; the croupiers were Messrs. A. R. Scott and J. A. Williamson, and among those present were Professor Baldwin Brown, Mr. Thomas Ross, Mr. J. Burnet, President of the Glasgow Institute of Architects; Mr. Tait Connar, President of the Glasgow Architectural Association. The Chairman, in proposing the toast of the Society, said he understood that the membership of the society was now very considerably over a hundred, which meant that they had practically exhausted the only source from which their membership could be drawn. The Society was one founded by Architectural students for Architectural students, and for them alone. The need for a Society of that kind seemed to him so evident that it was scarcely necessary to refer to it. All of them knew that the only practical means in this country of gaining a knowledge of Architecture was by entering the office of a practising Architect and becoming an apprentice. Whatever advantage that had, it had at least this defect, that it was impossible for the apprentices to meet each other—they only knew the men in the same office as themselves. In other professions the students had a common meeting ground, and their Society, he believed, would supply that ground for the Architectural students.—Mr. A. R. Scott acknowledged the toast on behalf of the Society. Mr. D. McLeod Craik proposed "Our Guests," to which Mr. W. Burnet responded.—Professor Baldwin Brown gave "The Town Council of Edinburgh," and spoke of the Corporation as the official guardians of the streets and buildings of the city.

Glasgow Architectural Association.—A meeting of this Association was held at the rooms, 187, Pitt Street, on Tuesday the 15th inst. Mr. Wm. Tait Conner occupied the Chair. Mr. Henry F. Kerr delivered a lecture, entitled "Notes on Elgin Cathedral." The purport of the lecture was to show what, in his opinion, had been the original disposition of the early Church, which he, the lecturer, had carefully studied for some years. From the standpoint of design, proportion, and detail, few of our Cathedrals can equal Elgin, and certainly none can excel it. The lecture was well illustrated with limelight views, and was terminated by a vote of thanks to the lecturer.

The Glasgow and West of Scotland Architectural Craftsman's Society.—The opening lecture of this new Society was recently delivered by the Honorary President, Professor Charles Gourlay, A.R.I.B.A., in the Andersonian Buildings, to an audience of about 150 past students and friends, the subject being "Paris from an Architectural Craftsman's Point of View." Mr. James Lochhead, President of the Society, presided. After a few general remarks on Paris, the Professor dealt with its system of sewerage, its methods of building practice in the materials of stone, plaster, concrete, iron construction, and parquet flooring. He then pointed

out the great advantages the Paris Architectural craftsman had in the admirable and excellently arranged museums of casts and other objects of instruction, to see which makes one ardently long for the completion of the new Art Galleries at Kelvingrove, where it is hoped that similar large and accurate casts will be placed for all to study by sketching and measuring. Lastly, the Professor showed that the history of Architecture could be studied with great success in Paris, because of the excellent remains of ancient and classic buildings to be found in the Louvre, and also in the buildings remaining till the present day, which show the Romanesque, Mediæval, and Renaissance styles very fully. The lecture was illustrated by a large number of photos. and diagrams, which were hung round the walls, by examples of French joinery, and by over 60 slides of Parisian buildings, which were well shown by the lantern.

The Civil and Mechanical Engineers' Society.—On the 10th December, the members of this Society paid a visit to the shot and lead works of Messrs. Walkers, Parker and Co., Limited, Belvedere Road, Lambeth. The party was conducted over by the engineer, Mr. Darling. The casting of the lead slabs and their conversion under the rolling mills into their sheets of lead was watched with special interest, together with the different processes used for drawing the lead pipes. The members afterwards visited the shot tower to view the process of shot-making from the commencement to the final packing for export.

Society of Engineers.—At the 43rd annual general meeting, held on the 14th instant, the chair was occupied by Mr. Samuel Herbert Cox, President. The following were duly elected as the Council and officers for 1897, viz. :—as President, Mr. G. Maxwell Lawford; as Vice-Presidents, Messrs. W. Worby Beaumont, J. Corry Fell and Henry O'Connor; as ordinary members of Council, Messrs. J. Patten Barber, Joseph Bernays, George Burt, D. B. Butler, H. S. H. Farrar, Percy Griffith, Charles Mason, and Stephen Sellon; as Hon. Sec. and Treasurer, Mr. Perry Fairfax Nursey; as Hon. Auditors, Messrs. Alfred Lass, F.C.A., and Samuel Wood, F.C.A. The proceedings terminated by a vote of thanks to the President, Council, and officers for 1896.

Views and Reviews.

CHRIST'S HOSPITAL:

Recollections of Lamb, Coleridge and Leigh Hunt.

THIS little book consists of memorials of their young school days extracted from the writings of Lamb, Coleridge, and Leigh Hunt, prefixed by an account of the first order and manner of the erection of the Hospital, and interspersed with 38 illustrations. It is very pleasant and interesting reading, connected with three well-known names in our literature, and the illustrations, copied from prints of the old schools and from sketches by Miss Florence Reason, add to its value. Mr. Johnson modestly terms himself editor; his work is well done, and many old and future Christ's Hospital boys will preserve the book in their cherished archives, and be grateful to him for collecting and presenting these records in so convenient a form.

CHRIST'S HOSPITAL: Recollections of Lamb, Coleridge and Leigh Hunt. Edited by R. Brimley Johnson. London: Allen.

MODERN OPERA HOUSES AND THEATRES.

Examples selected from Playhouses recently erected in Europe by EDWIN SACHS and ERNEST WOODROW.

THIS is a fine monumental book that is a credit to British taste and enterprise. The joint authors intend it as a continuation of the Atlas of Theatres, published by M. Coutant, at Paris, in 1842. Some monographs of individual examples, *e.g.*, the Paris Opera House, by M. Garnier, have been published; but no great collective "parallel" has been made for the last 50 years. The need of such a work had been strongly felt by specialists, both managers, lessees, and Architects, and the authors have, with Messrs Batsford's assistance, endeavoured, and we think with success, to supply it. It is quite up to date as regards illustration, the development of photograhic reproduction enabling authors and publishers to represent decorations, &c., in a manner that was impossible when M. Garnier first published his drawings. The introduction gives a clever analysis of the various classes into which theatres are divided, and all the more important examples in Europe, foreign as well as British, are included in the selection, with valuable critical remarks, and carefully prepared dimensions in each case. All the plates are drawn to a large scale, sufficient to shew every detail, and the photographic views of the buildings, interior as well as exterior, assist in giving a very clear idea of their arrangement. In addition, a parallel of sketch-plans of all the building is of great use for comparison. We do not like the manner in which, owing to the occasional insertion of an illustration in the middle of the rather wide page, the letterpress is divided into two streams between which the reader's eye must jump across from side to side with irritating fatigue, and mention this in hope that the authors will, according to the Arabian proverb, remember the reader. The plate of the ceiling in the Hofburg Theatre at Vienna, in particular, will serve to show perfecton of detail carried out in every part of this book. It is promised that the third volume will be a complete Treatise on Theatre Planning, with some supplements by experts on various practical details. Any treatise that will deal in a practical and exhaustive manner with the different multiform elements—the Auditorium or seeing place, with its boxes, stalls, pit, balcony, circles, &c.; the Access to (and *quick escape from*) each part of the house, with its internal and external stairs, corridors, outer balconies, &c.; the Saloons or lounges, with refreshment places, &c.; the Administration, with the ticket offices, check-takers' posts, &c.; the Orchestra, with its capabilities of expansion for occasional functions, &c.; the Stage, which, with the artists' rooms, constitutes a small world in itself, and the Workshops and Stores, for scenery and properties—showing how to place each element in its right relation *as regards position* to all the others, and how to weld the whole into one simple and easily understood plan—will be an addition to the common stock of knowledge in the world; and we hail the attempt. Fire prevention and the dealing with fires when they unhappily occur will be included; and we would also suggest a small chapter might be given on decoration and decorations, *i.e.*, the permanent Architectural and the temporary festal dressings which are required. We will return to this when the volume appears.

MODERN OPERA HOUSES AND THEATRES. Examples selected from Playhouses recently erected in Europe. By Ernest Sachs and Ernest Woodrow. London: Batsford.

Correspondence.

ON COMPETITIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Your article on Competitions in this week's number, prompts me to write and thank you for your protest in the cause of justice, and beg your indulgence for a few remarks, not so much on Belfast, Southamption, or Exeter, as on competitions in general.

While it is very certain that satisfactory results are improbable where the promoters are dishonest, yet it seems to me that, however honest they may be, unsatisfactory results are only too likely while competitions are conducted in the present manner. The whole question wants to be thoroughly threshed out, and if you would lend your aid in the matter, your would be furthering, not only the interests of the profession, but what is of far greater importance, the interests of Architecture.

What with unsuitable sites, insufficient money, and ridiculous conditions and requirements; a single assessor (where there is one at all) with fads, and possibly no theoretical knowledge or experience of the class of building he is expected to judge; a crowd of competitors who all have different ideas as to what Architecture is, and who send in designs in a dozen different styles; failure seems assured from the beginning. The wonder is to me that any satisfactory work of Art could ever have been produced under such conditions.

To begin with the question of site. The first thing necessary for a fine building is a fine site and suitable approaches. A town council is no more qualified to choose a proper site for a town hall than it is to judge the designs for the same; and until we have all sites for public buildings chosen or approved by qualified persons, we are always liable to be called upon rather to solve a puzzle than design a work of Art.

Then consider the question of assessor. However upright and impartial he may wish to be, it is very difficult in the nature of things for one man, unaided, to come to a just conclusion, and entirely sink his own personal tastes and predilections. The responsibility is too great for one man. Would it not be better to have a jury, chosen, perhaps, by the competitors?

Every detail of the management of competitors seems open to criticism, but I should trespass too much on your courtesy were I to attempt it. I would, however, just like to point out—that of the large sum of money you refer to in your article as spent every year by the profession—by far the greater part is paid away in assistance on the drawings, and so circulates from the elder to younger members, not leaving the profession at all. This is not altogether an unmixed evil, I think.

With all good wishes for the success of your new magazine, the Architectural Review.

Yours faithfully,

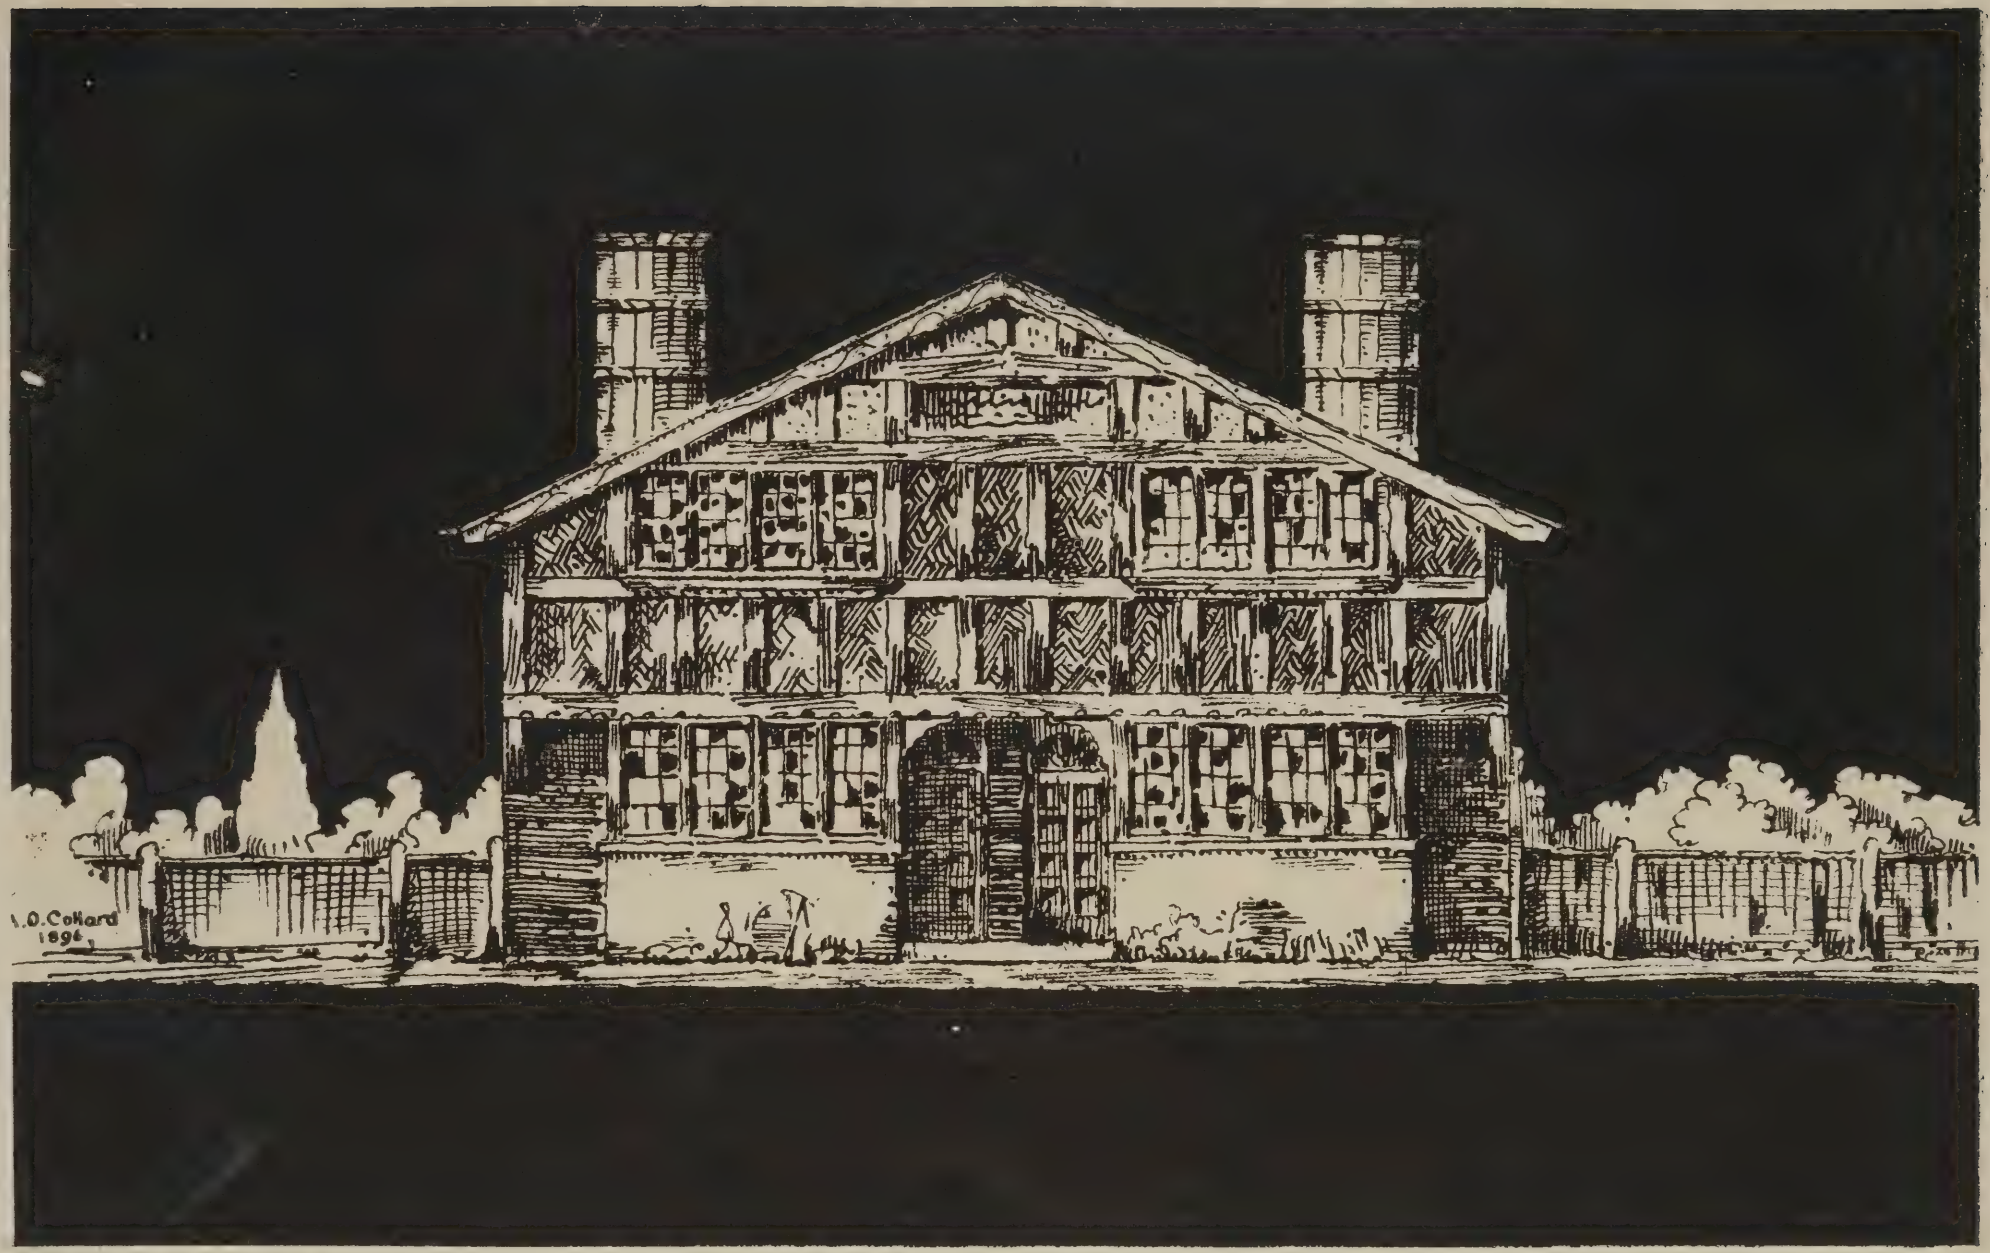
A. R. JEMMETT.

17A, Great George Street,
Westminster.
17th December, 1896.

SOME workmen who were sinking a well at Pear Tree Green, near Southampton Water, recently discovered what is believed to be a seam of coal. It is stated to be 18 inches in thickness.

THE heavy rain which accompanied the recent stormy weather caused several serious landslips in France. At Dieppe a large portion of the cliff at Bellevue gave way, bring about the destruction of the villa of M. Bamberger, the Paris banker. At the arsenal of Dieppe, the falling in of the adjacent cliff caused some old fissures round the building to spread considerably.

A LARGE meeting of ratepayers was recently held at Ilkley, for the purpose of getting an expression of opinion on the proposed Town Hall scheme, for which land has recently been acquired at a cost of £6,270, and on which it was rumoured that the Council proposed spending from £15,000 to £20,000 in buildings. It was resolved that the site selected was most unsuitable and to use every effort to prevent the scheme being carried out.



ACCORDING to Mr. Ernest W. Pierce, the Assistant Town Clerk of Leeds, the credit of initiating that class of legislation known as the public health laws belonged to Liverpool. The sanitary inspector was the person upon whose conduct the whole fabric of the law of public health depended. In the performance of his duties he would meet with many difficulties, and therefore he should make himself thoroughly acquainted with the duties he was obliged to perform.

THE Secretary for Foreign Affairs has received a dispatch from Her Majesty's Acting Consul-general at Christiania, stating that a notice has been published by the Norwegian Board of Works, inviting foreign as well as Norwegian engineers to draw up competitive plans of station arrangements for certain railways having their termini in that city. Four prizes, worth about £555 10*s.*, £222 4*s.* 6*d.*, £111 2*s.* 3*d.* and £55 11*s.* respectively are offered. Plans of intending competitors must be sent in before 2 o'clock p.m. on March 31st, 1897. Further particulars can be had on application to the Railway Office Board of Works, Victoria Terrace, No. 6, Christiania, where also maps and sections, &c., can be obtained on depositing 50 kroner (£2 15*s.* 6*d.*). Such further particulars as have been received may be seen at the Commercial Department of the Foreign Office, any day between 11 a.m. and 6 p.m.

Our Arts and Crafts. Now that the New Gallery is closed and the affair of the Arts and Crafts Exhibition ended for this occasion, no misinterpretation will be put on our words if we offer a criticism on the wider aspects of craftsmanship in this country as exemplified in the late collection of Art work in Regent Street. The whole motive and impulse of the Arts and Crafts Exhibition Society, and of kindred institutions and associations, and the spirit their activity inculcates, and the stimulus they give to private enterprise, are all of such great value and importance as marking a new era of Artistic activity after the deplorable lapses of the past seventy years, that it has been our endeavour to keep clear of any topic which might act in a prejudicial way against the Society or its exhibition, or alienate any of our readers from sympathy with its motives. It is clear, however, that a large number of those designers who showed work at the late exhibition, have fallen into one common error; nor is this a fault of technique or expression merely (though such were common enough in individual instances), but an error embracing the interpretation of the whole meaning and value for us of mediæval Art. These exhibitors have identified themselves with mere imitators of the feeling of past Arts; they have, at their best, but copied the spirit of the mediæval craftsman and the forms and technicalities of his work. This is stating the case generously for the exhibitors we are speaking of—granting them their highest achievement of feeling. A great many of the exhibits, while owning to an origin in the work of the fourteenth and fifteenth centuries, revealed no impulse from the spirit of the age they copied, but showed only an ingenious adaptation and rearrangement of its characteristic forms. Now it is beyond all reasonable question or dispute, that an applied Art can find no just or adequate appreciation apart from a recognition of the circumstances under which it flourished. The great and irresistible charm there is for us in the work of mediæval craftsmen—a charm which still stands, though the particular example may lack the elements of beauty—lies in that vibration of human sympathy, which is awakened whenever we recognize the fond work of man's hand and eye, inspired by dead sentiments and enthusiasms. The whole beauty and meaning of an applied Art must lie primarily in the truth with which it idealizes and interprets the life of the nation. The Art of a cult is meaningless and contemptible. The craftsman is not he that sits in a museum and reconstructs with the forms and feelings of past epochs in man's history, but he who can idealize about the wants and necessities of the day in which he

EXETER CHURCH COMPETITION. SOUTH ELEVATION OF MESSRS. HEATON AND RALPH'S DESIGN.

lives. This is the one exalted privilege of handicraft. It is strange in these later years, when so much is said and written on the subject of the past Arts, and all educated men and women aspire to some understanding in the matter, that the one vital lesson which is taught alike by every Art the world has seen, yet remains ignored of the generality. What sort of regard is this present period of handicraft to win of posterity? Picture the antiquarian of 1996 considering upon the drawing room fire screen painted with saints and halos, and the piano with the garden gates to it! The whole subject is certainly one that could only be adequately treated of in an essay of some considerableness. But to conclude now: assuredly we may consider we have an epoch in Art only when motor carriages, telephone stands, electric switches, gas stoves, and the other paraphernalia of our approaching twentieth century existence, are attentively shaped and decorated to an idealised expression of the particular artificial life of their day, and when our English craftsmen can leave their reproduction of mediæval inspirations, and acknowledge the facts of their own existence. Then, and not till then, will they be following the path that leads to that excellence and truth which they so devotedly reverence in the work of past ages. But before that day there must come a change. In no period of the history of the world's great Arts, did Art exist, as now, in the person of a precocious imp running about and crying, "Look! Look at me; I'm Art, I am."

THE RESTORATION OF PETERBOROUGH CATHEDRAL.

IS IT VANDALISM?

THE recent energetic move on behalf of Peterborough Cathedral, on the part of the Society for the Protection of Ancient Buildings, is worthy the sympathy and support of all Artists. There is no more chivalrous servant of the public existing than this Society, whose prompt action has often been the means of preserving many a priceless treasure of the past. Their energies were never exerted in a better cause than the present one, and never in one which required more ability, knowledge, and perseverance persistently applied against the prejudice and muleish obstinacy of a handful of men than against those who so unfortunately have the care of Peterborough Cathedral committed to them.

When we first heard the facts of the case, and after we had personally examined the Front for ourselves, we were inclined to take an aggressive attitude towards the proposals of the Dean and Chapter, and were entirely in sympathy with those by Mr. Webb. We think the former too sweeping and destructive in principle, and that they have but little regard for Art and history. There is some talk of a compromise. If a *via media* can be agreed upon between the Society and Mr. Webb, on the one hand, and Mr. Pearson and the Dean and Chapter on the other, by which they could travel together, and finally arrive at the goal which would give the maximum of sure and sound repair, with the minimum damage to the Front, both as regards its Art and its history, there will be found no more hearty supporters of such a way out of the difficulty than ourselves. But it is well to remember that at present there is a wide difference between the two schemes. The one means practically rebuilding: that is to say, when completed it would be, to all intent and purposes, a modern Front on the old lines. The other, that proposed by Mr. Philip Webb, on behalf of the Society, is better described as repair, and would leave the whole of the Front *practically untouched*. Between the two, therefore, there is now a great gulf fixed, and the bridge to join them will have to be constructed not only with great skill, delicacy, and care, but with a generous disposition on either side to give and take in the question of its building in a somewhat ample way. Although we cannot by any means agree with what Mr. Pearson has already done at Peterborough and elsewhere in the way of restoration, we are sure he has never been influenced by any but what he is convinced are the most rigid Artistic principles. No Architect would dispute that. It is, therefore, surely something bordering on the ridiculous to say, as the Athenæum did, that "a piece of Vandalism is likely to be committed at Peterborough, the like of which has not been seen since Lord Grimthorpe's doings at St. Alban's." Exaggeration of this kind weakens an otherwise strong argument against Mr. Pearson's recent proposals. We have very carefully compared both the plan of Mr. Pearson's restoration and that of Mr. Philip Webb (more correctly described as "repair"), and we unhesitatingly say the one of Mr. Webb is by far the best. It is best both constructively and Artistically, and above all, it is the best because it will leave the exterior of the West Front *practically untouched*. The genius and skill of Mr. Webb is admitted in the Architectural world, and the Dean and Chapter of Peterborough would do well to read, mark, and learn this opinion most carefully, before they sanction any scheme which has for its basis the rebuilding of such a priceless Artistic treasure as this wonderful West Front. It is well to emphasize the fact that it is incomparably the finest work of its date in England, and comparable only with the greatest achievements in the Art of Architecture of the ages. If there ever was an occasion for prompt and energetic measures it is surely the present one. The work of rebuilding has already been started; the whole of the Front is at present enveloped in a maze of scaffolding, and the preliminaries of under-pinning (necessary, however, in any case) are in active progress. Unless, therefore, immediate action is taken the damage will be done and done beyond recall. The appeal for subscriptions has been sent out long since, and here we may incidentally remark upon two things: (1) that as Mr. Webb's scheme is to attack the trouble from behind (leaving the façade practically untouched, and bonding it into the new masonry at the back) it is evident, therefore, it will be less costly, although it is true this is but a small matter in so great a question; (2) that the subscribers themselves have really the matter in their own hands. They have only to agree to unitedly support the new scheme and the Front is saved! Should, as we sincerely hope, the better of the two schemes prevail, then we repeat the thanks of the public are due mainly to the strong action on the part of the Society for the Protection of Ancient Buildings, to the Daily Chronicle, which has published a strong letter on the question from the Architectural Review, and a warlike letter from Mr. Ruskin appeared in the Times, which, although it was not actually written by him, contains the evident inspiration of the Master in what might be his own words. It is most pleasant to note that his letter coincides with that of the Architectural Review, more exactly as to the way in which the Front can be preserved.

Should the work of rebuilding be the outcome of it all, then it is well to bear in mind that the responsibility of such ruthless destruction rests primarily upon an indifferent and very ordinary Dean and Chapter, and upon the Editors of The Times and The Builder. The unhappy attitude the latter paper takes towards the subject is regrettable in the extreme, firstly, because it shows but little knowledge of the subject, and, secondly, because, with The Times, it shares the unenviable position of being vandalism's special pleader. That unclean spirit never had a better advocate than The Builder, and, it is but just to record, it has for once in a while a perfectly honest one. For whilst the Dean and Chapter labour very hard to prove the reverse of their intentions, the "Editor of the Builder" calmly gives their whole case away, and says, "the common sense of the matter is to rebuild from the foundations" (see letter to Times). He tells in plain English what everyone (who cares) *knows* to be the end the destructionists have in view, but we fancy the Dean and Chapter would wish to be spared from their candid friend, especially before the funds are in. Such revelations as these are very awkward.

THE Liverpool Insanitary Property Committee have decided to ask for £30,000, during 1897, for the purchase and demolition of insanitary property, and £10,300 for the completion of labourers' dwellings.

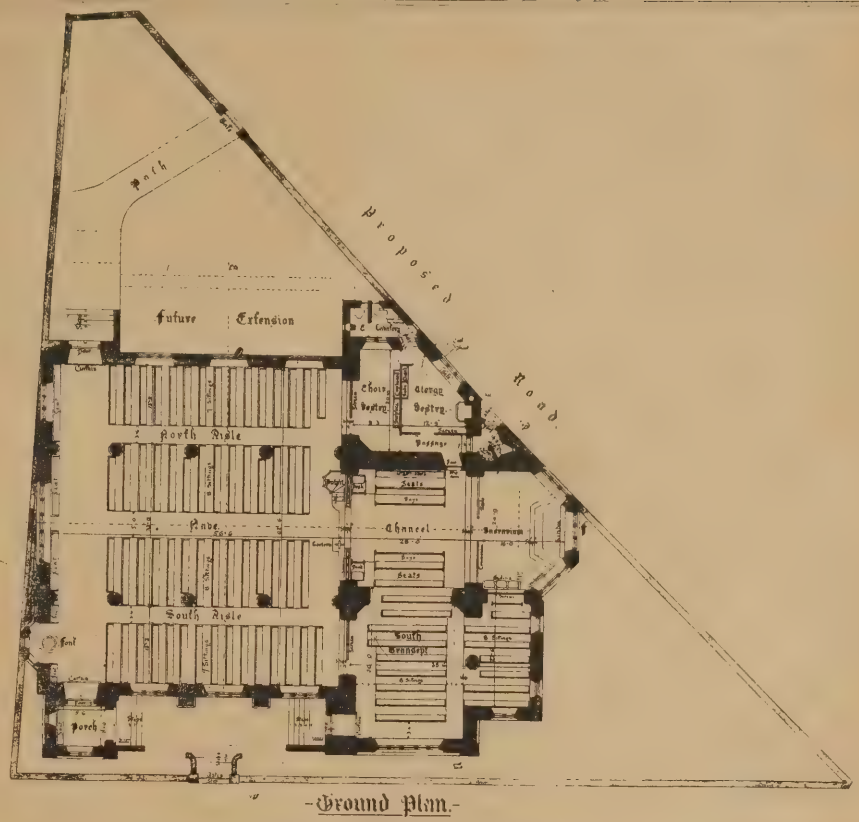
EXCAVATIONS AT THE CHURCH AND MONASTERY OF GREY FRIARS.

EXCAVATIONS on the site of this monastery were begun some years ago, and numerous walls were unearthed about two feet below the surface, but ancient walls crossed more modern structures, making the task of arriving at the exact plan of the monastery very difficult. No trace of the Church was found until Mr. C. B. Fowler, F.R.I.B.A., of Cardiff, under whose superintendence the work has been, and is being, carried on, commenced trenching on the south side of the monastery, and then, at a depth of about 2½ feet, the angle of one of the nave pier foundations was unearthed. This led to further excavations, with the result that now the whole plan of the Church has been laid bare, together with mouldings of arches, labels, caps and columns, window heads, jambs and mullions, &c., sufficient to give a very clear idea of what the Architecture of the Church was like. The Church is about 180 feet in length by 62 feet in width, and consists of nave, north and south aisles, and a large chancel about 30 feet wide. The connection between the Church and the monastic buildings has not yet been discovered. Many skeletons—over 30 in number—have been unearthed inside the walls of the Church and on the south and west sides outside. Many of them are in a very perfect state of preservation, the teeth being almost perfect and thoroughly sound. The skeleton found in the centre of the chancel was interred in a coffin, the remains of which were visible, and the arm-bones were placed as if in prayer. In 1538 the Grey Friars' Monastery surrendered to the King's Visitor, and the list then drawn up of the conventual property shows that it was of small value. The Friars signing the surrender were—Thos. Gwyn, Guardian, Roland Jones, Owen Jones, Robert Castell, Richard Mellyn, Hugh Sawyer, John Brown, Wm. Barler, and Garwain Johns. They delivered their goods to the bailey's deputy, John Loveday, and the visitor appropriated the most valuable articles. (King's Remembr. Books.) In another document Cromwell is informed "that the Black and Grey Friars' houses at Cardiff have no substance of lead save only some of them have small gutters." This kind of plunder, therefore, supplied but little to the Treasury. Owen Glyndwr was very fond of the Franciscans or Grey Friars, and refrained from destroying or pillaging their convent in Crockherbtown when he sacked Cardiff, but he seized their valuables, which they had lodged for safety in the castle. It is also said that Llewelyn Bren (the Welsh rebel) was buried in this Church, under a tomb on which was his effigy carved in wood; also that Fitzhamon, who was hanged, was also interred here. It is surprising what little is known regarding this monastery, which must have been a very extensive one. The little found is of interest, and add some particulars of the order of Franciscans or Grey Friars which Lord Bute has been the means of preserving to history. The walls will be built upon the old foundations in buff and grey bricks, 18 inches above ground, in a similar way to the Black Friars' Monastery, which is now completed.

IT is not generally known that Mrs. G. F. Watts, the wife of the great Artist, is very expert in moulding. She has decorated the ceilings of Limnerslease, the Surrey home of Mr. Watts, with charming designs.

A MOVEMENT is on foot in favour of the erection of a new bridge across the river at Fulham, so as to relieve the traffic of High Street and Lillie Road. The necessary powers were granted by Parliament many years ago, but never acted upon.

THE foundation stone of a new residence about to be erected in connection with the Mansfield House University Settlement, Canning Town, has been laid by the Master of Balliol, Dr. E. Caird. Principal Fairbairn is the President of the Settlement. The new building is expected to cost £8,000.



THE old and interesting Church of South Leverton, near Retford, has been badly in need of restoration for a long time. The amount required is £2,000, but up to the present only a little over £1,000 has been raised, and as the nave and tower are in a very bad state, the work is to be proceeded with at once.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

The Exeter Church Competition Fiasco.

A CRITICISM ON SOME OF THE DESIGNS.

AT the risk of repeating what every one knows, a brief recapitulation of the circumstances of this competition seems desirable. Early last year advertisements appeared in all the professional papers, asking Architects to compete for a proposed new Church in the district of St. Thomas, Exeter. Nearly six months were allowed for making the designs, and on the face the conditions seemed fair, and the four premiums—one of £100 and three of £25 each—liberal. Many questions were asked by competitors, and the committee very properly issued supplementary instructions in March, answering them. Although the site is a difficult one, it is interesting in its capabilities, and is quite large enough for what the committee appeared to require—a good-sized town Church. Consequently, the enormous number of 420, or as some say, 450 designs, were sent in on the first of June. In the original instructions the committee said they would call in the aid of an assessor, if they deemed it necessary, but in the supplementary instructions they were more definite, and stated that "the committee will call in the aid of an assessor, to advise them before making their award." This undertaking on the part of the committee was, no doubt, one of the principal reasons that induced so large a number to compete.

-Ground Plan.-

MESSRS. HEATON AND RALPH'S PLAN.

EAST ELEVATION OF MESSRS. HEATON AND RALPH'S DESIGN

Nothing further was heard beyond the announcement that over 400 designs had been received; there were also rumours of an exhibition being held in Exeter, though whether public or private did not transpire. In October a circular was received by each competitor announcing the four awards made by them, acting on the advice of Mr. B. Ingelow, F.R.I.B.A., their assessor, nominated by the President of the Royal Institute of British Architects. The names of the four gentlemen who had the distinguished honour of being the best quartette out of the total number, were, with the exception of Messrs. Cutts, not known to fame as Church Architects. If, however, they were really the best, Architecturally and ecclesiastically, then the award became only the more satisfactory.

Alas! this illusion was soon dispelled, so far as regards the selected design, when it was published in that respectable paper, The Builder, on November 28th. We all knew then that someone had blundered. It is incredible that Mr. Ingelow could have seen *all* the designs and placed so poor and mediocre a production at their head. The committee state in their circular announcing the awards, that "it will be impossible for them to undertake any correspondence concerning the awards, neither can they answer any question relative to the competition now closed." Their procedure in the matter is, therefore, being exposed in this paper in the interests of the enormous number of unsuccessful competitors. Surely, in common fairness to them, it is not too much to ask that the assessor's report should be published, and the number of designs examined by him made known! Is our senior Architectural body too senile to notice the continued and crying abuses of Architectural competitions? If dignified silence is the only response to this appeal, it must be conceded that the Institute's own assessor either saw but a small proportion of the designs submitted, or his appreciation of Church Architecture is limited to the cast-iron style in vogue some 20 or 30 years ago; a conclusion everyone would be loth to come to.

To back up these statements, plans and perspective views of a number of the unsuccessful designs are published in this number. They are chosen at random, and there may have been many sent in that are more suitable, but surely any one

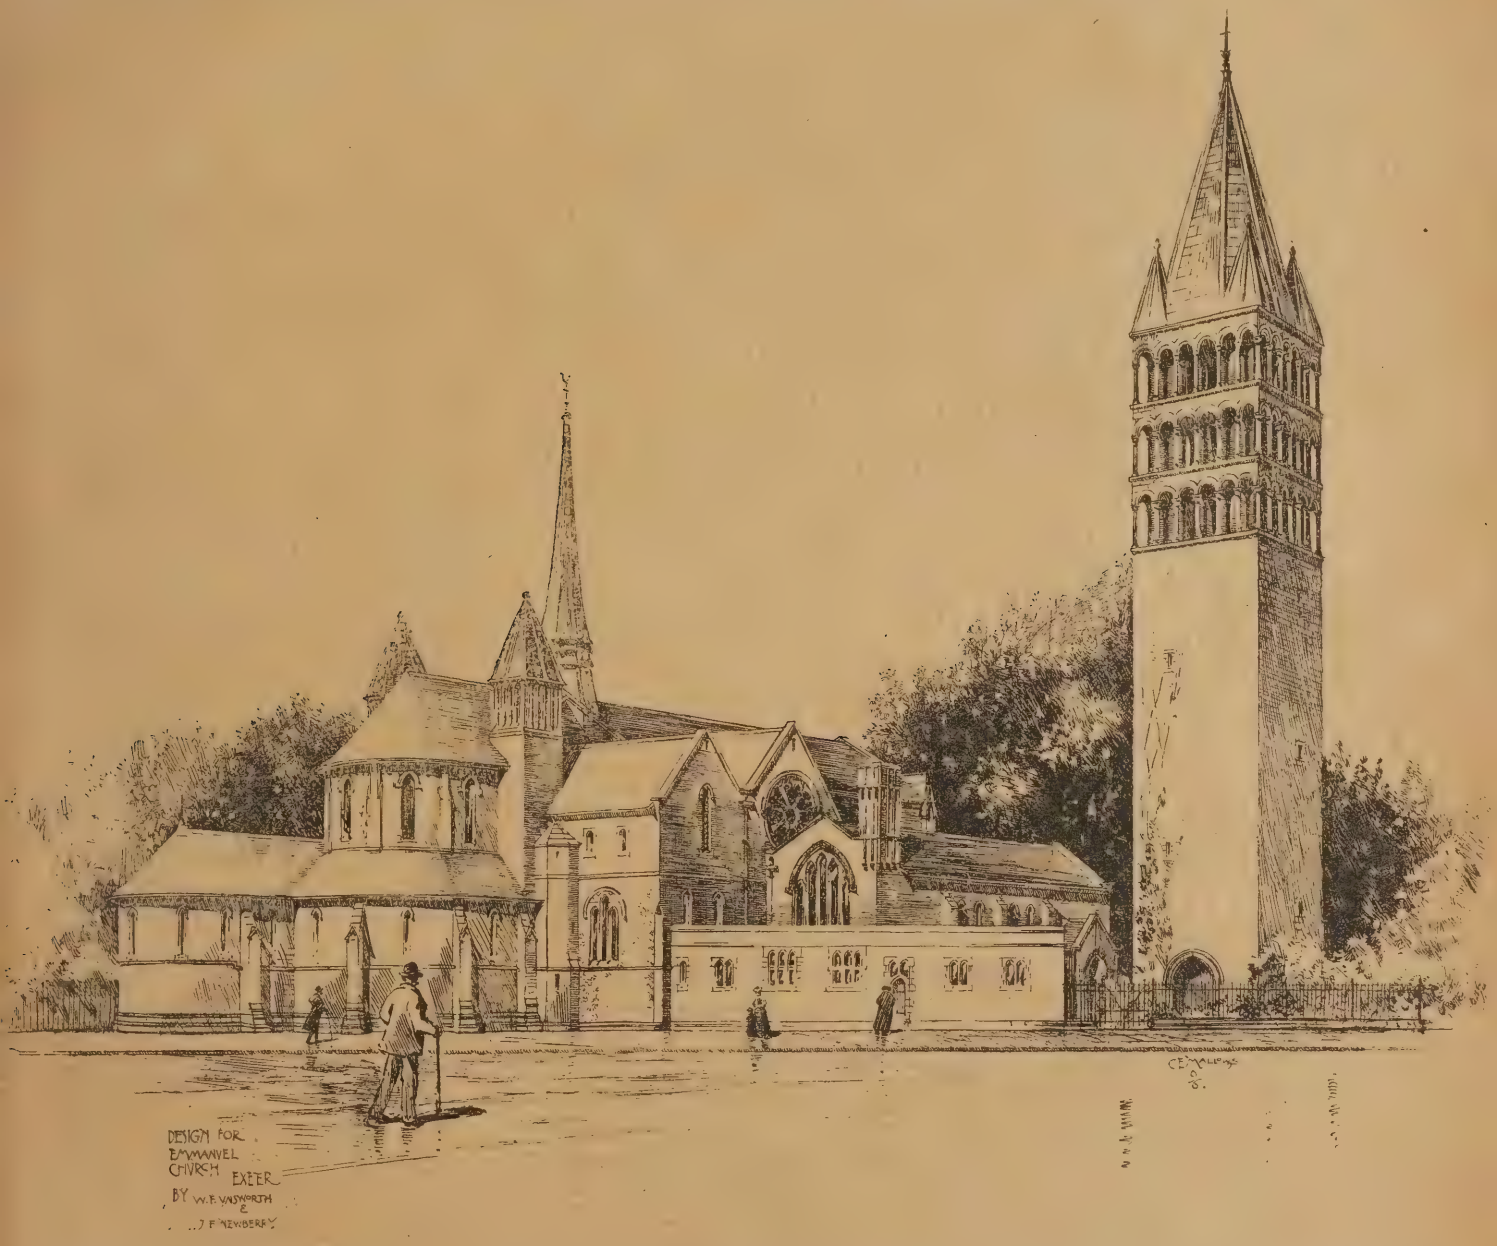
DESIGN FOR
EMMANUEL
CHURCH
EXETER

BY
P. A. ROBSON
WESTMINSTER.

of them is much better, Architecturally, than the selected design.

That by Mr. Robson is interesting in that it is probably differently placed on the site to the majority; the Church being parallel with the side street instead of with the main road. A picturesque grouping is thus obtained from the Okehampton Road. The type of Church is strictly English, and in the traditional and indigenous style of the district, late decorated, but treated in a modern spirit. The materials were intended to be local red brick, with Beer-stone dressings, the walls internally being plastered. The roofs are of the local "cradle" type, of red deal, boarded. A somewhat striking feature, internally, would be the nave arcade running through the transept, with pierced openings over. The floor is kept well above the ground level, thus enabling an excavated heating vault to be dispensed with, a most useful precaution on so damp a site.

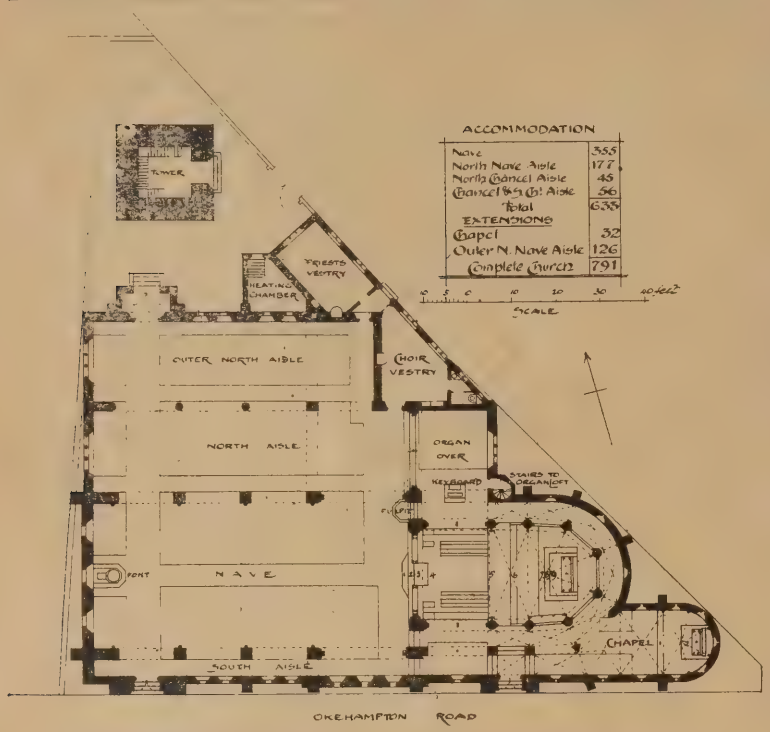
The cost of the Church, omitting certain suggested extensions, was estimated at £6,000, the tower, chapel, west gallery, and baptistery amounting to £4,700 more, and heating £155, the total cost thus being £10,855.



Messrs. Unsworth and Newberry's design is also a brick Church, with stone sparingly used, but is an adaption of a more early manner. The acute angle of the two roads seemed to suggest an apsidal termination, and this gave the key to thirteenth-century treatment. The Church is placed parallel and as close as possible to the main road, in order that the length may be taken full advantage of and the building orientated as nearly as may be. The suggested extensions were the outer north aisle, the morning Chapel and the tower. The wide nave and double aisles make a very spacious Church which would lend itself well to colour decoration. The sanctuary, ambulatory and Chapel were intended to be vaulted in brick with stone ribs. The tower is quite detached from the Church on account of the settlements that are sure to ensue if any extra weight is put on so treacherous a foundation as the site possesses. Although a large Church the authors estimated the cost, without extensions, at £6,000, basing their calculations on similar plain brick Churches. The total cost, without the tower, amounted to £7,724.

The design of Messrs. Heaton and Ralph is on more orthodox lines than the other two we publish this week, that is to say, it follows more or less closely on Gothic tradition. But if the general effect is rather "Geometrical," the whole design is uncommonly well worked out in detail, both in plan and external treatment. The tower, for example, has a well-proportioned upper part and the arrangement of the parapet is good, showing some feeling for the value of plain spaces, and a recognition of the uselessness of reviving dead forms. The external treatment of the south transept of the south porch is interesting and fresh in feeling. We do not, however, care very much for the treatment of the eastern termination of the chancel which is the most unsatisfactory part in a design otherwise creditable to its authors. They have, however, kept within the stipulated limit, although their design, we imagine, would prove a more expensive building than many of the others. The materials were coursed rubble for the main walls, with ashlar dressings.

KEYSTONES.



WE are pleased to acknowledge our indebtedness to Mr. Charles J. Heathcote for measured work, which we have been able to reproduce from time to time, of Tintern Abbey, Ledbury Church, Hereford; the Cloisters and Lady Chapel, Bristol Cathedral; Hereford Cathedral, and St. Chad's Church, Lichfield.

THE Indian Government has just placed with two Staffordshire firms an order for 120 miles of wire fencing. This is believed to be the heaviest order of the kind that has ever been given out by a Government Department. The barbed wire will be supplied by a North Staffordshire firm, and the iron rails by a Wolverhampton firm, who, in order to complete the contract, will be kept busily employed until April.

MR. OWEN MORRIS ROBERTS, Architect, well known in North Wales, died recently at his residence at Portmadoc after a long illness. The deceased, who was 63 years of age, had been entrusted with the designs of many important public buildings and Chapels in Anglesey and Carnarvonshire and Merioneth, and was the Architect for the proposed country buildings for Anglesey.

SOME Yorkshire antiquarians have been taking a new though merely academic interest in tithe-barns. Bolton Abbey is said to possess a very fine specimen. There is also a remarkable mediæval barn at Easington, near Spurn. The massive pillars which support the heavy oak roof are composed of trunks of oaks, standing on boulders obtained from the neighbouring boulder clay.

EXETER COMPETITION. MESSRS. UNSWORTH AND NEWBERRY'S PLAN.

MR. ALFRED WATERHOUSE, R.A., AND THE TECHNICAL SCHOOLS.

PRIZE DISTRIBUTION AT THE POLYTECHNIC.

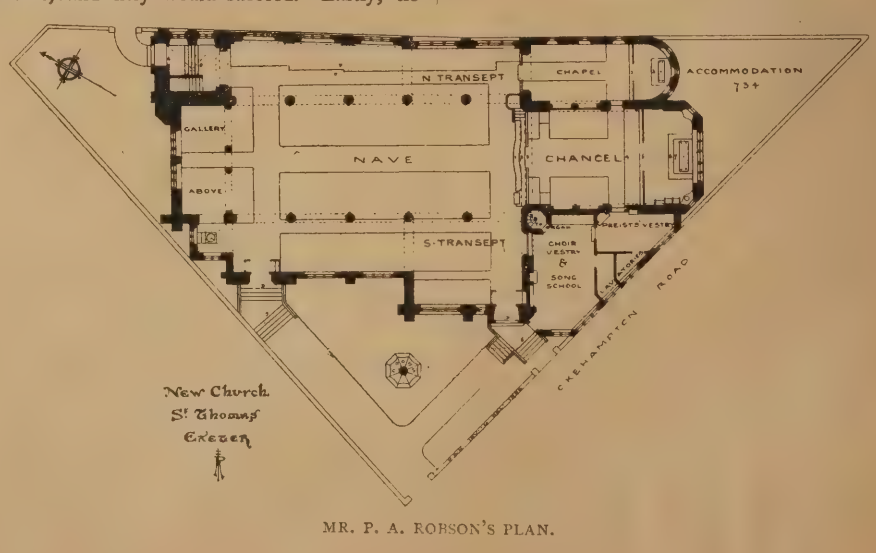
THE prizes and certificates gained during last session by the students attending the Architectural and Engineering Section of the Regent Street Polytechnic Technical and Continuation Schools, were distributed by Mr. Alfred Waterhouse, R.A., on Tuesday evening, the 22nd inst. Considerably over a thousand students had attended the section, and of this number something like 600 had gained prizes or certificates. The result was, in fact, signally successful, for not only has a large percentage gained reward in the shape of prizes or certificates, but many important posts have been secured by the students. Amongst their chief successes may be noted:—R.E. Asst. Surveyorships, seven places; Admiralty, one, a valuable post with a commencing salary of £180 a-year, rising to £500; Academy, two; Surveyors' Institute, three, including first place and prize, 1895; Preliminary Examination, R.I.B.A., twenty-nine, including three for the final Associateship; South Kensington examination in geometry, 1st class honours with medal, and the first place in England in advanced geometry; Architecture and Architectural Design, many passes, two students earning a special report from the Examiner on the consistent treatment of their designs. The students have also secured two London County Council Scholarships at the City and Guilds examination in carpentry, plastering, brickwork and masonry, while twenty-four medals, granted by the Carpenters' Company, have been gained, including one gold and seven silver ones. The consistent and steady work of many of the students has resulted in their obtaining valuable appointments at home and abroad, including several government assistant surveyorships; assistant engineer to the Admiralty, surveyor to the Prisons Board, and to the War Office (Architects' Department, &c.). Many of the students are doing well abroad, in the colonies especially; amongst others, A. W. Christie, who went to South Africa as an Architect, won the £100 competition for the design for a town hall at Salisbury; F. H. Pearse, who had a good deal to do with the building of Buluwayo; and several also in Johannesburg. Mr. Ross, after having filled a post as surveyor in Norway, is now under an engagement for Brazil. The post of chief assistant in one of the largest Architectural offices in Dublin has also been obtained by one of the members. The engineering classes generally have achieved a suecess hitherto unattained, both in the number of attendances and successes gained. In opening the distribution proceedings the Secretary mentioned that the Technical Education Board had added

A THEATRE AND A LABORATORY

to that institution during the past year, and commented on the fact that whereas the number of students in the Architectural and Engineering Section a year ago was 1,000, it now was 1,619. Mr. Waterhouse was then called upon to distribute the prizes and certificates, but before doing so he said that when he accepted the honour done him in inviting him to make that presentation, he was told that he would not have to make a speech. But he found that he had something more to do than make a speech; he had to hand out no less than 600 marks of distinction to those who had taken a foremost place in the studies of subjects allied with Architecture and Engineering, which studies were prosecuted with so much success in that hive of instruction. He ventured to take the opportunity of congratulating the students on the facilities which were afforded them of obtaining sound instruction in that home of the liberal Arts, and of congratulating its founder and its very efficient band of Professors also, on the success which had attended their enterprise and endeavours—a success most extraordinary. On visiting the Architectural classes he was much gratified in observing the lucid thoroughness of the instruction imparted to the students, and could not help contrasting it with the state of affairs half a century ago, when he was what most of them were then—a student seeking for instruction in Architecture. But he was unable to obtain anything like regular instruction, picking up a crumb of knowledge here and there whenever possible. Now, however, everything had changed and for the better. The student of to-day only wanted a certain amount of enthusiasm, a determination not to allow the pleasure of to-day to interfere with the success of a lifetime, and a resolve never to mis-spend an odd five minutes if they could help it. If they had this determination, ultimate success was sure. But they were not all prize-winners, and to those who had been unsuccessful he said—Never mind, only persevere; a little more effort, a little more patience, a little more determination, and they would succeed. Lastly, he would say to the Architectural students, make up your minds to pass the examinations of the Royal Institute of British Architects. They had candidates going there from all parts of the country, and he hoped the students there would show what the Polytechnic could do for them. They owed this to the institution and to its indefatigable Professors, as well as to themselves. The awards were then handed to the successful students, and, the long ceremony over, a programme of music given by the Polytechnic select choir and other artistes was gone through.

Our Illustrations.

A PAIR OF COTTAGES AT ADDLESTONE.



A BOAT-HOUSE ON THE SERPENTINE.

THE two black-and-white sketches, reproduced in this issue, show a partial development of a notion for illustrating, Architecturally and to scale, elevational and other drawings. Beautiful as many perspective drawings are, there is yet often a suppressed doubt, to the Architect as well as to the layman, as to how far a perspective may truly represent the actual or proposed building in ascertainable dimensions. It was this objection, as well as a desire to test the possibility of giving an impression, uninfluenced by the usual killing abundance of white, as usually permitted in black-and-white drawings and perspectives, that caused me to make these and other sketches from some of my own work.

The sketch of two cottages is drawn in pen-and-ink on paper, with the blacks brushed in; and the boat-house is drawn in wood-stump and ink on vellum—this stump work being a substitute for pen or pencil, adopted by Mr. Rudyard Kipling's father, in some of his Indian drawings in South Kensington Museum. A balance of white and black, and their proper distribution, makes an interesting problem, and the use of circumstantial advantages in the way of trees, hedges, fences, and even the conventional treatment of the water behind the boat-house, adapt themselves to treatment. Such questions have been put, as, "Where has it been done before?" "What gave the idea?" "Did Beardsley's drawings suggest the liberal use of a blacking brush?" How is it possible to say? Whether the idea be as old as Canterbury Cathedral, or newer than New Scotland Yard, it seems to me to have possibilities worth developing.

A. O. COLLARD.

[NOTE.—We do not necessarily identify ourselves with Mr. Collard's opinion, and we publish these sketches as we think they are interesting as experiments. Personally we are conservative enough to still prefer the perspective. Elevations, even when treated in this original way, can never give anything approaching a correct impression of a building, for the simple reason that, as everything is perspective, a purely elevational drawing must be false.—ED.]

MR. P. A. ROBSON'S PLAN.

Pictorial Architecture.

DISCUSSION AT THE LAST MEETING OF THE A.A. ON MR. R. SHEKLETON BALFOUR'S PAPER.

(*Concluded.*)

Mr. H. W. Lanchester, who opened the discussion, said, he thought that when Mr. Balfour brought them to the meeting, it was very likely to criticize the works of the painter and gloat over his delinquencies, while they congratulated themselves that they were not as other men were, and knew their work far better than the painter did his. It was very gratifying to find that Mr. Balfour had reserved his hardest knocks for themselves, to bring them to a sense of their responsibilities by reminding them that their own delinquencies were much more difficult to mend than those of the painter, who, after having accidentally made some Architectural blunder, was able to rectify it by a few strokes of his brush afterwards. He (the speaker) had only one criticism of a general character to make, and it was this: it did not appear that Mr. Balfour had quite entered into the spirit of the modern painter. Mr. Balfour had said that painting was decorative. He thought that was distinctly one-sided. Painting used to be decorative and many Architects said it ought still to be decorative. But he was not quite sure that it ought to be decorative, although it had been so for centuries past. A sort of short-sightedness had come over the world, he thought. They did not take things in that placid, easy way which their forefathers assumed. When they saw a painting in a room, they did not consider what part it played in the decoration, but at once began to silently criticise it. True, the painter did not intend them to consider his work only as it affected the general decoration of the room, but desired their honest consideration of that work. The painter desired to fix one impression upon them, and, if powerful enough, he succeeded, quite apart from the question of general decoration. He was not arguing that when a painter draws a picture he should not present his Architecture correctly, any more than he should present a figure incorrectly; it was only on the point of

PAINTINGS BEING DECORATIVE

that he was speaking. Mr. Balfour had quoted Morris, and he (the speaker) remembered having seen in one of his books a picture suggesting a possible placid existence on this earth, and after drawing the picture, Morris says, "it possesses little attraction when the present-day spirit of stress and concentration was considered." That expressed, to some degree, what the speaker meant as to the different attitudes painters take up now to what they did when painting was the handmaid of Architecture. Turner apparently did not attempt to make his paintings strictly decorative, as the word expressed embellishments, for it always seemed to him (the speaker) that the word decorative meant to embellish something. The two were quite apart, and there was no doubt that a very strong emotional impression was conveyed by combined Art or one phase of Art, however pure and simple, entirely divorced from any other Art. Music and painting, for instance, painting and Architecture, or music and the scene at the opera. He did not think that any painter could possibly feel anything hurtful by knowing thoroughly the basis and development of any work he might use in his painting. The painter had to construct the Architecture within certain limits, and he ought to acquire such knowledge as he felt would be desirable in the execution of his painting. The painter who depended merely upon tone or line, who merely used certain forms as suggestive of certain colour, in giving a representation of any object embodied certain emotion, and not through borrowing from any other Art. He might get suggestions for Architecture, and, of course, if he used these suggestions, he must know his Architecture thoroughly, but beyond the point to which he intended to carry his composition, it did not seem to the speaker that his knowledge need extend. Of course, as regards decorative painting, there could be no doubt to a man who knew the Architecture with which his painting was to be brought in harmony, would be very much more likely to produce a general result than the painter largely ignorant of a subject. Mr. E. Greenop said he wished to second the vote of thanks which he knew Mr. Lanchester intended to propose, for Mr. Balfour had given them a most interesting paper. Mr. Balfour had said that a painter could not suggest Architecture unless he understood it. He thought they would all agree with that; the painter could not suggest anything unless he understood it. This was a point he had seen strikingly exemplified once in going through an Art gallery. In one of the pictures was a violin, and he would undertake to say that no man ever saw such an abomination of a violin as it was, though he had no doubt the Artist had a violin before him in painting his picture. The bridge was about an inch out of position, which, in a violin, meant about forty-five per cent., and the head was twisted round as though it worked upon a hinge. Mr. Balfour had said that

TURNER WAS A TRUE IDEALIST

of pictorial Architecture. About this there might be a difference of opinion, but as Turner had been mentioned others should not be forgotten. Old George Barratt had not the advantages of Turner, but some of his compositions were full of poetry. Prout and Bonnington, too, ought to have been mentioned, together with other men whose Architecture was most beautiful. The Architecture of Albert Goodwin, he thought, was full of poetry; some of his compositions constituted what they might call an Architectural dream. Then, again, there was John Fulleylove and Harry Heim, with whose Architecture he did not think much fault could be found. Careful work was absolutely necessary to a painter, to prepare him for his richer work. He had always understood that some of our greatest painters had returned periodically to sharp point work, drawing the detail with the greatest accuracy, in order that they might not lose their exact precision as the result of constant work on their larger drawings. He had great pleasure in seconding the vote of thanks. Mr. J. Pennell said he had not much to say on the subject, because he was not an Architect. But he could assure Mr. Balfour that if he went among illustrators they would show him a few points concerning the branch of the profession as he had given them hints on his own branch. He could not help saying what had so often been pointed out, and which was equally applicable in the present instance, and that was—workers could not get away from their own profession in these discussions. Our own profession is the great thing: it is *the* profession, and other professions had nothing in common with us. We fail to grasp that we are

ONLY PART OF A GREAT ART,

and that those of us who are humble illustrators have some sort of interest in Architecture and really care about it. Although a man may not draw out all the details he sees, or thinks he sees, at any rate he is trying to express something. A great deal had been said of decorative painting. They did not mean decorative painting when they spoke of decoration. What they meant was "convention." If they looked up the works of William Morris, they would find that he said things were only decorative up to a certain period. He meant only "conventional." Take book illustrations. Nothing was decorative. What he meant was that nothing was "conventional." If they took the paintings of Turner, he could not see where the Architecture came in. He might be wrong, and was willing to admit that he did not pretend to know anything about Architecture, but he could not see why they would not admit that there were other kinds of decoration. For instance, colour, tone and line. The beauty of colour may be just as decorative as any form of outline or convention, for "convention" was what they meant. The word "decoration" had obtained a significance in England which it possessed nowhere in the world. In France or Spain they would find that the people spoke of great pictures as being decorative because they were in colour and contained no lines at all. If they looked at the work of masters like Rossetti or William Morris, they would find they had arranged their pictures with those conventional lives which were decorative from their point of view, and they had arranged them with the work, or at any rate to fit in with the frame in which they were hung. He knew that many painters brought their pictures up to the frame; the frame was considered a part of the decoration just as much as the work it bounded. He had never seen so much bad perspective and Architecture as that contained in the works of Turner in his younger days, and in many great works they would find no expression of Architecture at all. Many pilasters and so forth were painted to make the representation something like a building. But if a building exactly similar to that in the picture existed in reality, and would stand erect, he should be very much surprised. Then as to the one-sidedness of the Architect. Anybody who knew his subject mechanically could always find a painter in the wrong in every case. Personally, he had never tried to do anything in all his life but some one had gone to him and told him it was absolutely wrong. It probably was, and he did not care a bit. It did not make any difference. If an object looked like a bicycle, there it was, they could accept it as a bicycle. It was not the painter's business to give every object with Architectural precision, and he must not be expected to come down to these things, if Architects had to, when they talked about drawings they usually got mixed up between

ARCHITECTURAL DRAWINGS AND PICTORIAL DRAWINGS.

Keep the working drawings in their proper position. The criticism as to the violin was a criticism from a working point of view. That in the picture was never intended for anything but a picture of the violin, and so long as it was a general representation of that kind of instrument, what did it matter? The same sort of criticism was usually offered by a dressmaker when inspecting a picture in which costumes were painted. And for Architects to judge "ground plan" of a picture was absurd and ridiculous; it could not be there at all, and it would, of course, appear that the whole thing was wrong from beginning to end. If they looked at the greatest pictures they would see that it was not so much the subject treated and the way in which it was treated which made or marred the picture. It did not matter whether the subject represented a dirty old Jew being pulled up out of the ground—a picture supposed to be sacred because it was entitled "The Raising of Lazarus," it did not matter what the subject was, for that was not very material. The painter's mission was to paint things, and if he painted them as well as he could they ought to be thankful.—Mr. J. Stockdale said, those who took part in these discussions were supposed to be able to speak on any subject, from the hanging of a slate down to a new picture. But undoubtedly they did take more notice of the Architecture of a picture than the ordinary member of the public, and there could also be no doubt that the painter approached Architecture from a totally different view to that of the Architect. The painter put upon his canvas only what he saw, but the Architect frequently sketched what he did not see but what he knew to be there, with the result that the two productions were very different: nevertheless, some regard, he thought, ought to be paid to Architectural accuracy.—Mr. C. E. Mallows said, he thought Mr. Balfour had done a great service to them in laying before them such an interesting paper. But he would have done still greater service if he had called attention to the work of men like Albert Moore, E. A. Abbey, and Gerald Moira, whose work did not reveal that indifference to Architecture which previous speakers had so much complained of; especially with regard to Abbey's work, he thought there was a good deal of most sympathetic feeling and care for Architectural detail. A well-known and very able London Architect, who knows Mr. Abbey well, and his great love of Architecture, told him (the speaker) that the greatest amount of care and attention was given to every Architectural detail in his pictures. Indeed, it is only necessary to turn to any one of them to prove this. His illustrations to Andrew Lang's comments on Shakespeare, reveal an astonishing care for and knowledge of Architecture. If that was the case, he thought they might study Mr. Abbey's works with great advantage. Mr. J. Hyars said, he thought it was a pity Architects did not keep their drawings to themselves. They were really done for their own use, to see what sort of buildings they were going to put up, and as soon as they got the general idea it mattered nothing. So long as the public knew what was a door and what was a window, details as to height and so forth did not, or ought not, to concern them. The same thing applied to masonry and brickwork. No one, he took it, could mistake masonry for anything else but masonry. If they were not satisfied with their own drawings, it was a pity they did not employ Artists to draw them. He

did not agree that one should take no heed of pictorial Architecture, because, until they had drawn a thing in perspective, they did not know exactly what they were going to do.—Mr. H. A. Satchell said they must remember that the representation of Architecture could be approached from many standpoints, and it was the business of the painter to deal with the subject very differently from the Architect. He was reminded by this discussion of an interesting series of demonstrations given some time time ago at the Royal Academy by an American gentleman who sought to show that all painters who dealt with life in motion were wrong. Life was not long enough for them to learn everything appertaining even to one profession. The ideal form of pictorial expression for Architects would be for them to depict the building from what point of view it looked best.—The Chairman, Mr. W. Pywell, thought it was very useful to hear such a paper as Mr. Balfour had given, because it engendered thought on the subject treated. It seemed to him that if they strived to render their drawings pictorial they would be none the worse off, but he thought life was too short and they could not know everything, and time given to pictorial Architecture might possibly be better employed in attending to simple perspective. In his opinion

A PERSPECTIVE DRAWING WAS ABOUT THE LIMIT

of the ordinary Architect's representation of Architecture in a pictorial sense. Mr. H. W. Brewer said, he had listened to Mr. Balfour's paper with great pleasure. Mr. Balfour had treated the matter from what he might call a poetical point of view, and it seemed to be the opinion of certain speakers that he had been a little too poetical. He was bound to say, however—and he hoped no one would be offended—that the modern Architect might be a little more poetical. That was an element, he thought, which might fittingly be more widely introduced into the profession. Mr. Balfour had said that when a painter was painting the background of his picture he rather suggested than worked out the detail. It was a curious thing, but he had heard the same remark made very many years ago. He was once painting a piece of Architecture in the background, and had got it into the condition in which young men do—very much made out—when Mr. Stanfield, the well-known scene painter, went up to him and said, "Quite right, my boy, paint what you can see and when you have done that you will be an Art student. When you can suggest it without painting then you will be an Artist." This was one of those matters in which it was impossible to lay down the rules and principles. Indeed, he did not know whether the rules and principles in Art were an advantage or a disadvantage. He was afraid that Mr. Pennell would abolish them altogether, and he, the speaker, was not quite sure that he was wrong. As to the modern representation of Architecture, or Architectural drawing, as they called it, he had a word to say. The object of an Architectural drawing, or one of its objects, was to let the public know what a building was going to be like. If this was the case it seemed clear to him that something like a picture must be produced. He was not quite sure whether they were right in making a perspective drawing in pen and ink. When he was a lad, the Architectural room at the Royal Academy contained nothing but water-colour drawings, and he knew that at that time the room was generally filled with people anxious to see the drawings. Now-a-days, if they went there, they usually found about a couple of woe-begone men noting how wretchedly their drawings are hung. He did not question the fact that pen-and-ink was very beautiful material, but it was more beautiful for ancient buildings, such, for instance, as they saw in Mr. Pennelt's drawings. He said they were not correct, and he did not care about it. But they always seemed to him (Mr. Brewer) to be particularly correct. Mr. Pennell might take little liberties here and there, but he was bound to say, that nothing ever gave him a better idea of an old town than did his drawings. But it was another question when they came to the representation of modern buildings, and as Mr. Balfour had pointed out, it was scarcely fair to make the modern building look as though it was

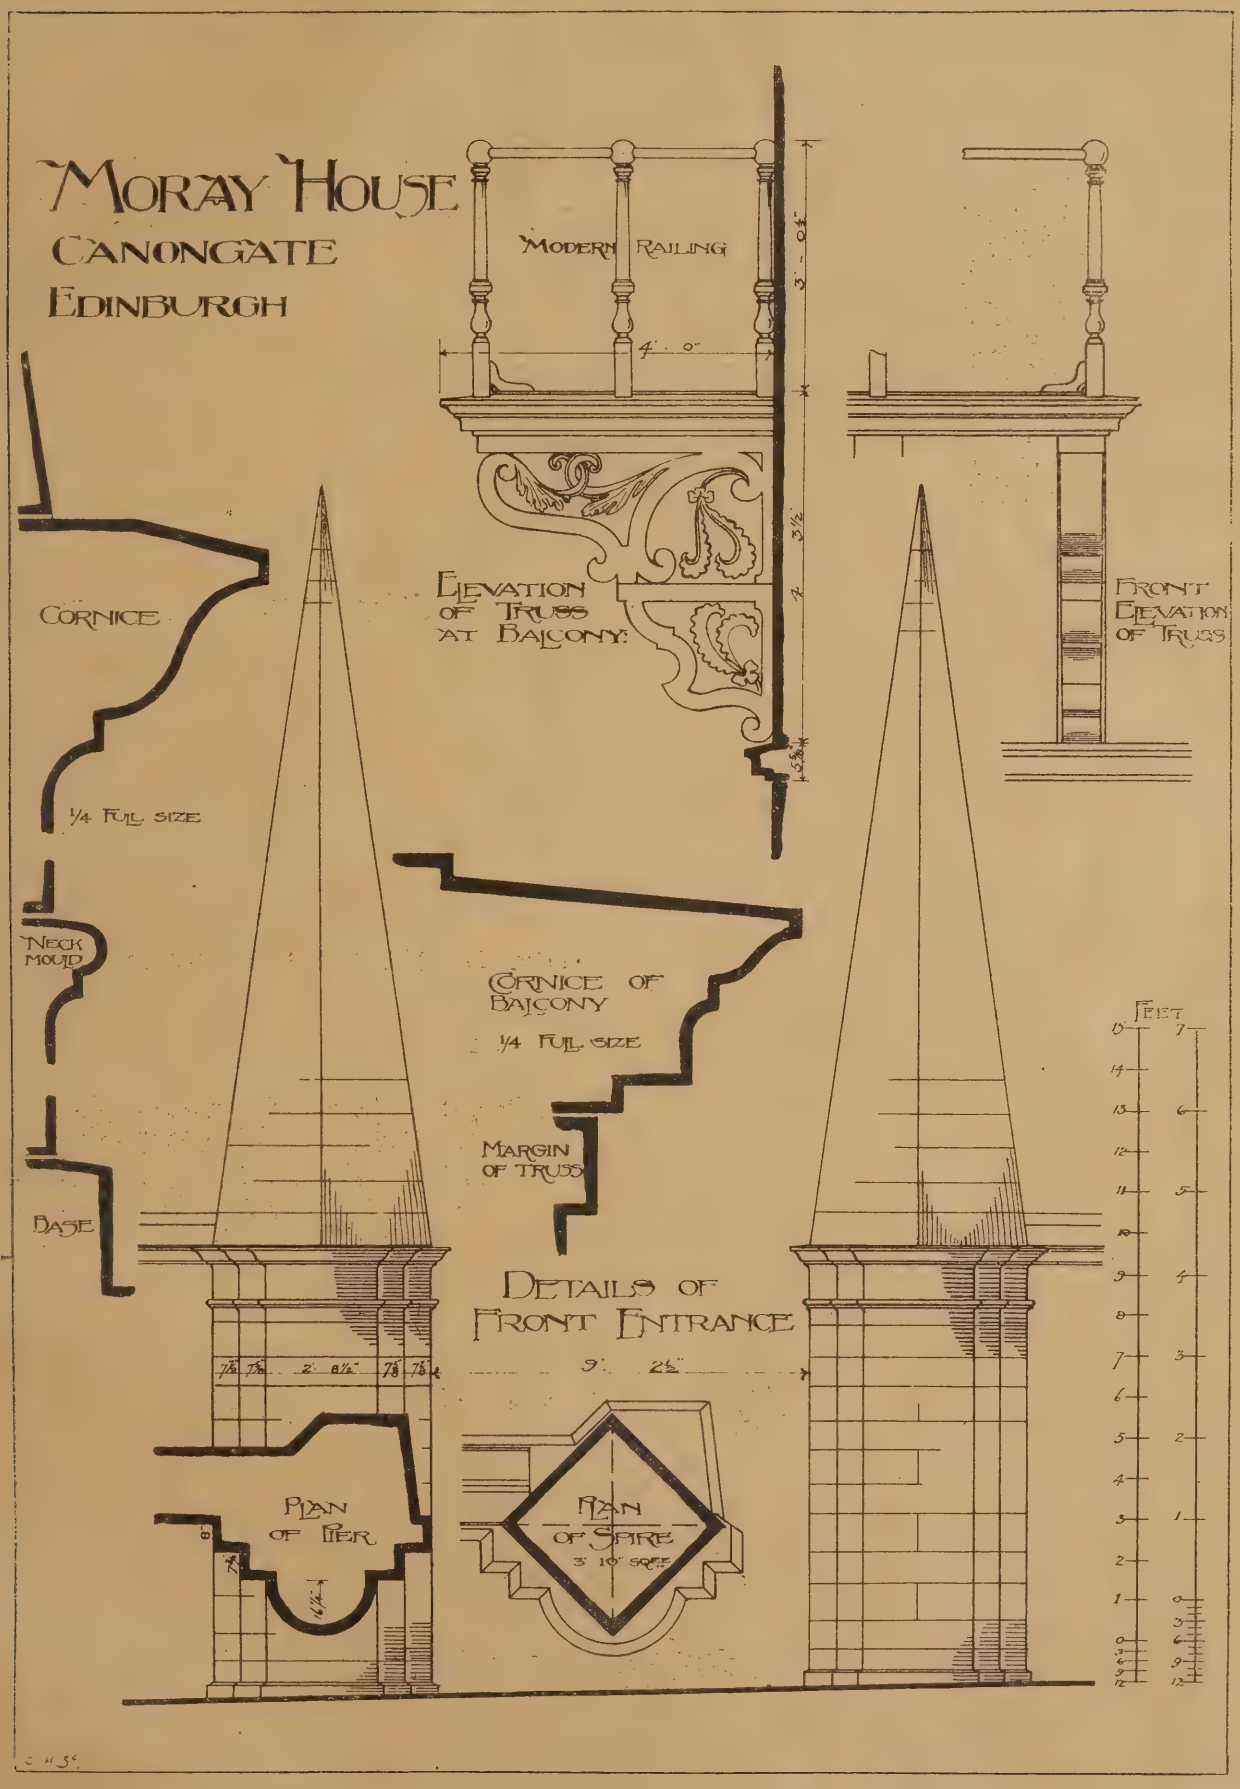
A VENERABLE ANTIQUITY.

It was not quite right, for instance, when they were going to put a Church up next week, to represent a vigorous growth of ivy round the tower. If pen and ink was the best material for drawings of modern buildings, it would be better, as had been suggested, to let no one see the drawings, and especially to keep a client in the dark. He knew of a case in which a gentleman, at whose expense a Church was being erected, expressed the greatest delight at the building, but on seeing the plans for the first time, when the Church was well advanced, said he was glad he had not been shown the designs earlier, otherwise he would not have allowed them to be carried out, so poorly did they represent to him the kind of building that was to be erected, and if a client, who was supposed to know something of plans, was deceived, how much more likely was it that the general public would be deceived. He was at an exhibition some time ago, when a friend went up to him and said, "Brewer, we can't make out a drawing—whether it represents the outside or inside." The friend was told that it represented both and neither, for it was a section. "Well, what is a section?" he asked, and Mr. Brewer explained as well as he could. "What are the black places here and there?" "They represent the walls cut through." "But are the walls to be cut through?" "No." "Then it won't look like the plan. How do you know what it would look like?" "I don't know." "Then, what is the good of representing it like that." Mr. Brewer gave the case up as hopeless. As to decorative painting—his own impression was, that anything which was exquisite and beautiful was decorative, and he thought they might take this as the real meaning of the word. He thought modern pictures should be looked upon as a decoration, for they gave wealth and colour to the wall. If they were to have pictures, however, it was quite clear, in these days of removal, that they must be moveable, and not a portion of the wall, as of old. The fact that pictures were no longer let into the wall, or made on panels, ought not to be considered as detracting from the decorative qualities of the picture.—Mr. Balfour briefly acknowledged the vote of thanks. The meeting terminated.

"THE WILLIAM MORRIS LABOUR CHURCH."

THE ancient meeting-house of the Friends, on Overton Bank, Leek, which will henceforth be known as "The William Morris Labour Church," is at present undergoing reparation at the hands of Mr. Billing, the builder. It is an unpretending, interesting, stone edifice, a couple of centuries old, standing in a well-turfed enclosure surrounded by tall old trees, where out-door meetings may be held under pleasant conditions "in the prime of summer time." It is furnished with old high-back pews, and has a comfortable upper chamber for small meetings; it will accommodate from 200 to 300 people if necessary. The walls are being lacquered a rich red, with stencil ornaments in colours to designs kindly contributed by Mr. Walter Crane. The ceiling and overhead beams are being finished (as also the barred sash windows) in pure white, and the woodwork painted a translucent green. The west and south upper windows will be draped with Morris blue velvet fabric, and the gas lighting is to be incandescent, with pink shades, &c. The decorations by Mr. J. Ratcliffe are under the general direction of Messrs. W. Sugden and Son, and Mr. Craigmile and Mr. George Rigby (as well as Mr. Crane) are giving valuable assistance. Mr. Rigby has designed a beautiful bookcloth, lettered in "Kelmscott" by Mr. D. Larner, which is now being embroidered by a skilled artist on Morris silk, and will be the gift of Mrs. Sugden and Miss Clodd. Miss Larner, of Hampstead, has presented the blue Morris velvet curtains. Mr. Stephen Webb (one of the founders of the Arts and Crafts, and associated with William Morris at South Kensington) is emblazoning a pair of silk banners with Morris quotations to hang aloft. The coloured festooned shade to the sunlight is the work of Mrs. W. L. Sugden. The emblematic figures and foliage decoration on the staircase walls, designed by Mr. Rigby, will not be complete for the opening. Already some 50 members have enrolled themselves.

Views and Reviews.



HAMPTON COURT.

BY WILLIAM H. HUTTON, B.D.

THIS book contains a collection of very charming sketches by Mr. Railton, in which we recognise all his characteristics of Artistic handling. His picture of the Great Banquetting Hall of Henry VIII., opposite page 50, is very fine. The frontispiece, a view from the river, is a good example of deft workmanship, putting in just so much as brings the scene before us, and knowing where to stop the hand. It is invidious to pick out the best ones where all are so good, but for dainty drawing, in Mr. Railton's best style, we think the Old Window in south front (p. 116), the Trophy Gate (p. 4), the Clock Court (p. 42), the Orange House (p. 104), and the exterior of Wolsey's private rooms (p. 48), will be most admired, and many may be glad to have such charming records of our most beautiful and most interesting of palaces. The accompanying letterpress is easy reading, and may lead those desirous of more information to the complete and exhaustive work by Mr. Ernest Law. The anecdotal gossip is amusing, but there is much that has no connection with Hampton Court. Ten pages are occupied by an elaborate attack on the character of William III., the King who passed the Toleration Acts, and eight are devoted to a one-sided account of the very one-sided conference between the nine bishops and five deans of the Episcopalian persuasion and the four Puritan divines, before King James I. He quotes from Mr. Paget, whom he rightly terms a "detective," and from some foreign author about the murder of the De Witts, and—we suppose on the principle that any stick will do—he tells us that William and his Queen, Mary, "both refused to touch for the king's evil, and so the quaint and solemn office was laid aside," and so on, while the theological legislation of Charles II. is slurred over. We do not perceive what all this has to do with Hampton Court, and the book would have been less bulky for its omission. He mentions the lately discovered private chamber of Wolsey, and Mr. Railton gives a sketch (p. 10) which shows how like the ceiling is, not to the chamber of Isabella d'Este, at Mantua, as Sir J. C. Robinson says, but to similar chambers in the Castle of Blois, built contemporaneously by Francis I. An interesting account of the great Mantegna Frieze is given, and the difficulty (we would say impossibility) of seeing it adequately is admitted. It is to be hoped that when the South Kensington Museum buildings are completed a room may be planned for these priceless pictures, so that they may be as safely and worthily housed, and as accessible to students as the Rafael Cartoons (formerly hidden away at Hampton Court) now are. When the danger of fire, from the number of irresponsible persons to whom free residences at Hampton Court are granted, is considered—a danger which is not an imaginary one as a recent fire there shows—the authorities may perhaps, before it be too late, remove these to a safer place. We observe that Mr. Hutton gives a choice between the two variants on page 189—Laguerre, in line 6, and La Guerre, in line 27. A good index is provided, for which every reader will be grateful. In closing this book we confess we do not know what class of the public will *use* it; for the library, the work by Mr. Law, beforementioned, will suffice; and for the visitor, the handy little book by the late Sir Henry Cole (which can be slipped into a breast pocket) is a model of its kind, giving a full account of all that he needs, with no airing of theological prejudices and no padding to make it bulky.

HAMPTON COURT, by William H. Hutton, B.D., with 43 Illustrations, by Herbert Railton. London: Nimmo.

A SCHEME for the erection of a new Church and parsonage at Newport, near Brough, is now in an advanced stage of development. A site has already been purchased from Mr. Milnes Gaskill, of Wakefield. It is intended to include a burial ground in the scheme, for a long time a great desideratum—the nearest burial ground being more than two miles away.

MEASURED AND DRAWN BY A. A. MacCULLOCH.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
December 30th, 1896.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gildea ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

RATHER a novel notion for public memorials has been mooted in the suggestion that special gas-lamps should be designed and dedicated to the memory of distinguished men. The proposal is made in connection with the R. L. Stephenson memorial, and it is obviously appropriate to the memory of the writer on gas-lamps in "Virginibus Puerisque," while Stevenson's affection for the lamplighter of his childhood is recorded in one of the most characteristic pieces in his "Child's Garland of Verses." But the utilization of public lighting for memorials might go much further. After all, our generation is greatest Artistically in domestic decoration, rather than in sculpture; and yet with all our modern appliances for lighting, our lamps are hideous and our streets and parks shockingly badly lighted. Why not plan out Hyde Park with at least one "Via Sacra" of memorial lamps? Here would be a combination of utility, Art, and honour.

PLANS and drawings for an extension of the Church House building have been prepared by Sir A. Blomfield, and they have been approved by the Council. The main elevation will be in Great Smith Street, and the building will occupy the site of the old Westminster Free Library, which has migrated into new quarters on the opposite side of the way. Latterly this old building has formed part of the premises of Church House. A clearance of the site is to be commenced shortly, and the new building, which will constitute an extension of the fine frontage already erected in Great Smith Street, will be commenced as soon as the ground is ready. It is to cost £18,000, and will afford a fine room for the House of Laymen on the first floor. The new structure will be dedicated to Mr. Henry Hoare. The work would probably have been commenced before this, but the death of the late Archbishop, who was the chairman of the Council, delayed it.

SOME significant statements as to the effects of the recent builders' strike in Dublin were recently made at the annual general meeting of the Royal Institute of Architects of Ireland. Mr. Albert Murray, hon. secretary, stated that one of its permanent effects would be to increase considerably the cost of building operations in that city, and that was a result greatly to be deplored. Mr. Thomas Drew remarked, that the strike had postponed or diverted for ever building investments to the value of £100,000 in the Dublin district alone, while the amount of wages lost to the men during their period of idleness was at least £50,000. He also referred to the proposed town hall for Belfast, which he said would cost £150,000. He then went into the history of the competition, and concluded by saying that it had been carried out unfairly. Though competitors had come from other quarters, the work has been, he said, unfairly given to a local firm.

THOUGH the Carlyle House in Chelsea has been on view to the public since July, 1895, the chief interest of 24, Cheyne-row has been confined to the past twelvemonth, by reason of the many valuable and interesting Carlyle relics entrusted to the trustees for the official opening in December last year, all of which, with the exception of the MS. notes for Carlyle's Edinburgh address, lent by Mr. Moncure D. Conway, still remain on view. One of the oldest manuscripts exhibited is the copy of agreement by which Carlyle first took possession, at a rental of £35 a year, of 5, Great Cheyne-row, and a comparison of his signature to this document with those of later years reveals hardly any change in his characteristic penmanship.

IT now appears that the County Council has no power to incur expenditure for the purchase of the Queen Boadicea statuary group by Mr. Thomas Thornycroft. In the case of Cleopatra's Needle, a special Act of Parliament was passed, providing for its preservation and maintenance and legalising the necessary expenditure. In these circumstances, and in order that the Council may be in a position to entertain similar offers, it is now proposed to procure the assent of Parliament to the insertion of a clause in a Bill empowering the authorities at Spring Gardens "to purchase, or contribute towards the cost of purchasing, or otherwise incur expenditure in connection with the provision and erection of works of Art in the county of London."

AMONG the novelties which are to be shown at the Paris Exhibition of 1900, will be an exact reproduction of the Montmartre Church of the Sacré Cœur, which is now being built under the superintendence of M. Rauline, the Architect. Before the foundations of the Church could be laid, the builders had to dig a series of 83 pits of considerable depth and about 5 yards in width, and fill them up with masonry and cement, producing in this way a large group of solid columns, on which the Church will stand. The building has already cost about 30,000,000 francs, and as yet the central dome is not nearly finished. The belfry has still to be built, and in other respects the building is in a backward state. The builders hope to have the central dome ready by the year 1900, but the Church will not be completed till 1910. The style of the Architecture is peculiar, although the whole effect is pleasing. It is not Gothic, nor pointed, nor Roman. The original Architect, M. Abodie, who died some years ago, was inspired by the Assyrian type of Architecture, to which we owe the elongated style of cupolas surmounting the towers and turrets of the building.

THE Sub-Music Committee of the Guildhall School of Music is preparing a scheme for the utilization of the vacant ground at the rear of the building on the Embankment and facing John Carpenter Street, which was, in the first instance, reserved in view of a probable extension of the school. This land is about 70 ft. long by 50 ft., and will, if built upon to the same elevation, give 12 additional class rooms. The probable cost will be a little over £10,000.

IT is a common assumption that a house is a substantial structure, and that persons may enter it without risk of danger to life or limb; but it appears from a case decided by the Court of Appeal on Saturday that the assumption is not altogether warranted. A workman was employed in removing furniture from a house near Barnet which had been only recently built. As he was engaged with another man in carrying a bedstead downstairs, the stair gave way, his leg went through, and he was severely injured. For this unexpected failure of the stairs, he has not unnaturally thought that some one ought to be responsible, and he has attempted to fix the responsibility on the owner of the house. At the time when the house was let it seems attention was called to its state, and complaint was made that the staircase was not safe. But with regard to the safety of houses the law professes complete indifference, and the Court of Appeal has left the workman without redress. Unless a tenant arranges to impose on the landlord some special liability, he takes the house in the state in which it happens to be, and whether it stands or falls is beside the mark. A visitor to the house is in no better position than the tenant, and whatever injury he may sustain in consequence of the rottenness of the house the landlord cannot be held responsible.

THE following letter recently appeared in a northern contemporary:—"I was very much astonished to observe in your issue of to-day's date that the Plans Committee of the Middlesbrough Corporation had rejected several plans because they were drawn to the ⅛-inch scale. I am perfectly aware that the bye-laws require the plans to be drawn to the ¼-inch scale, and drawings to this scale have had to be submitted for approval since the incorporation of the borough, but why, I am at a loss to understand, as, having during my professional career had to submit plans to various Corporations, I have never been asked to prepare plans to a larger scale than the ⅛-inch; in fact, this is the only town in England where such a preposterous scale is demanded, incurring from Architects an unnecessary expenditure of time and labour for no practical purpose whatever, simply to comply with an unreasonable bye-law. I feel assured that if the committee would for one moment consider the matter from a practical point of view they would not request Architects to prepare plans to a scale that is only adopted by drawing masters to instruct the uninitiated."

THE Finance Committee of Islington Vestry, in a report, direct the attention of the Vestry to the discrepancy between the aggregate amount of the contracts and other liabilities incurred by the Baths and Washhouses Committee for alterations and extensions at the Caledonian Road Baths, namely £16,099, and the amount originally estimated to be required for these works and sanctioned by the vestry on November 18th, 1895, namely £8,839. Further, the Finance Committee state that, although these contracts were reported to the Vestry by the Baths and Washhouses Committee, yet the Vestry's attention was not at any time drawn to the fact that the original sanction had been so largely exceeded. Owing to the irregularity which had occurred it was requisite to apply to the Local Government Board for sanction to borrow £7,260 in order to meet the deficit.

AT a recent meeting of the Birmingham Architectural Association, the Architectural aspect of the removal of the city Churches was discussed. Mr. T. Naden (who presided) opened the discussion, and said that there were two principal aspects of the subject—first, the Architectural merits of the buildings in question; and, secondly, what would most probably take their place if they were removed. He would consider Christ Church as of most importance, and though the general opinion, he believed, was that this Church was not a thing of beauty, he thought, with the horizontal lines of the Town Hall, the Council House, and other buildings round, the vertical lines of the spire of Christ Church formed a pleasing contrast, therefore the removal of the Church would be a distinct loss to the general effect of the group of buildings surrounding the square. If the Church were removed could they hope that a more beautiful building or one better adapted to the position would take its place? The purchase of the site and erection of business premises thereon would be a large undertaking, and would probably get into the hands of a syndicate of speculators, who would want to make the most of their bargain, and would have little regard to the beauty or appropriateness of the building for its position in perhaps the most prominent spot in Birmingham. In conclusion, Mr. Naden said that he was strongly of opinion that the removal of Christ Church (he would say nothing of St. Peter's) would be a distinct loss to the town from an Architectural point of view, and he would ask the members to enter a protest against it in the form of a resolution. Mr. C. E. Bateman and others spoke in support of the Chairman's views, and the general opinion of the meeting was that it would be doubtful if any other building would be found to harmonise with the surroundings so well. On the other hand, a small section of the meeting were of opinion that it would be possible to replace the Church with something of greater Architectural merit, and thoroughly harmonising with the surrounding buildings. On the motion of Mr. Naden it was resolved, "That this meeting dissents from the present scheme for the removal of Christ Church, and will use all means in its power to oppose it, and that the matter be referred to a sub-committee of the Association for further discussion."

PROFESSOR GLAISTER, St. Mungo's College, Glasgow, lecturing to the members of the Edinburgh and East of Scotland Branch of the National Registration of Plumbers, said the earliest occupation that called the plumber into existence was the builder, who operated entirely in wood or stone. The craft of the lead-worker had then nowhere a place in building, but when

Architecture made bolder advances into the regions of Artistic endeavour and form, the Art of the carpenter and mason was apt to fail in making the fabric watertight, and the worker in metals was called in to supply the deficiency. Lead supplied the deficiency of the workers in wood and stone. Hence the earliest use of lead in fabrics was as a roof-covering, as it was so commonly and extensively used to-day on flat roofs, and to some extent on all roofs. Beyond this there was not much evidence to show that the Art of the lead-worker was required. In the palmiest days of Rome they found that in some of the principal buildings lead pipes were used for various purposes, and of the civilizing influences which in these conquests the Roman Empire exercised, none was more apparent than the sanitary arrangements prevalent in their settlements. In proof of this he pointed to several aqueducts which were made by the Romans for bringing the water supply a distance of 60 miles, and said that one of these served its original purpose till this day. The lecturer proceeded to show how various improvements had been carried out in the plumbing trade, and dwelt upon the high position which it occupied among the trades at the present time.

THE progress which has been made towards the realization of colour photography has been demonstrated at the Fine Art Society's meeting by Mr. Ives, an American, as the result of twenty years' study of the subject. Acting upon a suggestion made by Professor Clerk-Maxwell at the London Institution, so long ago as 1861, who measured the spectrum colour mixtures and designed curves showing in what proportions his fundamental colour sensations combined to reproduce the other hues of the spectrum, a system of colour photography has been based upon his deductions, and from it negative images are produced which on a single-sensitive plate make a colour record. These, when cut in three and mounted in a folding frame are dropped into an optical instrument called by the unsympathetic name of Krōmskōp, and which somewhat resembles a stereoscope. The result is a reproduction which is completely satisfying to the eye of most people, and must be a surprise to all. The discovery seems to open the door to a vast field of usefulness as well as pleasure, for it will afford an imperishable record of colour in many varying walks of daily life, where such a record must be of great and lasting service to mankind. The invention will be on view to the public in a few days at the St. George's Gallery, Albemarle Street.

AT the Public Library, Uxbridge Road, Shepherd's Bush, the medallion portrait of the late Charles S. Keene, which has been set up in the entrance-hall of the building was recently unveiled. The work, which has been executed by Mr. G. Frampton, A.R.A., is in bronze, with a Sienna marble background. The portrait, a posthumous one, is a profile bust of the late artist, with the inscription, "Chas. S. Keene. Born August 10, 1823. Died Jan. 4, 1891." The tablet is surmounted by two small figures, one, mourning over his drawings, which are represented as lying across the knees of the figure, and the other, Humour, also mourning, the figure having in the right hand a staff with Punch's head at the top, which is resting on the ground. The memorial was subscribed for by about 60 of Mr. Keene's personal friends and admirers, the cost of the work being about 100 guineas. The library being dedicated to Leigh Hunt and Charles Keene, it was thought the place would be very appropriate for such a memorial, and the sanction of the Library Committee was readily obtained.

A MAP, showing the prehistoric monuments and sites in the State, is about to be published by the Ohio State Archæological and Historical Society. It appears that the mounds, earthworks, and sites of ancient villages follow the streams. In the Muskingum Valley, along the Ohio River, and in Bush Creek Valley, stone monuments predominate over those of earth, whereas in the Sciota Valley the contrary holds good. In seven of the counties there is a total of 918 monuments.

SOME of the most interesting of the Tel-el-Amarna tablets are those relating to Jerusalem and Central Palestine. At a recent meeting of the Society of Biblical Archæology, Mr. J. Offord gave details of a small number of tablets emanating from "Uru Salem," or Jerusalem, which afforded an insight into the politics and manners of that hill-city some centuries before the date of the Exodus. The date of the tablets is approximately 1500 B.C.

M. GASTON BOISSIER has made a communication to the Academy of Inscriptions respecting what is supposed to be the earliest known portrait of Virgil. It is in mosaic, and was recently discovered by some soldiers, at Soussa, in Tunis. The figure is seated, robed in a white toga, with a papyrus on his knees; on either hand are the muses of history and tragedy. The face is beardless, the hair short, and the portrait resembles the miniature portraits of Virgil in MSS., the best known of which are in the Vatican.

AN object-lesson which the anti-aliens people may well take to heart, was furnished at the opening of the Davy-Faraday Research Laboratory, of which this country has become possessed through the munificence of Dr. Ludwig Mond, a distinguished foreigner who has long resided over here as a member of the firm of Brunner, Mond, and Co. The laboratory, which is one of the finest of its kind in the world, has been erected in Albemarle Street, in premises adjoining the Royal Institution, and given to the institution by Dr. Ludwig Mond, along with an ample endowment for its maintenance. Lord Rayleigh and Professor Dewar have consented to undertake the duties of directors, and persons of either sex or of any nationality will be welcome within its walls, who can satisfy the laboratory committee that they are fully qualified to undertake original research work in pure and physical chemistry. The Prince of Wales, who performed the opening ceremony, congratulated the members of the Royal Institution on this most important accession to its resources, which they owed to Dr. Mond's generosity.

IF the twenty-eighth annual report of the Council is any criterion, the Glasgow Institute of Architects is in a most flourishing state. Whilst it is without the support of such pillars of strength as the late Lord Leighton, and Mr. Robert Blackie, whose deaths are recorded with expressions of deep regret, it is satisfactory to note that the Institute now enjoys the largest membership since its incorporation, its members including, with few exceptions, all the Architects in the west of Scotland with the necessary standing and qualifications. The joint occupation of the rooms at 187, Pitt Street, by the Institute and the Architectural Association has, in the opinion of the Council, been beneficial to both societies, and it is believed that it will be increasingly so in the future. The reading room is well furnished with English and continental magazines of Architecture and the other Arts, and the Council hope ultimately to acquire, by gift and purchase, a valuable library. As the result of a recommendation from a general meeting of the Institute, the Council agreed to give a donation of £30 to the library fund, and a list of books to be purchased is in preparation. Proposals have been received by the Council for the revision of the rules as to the measurement of brick work, painter work, plaster work, and glazier work, but the Council considered that the time had not yet come for revising the rules for measurement so recently prepared. As some misconception appears to exist with reference to the purpose of the Institute in taking part in the preparation of rules of measurement, the Council state in the report that it was never intended that the adoption of the rules should be made compulsory on any one. The Council consider that, however the rules may be modified or amended in the future, it must still be left to Architects and measurers to apply them intelligently, and to adapt them to changing conditions, and to the varying requirements of different buildings. In view of this, the Council are of opinion that the revision of the rules is not a matter of urgency, and that it may be conveniently deferred for a few years. To refer to all the good work of the Institute would create too great a record, but it may be mentioned that in order to encourage and promote the education of students, the Council agreed to take forty tickets, to be disposed of among the members, for the course of lectures on Domestic Architecture, delivered by Mr. A. N. Paterson, in connection with the Glasgow School of Art.

WE would call the special attention of our readers to the latest appeal against the Peterboro' Vandalism which takes the form of a letter and a very remarkable pen drawing by Mr. Joseph Pennell, in yesterday's issue of the Daily Chronicle. The drawing is worth careful study, not only as a picture (that goes without saying), but as a triumph of rapid newspaper printing on the part of the Chronicle. Apart, however, from its Artistic merits, the illustration is a powerful, telling, and eloquent protest against the proposed destruction of the Front. Looking at this impressive picture one almost feels the dumb appeal for help, coming from the stones themselves, asking from the nation that protection from the lust of the "*restorer*" which their present legal guardians refuse to give. We fancy those indiscreet gentlemen who have given support to the "little clique of obscure clerics" will shortly wish themselves rid of such unpopular and unpleasant company. Particularly when they find themselves opposed by such men as John Ruskin, Burne-Jones, G. F. Watts, Walter Crane, Holman Hunt, John Sargeant, and the rest of the distinguished names which form the protest now being drawn up by the Societies of Antiquaries and for the Protection of Ancient Buildings against this awful piece of Vandalism. A little while ago there was some talk of a compromise, to which we refer in another part of the Journal, but it seems as if the time for that had now gone by; compromise with asinine obstinacy is impossible any way. The proper course is that suggested by the Architectural Review, viz., to appoint either a Minister of the Fine Arts or a National Committee, which should have the entire care and responsibility of such treasures as these, our national and historical buildings, and to remove them at once from their present careless and incompetent hands. That there is urgent need for strong action to be taken immediately, the perilous state of Peterborough West Front amply proves. It may soon be destroyed *beyond recovery* if those in the right place do not move in the matter.

AN acquisition has been made by the British Museum of a papyrus manuscript, probably of an age some years earlier than the Christian Era, which has been found to contain the lost odes of the lyric poet, Bacchylides, a contemporary of Pindar and Simonides, whose poems were written to celebrate the victories of his patrons in the Olympic and other great games of ancient Greece. The manuscript is finely written, but has been much mutilated, and it is uncertain how many poems are contained in it, but there appear to be portions of at least fifteen or twenty, some of which are absolutely or substantially intact. This gives another Greek author whose works, until quite recently, were regarded as hopelessly lost, who has found preservation in papyrus manuscripts in Egypt.

A SURVEY of the picturesque remains of Birkenhead Priory is proceeding, and already curious discoveries have been made of the base uses to which the venerable pile has been subjected. For instance, the beautiful crypt has been found to have been employed as a donkey stable. Monk's Ferry, which was once the waterway from Liverpool to the terminus of the Great Western Railway system in Birkenhead, is a thing of the past, and it is interesting to recall that it derived its name from the habitation near by of cloistered ecclesiastics.

PREPARATIONS for the reopening of Parliament are in progress, but with the exception of washing the ceiling of the House of Commons and clearing the interior generally, no outlay has taken place. The vacation staff of workpeople has been, indeed, exceptionally small. The statue of Mr. John Bright, which last session was the subject of some heated controversy in Parliament, still occupies its place in the main hall of St. Stephen's, although it was understood when the session closed that the First Commissioner of Works had ordered its removal. The marble is grimy with dust, and this is the more noticeable as an instance of neglect from the fact that the marble memorials of Earl Russell, Earl Granville, and the Earl of Iddesleigh, in the same hall, have been carefully protected. These are now covered with cloths, after having undergone their customary cleaning, but as no one apparently knows to whom the statue of Mr. Bright belongs, the workmen have left it severely alone.

ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.

ANNUAL GENERAL MEETING.

AT the annual general meeting, held at 37, Dawson Street, Mr. Thomas Drew, President, occupied the chair. Mr. Albert E. Murray, the Hon. Sec., presented the annual report, which stated that:—The continued popularity of the Institute had been realized beyond their expectations, no fewer than 11 new names having been added to the muster roll during the last 12 months, bringing their number up to 82. They held 14 meetings during the past session, of which 8 were ordinary and 6 special. They had under consideration the best means to adopt in order to prevent work from passing into unqualified hands for execution. They also desired to call attention to the way in which the profession is injured by the employment of the salaried officials of large public bodies for private buildings. The Board of Works is an old offender in this respect, and endeavours have previously been made to have this grievance removed, but so far without success. The stronger the Institute becomes the more effective will be its action against all such professional abuses. The Council sent three representatives, including the President and Honorary Secretary, to the general meeting of the Royal Institute of British Architects, held in Manchester last May. The great strike which paralysed the building trade during the whole of last summer was one of the most noticeable events of the year, and caused an immense amount of disturbance and suffering, the effects of which are still being felt. One of the results of the strike has been to increase still further the cost of building in Dublin, a result to be deplored, and one sure to prove detrimental to the interests of all concerned. They had a very interesting interview and correspondence with the Master Builders' Association recently. This Society has greatly increased its numbers since the commencement of the strike, and now numbers all, or nearly all, of the larger building contractors of Dublin. The object of the conference was the desire on the part of the builders that they should adopt a series of recommendations which they had drawn up for their consideration. They related chiefly to the methods they wished them to observe in asking for tenders for buildings, so as to secure, as far as practicable, a fair and impartial decision in every competition, and to discourage favouritism and unfair tendering. Mr. C. Geoghegan moved, and Mr. R. C. Miller seconded the adoption of the report. The Auditors' report showed that there was a balance in hand of £85 14*s.*, of which £58 15*s.* 9*d.* had been carried over from last year's account. The President delivered his address, in the course of which he said that when he addressed them last year he did so in a cheerful spirit of prophecy of coming activity in the operations of their profession, and of good times for them all round, such as had not been known to Architects in Ireland in times of unrest and economic disturbance. Unfortunately for them, in Dublin at least, they reckoned cheerfully on general principles of political economy without taking account of the accidental issues of unrest and unreason which disturb the course of abstract philosophy in this country. They did not take account of a general strike in the building trade in Dublin. This strike began in May last, and paralysed building operations practically for nine months of the year—throughout the building months—condemning many willing working men to idleness, and Architects to sit with folded hands. It was probably within estimate that this strike had postponed, or diverted for ever, building investments to the value of £100,000 in the Dublin district, and that the

WILFUL LOSS OF WAGES

payable for skilled labour throughout this long wasted summer of 1896 had not represented less than £50,000 to the men of the trades. The ambition of the Irish Architect was to design and build fine monumental Architecture, and before all other materials, in the incomparable native building stones of his own country, and wrought by native hands; but let the stone-cutting trade take note that whether it was demanding but a fair living wage or not, its craft was a declining one in the country. Its cost had reached a price that was widely prohibitive. The inroad of artificial products and new expression of Architecture was encouraged. The plasterers' case was also, for instance, a craft in danger in Ireland. There was notoriously not a sufficient supply of skilful working plasterers for current wants; skilled labour had to be imported, and in any case the cost of ordinary plasterer's work had become so enhanced beyond its value that those who build seek every device to dispense with its use, and there were many modern devices to dispense with the plaster. During the late suspension of work, which had touched them as Architects, the general question of the status of the "foreman," who is the responsible practical director of the building works—the representative of the contractor with whom the Architect had daily to do—had been discussed by Architects. This was not a mere question between masters and men. It was one to which the public, whether as private employers or public department employers, had something to say, and Architects, in their representative position, were both entitled and bound to express an opinion on such a question. The

ART OF BUILDING—

had come to be one of extreme complexity. It demanded for its direction a man of education, of special and versatile knowledge of many things, and with an authority—a status and weight over the heads of the body of various tradesmen—which had as yet been unrealised. A new and specially trained class of managers or controllers of building works must be created. It should be clearly stated, from an Architect's point of view, what full qualification should be required for the man of the future who would take service under the extensive building contractor, the Crown, or the great and increasing number of wealthy building employers. He should be a tradesman—that is, the master of one handicraft, however acquired—say an operative carpenter. The men under him must know him to be as good a man as themselves, or better at a craft, and respect him accordingly, and he must also acquire by some technical training a general knowledge of the methods of all other trades employed in building. He now passed on to another subject which had an interest for them—namely, the late

COMPETITION FOR THE TOWN HALL IN BELFAST

—and he would like to make a few remarks in its regard. It was an important work, and would cost about £150,000. The Corporation of Belfast applied to the Royal Institute of British Architects to frame conditions and name an assessor. They did both. They were communicated to the Town Council. They began by omitting to thank the Institute, and it was evident later on that matters had been interpolated into the conditions—things which the President believed were perfectly foreign to competition and quite inoperative, but Mr. Waterhouse insisted on the matter being set right, and the result was that there was no fault to be found there. Mr. Waterhouse, with Mr. Bretland, finally selected three designs from those sent in, and proposed then and there, as the President had gathered, that the envelopes should be opened and the successful men declared. That was quite a proper thing. Mr. Waterhouse then went back to London as fast as he could. Strange to say no announcement appeared of this, though the proceedings were known in Dublin, London, and Edinburgh, within twenty-four hours. The committee in charge of the matter were not quite satisfied, and they wanted to bring in two other designs; and this committee proceeded illegally and improperly to vote for three plans out of five for final competition, and eighteen members plumped for the Belfast man, and the now celebrated Plan No. 22 was selected. The proceedings next came to the Belfast Corporation for confirmation, and the result of the matter, he thought, reflected great credit on the town of Belfast. The majority of the Corporation had got hold of the right end of the stick, and fell foul of the committee. Plain talk was used in that part of the country, and the mildest words used were "jobbers and tricksters," and such like. The whole proceedings were carefully discussed, and a strong feeling had arisen about it in Belfast. Some of them were inclined to express sympathy with the Architects who had been put into this position. They lost no time in writing to the Corporation withdrawing their plans, and declaring they would not be put in a position of the kind. This made the row very much worse; he thought these gentlemen had acted very properly, and he was glad to say that there was perfect unanimity in regard to this subject amongst their professional brethren in Belfast. Well, the decision of Mr. Waterhouse now stood, and he understood the gentlemen who had drawn the selected plans had been communicated with in order that they might go in for the final competition. That showed what public opinion could do. The President concluded by hoping that the Royal Institute of British Architects would give greater inducements to provincial Architects to join that body.

KEYSTONES.

A PROPOSAL is on foot to erect an illuminated clock in the tower of St. Paul's Church, Foleshill.

A NEW hospital is about to be opened in London, to be known as the New Central Hospital.

AT a recent meeting held at Tonbridge School, it was resolved to erect a Chapel.

A NEW Chapel is to be erected at Lowerhouse. Accommodation is to be provided for 450 persons, at a cost of £1,300.

ALL idea of unveiling the obelisk which is about to be erected in the Isle of Wight, in memory of Lord Tennyson has been abandoned for this year.

THE Elder Yard Unitarian Chapel, Saltergate, Chesterfield, has just been restored at a cost of £1,000.

A NEW Primitive Methodist Chapel is about to be erected at Fleetwood, on which it is proposed to spend £4,000.

HAMPSTEAD Board of Guardians proposes to add a new wing to the workhouse to accommodate about 100 inmates.

WITHIN a few years 200 artesian wells have been opened in Queensland, yielding 125,000,000 gallons of water a day.

A BRONZE statue erected in Leinster Lawn, Dublin, to the memory of Surgeon-Major Parke, has been unveiled by Lord Roberts.

Mr. FREDERICK VANGO BURRIDGE, A.R.E., late of the Royal College of Art, South Kensington, has been appointed to the head-mastership of the School of Art, Mount Street, Liverpool.

THE chancel of St. James's Church, Glossop, has been panelled with oak, and the organ front covered in with the same material, to harmonize with the choir stalls and other Church furniture.

IT has been resolved at a public meeting, held at Canterbury, to open a local fund in aid of the movement for the establishment of a national memorial of the late Primate, in Canterbury Cathedral.

A SERIES of experiments in the use of oil fuel are shortly to be tried at Portsmouth. The "Surly," has been selected for the experiments, which are the first of the kind ever carried out in the British Navy.

FURTHER additions have been made to the building in Brompton Road occupied by Harrod's Stores, greatly to the convenience of customers. An area of 26,000 square feet is covered by the new premises, which have a frontage of 400 feet.

THE Tynemouth Town Council is promoting a Bill in Parliament, to supply water in the borough and adjacent places, and to acquire the undertaking of the Company of Proprietors of the North Shields Waterworks.

THE Wesleyan Chapel at Ryhall, about two and-a-half miles from Stamford, has been re-opened after considerable alterations and improvements. A new schoolroom, two class-rooms, and vestries have been erected on land adjoining the Chapel.

OPERATIONS are being carried out at Stonehaven with the view of rendering perpendicular one of the pillars supporting the west side of Ironfield Bridge. This bridge was destroyed about the end of 1895, and erected again in the autumn of the present year.

THE old bell which the crier used to ring outside the condemned cell at Newgate, on the eve of its tenant's execution, has been discovered in St. Sepulchre's Church, and it is proposed to place an appropriate inscription on the bell and hang it in a prominent position in the Church.

THE question of a subway for vehicles underneath the Mersey appears to be again coming to the front. Much valuable time and a large amount of lighterage expenses would be saved by the construction of such a tunnel between Liverpool and Birkenhead. Some years ago a company was formed with the view of constructing a subway, but the scheme was abandoned.

ECCLESIOLOGICAL NOTES FROM NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

(Continued.)

THE Augustinian Church at Erfurt, of less grandiose dimensions, lies a little to the north of those just described. Instead of clerestory it has a low wall just above the lean-to roofs of the aisles unpierced by windows, and against whose north side a beautiful little octagonal belfry, terminating in a coronal of pinnacles, rests. The tympanum* of the north door is traceried like those at the Dominican and Franciscan Churches, but in a more geometrical style.

The finest parts of the Dom at Erfurt—imposingly placed at the summit of a flight of steps above the market, towards the western extremity of the city, are its choir, its triangular northern portal, and its cloisters. The choir,† one of the most satisfactory buildings of that class in which the German Architects of the latter half of the fourteenth century evinced their predilection for tallness of fenestration, retains the original painted glass in its richly traceried and lofty windows of three lights. Inclusive of those in the apse, there are fifteen windows, but unfortunately, owing to the narrowness of the arch opening from the nave into the choir, it is impossible to take in the whole of this magnificent lantern of mediæval vitreous decoration at a *coup d'œil*. The porch, of a type found occasionally in Germany—as for example at Ratisbon—has its portals facing north-east and north-west, the base of the triangle being the northern wall of the nave. The north-eastern portal is guarded by figures of the Apostles, while effigies of the Wise and Foolish Virgins‡ flank the companion one. A graceful little flèche rises from this interesting triangular composition, whose north-eastern door forms the crowning point of the aforementioned flight of steps. The nave of the Dom at Erfurt, as well as that of the contiguous St. Severus', is of the "hall" kind, and a century later than the choir. It has a curious declension to the north, and the side aisles, which, externally are gabled above the windows, as at St. Stephen's, Vienna, are wider than the central one. As a whole, this part of the Church does not rise above mediocrity, although its general effect internally is imposing, and may possibly have supplied Pugin with his model for St. Chad's, Birmingham, where its tall reeded pillars and immense painted windows are reproduced. The "hall" nave at St. Severus has double aisles on either side, and the whole is covered up, as with an extinguisher, by an immense mass of steep tiled roof. The most remarkable feature of St. Severus—so close to the Dom that the two western façades, viewed at a little distance to the south-west, appear to touch—is its triplet of sharply-pointed slate spires, very plain, and surmounting towers, which grow up from an elongated mass of wall inserted between the nave and the pentagonal apse, in lieu of transept. This same arrangement—recalling in some degree the screen façades of Maastricht—occurs also in the Dom. Here it is chiefly modern, for, on reference to Puttrich,§ the original fifteenth-century design appears never to have been properly reinstated, after injury in a storm of 1717, until the present half century restored the three richly crocketed spirelets, which, taken in conjunction with the adjoining ones at St. Severus, combine to form an Architectural composition of much dignity and interest. The wall space which these spires at the Dom surmount is Romanesque, and apparently the only remaining portion of the original Church, which was rebuilt piecemeal during the fourteenth and fifteenth centuries. On the south side of the Dom, at Erfurt, lies one of the most beautiful cloisters* in Germany, Middle-Pointed in style, and very reminiscent of those at Lincoln. The eastern side is the oldest, but nowhere are two windows similarly traceried, consequently they afford a beautifully varied series for transference to the note-book or the sketching block.

On the whole, German Churches have been far more fortunate in the retention of these *entourages* than French ones, a cloister approaching anything like completeness being somewhat difficult to meet with in the great Churches of such provinces as Picardy, Normandy, and Champagne. Germany was extremely rich in religious houses,† and it is not uncommon to find more than one cloistered Church in several towns. Paderborn, for instance, possesses a charming decorated cloister on the eastern side of its Cathedral's north transept; while a very large one of Transitional character extends along the south side of the Busdorf Kirche in the same city. Some of the best examples of German cloisters may be mentioned here. Romanesque or Transitional: Bonn (the Minster); Essen (the Minster); St. Maria in Capitolio, at Cologne; Hildesheim (the Cathedral); Halberstadt (the Dom): the last are peculiarly elegant, and, like those at Osnabrück Cathedral, have an upper story. Decorated cloisters—the following deserve especial mention:—Those belonging to the Cathedrals of Aachen, Erfurt, Mayence, and Münster; and to the Churches of St. Victor, at Xanten, St. John, at Osnabrück, and St. Servatius, at Maastricht. Naumburg Cathedral possessed two cloisters before it passed into the hands of the Reformers, one on either side of the nave. The southern one, of Transitional character, remains.

At Herford, the cloisters, which must have been on an extraordinary noble scale, have entirely vanished, little being left to tell the tale, as at Naumburg, but a few stumps of attached groining shafts against the wall of the northern aisle.

It is interesting to observe how little the outline of the complete Gothic tower of Germany differs from that of the Romanesque and Transitional periods, being still divided into stories of equal height by string courses, and its windows—never very large—set, if I may so speak, in a framework of masonry, projecting, in lieu of buttresses, but little from the wall in which they are pierced. Mr. Hanson's pen-drawings of the steeples attached to the Cathedral and St. John's, at Osnabrück, which appeared on December 16th, illustrate this better than any words of mine. The somewhat rude character of the Romanesque north-western tower of the Cathedral is remarkable; its contour bearing a considerable resemblance to that of the solitary western tower at Paderborn. The Transitional pair of western steeples at Münster Cathedral are, if we except their fenestration, almost identical with those of St. John at Osnabrück, the pyramidal slate capping, common to both, materially increasing the resemblance. Indeed, so little change took place in the outlines of steeples in this part of Germany, *i.e.*, Westphalia and Saxon-Prussia, that they are apt to become not a little monotonous. The richness and variety of such steeples as cluster so thickly in the southern part of Lincolnshire, between Sleaford and King's Lynn, are, I think, hard to find anywhere on the continent. Frequently the Westphalian and Saxon towers are roofed with tall slate or lead, but rarely stone, spires; while in many instances we meet with the low pyramidal, or fantastically domed, capping, both of which types appear in Mr. Hanson's sketches. Some exceptions, however, demand attention. In that part of Westphalia, neighbouring to the Rhine district, the gabled tower with the short quadrilateral spire of stone or metal—an adumbration of the spires to be presently alluded to, and with its ribs springing from the gables' apices—is met with, as, for instance, in the Marien Kirche, Dortmund. At Essen the western steeple of the Minster, *i.e.*, that surmounting the old Romanesque octagon, is of the Laach type. St. Peter's, at Dortmund, has an elegant unbroached and crocketed spire of stone, rising from a square tower with angle pinnacles; and at Unna a good-sized town between Dortmund and Soëst, a slate spire surmounts a tower of the same type.

The tower, gabled on each side, alluded to above, although encountered frequently in the Rhine provinces, does not come before the notice on a very grandiose scale until Soëst is reached. Here we have an unusually dignified example of it in the steeple of the principal Church of that city, St. Patroclus. It dates from the earliest years of the thirteenth century. Crowned with a sturdy metal spire of extremely pleasing outline—a spire whose ribs rest alternately on the angles of the tower and the apices of the gables which terminate it, this steeple of St. Patroclus, at Soëst, may be taken as a *via media* between the stunted quadrilateral Rhenish spire and those fully-developed ones met with at Lübeck* and Lüneburg. Between Soëst and Paderborn, this same type of tower, sometimes with a spire, at others taking the form of a cruciform† saddleback, frequently occurs in the villages which, bordering the railway line, might, in case of detention or overmuch leisure, prove worth a visit. Time, however, did not permit of the experiment being tried in this instance. Of the cruciform saddleback we have a fine example in the steeple of the Busdorf Kirche at Paderborn, and this was the form the steeple at the Cathedral took until the erection, within the last half-century, of the present ugly black lead spire. The favourite place for the steeple in Westphalia seems to have been at the west end of the nave. Each of the Dortmund Churches has its steeple in this position, likewise those at Soëst, with the exception of the Wiesen Kirche, which has a pair of modern spires, with open tracery like Cologne and Freiburg at the west end. There is considerable variety in the Soëst steeples so proudly dominated by that of St. Patroclus just touched upon. The Paulus Kirche has a most pleasingly contoured tower built of a peculiar greenish stone, with small windows delicately traceried in its belfry stage, and a rather elongated pyramidal spire of metal. St. Maria in Hohe, also at Soëst, has a gabled tower surmounted by a tall slate spire curiously inclining towards the west‡. Münster possesses two very beautiful fourteenth-century steeples—those of St. Mary Ueberwasser and St. Ludger. The former, carried up square in several stages, is surmounted by a solid octagon of rich workmanship, crested, and with pinnacles masking its alternate sides; St. Ludger's lantern is much lighter, *ouvert au jour*, and surmounting an octagonal tower, which in its lower stages is Romanesque. At St. Lambert's, in the same city, the tower, lately rebuilt, opens into the nave at the west end by a noble arch on slender shafts, in a manner recalling some of our grand Decorated and Perpendicular examples in Lincolnshire and Somersetshire.

Such groups of steeples as occur along the Rhine are not common in the centre of Germany, while the tall central tower, on the imposing scale of Coutances, Rouen, York, and Gloucester, is almost, if not quite, unknown. St. Mauritius at Münster, and St. Mary at Lippstadt, are very similarly planned as regards their towers, each having a very massive one at the west end of the nave, and a slimmer pair flanking the entrance to the choir.

* The tympanum of the south door of the Lamberti Kirche at Münster has the space filled in with a beautiful Radix Jesse, while, in the much earlier western portal of St. Elizabeth at Marburg, the roses and lilies which play so int resting a part in that saint's history are introduced.

† Mr. Pryone, in the very striking Church lately built from his design at West Dulwich, seems to have been influenced by this choir at Erfurt.

‡ The Parable of the Wise and Foolish Virgins was frequently selected for illustration in this situation in German Churches. It occurs in the magnificent western portal of the Minster at Freiburg-in-Breisgau; at Bamberg, in the north door of the Upper Parish Church; at St. Sebald's, Nuremberg; and in the south-western portal of Strasburg. The same subject is portrayed in panels on either side of the south transept window of Paderborn Cathedral.

§ Baukunst des Mittelalters in Sachsen.

* Called, in Germany, Kreuzgang (Way of the Cross) from their appropriation to the recital of this office. Most of the cloisters are provided with pictures of the Stations, and furnished with desks and kneelers. At Osnabrück the Stations, in the form of shrines, are disposed outside, around the garth.

† Many of these conventual establishments which survived the Reformation, were only suppressed in 1803.

* At Lübeck the surfaces of these gables are relieved with small panels enclosing quatrefoils, all executed in brickwork, and imparting a very rich effect.

† The "saddleback" tower is nowhere seen on so fine a scale as in Normandy. Numerous imposing examples meet the view during the railway ride from Lisieux to Coutances, while in the Cotentin they abound. In England this type of steeple was never employed on so grandiose a scale, but its use has been brought into requisition, since the Gothic revival, pretty frequently. When funds are not forthcoming for the erection of a spire, perhaps no termination is more pleasing than the gabled one. As a remarkably fine example of a modern "saddleback," the tower of St. Matthias, Stoke Newington, one of Mr. Butterfield's most original designs, may be singled out for special mention. The treatment of the common brickwork, relieved with a very little stone dressing, is most masterly; while the manner in which it rises at the east end of the nave, with the aisles continued along its sides in lieu of transepts, is among the finest things modern Architecture has seen. At St. Luke's, Kentish Town, is a lofty cruciform "saddleback," occupying the same position, and resembling in general contour the German ones alluded to above.

‡ The south-eastern spire of Gelnhausen has a similar, but more marked, inclination.

(To be concluded.)

SWANSEA Market is approaching completion, the original contract having been carried out; but there remains yet to be done the additional work recently decided upon by the Council, of putting the western side into something like consonance with the new building.

Professional Items.

BEDFORD COURT, LONDON.—The large block of residential flats now being built here will be equipped with three electric passenger lifts and one electric goods lift. The whole of the work, including motors, electric lights, bells, and indicators, will be carried out by Messrs. Easton, Anderson, and Goolden, Limited, of Erith.

BLAGDON.—The restoration of Blagdon Church Tower is now complete. The restoration was entrusted to Mr. Frank Wills, Architect, under whose supervision the contractors, Messrs. Wm. Cowlin and Son, have carried out the work, every endeavour being made to discover any relics of the old structure, in order that a faithful reproduction should be ensured. With this end in view no trouble was spared in searching the neighbourhood, where portions of the original work were supposed to be, and which had been removed when the first so-called restoration took place. The work was commenced about Easter, when several weeks were spent in encircling the tower from bottom to top with a gigantic scaffolding. This being completed, the whole of the balustrading of the tower was taken down. There were originally on top a turret surmounting the staircase, three large pinnacles at the other corners, and four smaller ones midway between. These had all been removed some years ago, as they were considered unsafe. An examination of the Church building revealed one of these pinnacles, which had been placed above the chancel. Following this original design, the whole of the pinnacles have been restored with their masoned crockets in the same manner as formerly, so far as discovered remains of the originals gave evidence, and are executed in stone from the Lulsgate Quarry, which was undoubtedly the same whence the stone came years ago. The large pinnacle is 16 feet high, and the smaller ones are of proportionate dimensions. The fretted and moulded parapet surrounding the tower has been faithfully reproduced, all existing stones being re-used and jointed together with slate dowels so as to prevent a repetition of the damage done by the previous use of iron cramps, which had caused much disintegration of the stone. The above was all that had been originally intended to be done, the cost of which was about £600. But on examination of the lower part of the tower it was found that the original west window had been shortened at some time or other, and the door of the tower had been made much higher than at first, a portion of the original sill of the window being discernible, as also was the label course from which the arch of the door sprang. There were also found the moulded springers of a groined ceiling inside the porch. The two floors of the tower were found to be in a ruinous condition; these extra works have been carried out. The ringing chamber has been taken away, and an elaborate groined ceiling of Gothic fan tracery of the Somersetshire type has been constructed, which enhances the effect on entering the porch. The old west window has been taken out, enlarged to its original size, and filled in with cathedral glass by Messrs. J. Bell and Son, of College Green, Bristol. The exterior part of the tower has been repaired wherever it was found necessary.

BORDESLEY GREEN.—An iron mission room has been opened in Cherrywood Lane, Bordesley Green. The building, which is lined throughout with wood, will accommodate 160 persons. The contractors were Messrs. E. C. and J. Keay (Limited) and Mr. J. Hyde.

BRISTOL.—The re-opening of the Moravian Church, Maudlin Street, which has recently been rebuilt on the foundations of the old Church, which dates back to 1756, has taken place. About 30 years ago the level of Maudlin Street was raised, and then the Church was left at an inconvenient depth below. It has long been the wish of the congregation to raise the edifice up to the street, and this has now been done and the Church practically rebuilt, at a cost of £2,000, towards which £1,120 has been raised. Beneath the Church is a spacious schoolroom, 51 ft. by 30 ft., a meeting-room, and other offices, all of which are well lighted, owing to the natural fall of the ground. Externally the buildings are designed in accordance with the style of Architecture which prevailed in the last century. The Church is faced with red brick, with stone dressings, the porch being entirely of stone, with well-designed doorhead, carved by Mr. Gilbert Seale. The lower portion of the walls have been rough cast, with pebble dashing, making a pleasing contrast to the red brickwork above. The roofs are covered with Brosley's tiles. On entering the Church from the porch, which is paved with black-and-white marble, one of the most noticeable features of the interior are the beautiful stained-glass windows. The Church provides seating accommodation for 230. The contract was taken by Messrs. Cowlin and Sons in July last, under the supervision of the Architect, Mr. Edward Gabriel.

CHELTENHAM.—A new Chapel at Cheltenham College was recently opened. The Architect was Mr. Prothero. Much, however, remains to be done before the Chapel can be pronounced complete. Plain glass in the windows will not satisfy the college authorities, and the simulacrum under the east window is merely the emblem of that which it is desired to establish in the future.

CHESTERFIELD.—After being closed several months for purposes of restoration and decoration, the old Chapel in Fider Yard, Saltergate, Chesterfield, has been re-opened.

CONSETT.—The New Theatre in Front Street is now completed. There are three main entrances from Front Street, and there are three emergency exits, besides those from the stage. The auditorium is 43 ft. wide by 52 ft. 6 in. in depth. The pit floor has a slope of 2 ft. 6 in. from the back to the proscenium, and will comfortably seat over 600 persons. The stage is 37 ft. 6 in. wide by 31 ft. in depth, with all the requisite outlets, artistes' entrances, dressing rooms, &c. The ceiling of the auditorium is done in Lincrusta Walton and decorated, and the circle and gallery fronts covered with asbestors decoration, and rendered fireproof. The plans were designed, and the building carried out, under the supervision of Mr. W. S. Shell, of Consett.

DERBY.—The Education Department has sanctioned the loan of £9,470 for the erection of a new school at Pear Tree. It was originally intended to supply accommodation for 600 children, at a cost of £8,300. It has been found that to complete the block for 1,000 would only cost £10,000, and this the Building Committee recommends should be done.

DOUGLAS.—Opinion seems to be gaining ground that the Town Council, in deciding upon the site in Ridgeway Street for the new municipal buildings, which can never be made to hold suitable town buildings, are making a great mistake, the effects of which will be felt for generations to come. It is unfortunate that, just at this juncture, the attention of the Council, and more or less the attention of the public, is so taken up with other weighty matters—such as the new drainage, the water supply, and electric lighting—that the equally important question of the municipal buildings is likely to drop out of sight, and if the Council proceeds to carry into effect the policy to which it has already pledged itself, there is reason to believe that an irretrievable blunder will have been committed.

FARSLEY.—At a recent meeting of the District Council, the question of widening the town street was discussed. Mr. J. Isle said this formed part of a big scheme, and the best plan in his opinion was to engage a surveyor to prepare a plan showing how best the whole of the main street could be widened to a uniform width of 14 yards. It was decided that Mr. W. D. Gill, Architect and Surveyor, should be engaged to prepare a plan.

FORT WILLIAM. — The plans prepared by Messrs. L. and J. Falconer, Architects, Blairgowrie and Fort William, have been accepted for the erection of a new post-office at Fort William. The stonework of the lower portion of the façade, as well as the cornicing, pediments, oriel windows, and other dressings, is of red sandstone, from Corsehill quarries, near Annan; while the coursers which occupy the space between the oriel windows are of light blue rock from Duntrune quarry. Supporting the front are panelled stone pillars with moulded capitals and bases, and the lintels for doors and windows are carved on soffit, panelled on face, and surmounted by a projecting moulded cornice, with moulded and carved trusses at each end.

GOSFORTH.—A new Catholic Church has been opened at Gosforth. The Church, which is built of iron, is situated in Church Road, a little to the right of the main road from Newcastle. It has been erected by Messrs. Croggon and Co., of Liverpool and London, and will hold 400 persons. It is of one span, with Gothic windows, tinted glass, and sacristy.

GRINDLEFORD.—It has now been decided to erect a new Chapel at a cost of about £800 at Grindleford. It is expected arrangements will be made for an eligible site on the Sheffield Road. Plans of the new building are being prepared by Mr. G. Wesley Johnson, Architect, Whaley Bridge. The style will be Gothic.

HALIFAX.—The new Infirmary buildings of the Halifax Union are to be fitted with six passenger lifts and two service lifts, all worked by electricity, and supplied and fixed, with all necessary motors and gear, by Messrs. Easton, Anderson, and Goolden, Limited, of Erith.

HAYES MARKET.—Messrs. D. Rees and Co., Limited, have decided to accept the lowest tender of £5,123 sent in by Messrs. W. Thomas and Co., for the erection of their new premises, and the Architects, Messrs. J. P. Jones, Richards, and Budgen, have been instructed to see that the work was commenced at once.

HULL. - In the complete Bill for extending the boundaries of the county borough of Kingston-upon-Hull, and for other purposes, is included powers to construct a new bridge over the River Hull, with approaches thereto, to make new streets and improvements of streets, also to construct crematories in the Hull Western Cemetery and near the Hedon Road Cemetery. The financial clauses provide for the expenditure of £25,000 on the new bridge, £200,000 on the construction of new streets, and £3,500 on the construction of crematories.

LEEDS.—Several matters affecting the improvement of Leeds streets recently came before the Streets and Sewerage Committee of the Corporation. A resolution was passed approving of the widening of Burley Street at the Burley end of that thoroughfare. The City Engineer was requested to prepare plans for the widening of East Street, and report. The North Street improvement was discussed, and a resolution passed with reference to dealing with properties already acquired. It was also decided to improve Cardigan Lane, from Cardigan Road towards Burley.

LISBURN. — The advisability of engaging a competent electrical engineer to report as to whether electric lighting plant could be erected for the purpose of lighting Lisburn by electricity has been under consideration, and at a recent meeting of the committee, Mr. E. S. Dashwood, electrical engineer to Messrs. William Coates and Son, Belfast, was appointed consulting electrical engineer to the Town Commissioners, with instructions to report fully as to the best system to be adopted for lighting the town.

LIVERPOOL.—The new block of buildings at the corner of Gregory Boulevard and Radford Road, which will comprise a branch police station, reading room, fire station, mortuary, and inquest room has been opened. The site was purchased by the Corporation many years ago from the Gregory trustees. Some 12 months have been occupied by the builders in the work of erection, the contractor being Mr. J. J. Adams, of Nottingham. The plans were designed by the borough engineer (Mr. Arthur Brown), under whose personal superintendence the whole of the work has been carried out.

LIVERPOOL.—The old Alexandra Theatre, Liverpool, has undergone complete transformation, and little of the original building remains except the walls and roof. The principal external alterations include the erection of a large pediment on the top of the front elevation, and the whole of the entrances, except that to the gallery, are now brought to the front. The undesirable entrances in Coal

Street are either entirely abolished or used for exits. The theatre frontage is a large glass and iron shelter, illuminated by electric light. A new vestibule has been formed, with lobbies and double set of doors to prevent draughts, whence a wide corridor leads through a capacious crush-room, brightly decorated, to the orchestra stalls. The decorations are from Mr. Matcham's design.

LONDON. The Huxley Memorial Medal Committee has selected Mr. Frank Bowcher's design for the Royal College of Science medal. The competition produced about 40 models; and the one adopted bears on the obverse a good likeness of the distinguished scientist, and on the reverse a building of classic design in illustration of a college.

MANCHESTER.—An electric passenger lift is to be placed in the Technical Schools, the contract being in the hands of Messrs. Easton, Anderson, and Goolden, Limited.

MONTROSE.—The Rifle Volunteer Hall has been re-erected on a site in Mill Street. The preparation of plans was entrusted to Mr. John Sim, C.E. Utility more than ornament has been kept in view, but for all practical purposes the whole arrangements internally leave nothing to be desired. The building is now approaching completion, and it is intended to open it early in the year.

MUTHILL.—Some time ago the old Free Church, Muthill (from which the congregation had been evicted, owing to some legal difficulty in the charter) was purchased by Mr. G. T. Ewing, Architect, who has had the building converted into a public hall for the village, calling it the Ewing Hall.

NEWCASTLE.—The Redheugh Bridge, which has for some twenty-five years formed the principal means of communication between the western portions of Newcastle and Gateshead, is about to disappear and have its place taken by a better and more prepossessing structure. The present bridge had as engineer the late Sir Thomas Bouch, who designed the ill-fated Tay Bridge. The new one by which the Redheugh Bridge Company are about to displace it, has been designed by Messrs. Sandeman and Moncrieff, a Newcastle firm. The Redheugh Bridge Company are now advertising for tenders for the construction of the new bridge, which is to be built of steel, and to occupy the same position as the old one. The proposed bridge is to consist of two spans, each of 248 feet centres of bearings; two spans, each of 168 feet centres of bearings; and eleven spans, each of from twenty-seven to twenty-nine feet centres of bearings, together with cylinder foundations, steel-braced river piers, steel gas and water mains. It is estimated that the time occupied in its building will be from two to three years.

NEWPORT.—As many as 32 plans have been received for the proposed new infirmary at Newport, which is to cost £20,000. The assessor's report has not yet transpired.

PERTH.—Building operations have been commenced on the site of the new post-office. Large barricades have been erected, and the foundations are being dug.

PORTHCAWL.—A great deal of interest is felt in comprehensive improvements projected at Porthcawl. The scheme will take up all the land from the College to the Hatchin's Farm, and, if possible, from there to the Rest. It is intended to build a pier, a breakwater, and an electric tramway, connecting the pier with the Great Western Railway system, and making roads and buildings, sufficient capital for all of which would be raised amongst the members of a syndicate. The sum of £100,000 has been fixed as the nominal capital.

TIPTON.—The ceremony of opening the new post-office at Tipton took place on the 21st inst. The building, which is a handsome structure at the corner of Horseley Road, Dudley Port, was designed by Mr. Tanner (chief Architect of H.M. Office of Works), Mr. J. Mallin, Churchfield, West Bromwich, being the builder, and Mr. Atkinson clerk of works.

WINGATE.—The tender of Mr. John Davison, Contractor, Stockton, has been accepted for the erection of additional schools at Wingate, with sitting accommodation for 280 children. It has also been decided to purchase land from Messrs. Wilkinson for the erection of additional schools at Deaf Hill.

WOMBWELL.—The foundation stone of a new parish Church for Wombwell was laid on Monday. The old Church of St. Mary's was erected in the thirteenth century, and additions have been made from time to time. The old edifice, with the exception of the chancel, has been demolished, but the pillars and arches of the nave and chancel and the old western tower have been carefully removed, and will be incorporated with the new building. The new Church is to be built on the site of the old one, in the style prevailing during the latter part of the fifteenth century, and will be entirely of a South Yorkshire type. The nave will be 90 ft. long, 55 ft. wide, and 40 ft. high. It is intended to first build the nave and aisles, at a cost of £4,500, and this will provide accommodation for 750 worshippers. On the completion of this work, next autumn, it is hoped to remove the old chancel and proceed with the completion of the Church and the building of the parish room beneath. This will cost an additional £2,000, and, when the scheme is completed, the seating will be for 800 persons. Messrs. G. Webster and Son, Sheffield, are the contractors, and Messrs. C. Hadfield and A. R. Garland the Architects.

YORK.—A tablet in memory of the great Chinese Missionary, the Rev. David Hill, was recently unveiled at the Centenary Chapel, York. The tablet was executed by Mr. G. W. Milburn. The slab for inscription is of white marble with black letters. There is a white alabaster portrait and two figures representing "Faithfulness" and "Truth."

SOCIETY MEETINGS.

Glasgow Archæological Society.—"Recent Archæological Discoveries in the Parish of Lesmahagow" was the subject of a paper by Mr. James Young, Lesmahagow, and Professor Young, M.D., read at the last monthly meeting of this Society. Mr. Young described how he had discovered twenty stone cists, all having human bones in them, at Knocken, in the parish of Lesmahagow, showing that the place had been a burying ground in the stone age fully 2000 years ago, and also dealt with other discoveries. The most interesting thing he had to show was a stone implement, found on the farm of South Cumberhead this year. It was two feet long, and resembled in shape a Lochaber battle-axe. It was the biggest stone implement he had ever seen, and he thought it would be admitted that it exceeded in size anything of the kind ever before discovered.

Mr. J. R. FINDLAY has been peesented with the freedom of the city of Edindurgh, in token of their respect for him, in recognition of his public spirit as a citizen of Edinburgh, and in testimony of their appreciation of his munificence in providing the noble edifice for the Scottish National Portrait Gallery.

COLONEL J. T. MARSH, R.E., an inspector under the Local Government Board, held an inquiry at the Town Hall, Leicester, last week, in reference to applications by the Corporation for sanction to borrow £49,836 for purposes of street improvement and sewerage.

THE Streatham Library Commissioners have resolved to establish a branch library at Balham, and to ask the Streatham Vestry to sanction the borrowing of £1,500 for the erection of a suitable building on the freehold site in Ramsden Road, Balham, which Mr. Tate has offered for the purpose.

MR. THOMAS H. ISMAY, of the White Star Line, has announced his intention to subscribe £1,000 towards the building of a new hospital in Belfast in commemoration of the 60th year of the Queen's reign. The fund now exceeds £22,000.

SANITARY TESTS.

By ARTHUR B. PLUMMER.

IN reading a paper on "Sanitary Tests," before the Northern Architectural Association, Mr. Arthur B. Plummer said:—Since reading my paper at the Sanitary Congress, Mr. Allen (of Messrs. Harriman and Co.), with as little delay as was possible, had a special model made, and a die thereupon prepared, and afterwards my special form of 6-inch sanitary pipes were cast and burnt in the kiln, and laid in the Manors Yard in the exact position of the former ordinary 6-inch pipe. The Northern Architectural Association Sub-Committee were invited, and the same representatives met in order to test the new pipes. The tests were again conducted as follows:—Each closet was charged twenty times in rotation, proceeding from top floor to ground floor and to yard closets, with 6 ozs. of charge and papers as before, and a two-gallon flush. Throughout the whole of these sixty flushes the whole of the charge from each closet came direct to the trap with the one flush. This was hardly ever the case in the whole of the tests conducted previous to the Sanitary Congress. There were openings made in the tops of the pipes, for inspection, and in the case of my pipes the charge floated in the water with great ease, whereas in the case of the ordinary 6-inch pipe the charge rubbed, and stuck along the bottom of the pipes. During the course of these sixty tests we again found (on the occasion of the thirty-second charge) a slight temporary stoppage in the trap (which was the same Buchan trap that had been used in the former Sanitary Congress tests). We found, also, at the fifty-eighth charge a temporary stoppage at the bend, which was also the same bend we had used before, and which had a hole in the top for inspection. However, of the total amount of 360 ozs. flushed into the drain, 297 ozs. had been flushed out after the sixtieth flush, and 28 ozs. was taken out of the trap, the remainder being in the drain. It was next proposed that another course of tests be started, with a second or alternate flush of water, only without any charge. I, however, felt that a further course of tests, the same as the last, would be more valuable, though severe. The result of this second course of sixty flushes was all that could be desired, every charge again came direct with each flush into the trap, and there was no obstruction of any kind anywhere at any time. 360 ozs. were again put in the drain, and 367 ozs. were flushed out, including the slight necessary extra weight of water. Having become convinced in my own mind that this form of pipe is an improvement for flushing purposes, I next consider the question of cost. I find that for an ordinary terrace or villa house the total extra cost of these drains, as compared with the ordinary drains of the same external diameter, would be 2s. or 3s. per house extra. The pipes, I may say, are now to be made with the sockets flat on the underside.—Mr. Frank Caws, Sunderland, in opening the discussion, said they as an Association should be proud to think that one of themselves had brought about such an important change in drain pipes, as he was sure Mr. Plummer's improvement would be recognised by the profession at large and all interested in sanitation. He hoped and believed that that pipe would clear all other pipes out of the market. He thought it would do so because there was common sense in it. He moved a vote of thanks to Mr. Plummer for his paper. Mr. Bruce (Messrs. Badenoch and Bruce) seconded the motion.—The Chairman, in putting the motion to the meeting, hoped it would not go forth to the public that that Association approved of the two-gallon flush. There were miles upon miles of the old class of pipe which could not be taken up for a long time, and he thought they should have as great a flush as possible. The motion was carried heartily, and Mr. Plummer returned thanks.—During the evening there were on view the best sets of sketches prepared by Mr. H. Rains and Mr. S. M. Mould, and the best sets of measured drawings by Mr. S. M. Mould and Mr. B. Procter.

EXTENSIVE improvements are about to be made on the Mid-Kent line of the South-Eastern Railway Company. New stations are to be erected at New Beckenham and Lower Sydenham, and a bridge constructed in place of a level crossing.

A BIG SCHEME OF LONDON IMPROVEMENTS.

IN addition to the Bills dealing with the water question, the London County Council, on Monday, deposited five measures to carry out various London improvements. Their General Powers Bill proposes the construction of a new street from Tabard Street to Borough High Street, a widening of Long Lane, a widening of Battersea Park Road, and in connection therewith a widening and improvement of the bridge carrying the West London Extension Railway over the road, a widening of Holloway Road, and a widening of Old Street and Goswell Road. In connection with the construction of the new street in Southwark, it is proposed to purchase and appropriate towards the site a portion of the grounds of the Parish Church of St. George in the Borough. The widening of Old Street and Goswell Road is to be made on the northern side of Old Street and the eastern side of Goswell Road, commencing in Old Street at Central Street, and terminating in Goswell Road at Ludlow Street. Land is to be taken for fire-brigade purposes on the north side of Grosvenor Road and at Homerton. The estimate of the amount which the Council require to expend out of borrowed money or money raised by the creation and issue of stock for the purposes of the Act are:—For the new new street in Southwark and widening of Long Lane, £207,400; and for the other widenings and acquisition of lands, £228,840; total, £436,240. The proposed

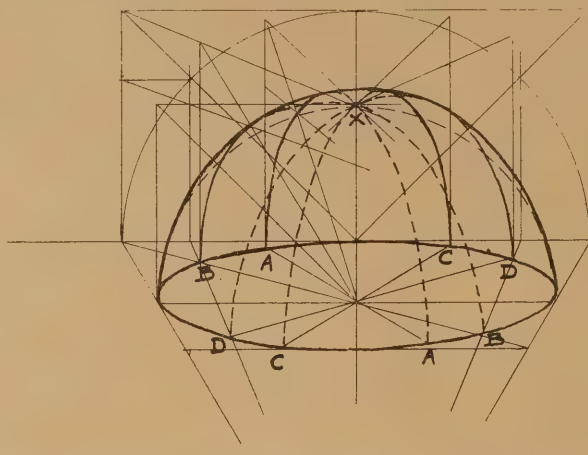
SUBWAY BENEATH THE THAMES

from Greenwich to Millwall—which is the subject of a second measure, is to extend from a point at or near Brewhouse Lane, Greenwich, to a point at or near the Island Gardens, Poplar. A third measure—the London County Buildings Bill—recites that the Council have no central office or premises adequate for the conduct of their administrative business, and no sufficient accommodation for their officers and staff; that it is impossible to provide at the present premises of the Council and adjoining buildings such accommodation, and that the business of important departments is necessarily conducted in such scattered houses as can be procured in different streets. Estimates have been prepared by the Council as to the amount which they will require to expend for the purpose of the Act, and these estimates amount to £851,000. By their Improvements Bill the Council propose to make an

EMBANKMENT WALL,

and an embankment on the foreshore of the Thames at Chelsea, commencing at the termination of the existing embankment at or near Battersea Bridge, and terminating near Seaton Street; a widening of Cheyne Walk in connection with the improvement just described; a new street commencing at the junction of Great Prescott Street with Mansell Street, and terminating in Little Tower Hill and Upper East Smithfield, opposite the northern end of the Tower Bridge approach; and a widening of the Strand, commencing at the eastern end of the Churchyard of St. Mary-le-Strand, and terminating at the western end of the Churchyard of St. Clement Dane's. The estimates of expense are: Chelsea Embankment, including Cheyne Walk widening, £64,000; new northern approach to Tower Bridge, £214,000; Strand widening, £569,130; Tottenham Court Road widening, £47,860; total, £894,990. The Bill contains a clause under which the lands in certain defined improvement areas will be subject to a "betterment" charge.

THE famous Bonomi-Cereda Gallery in Milan is about to be sold by auction. Among the paintings are several valuable works by Bernardino Luini, Borgognone, Bolaffio, Enea Salmeggio, the Lombardian Raphael, and other masters of the Lombard and Venetian schools.



THE foundation-stone of an extension of the Jubilee Almshouses, Greenwich Road, S.E., was recently laid. The almshouses, originally built to celebrate the jubilee of George III., were added to and partially rebuilt in the year of Queen Victoria's jubilee. The present addition consists of four houses, the total cost of which is borne by Mr. Cox.

Correspondence.

PERSPECTIVE.

To the Editor of THE BUILDERS' JOURNAL

DEAR SIR,—In your issue of yesterday's date, there is an explanation given by Mr. Cummings as to the method in which to put a dome into perspective. Excuse me if I point out that the method described is not and *cannot* be correct. Any person considering the matter will know that it is both theoretically and practically impossible

for any person to see the apex or highest point in a dome unless he is at least as high as that point, and that in no case will he see that point on the outline of the perspective representation except when his eye is exactly on a level with it. But according to Mr. Cummings' method, the highest point of the dome is also the highest point in its perspective representation.

With all respect to obverse opinion, I think the method, of which I send you an outline herewith, is more correct, and certainly explains itself. Imagine the dome to be a ribbed one, and first put into perspective the ribs, which will be a series of vertical semicircles crossing one another at the centre (*see* AA, BB, CC, DD, in sketch), and at the apex (X). It is obvious that the outline of the dome will be a line drawn tangentially to the outlines of these semicircles.

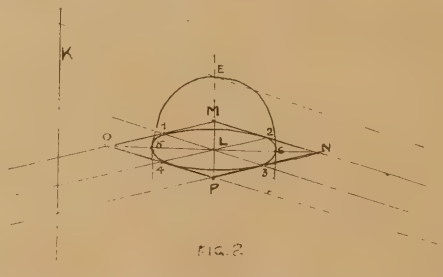


FIG. 2.

It would be a pity if students referring to your most excellent paper were misled by any article therein, so you may be glad to correct any false impressions made by the article in question.

I am, dear Sir,
Yours, &c.,
EDWIN BRADBURY.

3, Brighton Square,
Rathgar, Dublin,
December 10th, 1896.

COMPETITIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I was glad, in your last issue, to read Mr. A. R. Jemmett's hearty endorsement of the article on Competitions, of December 16th, as drawing attention to a matter that calls for grave reforms. For this reason, which Mr. Jemmett will approve, I feel it well to point out, that he makes an unsound criticism when he says:—"I would, however, like to point out, that of the large sum of money you refer to in your article as spent every year by the profession, by far the greater part is paid away in assistance on the drawings, and so circulates from the elder to younger members, not leaving the profession at all." Mr. Jemmett here falls into an error, of which the political economists have been unanimous in attempting to disabuse the public mind; to be brief, he has not distinguished between *productive* and *unproductive* labour. Competitions, in so far as competing is an unproductive labour, render the labour of those who help to produce the drawings unprofitable also; it is, therefore, lost labour to the profession, and for convenience the value of that lost labour was stated, according to precedent, in pounds sterling. The conjectural sum of money named was the *representative value* of the labour lost. A parallel case may be stated thus:—if a glazier, for advertisment or otherwise, broke his windows to the value of £100 and paid other glaziers to mend them, the glazier trade would manifestly be at a loss by the incident, precisely to the extent of the £100 the sum representing the value of labour absorbed in producing nothing.

Yours obediently,
THE WRITER OF THE ARTICLE.

KEYSTONES.

FOR some two months past a scheme has been on foot to erect a memorial in Westminster Abbey to Sir Walter Scott. The total amount wanted is £600, and though £400 has already been subscribed, the project is hanging fire for want of the remaining £200.

THE Admiralty is about to place orders for 12,000 tons of armour for the five first-class battleships of the "Canopus" class which are now in course of construction. All this will be manufactured in Sheffield, and the order for the bulkhead armour has already been received. The whole is to be made of Harveyised steel.

THERE is now on view at Mr. Draycott's Gallery, in New Street, the model of Bruce-Joy's well-known marble bust of the late Dr. Benson, from which Messrs. Boussod, Valadon, and Co., of the Goupil Gallery, are publishing half-scale replicas in a patent plaster which has the solidity and surface appearance of marble.

AN addition to the Sick Children's Hospital, at Aberdeen, is to be made in the form of a home for nurses, and plans have been passed by the Town Council Committee. The home will be situated on the east side of the hospital, and of three stories in height, with attic and basement. The estimated cost of the building is £2,000.

THE Admiralty has definitely resolved upon the extension of the naval depôt at Chatham. Two schemes are to be carried out—namely, the erection of naval barracks on a considerable scale, and the building of a new hospital for the reception of naval patients, royal marines, and dockyard accident cases.

WE understand that the management of the Building Trades Exhibition, 1897, offer a premium of £10 for the best design for a poster, to be used in advertising the exhibition. The adjudicators are Mr. Seymour Lucas, A.R.A., Professor Banister Fletcher, and Mr. H. Greville Montgomery.

No district has fewer facilities for communicating wtth the outside world than the Lake District and Westmorland, and to reduce the inconvenience several light railway schemes have been mooted, and some of them have already been described. The latest project is for a line between Kendal and Kirkby Lonsdale. There is already railway communication between the two places, but the route is circuitous and very inconvenient.

A Last Word on Peterboro'. No Artistic question within recent years has surely ever stirred public feeling in England, so strongly as this one of the Peterboro' Restoration, and it is pleasant to see that the Art loving public are following the lead given by the recent letter in The Chronicle, from The Architectural Review, and taking the right side — the side against lay vandalism and clerical indifference to Art. There has been so much written and spoken about the subject within the last three or four weeks, that one would think all possible points that could be raised had been raised, and all the arguments argued out. But there is one remarkable article in the present issue of The Saturday Review, headed "Must Peterboro' Perish," which deserves more than passing notice. The vigorous and lively English in which it is written is an Artistic treat, and, if a somewhat *ex parte* defence of the Artists against the "Restorers," is right in its main lines, and puts the case for the preservation of the Front so strongly and ably, that we recommend all our readers who are interested and roused by the recent stupid letter of the Dean and Chapter, to very attentively study it. The principal point which the Dean made in his last letter, viz., that only the northern gable is proposed to be touched, and that it will be taken down and "rebuilt stone by stone" (most convenient and wearisome of phrases), is mercilessly shattered, and leaves the author of it without the possibility of a satisfactory answer. It will be interesting to see if a reply is given ; it will certainly be most amusing if it comes. It will be almost, but surely not quite, as amusing as the replies of the Editor of The Builder to Mr. Wilson's recent pillory of him in The Daily Chronicle. Really, we are very sorry for The Builder. Until lately the letters of the Editor of that paper to The Times and The Chronicle were only, as Mr. Wilson calls them, "regrettable," now they are positively pathetic. They are pathetic because it is so sad to see the Editor of a journal supposed to represent Architecture, and which has done such good service in years gone by, giving the position of his paper (which, as a weekly Architectural journal, should be the leading one) away so completely, and losing publicly the dignity of a position which he has, we willingly admit, well won. And this is not all. That most unfortunate and unnecessary phrase about "Art-Architects" and the Society for the Protection of Ancient Buildings, convicts the Editor in his own words of a most amazing ignorance, not only of the standing of the Artists he so foolishly criticises, but also of the nature and extent of the work they have done in the way of Church repair. He classes them in a word with Carlyle's "damned dilletanti." Some of the most delicate and difficult operations necessary to keep old work preserved have been undertaken and successfully carried out by them, work in comparison to which the Peterborough problem is simplicity itself. If a list of these works were given to the public, it would be astonished to find what the anti-scrape people have done in regard to the preservation of the priceless art treasures of England and other countries, and, moreover, let The Builder understand, at a sacrifice of time and care without a parallel in its way, and with an unselfish devotion to Art, the like of which is seldom seen or heard of. Did the Editor of The Builder know of this when he wrote to The Chronicle? If not, his ignorance for a man in his position is astounding ; if he did, and with that knowledge wrote slightingly of these men, what answer has he to make in defence? We leave that to our readers, and the reply is not a difficult one.

IRON ELECTROLIER, DESIGNED BY GEO. C. HAITÉ.

ECCLESIOLOGICAL NOTES FROM NORTH GERMANY.

BY THE AUTHOR OF "LONDON CHURCHES, ANCIENT AND MODERN."

(Concluded.)

THE vast Minster at Herford‡ was planned for a pair of western steeples, but the southern one has only been completed. Its tower, surmounted by a tall spire of slate relieved with scallop work, has the peculiarity of two gables on each face. At Hildesheim, and in the district surrounding it, the towers of the Churches of St. Godehard and St. Michael have thin spires spreading out at their bases to meet the massive towers, like some of our Weald-of-Kent examples.

The tall, quadrangular western façades of Brunswick, Goslar, and its neighbourhood have already been mentioned, as have the steeples of the Halberstadt Churches. Those of the Dom at Halberstadt are of quite recent erection, their lofty belfry windows having been evidently copied from those in the cloisters. Puttrich and other writers on the ecclesiology of Germany give illustrations of this Church with a pair of quite low western towers, finished off square and capped with low spires. Now, the western steeples are very like the Lübeck ones.

Leaving Halle, and proceeding, first in a southerly direction towards Nuremburg, *viâ* Naumburg and Bamberg, and thence Rhinewards through Gelnhausen and Limburg, several fine tower-groups present themselves. The great Churches of Naumburg and Bamberg, which have many features in common, show two pairs of steeples, one flanking the western, the other the eastern apse or "choir."

Naumburg has been made the possessor of a fine group of steeples. Those placed at the angles formed by the transept and the eastern choir are mainly Romanesque. Square in their lowest stage, and opening on their eastern side into a small apse, they afterwards become octagonal, are finished off with a little Late Gothic work, and capped with bulbous domes. The two western steeples are almost entirely modern, but have been carried up according to the original designs, sufficient data having been forthcoming to go upon.

The light, open tourelles of these western steeples at Naumburg, and of the eastern pair at Bamberg, closely resemble the more familiar ones of Laon. Gelnhausen has a very pleasing group of steeples; a slender octagonal one flanks the apse on either side; another of the same shape rises at the crossing, and a heavy square tower, gabled on each side, and rising into a quadrilateral spire, stands at the west end. Although the Church of Gelnhausen is Pointed, the whole has the air of a Romanesque building; like St. Cunibert's, at Cologne, it is one of the most remarkable instances of the long duration of the German national style, its completion dating far on into the second half of the thirteenth century. Limburg Cathedral is another noble Church of the same age and class, but more advanced than Gelnhausen. It is not a large building, but the Durham-like grandeur of its situation, and the careful disposition of its seven steeples, invest it with an air of great size. Limburg should on no account be left unvisited by those making the tour of the Rhine, since it can be easily reached at the expense of a short railway journey along the beautiful valley of the Lahn, from Coblentz.

No sketch of German ecclesiology, however brief, would be complete without reference to the extraordinary quantity of mediæval furniture and decoration, which, in spite of the country's having been the cradle of the Reformation, its Churches have succeeded in retaining, and, curiously enough, by those belonging to the cities which were among the first to embrace the tenets of Luther.† The desirability of bringing these notes to a termination with the present volume, precludes any lengthy comment upon these remarkable *instrumenta ecclesiastica*; a mere list of them, with the *locales* of those most interesting and instructive to the student, being all that can be given.

High close screens‡ of stone, frequently retaining the Holy Rood and its attendant figures, are to be found at Wechselburg (an early and most interesting Saxon example), Naumburg, Meissen (these have two a-piece), Klosteck, Maulbronn, Gelnhausen, and Sitten-in-Vallis. All these belong to the Romanesque or Transitional epochs. Of complete Gothic rood-screens, or Lettner, as they are called in Germany, two more beautiful examples could not be found than those at Halberstadt and Oberwesel; while those at Magdeburg (begun on St. Valentine's Day, 1445), Marburg, Breisach, and Wetzlar should not be overlooked by the ecclesiologist. Frequently, the great rood is found, either hanging alone, or resting upon a beam, as, for instance, in St. Catherine's, at Osnabrück; St. Mary and St. Rheinhold, Dortmund; St. Ulrich, Sangerhausen; the Dom, and St. Catherine, Lübeck. In St. Victor, at Xanten,§ a beautiful Decorated Church of the extreme N.E., containing many objects of especial interest in stone, wood, and metal work, is a light open brass screen, from whose rich floriated ornamentation, candlesticks are formed. The *Sacraments-Hauslein* (always an important item in the furniture of German Churches), and other tabernacles terminating spirally, may be looked for in the Dortmund Churches; St. Mary, at Lipstadt; St. John, at Osnabrück; Münster Cathedral; St. Mary-in-Meadows, at Soëst; and in the Dom, at Magdeburg. Carved altar-pieces, tryptichal and polyptichal, exist in great profusion at Calcar and Xanten, most minutely and delicately carved and enriched with colour. Colossal specimens of this kind of reredos can be seen in the Pfarr Kirche and St. Peter, at Dortmund; in the Barfüsser Kirche, at Erfurt; at Halle, in the Ulrich's, Neumarkt, and Moritz Churches; and a particularly fine one at Schleswig. Other specimens may be named as existing in the Nicolai Kirchen, at Rostock and Stralsund; in the Breslau Churches of St. Elizabeth, Corpus Christi, and St. Mary Magdalene; at Dantzig, Lübeck, and Salzwedel.

The great coronæ at Hildesheim and Aachen are world renowned; the Cathedrals of Münster, Halberstadt, and Magdeburg also enshrine one or more; chandeliers of much elegance hang in the Pfarr Kirche, at Dortmund, and in the Churches of Erkelenz, Calcar, and Kempen. Of candelabra, those in the Minster, at Essen (eleventh century); the Cathedral, at Brunswick; the Dom and Liebfrau Kirchen, at Halberstadt; the Ober Kirche, at Frankfort-on-the-Oder; St. Cunibert, at Cologne; Magdeburg Cathedral, and the Busdorf Kirche, at Paderborn, are of exceedingly grand dimensions, and, where left standing in the body of the Churches, form remarkably picturesque items in the furniture. In the sacristy of the Cathedral, at Osnabrück, may be seen a wrought-iron herse-light, triangular in shape, and sustaining 15 candles, used for the office of *Tenebræ*. Many Cathedrals and Churches have metal fonts of great antiquity; those at Hildesheim and Münster‖ merit close study, as do those in Osnabrück and Bremen Cathedrals, and St. Godehard at Brandenburg. St. Mary and St. James, Lübeck; the Stadt Kirche at Wittenburg, and St. Cross, Hanover, possess metal fonts of later Gothic date. The finest carved choir stalls are at Altenberg, Calcar, Cologne (Cathedral and St. Andrew's); St. Mary, Dortmund; Erfurt (the Dom); Emmerich, Ermbeck; Halberstadt, Kempen and Xanten. Mediæval organ cases are found at Strasburg (Cathedral), Dortmund (St. Mary), and Lübeck (St. James); renaissance and revived classical ones are of constant occurrence.

The Cathedrals of Cologne, Strasburg, and Metz, and the Churches of Erfurt, Naumburg, St. Mary and St. Paul at Soëst, and St. Reinhold at Dortmund, boast goodly supplies of stained glass. Frescoes can be seen in the little apse opening from the north transept of St. Patroclus, at Soëst; at St. Nicholas, in the same town; at Brunswick Cathedral, and in the conch of the apse at the Liebfrau Kirche, Halberstadt.¶

The sacristies and treasuries (*Schatz Kammern*) of German Churches should always be enquired for and visited. In the treasury at Halberstadt is a magnificent array of copes, chasubles, dalmatics, albs, stoles, mitres, altar-plate, and frontals, processional crosses, reliquaries, illuminated books, all in a wonderful state of preservation. There is likewise a fine collection of vestments at Brandenburg and Speyer.

Taking it all round, Germany is indubitably richer, ecclesiologically, than France, and although, as regards much of the Middle Pointed work, her Churches are inferior, both in detail and dimension, yet they have all proved a source of great delight to one who spent two very happy holidays among them, who had long looked forward to visiting them, who now regards them as old and valued friends, and who has endeavoured to record his impressions of them in these notes, which, from the pleasure their compilation has afforded him, must, to his regret, be now concluded.

‡ This great Benedictine nunnery was dissolved at the Reformation, which seems to have been eagerly embraced at Herford, all its old churches being in Protestant hands. The abbesses of Herford and Essen, as well as the abbots of two other great Westphalian houses, Corvey and Stablo, held high office in the State.

† The Churches of the Rhenish provinces, which have always been remarkable for their adherence to Catholicism, are singularly deficient in mediæval *instrumenta*. This may be accounted for, primarily, by the terrible ravages this part of Germany underwent at the end of the seventeenth century under Louis XIV., and at the time of the French Revolution, a hundred years later. Secondarily, by the bad taste of Catholics themselves.

‡ The German rood screens in Cathedral and conventual Churches are distinguished from those in England by having their central portion facing the nave occupied by the people's altar, the entrances to the choir being at the sides. This arrangement has been preserved by the Lutherans down to the present time. The two rood screens at Naumburg close, respectively, the eastern and western choirs. That to the latter is an exquisite specimen of German first-pointed work. Here, however, the door is central. It is a pointed one of two openings, and the Holy Rood has been taken down from the loft and placed against the column between them. St. Mary and St. John have likewise been removed, and now flank the door on either side; the effect is not unpleasing. At Gelnhausen the wall-space in the centre of the rood screen is pierced with a large foliated circle, to afford those seated in the nave an opportunity of assisting at the choir offices.

§ Scott may perhaps have derived the idea for his screens at Lichfield and Hereford, from this one at Xanten.

‖ See Mr. Hanson's drawing in our No. for Dec. 16.

¶ Since the Gothic revival in Germany, many of the great Churches—notably those in the Rhenish provinces—have been extensively frescoed; as examples, the following may be quoted:—Neuss (St. Quirinus); Cologne (St. Mary Capitol, St. Cunibert, and St. Martin); Sinzig Church; Limburg Cathedral; the Minster at Essen; the Cathedral at Münster; and the Dom at Minden.

HERIOT'S HOSPITAL, EDINBURGH.

IT has only just been brought to our notice that in our issue of June 24th, 1896, an elevation and plan of this hospital were published without the author's name, and we have much pleasure in stating that these were by Mr. R. Shekleton Balfour.

MR. JAMES FORD, one of the best known builders in Montrose, died at his residence, Melbourne Cottage, on the 22nd ult.

THE window presented to Hawarden Church by the Armenians in memory of the recent massacres is approaching completion, and is to be unveiled to day.

ORDERS were given to close a number of uninhabitable houses in Glasgow. Mr. Lindsay, interim Police Clerk, reports, that since March 17th, 1891, a total of 409 houses had been dealt with.

THE "Hafruen" has arrived from Rockingham, W.A., with 540 loads of "Jarrahdale, Jarrah," aboard, to the order of McLean Bros. & Rigg, Limited, 1, Fenchurch Avenue, London, E.C.

AT a special meeting of the Burnley Town Council it was decided to accept the tender of Messrs. Smith Brothers, of Burnley, for the construction of the second subway under the canal at Yorkshire Street, for the sum of £1,227.

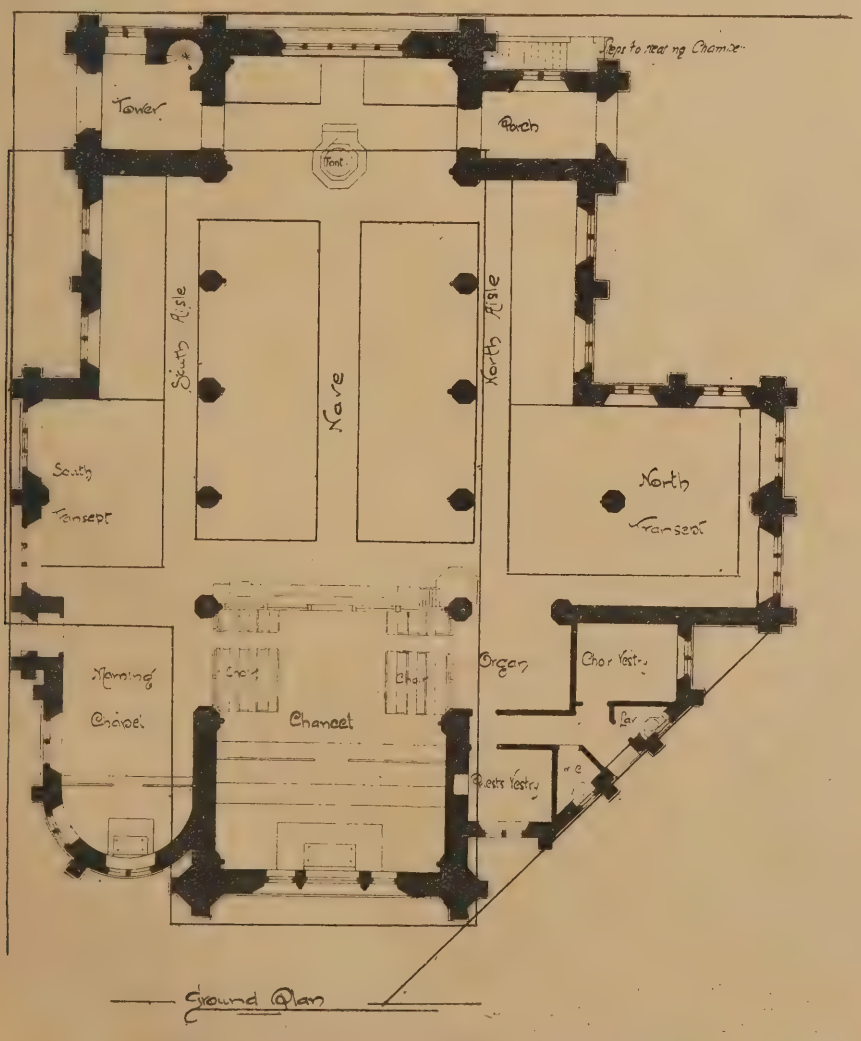
THE Peninsular and Oriental Company has lately added some good specimens of marine Architecture to its fleet. It is a wonder that nobody has yet undertaken to write a history of the service which is quasi-national in its interest for Englishmen. There must be a wealth of material.

AT a meeting of the Wishaw magistrates, a report by the Master of Works on plans for the erection of eight shops at Craigneuk, by Mr. John Wilson, Motherwell, was read. The report showed that the proposed building would infringe the Burgh Police Act, in as far as it did not leave the statutory space between present building and the one proposed, and permission was therefore refused.

THE Glasgow Corporation is about to consider a scheme for the straightening of the Clyde, which makes a great south-easterly bend between St. Andrew's Suspension Bridge and Rutherglen Bridge. It is proposed to cut a new channel across the King's Park. The original river bed could be filled up and built upon or converted into a public promenade.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

The Exeter Church Competition Fiasco.



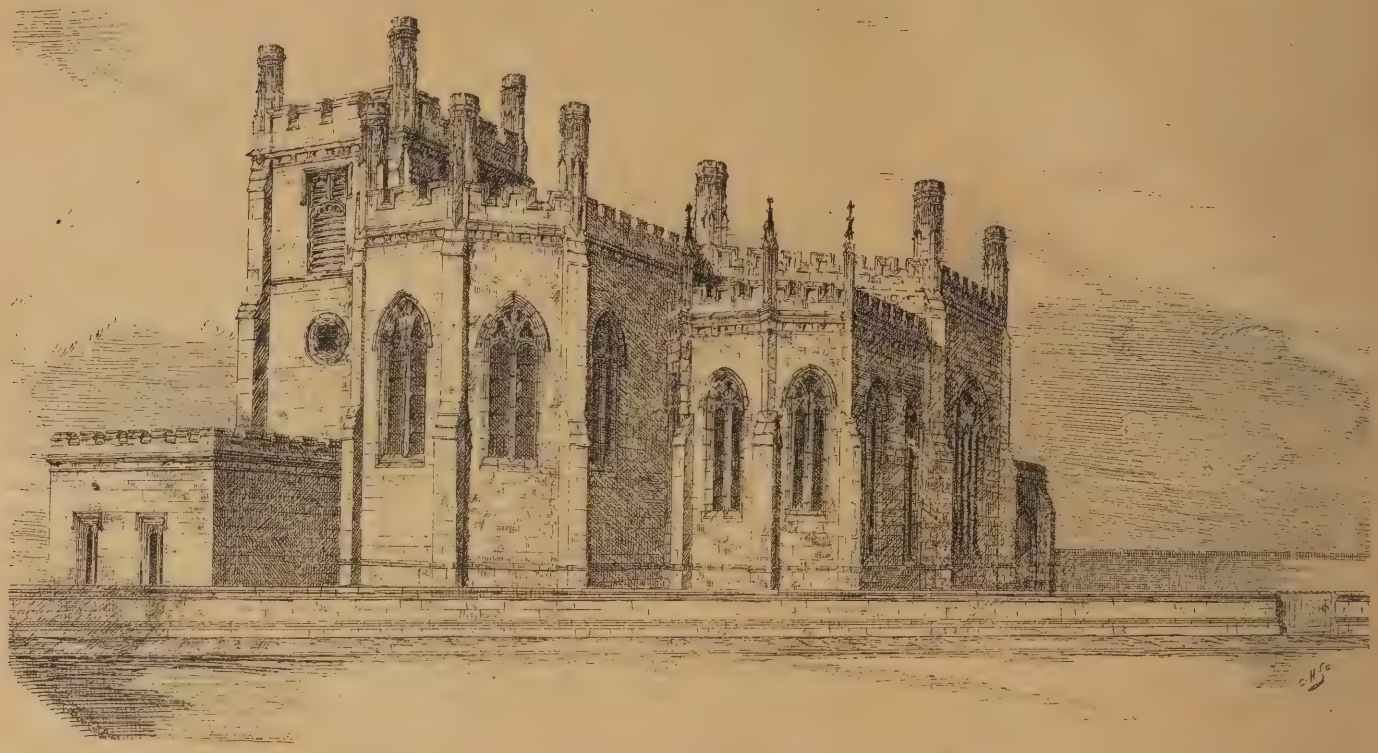
Second Notice.

THE designs we publish this week, with exceptions, fall below the standard we had hoped to keep for this competition, but, we are pleased to tell our readers, next week we hope to give some illustrations, specially drawn for the Journal by Mr. C. E. Mallows, of designs by Messrs. Wimperis and East, of London, and Messrs. Hall, Cooper, and Davis, of Scarborough, both of which reach a very high standard of excellence, and are admirable alike in the freshness, vigour, and originality of Architectural treatment, and in the economical and Artistic nature of their planning.

These drawings, together with those already illustrated, and those we publish this week, should form a pretty strong argument against the decision of the committee and their assessor; but we wish this protest to be more formidable still, and we therefore once more appeal to those who were competitors to send us on their designs, *accompanied by perspective sketches*, so that we can make a further selection and a still stronger case against one of the worst-conducted competitions in recent years. We hope by this means to teach competition committees a lesson which will be beneficial to them and to Architects generally.

EXETER COMPETITION. SOUTH ELEVATION OF DESIGN BY HORACE W. COLLINS.

EXETER COMPETITION. MR. HORACE W. COLLINS' PLAN.



The design by Mr. Stephenson, which is illustrated by a perspective view and plan, is marked by a refined and dignified treatment throughout, reminiscent in parts a little, perhaps, of the work of masters of their Art, such as the younger Scott and Leonard Stokes, just as Mr. Robson's design, last week, was evidently inspired by the work of Mr. Bentley, or Mr. Newberry's by that of Mr. Pearson. But then all these Artists, whilst evidently students of the work of greater men, have not slavishly copied but managed to instil into their own designs a character and individuality quite their own.

For example, whilst the treatment of the windows in detail, of Mr. Stephenson's designs, has clearly been affected by the work of Scott in St. Agnes, Kennington, and by other of his Churches, the arrangement of the east end, and the simple and most effective exterior of the north transept is clearly his own, and moreover shows promise of future strength and power of design. The little turret at the foot, however, is not happily introduced and looks like an afterthought, whereas it might be made to form a more cohesive and base-like portion of this part of the transept end. Otherwise we have nothing but our congratulations to offer the author and to say we certainly should have placed his design amongst the premiated but for certain portions of his plans which are not altogether satisfactory or so Artistic as they might be.

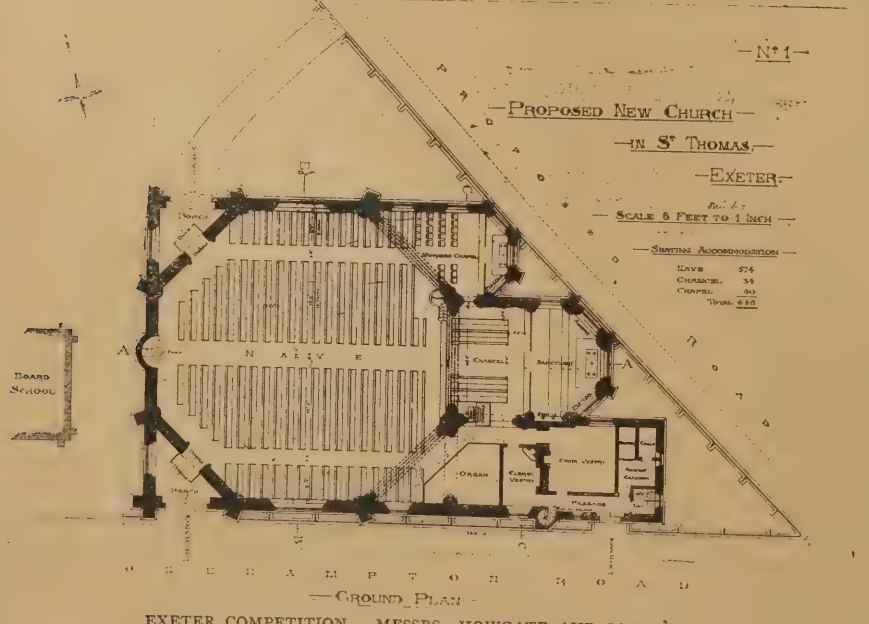
Mr. Pite's plan has evidently been studied with a view to the preacher being seen and heard properly: there would be but few objections in this respect, and in other ways the plan is good. In some respects, however, the proportions of nave and aisles would not be altogether pleasant. The general character of the external treatment, which is a combination of fourteenth and fifteenth century Gothic, arranged in Mr. Pite's own way, can be judged by the sketch we publish herewith.

The other designs we illustrate this week do not call for any special remark; our readers will judge for themselves.

THE eastern window at Heckington Parish Church is to be filled with stained glass. The cost, about £1,400, will be borne by a lady parishioner.

EXETER COMPETITION.—DESIGN BY MESSRS. HOWGATE AND LEEDS.

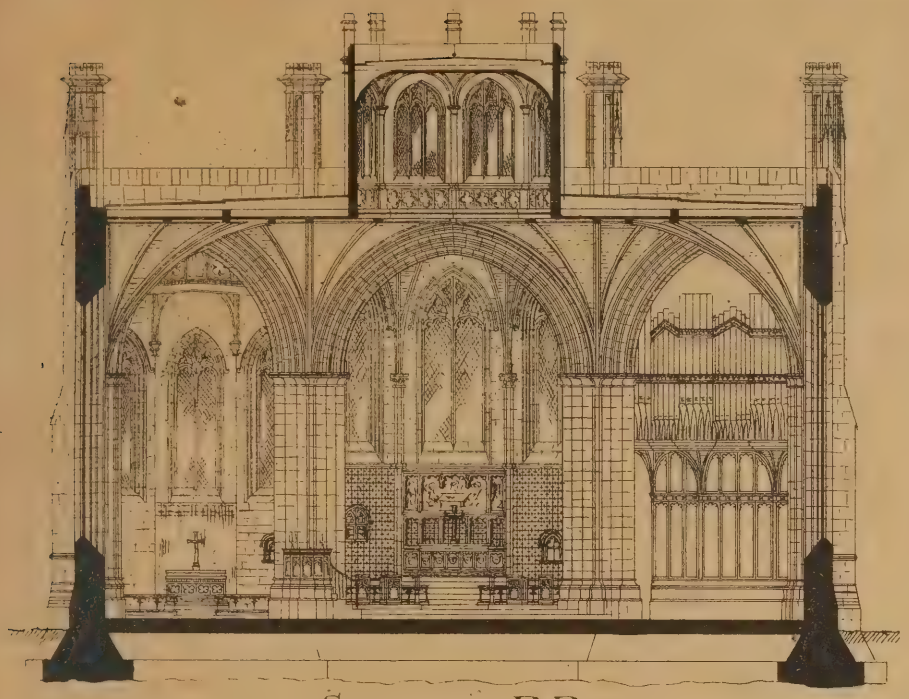
A CHURCHMAN'S VIEWS ON CHURCH BUILDING IN LONDON.



SPEAKING from observation, it is evident that not only has ceremonial become more generally ornate, but in the buildings that have been erected by High Churchmen in London during Dr. Temple's time, founders have not been trammelled in carrying out their particular devotional ideals as they were almost invariably in the days of Dr. Jackson. That prelate had a rooted objection to a second altar in a Church. It is not too much to say, that in Churches built during the last ten years this adjunct has become the rule rather than the exception. There are, indeed, Churches where, as at St. John the Baptist's, Kensington, a third altar has been allowed. This particular Church—a noble building by the way—instances another revival of an old ideal. Its chancel is enclosed by a massive rood-screen in stone, whereof the central figures are flanked by angels bearing the "instruments of the Passion" and numerous statuettes of saints. Not so many years ago, when the fine Church of St. Agnes was built at Kennington, it was understood that the figures, which it was at first intended to place upon its rood-screen would not be executed. Under Dr. Temple's sway, however, the original design has been quietly carried out, and the fine screen of oak, upon which room has been found for an organ, is one of

THE BEST MODERN EXAMPLES

of its kind in the country. A heavy rood-beam, with life-size figures, also adorns St. Cuthbert's, Earl's Court, a Church which is rapidly becoming a museum of modern ecclesiastical Art. Among the latest additions to its furniture is a huge and massive lectern of bronze, which rivals in importance the handsome pulpit on the opposite side of the nave. Here, too, a beginning has been made with highly decorative canopied stalls for the clergy, and these are merely items in an elaborate scheme of decoration which steadily approaches completion. These Churches are mentioned as typical, and by no means solitary, instances of the progress which is being made in the fulfilment of æsthetic ideals. And let it not be thought that beautiful Churches are peculiar to the rich West End. The East End of London boasts temples equally dignified in scope, though seldom so completely decorated. Of these the latest is the Church of St. Philip, Stepney, which replaces a smaller edifice in "Churchwarden Gothic." The present building, of the severest early English type, might readily serve as a collegiate Church, or even as a Cathedral for an East End diocese. The roof is vaulted in brick, with stone ribs throughout, and the double aisles are lavishly beautified with clustered columns. So stately a building clamours for ceremonial (not necessarily elaborate) and finished choral performances. Unless such be attainable, the purpose of a Church on such a scale is hardly perceptible. Splendid Churches are sometimes built at a



COST ALTOGETHER DISPROPORTIONATE

to the means in existence for the carrying out of services on a scale of due solidity and fulness. Old Churches, built in the ugly style of pre-Tractarian days, sometimes find it hard to hold their own against their modern rivals. St. Philip's Church, Clerkenwell, for instance, has now neighbours of more attractive aspect. But this old cradle of the ritualistic movement in Clerkenwell, which paved the way for the still more ornate services of St. Alban's, Holborn, and the well-known group of Haggerston Churches, has of late taken a new lease of life.

EXETER COMPETITION. MESSRS. HOWGATE AND LEEDS' PLAN.

NICKEL steel, instead of Harveyed steel, is to be used as the protective material for the new ships now being laid down. Between three and four years ago, the Harveyed process was adopted for the British Navy, and although it has in a great measure answered the expectations formed in regard to it, nickel steel is now thought to be less penetrable.

SECTION BB

EXETER COMPETITION. FROM MESSRS. HOWGATE AND LEEDS' DESIGN.

A SMALL COMPETITION AT POPLAR.

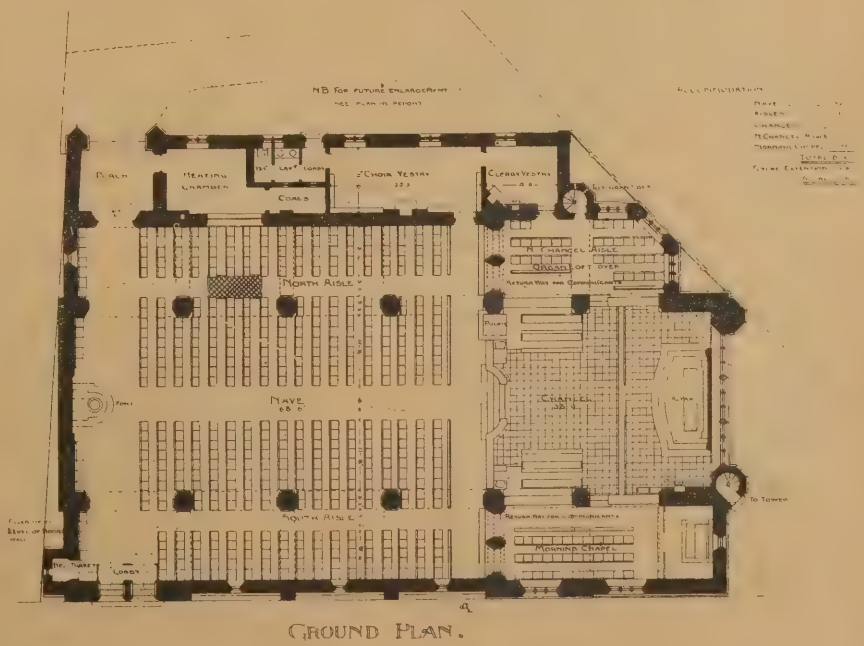
PROPOSED CORONER'S BUILDINGS AND MORTUARIES.

POPLAR, although in parts very picturesque, is perhaps not the most inspiriting place in all London for Architects. To be sure, there are not a few things hidden away amongst the slummiest of the slums which make beautiful pictures in themselves; we saw the other day many a subject near the Town Hall, which recalled a Whistler on a Mérigan etching, some good fragments of the Georgian days declining to decay, and some comparatively new work by Nesfield, very tempting for a sketch, but they all require finding. Who hears of students working at Poplar? Yet an afternoon's search after Architecture would yield some pleasant surprises—to an energetic searcher. Perhaps it is because the merits of Poplar as an Architectural hunting ground are not at first sight apparent, or it may be the subject for the competition is not exactly an attractive one; but whatever the reason, it is a fact that this very small competition was undoubtedly a very large failure. The accommodation required was: court-room, jury, doctors', police, reporters', witnesses', and private rooms for coroner, two mortuaries with common lobby, and caretaker's residence.

The problem was an easy one, the site, saving some restriction as to ancient light, good, the premiums (£30 and £20) ample, and the conditions fair. What more was wanted? Yet with all these things in its favour, Architecture has responded with but one solitary *Artistic* design (No. 12), and but one good plan, the winning one. The rest of the designs, without exception, would have disgraced an elementary student's competition in a local School of Art. Poplar may well complain, when, with so much to give to Artists, she gets nothing in return! Messrs. Wimperis and East's design, however, would have been a gift worth the having. The elevations are excellent, treated in a version of Renaissance which has much distinction in character. The front to the High Street, saving the rather curious high gable at the angle of the streets, is admirable and right, as expressing the semi-public nature of the building. But the authors have unfortunately failed with their plan; it does not compare with the winners, so far as the arrangement of the various blocks on the site are concerned. They are too distributed and there is not a sufficient amount of air space provided, otherwise the internal arrangements of the various rooms, especially those of the coroner's block, are good and much better than the first premiated. This latter design is by Messrs. Lansdell & Harrison. Beyond noting that it well deserves the place for the merits of the plan alone, and that the idea of the open space separating the mortuary from the coroner's court with a grass plot in the centre is excellent and goes more than half-way in placing the design first, there is not much to say. Certainly the least said about the elevation the better. We hope the authors will be recommended to reconsider them or work in conjunction with an Artist. Poplar is poor in many respects, but that is no reason why she should have poor building; we hope the authorities will see to this and let us have a building which at all events shall not be Artistically offensive, as this design undoubtedly would be if carried out as proposed. It would not matter if the design was only uninteresting, but it actually offends. At the same time it is only fair to say that it is the least objectionable, save one, in the room, but, then . With regard to the arrangement of the plan in detail, the coroner's court block is placed to the front of the site. The court itself faces the court-yard just mentioned and is nearly central on the block. The witnesses' waiting room, the coroner's retiring room, and the jury room occupy the angle of High Street and Finch Court. The mortuary block is placed at the extreme north of the site.

The second premium of £20 is given to Mr. H. Gilbert for a set of drawings showing some care in planning and no ability whatever in design. In this plan the coroner's court occupies the west angle of the street, and the caretaker's house is on the right. The waiting rooms, coroner's rooms, and other offices are at the back. The mortuaries are at the north of the site, and between the blocks there is an area for light and air, but not nearly so well planned as the first premiated.

The character of the design of Messrs. Wimperis and East may be judged by the accompanying sketch, a portion of the High Street front. The row of four windows with the small Ionic pilasters between, gives light to the coroner's court, and expresses well the public character of the room itself. The treatment of the doors is unaffected and pleasant. The door to the right hand gives access to the court and offices, and the other (to the left) is for the caretaker.



The design of Mr. W. T. Stocks (No. 3), differs from most of the others in separating the caretaker's block from the court block by an open gateway, and also in providing a fair amount of air space, but it agrees wholly with the majority as regards the design.

An alternative design, by Messrs. Lansdell and Harrison, shows the buildings arranged with due regard for light and ventilation, but otherwise there is nothing to call for special comment. The authors have evidently but one type of building for their elevations, and that is of the character just criticised.

A FALL of about 100 tons of rock has taken place on the Callander and Oban Railway, near the Falis of Cruachan Station. The *débris*, which has since been removed, caused grent delay to trains.

AT Kirkcaldy, it is proposed to commemorate the Queen's long and prosperous reign by founding, erecting, and handing over to the town, free of debt, an hospital for infectious diseases for the town and neighbourhood, provided by public subscription, at a cost of something like £20,000.

THE Cottage Homes scheme which the Oldham Board of Guardians have had under consideration for some years has advanced another stage. The Local Government Boar l has asked for information in respect to the land, and this will be forwarded in the course of a few days.

GROUND PLAN.

EXETER COMPETITION. MR. J. G. STEPHENSON'S PLAN.

DESIGN FOR
EMMANUEL
CHURCH
EXETER 3?
J C STEPHENSON

THE YEAR'S BUILDING TRADE IN DUNDEE.

THROUGHOUT the year there has been no lack of employment in any of the branches of the building trade. Indeed, so far as masons are concerned, the difficulty has rather been in a scarcity of men, and no relief could be obtained from other centres in Scotland, where trade has been equally brisk. The only serious trouble was the strike of hewers at the end of May for an increase of ½d. per hour in their wages. Their action brought about a complete stoppage of building operations in the city, but after a struggle lasting for a month or five weeks the men returned to their employment on the old terms. The rate of wages has, therefore, remained unchanged during the year—viz., 9d. per hour for builders (who have to contend against the inclemencies of the weather, without shed accommodation), and 8½d. per hour for hewers. The demand for houses of three rooms has been slack. In many parts of the city, too, there are numerous empty flats of four and five-roomed houses, accounted for partly by the fact that many people who were formerly content with dwellings of this kind in the city are finding their way to suburbs like Downfield, Wormit, or Newport, particularly the two last-named, with which there are cheap and easy means of communication. Thus, year by year it is becoming increasingly evident that Dundee has been over-built with dwelling-houses, and that if proprietors do not wish to throw away their money in the erection of property which will lie unoccupied upon their hands, their best policy is to invest it otherwise than in dwelling-houses. Judging by present appearances, there will be much less tenement building in 1897 than there has been for several years past. Dealing more in detail with the various works which have been begun, completed, or advanced during 1896, the first that claims notice is

The New Post Office.

This structure was begun about 18 months ago, and by the end of 1895 the foundation walls had been completed. The past year has seen the building rapidly advanced towards completion. The builders have completed the ground and first floors, and expect, with a continuance of open weather, to add the third and last story early in the season. The red stone structure erected by the Prudential Assurance Company in Meadowside is now approaching completion, the mason and plaster work being finished. In its construction many novelties have been introduced for the first time in Dundee, while the lavishness with which money is to be spent in internal fitting and decoration has never been equalled. Another block of business premises will be that begun some months ago for the Pearl Assurance Company, adjoining the Royal Exchange in Meadowside. The foundations have already been laid, and building will probably begin early in the year. The extensive bakery establishment for the Dundee Eastern Co-operative Society, Limited, in Clepington Road, has been completed, as has also the Girls' Industrial School in Blackness Road, which was opened on 24th June. The Dalgleish Home for Nurses at the Royal Infirmary is another important building of the year, although it is not yet quite completed. In ecclesiastical Architecture the only structure of the year is the new Church for Lochee Road U.P. congregation. In Dudhope Crescent a neat little building was erected for the work of Lemuel Mission. No building has been required by the School Board during the year, except a small addition to the Art department of Morgan Academy. In the department of warehouses, factories, and

Business Premises

generally, there has been little of a noteworthy character. The largest work of the kind was perhaps the huge store erected by Messrs. James Watson & Company, in Trades Lane, for the storage of whisky. Then Messrs. Smith Brothers, tailors and clothiers, have commenced the erection of extensive premises on the south side of Murray Gate. Malcolm Brothers, auctioneers, converted a set of warehouses in Commercial Street into commodious and well-furnished auction rooms. The Caledonian Railway Company put down new stables in Yeaman Shore. At the corner of South Union Street and Craig Street, Messrs. Watson & Philip, produce brokers and flour merchants, have erected a block, comprising business premises and dwelling-houses, while old warehouses in Craig Street have been extensively altered so as to suit the requirements of the firm. The establishment of Messrs. Andrew, Taylor & Co., manufacturers, Forebank Road, which was destroyed by fire, and the warehouses in the same street belonging to Messrs. William Watson & Co., which suffered the same fate, have both been rebuilt. Messrs. Marshall & Brush, Dundee Carpet Works, and Messrs. A. P. Mathewson & Co., Lower Pleasance Works, carried out extensions of their premises. The conspicuous feature of the year's building has again been the vast amount of

New Dwelling-House Property.

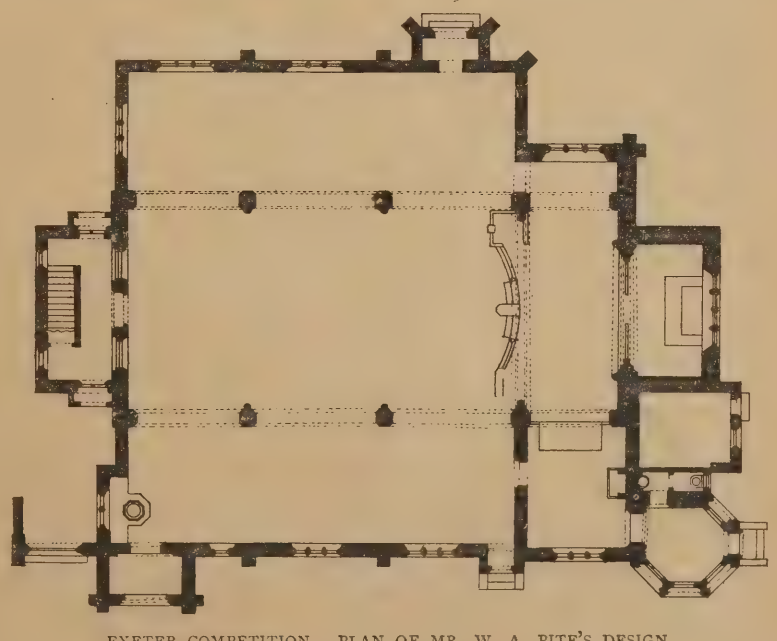
Villas, cottages, and tenements have gone up in all quarters, but the great bulk of this class of building has been carried on in the northern and north-eastern districts. Beginning with the north-east end of the city, we have to chronicle the erection of a tenement of dwelling-houses for Messrs. Malcolm, Ogilvie, & Co., in Lyon Street. This property brings the north side of Lyon Street, at its west end, to the corner of a new street which is to be named Cunningham Street. In Dens Road, Mr. James Burnett has put up tenements of dwelling-houses, and Messrs. Alexander Esplin & Sons have constructed properties in Dura Street. Further to the east, Balmore Street has been developed by the construction of dwelling-houses for Mr. Alexander C. Milne; in Baldovan Terrace, tenements have been built for Mr. William Foggie, Mr. John Dempster, and the Misses Langlands. In Maryfield district building has not been so extensive as in some previous years. Extraordinary development has taken place in the Fairmuir, Strathmartine Road, and West Clepington districts. In the central districts there has been comparatively little done in the erection of new dwelling-houses. From this statement, however, must be excepted the extensive scheme of dwelling-house property at present being carried out in the district bounded by Nelson Street, Victoria Road, and Bonnybank Road. The completed scheme shows altogether fifteen tenements, of which three have a frontage to Victoria Road. The Architects for the entire scheme are Messrs. M'Culloch & Jamieson, Whitehall Street, Dundee. Towards the west end there has not been much building during the year. Mr. Daniel Black put up a block of dwelling-houses in Benvie Road, and property of the same description was constructed for Mr. Charles Macintosh in Walton Street, and for Messrs. P. F. and J. Husband in Milnbank Road. There has again been a fair amount of building in

The Western Districts.

Messrs. R. and A. Lickley completed Rosewood Terrace, West Park Road, making in all 15 villa houses of a splendid type. The formation of Melgund Terrace, at the south end of Windsor Terrace, has also begun, three or four of the eight houses of which it will be composed being now on the way. A large amount of work has been done by the Sanitary Committee of the Town Council in the reconstruction of slum properties. The work has gone on briskly and uninterruptedly during the year, the districts to which special attention has been devoted being Scouringburn and Maxwelltown. A great deal has also been done by the sanitary department in the reconstruction of dairy premises. In every case the space of 800 cubic feet per animal is being insisted upon, while the structures have been greatly improved by paving and drainage works. As to the building

Prospects for this Year,

they are not so good as were the prospects for the past year. Still there are in view a sufficient number of large "jobs" to keep the trade fairly well employed throughout the year. Among these may be mentioned the Pearl Assurance Company's offices; the new buildings of the Royal Bank in High Street; a large block of business premises in Seagate, for John Robertson and Son, Limited, wine merchants; the vestry and hall for Dundee Parish Church; the proposed convalescent home in connection with the Convent of Mercy, at Lawside; the covering in of the cattle market; and the extension of the Eastern Necropolis.



MR. PASSMORE EDWARDS has offered to provide, at a cost of £5,000, a Public Library building for the parish of St. George's-in-the-East, so soon as the Commissioners for Public Libraries have bought the freehold for a site.

THE Tramway Committee of Glasgow Corporation, after considering the offer by Sir William Arrol and Mr. G. Johnston to equip, free of expense, a section of the local tramways with motor cars, has decided not to accept the offer.

A MOVEMENT is on foot for placing some memorial of the author of "Tom Brown's Schooldays" in the Church at Longcote, Berkshire, where Judge Hughes read the lessons when his father was vicar, and with which he was associated for some 40 years.

SEVERAL alterations and improvements have recently been made at St. Bartholomew, Heigham. The chancel end of the building has been raised, whilst a new communion table has been provided. The seating arrangements of the building have also been re-modelled, so as to provide a central aisle.

BY the City and West End Railway Bill, which has been deposited for next session, power is sought to incorporate a company for the purpose of constructing an underground railway, over 6¼ miles in length, commencing under Bridge Road, Hammersmith, and terminating under Cannon Street, at a point near Budge Row. The capital required by the company is £3,150,000, upon which it is proposed to borrow a further sum of £1,050,000

EXETER COMPETITION. PLAN OF MR. W. A. PITE'S DESIGN.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
January 6th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gildea ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

As a test of the hold which Pre-Raphaelitism still has upon the popular fancy, the forthcoming exhibition of the collected productions of Ford Madox Brown, at the Grafton Gallery will be interesting. In his work, the principles of this particular creed are set forth with a plain directness that cannot be mistaken, and yet the assertion of them was not helped by any prominent part which he took in art agitations. The influence of his personality upon the public has for many years been too slight to gain for his pictures the popularity and attention given to the early works of such an artist as Sir John Millais. If the Grafton Gallery exhibition proves convincing, it will be by the absolute Artistic importance of the collection, and by his power to persuade the technical unbeliever.

THERE has just been placed upon the wall of Whippingham Parish Church, a tablet to the memory of the late Andrew Blake, for many years Her Majesty's land steward at Osborne House. Mr. Blake's grave is in Scotland, where he died, and the addition of this tablet is in conformity with a decision to invest Whippingham with the same memorial character as the Parish Church of Crathie and the private Chapel within Windsor Castle. In this connection it may be added that the decision has been made to place no tablets in the private service-rooms either of Balmoral or of Osborne. The Blake tablet was designed and executed at Windsor, the Architect being Mr. Nutt, who habitually designs the illuminated vellum covers for the programmes used by the Queen on the occasion of concerts before the Court.

IN rural districts the housing problem remains unsolved, and some startling facts come from Norfolk. We are assured that the Erpingham Board of Guardians had a family in the workhouse, the husband being outside and in good employment, but unable to find a cottage. The guardians called upon him to remove his children, and the upshot of it was that the man, having no home to which to take them, had to throw up his work and join them in the House. This story is no isolated case, but typical of a widespread state of things. Where are the builders?

MANY of the towns of France are at present awakening to realise their need for better sanitary conditions, and plans and systems for better drainage are receiving much public attention. That there is much need for improvement most British sojourners in France are quite convinced. Trouville, the favourite seaside resort, is among the pioneers in this crusade. When it is remembered that 14,000 of the summer population are visitors, to whom good sanitation is all-important, it will be understood that the condition of Trouville in this respect is of great moment to the native population. The municipality think it well to avoid the risk of another such scare as took place some years ago, when a well-known actress contracted typhoid fever in the town, and are about to adopt the Liernur system of ridding the town of the refuse products. This system has been in operation at Amsterdam since 1872, and has there gained credit for lowering the death-rate from 26 per 1,000 to 17 per 1,000. By this method a whole city has its refuse discharged each day to a central reservoir, where it is immediately treated with sulphuric acid, run into an apparatus heated by steam, and dried by a process of evaporation. The whole treatment is effected in closed vessels at a very high rate of temperature to destroy all decomposing agents, microbes, germs, &c. The sterilised matter left is a valuable and marketable manure ready for agricultural purposes, which more than pays the cost of treatment.

IN Durham, the Art Circle is a society of Artists holding exhibitions periodically with the object of producing a continual endeavour on the part of members to attain to, and maintain, a high standard in their works. Students of the School of Art (Durham College of Science) are also permitted to submit works for exhibition, such as are of sufficient merit being accepted. Messrs. Ralph Bullock, John Charlton, R. G. Hatton, Ralph Hedley, Robert Jobling, A. H. Marsh, A.R.W.S., C. W. Mitchell, George Rushton, C. J. Spence and Robert Spence, are all represented in the Circle's First Exhibition, which is held at the College of Science during this week, and to which admission is by presentation of card. A first exhibition can hardly show the Circle's effect upon its members, and will naturally be somewhat experimental, so that the students have been rather leniently dealt with.

MILLBANK PRISON is a thing of the past, and on the site will shortly be built a huge block of County Council model dwelling-houses. Negotiations for the purchase of the ground have been nearly completed with the Treasury, and already plans have been prepared showing how the land may be laid out to the best advantage. The price agreed upon between the Council and the Treasury is £22,242, and the cost of the proposed buildings is roughly estimated at £200,000, while £30,000 will be expended in the laying out of roads and in other necessary works. It is believed that accommodation can be provided for about 4,400, and, so far as the preliminaries have been arranged, it is intended to erect two separate blocks of buildings, with a broad avenue between, planted with four rows of trees. The Council is desirous of proceeding with the scheme at once, especially as housing must be provided for 1,500 people who will be displaced from Clare Market in consequence of the operations about to be commenced there.

THE Calcutta correspondent of the Times says that an archæological mission, visiting the Nepal Terai this winter, discovered the long-lost birthplace of Buddha. The discovery was made at Mauza Paderiya, near the tahsil of Bhagwanpur, in the zillah of Butaul, close to the general's camp. Here, near the *débris* of several ruined stupas stood one of Asoka's monoliths, rising about 10 feet above the level of the surrounding ruins, and covered with several pilgrims' records, of which one belongs to about the ninth century. The archæologist's attention was at once caught by this, and the pillar was unearthed to the depth of another 14 feet, when a well-preserved inscription of the great Emperor Peyaddassi, or Asoka, was found about 3 feet below the former level of the ruins. In this inscription, Asoka states that after having been anointed 20 years (about 239 B.C.), he came himself to the Garden of Lubini, worshipped, and erected several stupas and this column, on the very spot where Lord Buddha was born.

SERIOUS floods have occurred at Liverpool. On Christmas Eve the sewer burst, and gas and water-pipes were fractured owing to a subsidence of ground. Houses were flooded, walls carried away, and a hothouse 150 ft. long was demolished. Preparations were being made by the City Engineer and staff to repair the sewer when it again burst, with the result that another subsidence took place, leaving a hole in the ground 75 ft. long, 25 ft. wide, and 25 ft. deep. The basements of large houses in the vicinity of the floods are full of water and sewage, and it has been deemed advisable in one case to vacate a dwelling-house, the foundations of which have become damaged.

ONCE more the question of obtaining the historic "Physick Garden," at Chelsea, as a public garden is before the local authorities. It is almost the sole remnant of the picturesque old Chelsea left untouched by the modern expansion of London, but has been long practically useless for its original purpose, although kept in careful condition by the Apothecaries' Company. Should the Company decide to give up its maintenance, it will be surrendered to Earl Cadogan. The value of the site for building purposes is sufficiently obvious, but it is to be hoped that this quaint old relic, the last of many old English botanic gardens, will be saved for posterity. Its history is replete with interesting associations of Sloane, Banks, Linnæus, Miller, and Lindley.

DURING the past few days over half a dozen stone coffins containing human remains were discovered at Bellfield, Musselburgh, where excavating operations have been going on previous to the erection of a tenement of houses. They varied in size from 3½ feet by 2½ feet to 14 inches by 7 inches. In several cases a quantity of human remains were found inside the coffins, while skulls and other human bones were unearthed close by. An arrow flint in a very fair state of preservation was also dug up.

AT a recent sale of engravings at Christie's, an example of the excessively rare engravings of Sir Thomas Frankland's daughters, printed in colours, after Hoppner's picture by W. Ward, sold for 290 guineas; and nine examples from the "Cries of London" series, after Wheatley, brought a total of over £237. A fine series of autograph letters of John Locke, the philosopher, sold at Sotheby's for £155. Most of them were on business matters, and two or three had reference to "clipt" money.

IT would be interesting to ascertain whether the curious landslip which has taken place in the Homestead Road, Fulham, has any connection with the recent earthquake. The cavity which has shown itself in the road is said to be large enough for an omnibus to turn round in. It is evident that the ground in this part is in a somewhat peculiar state, as a steam roller sank some seven or eight feet into it near this spot about two years ago. Whether the present subsidence is due to the earthquake or not it is evidently the duty of the Vestry to make a careful investigation of the road and its surroundings.

AMONG the latest proposals set aside for further consideration by the committee of the 1900 Paris exhibition is that of M. Nublat, who suggests the erection of a small theatre, the scenery of which is to consist of reproductions of landscapes by famous French painters. The pictures selected are to illustrate every French district famous for natural beauty, and the stage is to be simultaneously occupied by *figurantes* wearing the costume of the district represented by the scene.

WE understand that the Leighton Memorial will take the form of a monument in St. Paul's, from the design of Mr. W. B. Richmond, R.A. Through his exertions the objections of the Cathedral dignitaries to a place on the walls of the nave has been overcome. The monument will, we believe, be an effigy of the President, and will cost £2,000.

THE Davy-Faraday Laboratory, which was opened last week by the Prince of Wales, and will form an annexe to the Royal Institution, where Davy and Faraday laboured, is admirably fitted up for scientific research. There are nine private rooms, and three fitted for special research, the students being admitted without distinction of sex or nationality. Under the guidance of Lord Rayleigh, Professor Dewar, and others, the students will have the advantage of the use of a collection of chemical and physical apparatus such as can be found in no other building in England. The instrument-room is fitted up with the best appliances obtainable from all parts of the world. From Germany comes optical instruments and standard glass measuring vessels; from France, calorimetric and other instruments of precision; and England contributes electrical instruments; in fact, almost the whole world has been laid under contribution to complete this magnificent gift to science.

As to the form which the memorial to Robert Louis Stevenson should take at Edinburgh, the discussion still rages. Mr. Edmund Gosse expresses a very strong opinion that "the memorial, whatever its ultimate expansion, should not fail to

start with the idea of a portrait in sculpture." Mr. Sydney Colvin, however (Stevenson's literary executor), is against the idea of a statue on the ground that the poet was not a man of statuesque proportions. He suggests a seated figure, or, better still, a kind of classical temple or Belvedere, on Calton Hill, with commemorative medallions. Stevenson himself would probably have preferred a statue. In his early manhood, chancing to come across a grave marked by a rude weather-worn stone among the Pentland Hills—the last resting-place of some warrior—he renovated the tombstone with his own hands, and, in one of the very last letters he wrote, he expressed heartiest approbation and sent a subscription for commemorating the poet Fergusson in similar monumental fashion.

A history of the Cistercian Abbey of Margam, in Glamorganshire, one of the interesting monasteries of Great Britain, has only really been within range of possible preparation for the last few years, when the materials for adequate research have been promulgated in various recent works. The deeds now known, which relate to this house, are very numerous, and they throw much light on the constitution of the Abbey and extent of its possessions and influence, also on the local history of many neighbouring places, and on the manners and customs and historical events of the Principality. Dr. Walter Birch, F.S.A., is preparing such a work, and it will be issued to the subscribers early in the new year. It will treat critically of several obscure points in the history of the Abbey.

AT last the white marble statue of St. Winefride is completed, and is on view at the studio of the sculptor, Mr. Joseph Swynnerton. The statue is of pure Carrara marble, almost 7 ft. in height, and portrays Winefride in the freshness and beauty of youth. In her left hand she holds a gilt crozier of ancient Celtic design, and in her right hand is the palm of martyrdom. The borders of her robes are adorned with quaint and ancient Celtic designs, picked out in dull gold. A low crown surmounts the veil, which drapes the head and shoulders, adding dignity to the figure. It is intended to offer the statue for a place in one of the spring exhibitions in London, and it will afterwards be conveyed to Holywell.

THE moving of the bog on the Kenmare Estate has fortunately been attended with less loss of life than might have been expected, seeing that no less than 200 acres of boggy soil, with a depth of 30 feet in parts, have swept down, and carried everything away before the rush for miles. Mr. Bram Stoker, in an Irish story published some years ago, the title of which, if we remember aright, is "The Snake's Pass," gives a graphic and weird description of the slipping of a great Irish bog.

FOUR pictures by Gainsborough have just been added to the collection in the National Gallery, to which institution they have been presented by the daughters of R. J. Lane, the engraver. Another addition to the pictures by British artists, is a landscape, "The Dewar Stone," by J. W. Inchbold, which was bequeathed by Sir Russell Reynolds. Two portraits of "Venetian Senators," belonging to the Venetian School of the sixteenth century, have been transferred to Trafalgar Square from the South Kensington Museum. The Department of Egyptian and Assyrian Antiquities of the British Museum has also been added to by a set of three inscribed cones in terra-cotta, containing the name of Amil Babbar, about B.C. 2200. These cones were mostly dedicated to Ningirsm, the fire god, and were often let into the walls of private houses and temples, in order to protect them from evil spirits. Cones of this description are found in large quantities in the neigbourhood of Warka, the ancient Erech, where temple dedicated to the fire god stood in ancient times.

THERE seems to be growing up in America a definite appreciation of the work of British Artists. Since the Chicago Exhibition, the demand for pictures painted in this country has perceptibly increased on the other side of the Atlantic, and the contributions by our Artists to American exhibitions have become more numerous. The first annual show recently opened at the Carnegie Art Galleries, at Pittsburg, included a considerable number of canvases sent from London. Among these were Mr. Whistler's "Fur Jacket," and his portrait of Señor Sarasate; Mr. Orchardson's "Master Baby"; Mr. Alma Tadema's "Tibullus in Delos"; a study for "The Widower," by Mr. Luke Fildes; the "Lady in Brown," by Mr. Lavery; and "The Merciful Knight," by Sir Edward Burne-Jones.

DESIGNED by M. Girault, the Architect of the Palais de l'Industrie, M. Pasteur's tomb is on the model of the celebrated mausoleum of the Empress Galla Placidia, at Ravenna. Over the entrance is the inscription "Ici repose Pasteur." The walls of the crypt are covered with frescoes representing Faith, Hope, Charity, and Science. Numerous symbols and inscriptions of Pasteur's life and labours are also displayed.

NEARLY a million sterling is to be spent in increasing the dock accommodation at Antwerp. The Belgian Minister of Public Works has decided to extend the quays 3,000 feet to the south. The Etoile Belge says a channel 200 feet wide and 24 feet deep is to be constructed. The work is to be carried out by contract, the specifications not only defining a minimum wage for the workmen, but requiring them to be insured and measures taken for their safety. The present works are only part of a scheme for a still greater extension of the port, surveys having been made further down the Scheldt.

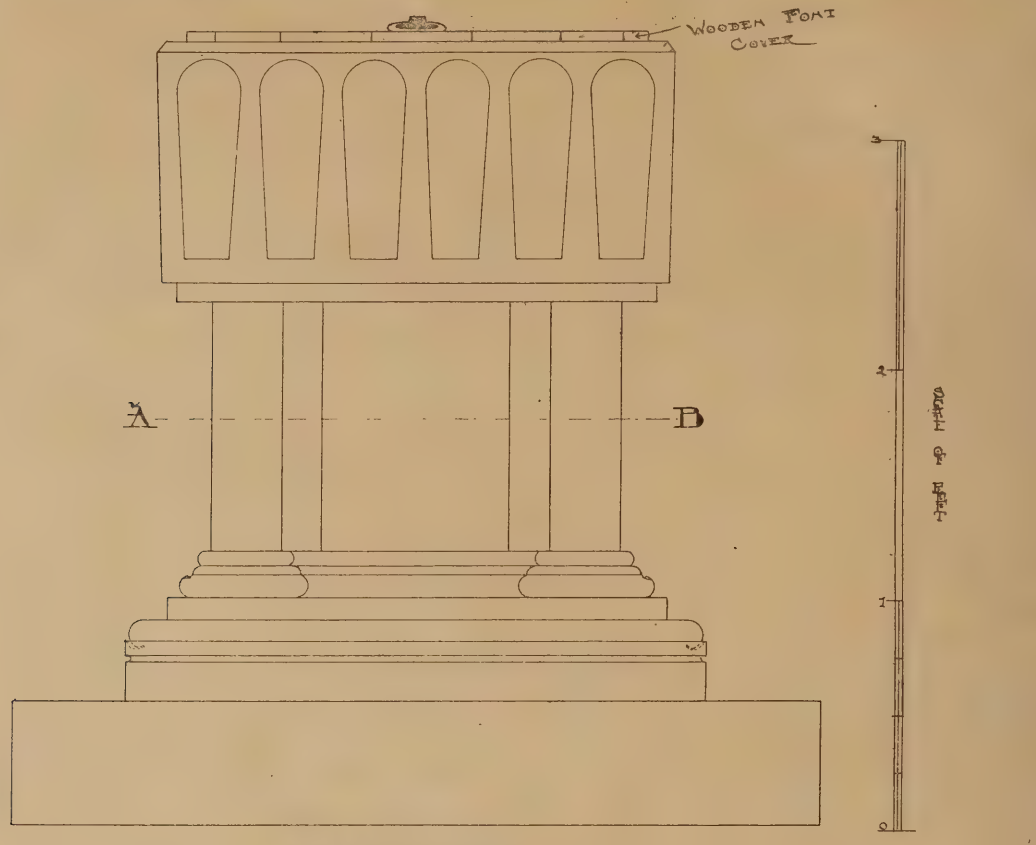
DURING the past four or five springs and summers, the Carrington House site in Whitehall has bloomed with a constant succession of many flowers of field or hedgerow, self-sown at Nature's mysterious bidding to beautify the heaps of brick-bats and mortar which are all that remain of Lord Carrington's fine town house. More seasons will probably wax and wane before the site is dug for foundations, for departmental building schemes have a way of being long considered and carried out only after a succession of delays.

WHAT difference a span of 13 years makes in the fashion of an Artist's work, will be abundantly evidenced in a comparison between the two exhibitions of Lord Leighton and Mr. Watts. It is said that Mr. Watts is uncertain as to the date of his birth, but a portrait of himself, painted in 1834 is stated to represent him in his eighteenth year. This would make him Leighton's senior by 13 years, and his present age to be 80. But the dresses and the style of painting of his early work would appear to be removed by half a century from the first performances of Leighton. How much earlier than Leighton, Watts was in getting to work, is evidenced by his beautiful study of a heron, his first exhibited work, painted before he was of age; but if we take his "Lady Holland" and compare it with Leighton's "Cimabue," painted by the artists at the age of 27 and 26 respectively, we see how rapidly Leighton overtook him in draughtsmanship, which has always been Watt's weak point.

FEW appreciate how valuable a field of education are the historic buildings of London. The fact, however, is recognised by the Committee of the Female Orphan Asylum, at Beddington. The annual report just issued, contains a statement that, with a view to "enlarging the minds of the children, and imparting a more useful and general knowledge of common things," the system has been adopted of taking the elder girls once a quarter to some interesting institution in London. The plan is an excellent one, and will fully justify in every respect the small expenditure the organization of the trips will entail upon the charity. Other charity foundations and the public schools might with advantage follow the example.

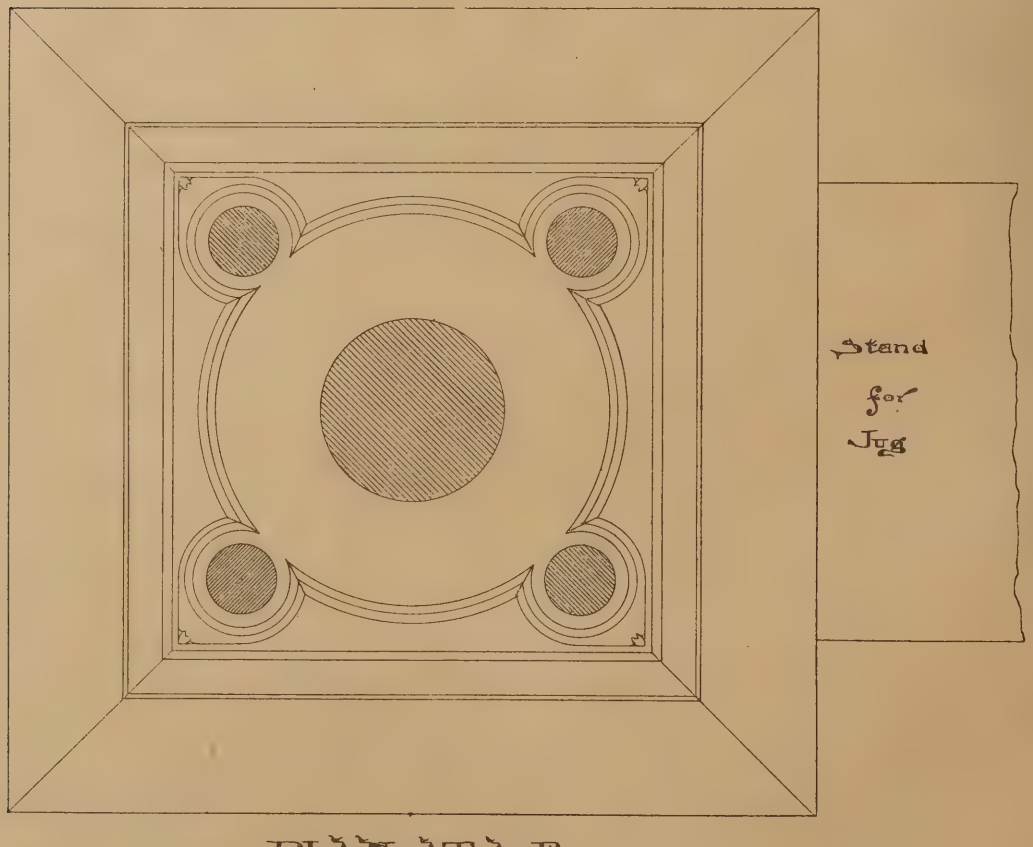
QUEEN'S House, Cheyne Walk, a house with an interesting history, is now in the market. The name it now bears has been given to it from the supposed residence of Charles II.'s neglected Queen, Katherine of Braganza. Though this is very dubious, and only supported by tradition and the initials in the fine wrought-iron gate, the house will always be memorable as that to which Dante G. Rossetti, his brother William, George Meredith, and Algernon Swinburne came to live in 1862. Their partnership in the house was not of long duration, but "D. G. R.," as is well-known, retained it until his death, in 1882. It is now occupied by the Rev. Mr. Haweis, who gave it its present name, and added the figure of Mercury on the roof. The house is a good specimen of the Wren model, with a disfiguring bay added in later years. It stands on or near the site of the new Manor House, built for a royal nursery by Henry VIII., where Queen Elizabeth spent much of her girlhood, which was demolished after the death of Sir Hans Sloane, its last occupant.

MUCH of the "Altstadt" of Prague has been condemned as insanitary, and will, in the course of a few years, be destroyed and rebuilt. With it the old "Ghetto," one of the oldest in Europe, will vanish. In the old burial-ground, which was used by the Jewish community of the city as early as 941, tombstones, with characters engraven nearly one thousand years ago, may be traced. The old Jewish quarter and, indeed, the "Altstadt" as a whole, form the picturesque part of the city, and, when it is replaced with modern houses and broad streets, Prague will be no longer the Prague we have known. One of the chief resorts for public inspection was the Patrizierhaus, which is among the oldest where all is so very old. It must at one time have been the home of a distinguished family, judging from the paintings on the walls, as well as the average size of the rooms. The forepart of the house contains three stories, the back portion five, and the main hall rejoices in a handsome Gothic roof.



THE group of figures which it is proposed to place in the pediment of the new Academy at Dumfries has been modelled in stucco by Mr. Rhind, Edinburgh, from a design of Mr. Carruthers, the Architect of the building. It is intended that each of the figures in the group should represent one of the various Arts and Sciences in the person of a noted disciple belonging to the district. The central figure is that of Burns, and to his right are the figures of Paterson, the founder of the Bank of England, in the wig and coat of the period; Nasmyth, the painter; Sir Andrew Halliday, the eminent physician; and Clapperton, the African explorer, whose mother still resides in Annan. To the left are Lord Young, the author of the school board system; Thomas Carlyle, and Telford, the engineer. There is an alternative proposal that the pediment should be ornamented only with a scroll design, with a shield in the centre bearing the image of St. Michael. This would cost £100, while the statuary would cost £300.

AN instance of what brains and industry can accomplish is furnished by the career of Sir John Brown, who has just died at the age of 80. His start in life was humble. His father was a working slater, and had his son apprenticed to a file factory. From the making of files he became one of the leading captains of industry in Sheffield, the great steel firm of John Brown & Co. being known all over the world. He first came to the front by manufacturing railway buffers, but it was his armour plates for English warships which made his fame and fortune. He was thrice Mayor of Sheffield, and received his knighthood in 1867.



AT the present time the question of providing new schoolhouses is attracting attention in New York, says the Tribune. On both sides of the East River, the neglect of former city authorities to make adequate provision for the needs of rapidly growing populations is now seriously felt, and urgent steps are being taken to bring the schoolhouses abreast with the demands. In New York there are hopeful prospects of facilitating the work of building new schools, commonly a slow and tedious process. Several million dollars are available for new school buildings, and the Board of Education is preparing to make the best use of this large sum. It is estimated that about 10,000 more sittings are required at once. Moreover, the public school accommodations of the city are more inadequate at the close of 1896 than they were at the close of 1895. While it is estimated that 776,000 dollars are needed to provide the accommodations urgently and immediately required there, it would be a most short-sighted policy to fail to take into account the growth of the city and the growing needs that go hand in hand therewith. The Board of Education has wisely agreed to appeal to the Legislature, for the passage of a Bill authorising the issue of bonds to the amount of 2,000,000 dollars for the purchase of sites and the erection of school buildings in 1897 and 1898.

CONSIDERABLE litigation is threatened as an outcome of the washing away of the Old Chain Pier at Brighton. The West Pier Company, whose structure was damaged to the tune of £4,000, has given notice of a serious claim against both the Chain Pier Company and the Brighton Corporation. The former is to be sued for the actual damage occasioned by the floating débris of the old pier, and the Town Council is to be held responsible for not seeing that the demolished structure was taken down immediately after it had been officially condemned. It is understood that the West Pier Company also seeks to obtain redress from the Corporation for alleged damage caused by the plant of the contractor of the new sea-wall, which was washed about during the fearful gale of Friday night, the 4th ult. The work of continuing the new sea-wall and esplanade under the West Pier has been stopped, owing, it is said, to the claim put in by the company that the foreshore belongs absolutely to them and that the Corporation has no power to carry out the proposed plans.

A BILL has been deposited for next session by the Tower Subway Company, asking for power to sell their undertaking in consequence of "the opening of the Tower Bridge having reduced their tolls to a sum insufficient to pay the expenses of lighting and management." From the preamble of this Bill it appears that the company have expended upon the construction of this subway £26,600, since which they have received £11,500 as compensation from the Corporation of London for loss of revenue resulting from the opening of the Tower Bridge. Upon a sale of the subway being effected, it is proposed to dissolve the company.

THE International Exhibition of Arts at Florence, which was opened recently by King Humbert, contains a notable quantity of English pictures, including works by Sir E. J. Poynter, Sir Edward Burne-Jones, and Messrs. Frank Dicksee, Alma Tadema, Seymour Lucas, Alfred Parsons, Briton Riviere, Swan, Corbett, G. Richmond, Alfred East, and A. Waterhouse. With such representatives it is not surprising to learn that contemporary British Art has made a great impression on the frequenters of the Exhibition.

IT is greatly to the credit of the manufacturing town of Paisley that it should be able, year after year, to organize an Art Exhibition, and to maintain an Art Institute in its midst, the membership of which numbers 595. As heretofore, the valuable private collections of paintings of the local magnates have been laid under liberal contribution. In themselves the loan paintings are an attraction greater than many of the leading Art exhibitions can offer. There is, for instance, on the walls an example of Velasquez, given on loan by Mr. Archibald Coats, of Woodside. This is the Countess Ruffo Bouneval de la Fard, and is delightfully pure in colour and vivid in execution. From the same collection there has been contributed the portrait of Miss Francis Harford, by Romney, the eminent early English portraitist; while Sir Thomas Glen-Coats, of Ferguslie, has given an example of the work of Sir Thomas Lawrence, P.R.A.

THE statue of St. Michael, the patron saint of Brussels, which adorns the spire of the Hôtel de Ville, has just made a second descent. It was first erected in 1455, and lost its head in a tremendous storm which swept over the city in 1608. Nine years later it was taken down for repairs, but since it was re-erected the necessary processes of renovation have been carried on with the statue in position. It has now been found necessary to take it down for the purpose of rebuilding, and this work having been completed, it is on view to the public for a few days before being replaced.

M. KAEMPFEN, Director of the National Art Galleries of France, in a speech to the students of the Ecole des Beaux Arts, protested against the extreme modernists, who would banish the antique altogether from the schools. "Be of all ages," said Mr. Kaempfen, "even of that which is to come, if you have imagination enough to invent it. Borrow from ours, to reproduce our greatness and misery, our beauty and ugliness—but do not impoverish Art by suppressing antiquity. To have learned to drape a tunic, a peplum, a toga, or a chlamys, does not incapacitate an Artist from copying accurately a frock-coat, a waist-coat, or a pair of pantaloons; perhaps, indeed, the task will be rendered easier by the accomplishment of a previous one of greater difficulty."

IN deference to the generally expressed desire, both private and public, an arrangement has been come to between the First Commissioner of Works and the memorial committee, whereby the statue of John Bright, in the Houses of Parliament, shall be removed from the Central Hall prior to the opening of the session, and deposited in a safe place, pending its transfer to some public institution.

THOUGH a site has been chosen for the bust of Sir Walter Scott, there will yet be a little delay before it is finally set up in the Abbey. This is due to several causes, one, though certainly not the most important, being that the money has not yet been fully subscribed. This has been so nearly done that Mr. Hutchinson's bust has already been chosen and acquired. It is a copy and, as nearly as possible, an exact reproduction of the familiar Chantrey marble. The original is at Abbotsford, and is the first of three busts taken by the Sculptor. Chantrey was so successful with it that there was a great desire to obtain copies of it. But the Artist, while preserving in each absolutely the original pose, had for the two succeeding portraits separate sittings. One of these was for Sir Robert Peel, and is still in possession of the family; the other was for the Duke of Wellington, and it is now at Apsley House. The inevitable variation gives a peculiar interest to the three portraits. The site chosen in Poet's Corner is just by the Duke of Argyll's monument. But this position—admirable from a literary point of view—will not, we hope, be finally adopted without some consideration for the Abbey itself. When once the marble is placed in its chosen place it cannot be removed without tedious and costly formalities.

THE recent heavy landslip at Bournemouth, on the east cliff, has revived the question of the undercliff drive that has been more or less before the town for 13 years. The Town Council, having received a letter from the ground landlord, Sir George Meyrick, favourable to giving the town a lease of appropriation of the cliffs, has decided to get a scheme for the preservation of the cliffs and the construction of an undercliff drive drawn up by the borough surveyor, and considered at the next meeting. Sir George Meyrick has asked the Corporation what would be done with the cliffs if handed over to the town.

NOT long ago students working at the National Gallery petitioned the trustees for certain concessions to which they deemed themselves entitled. One was that they should be given a special room for the public exhibition of their copies, and another that each of their pictures should be submitted to a committee of the trustees, to determine whether it was worthy of a Government stamp—in other words, they asked that the approval of the institution should be impressed upon their canvasses. Needless to say, the latter request was not entertained. In regard to the first, however, they were practically met half way, for the authorities, while declining to permit any special exhibition of the students' work in the manner indicated, relaxed the rule compelling copies to be removed within a fortnight of completion, and, in future, will allow them to be stored on the premises. A room is now in course of preparation to carry out that object, but the impression that the efforts of the students will be open to the inspection of the public is an erroneous one, though ample opportunities will be afforded prospective purchasers of viewing any particular studies for which they may have a fancy.

THE 226th anniversary of the founding of the Hotel des Invalides by the Grand Monarque, suggested to a French paper a brief sketch of its origin and history. Before the reign of Henry IV., soldiers incapacitated by wounds, sickness, or age were compelled to resort to either brigandage or begging for their existence. Those who were very lucky might be taken as lay brothers into a monastery. Henry IV. established the Hospital of the Oursine, where old soldiers admitted by his order were to be clothed, fed, and cared for. In 1634, Louis XIII., finding this building too small, removed it to Bicetre, which became known afterwards as the barrack of St. Louis. In 1670, Louis IV. decided to found the Invalides, which was first opened in 1674, but the dome was not finished for another thirty years. Of late years the lot of the pensioners has been much improved, and a special class has been formed of those old soldiers who could not receive proper care and attention from their own families. The officers are divided into two classes of lay brothers, the higher of whom enjoy the privilege of having their meals in their own apartments. At present there are 500 pensioners in the Invalides.

THE design for the memorial to be placed over the tomb of the late Sir Augustus Harris is now on view at The Studios, Vincent Square, Westminster, the house of Mr. Joseph Whitehead, who has been commissioned by Lady Harris to execute the monument. The memorial, which will be finished in about six months, consists of a white marble pillar surmounted by a bust of the late Sir Augustus. On one side stands a female figure, emblematic of Fame, crowning the bust with a wreath, while on the other side is a trophy emblematic of Music and the Drama.

AN interesting discovery has been made in Well Street, Bradford, the old well from which the name of the street is derived being found in the basement of a block of buildings bounded by Swaine Street, Ship Alley, and Brown Street, in premises occupied by Mr. R. Thompson, paper merchant, situated at the corner of Swaine Street. But for a large quantity of sediment the well remains much the same as when its waters supplied nearly the whole of that portion of Bradford. The depth is supposed to be about 18 feet, and the diameter about 5 feet. It is walled in regular courses, but with undressed stone. The discovery of this relic of Old Bradford is especially interesting, as the well probably dates back several hundred years. It may not be generally known that the Bradford Grammar School was formerly situated on the site of the present General Post Office, the favourite playground of the boys being the open space now occupied by Foster's Buildings, extending from Hall Ings to Swaine Street, and the "Isle of Man," a triangular plot of ground adjoining, but nearer to Kirkgate. Well Street, although much narrower in width, occupied its present position, and got its name from the existence of the well, known as the "School-house Well," now so singularly brought to light. The well supplied nearly all the lower portion of the town, and at one time received its supply from a stream which emptied into the beck at Broadstones. Along this stream willows grew, and at that time the aspect was quite suburban. The well was originally reached by descending three or four steps.

AN interesting example of a last-century carving is to be found at No. 4, College-Hill—a street famous for possessing the Church of St. Michael Paternoster Royal, and the well-known magnificently carved lintels of Nos. 21 and 22, which are of seventeenth-century date. With them the at-present-considered work can in no way compare. It is stiff where they are free, and rigid where they are flowing, but in its way, and as a survivor of a race of doorways fast becoming extinct in the City, it will repay more than a passing glance. Mr. Edward Crosby writes as follows concerning the house generally: "It is," he says, "of last century's date, but new windows have at some time been put in. The attic story, however, together with the old coping and the rain-water catch, shows it to have been an old City mansion-house. The portico is of wood, painted over, of course, and shows an unbroken pediment supported by carved brackets. In the tympanum are carvings of a head crowned with a wreath, two cherubs' heads and wings, the space being filled up with fruit, flowers, and scroll work."

SIR HORATIO LLOYD, the Recorder of Chester, recently suggested that a statue of the Duke of Westminster should be erected in Chester, as a mark of public appreciation of his Grace's beneficence to the city and county. His grace, however, desires that the movement should not proceed.

Professional Items.

AUCHTERARDER.—The St. Kessog's Church, Auchterarder, the memorial stone of which has just been laid, is situated in a park of 2½ acres on the north side of the High Street of Auchterarder. The church consists of a nave 48 feet by 24 feet, and a chancel 26 feet by 24 feet, separated by a handsome stone chancel arch, with richly carved capitals. The porch is at the south-west corner of the nave, and in a niche above the doorway is a statue of St. Kessog. The vestries and organ chamber are on the north side of the chancel. The chancel is the same width as the nave, and the roof is externally the same height in both, the ridging of red tiles being continuous from one end of the building to the other, except over the chancel arch, where it is intersected by the flèche. The flèche is of wood, covered, like the rest of the building, with green slates from Aberfoyle. It rises to a height of 70 feet. Externally and internally the walls are of warm red local stone, the dressing being in white stone from Auchinlea Quarries, near Motherwell. The roofs are of dressed timber, open to the ridge, 35 feet above the floor of the nave. The nave is divided into four bays, and is lighted by groups of double lancets along the sides, and by triple traceried lancets in the west gable. The nave will accommodate nearly 200 persons. The design is early decorated Gothic, and the Architects are Messrs. Ross and Macbeth, of Inverness. The contractors are:—Mason, Peter Anderson, Auchterarder; carpenter, James Martin, Auchterarder; slater, R. Gibson, Auchterarder; plumber, James Macleish, Perth; painter and glazier, C. Alexander, Perth.

BAKEWELL.—A vestry meeting was held at the Parish Church, Bakewell, on Thursday, Dec. 24th, for the purpose of adopting plans for a new vestry. Plans had been prepared by Mr. Naylor, the Diocesan Architect, and the committee recommend that a vestry be built adjoining the north transept of the Church, and a faculty be applied for to commence the work at once was unanimously adopted.

BEARSDEN.—During the past year great activity has been manifested in the building trade, and an unusually large number of villas and cottages have been erected. At Exshine Park and other parts of Bearsden upwards of 20 villas and cottages have been built. The large field recently occupied by the football club has been fenced, and two villas are already in course of construction upon it, and on a field at Feguston Farm several cottages have been commenced. Notwithstanding these extensive additions the demand for houses continues.

BRIGHTON.—A new Chapel has been built at Windlesham House School in memory of the late Mr. C. Scott Malden. The Chapel was begun by Mr. Scott Malden, the walls being half up at the time of his death, and it has now been finished by his friends as a memorial to him. The Chapel accommodates over 150 persons, and an interesting feature about it is that a considerable part of it has been built from the material of the old Carfax Church at Oxford. The old oak of the Carfax has been used to make the roof, the organ loft, and other parts, the pulpit also being from this celebrated Oxford Church, while the beautiful carved oak altar and reredos are of fifteenth-century work—so that, as regards its interior at least, the Windlesham House Chapel may be said, in a sense, to be at once the newest of the oldest of the places of worship in Brighton.

BYKER.—At St. Michael's Parish Church, the stained-glass window which has been erected on the north side of the Church in memory of the Rev. H. T. Ormerod, B.A., has just been unveiled. The work has been executed by Messrs. Wailes and Strang. The window consists of two lights and a geometric tracery above, all of which have been filled with rich glass. Two figures, those of St. Matthew and St. Luke, are represented in Eastern robes and bearing pens and books in their right and left hands respectively. The former is depicted in rich ruby purple, yellow, and deep blue robes, while the latter is in rich ruby, green, and blue purple.

CHESTER-LE-STREET.—The limited, and altogether insufficient, amount of house accommodation at Chester-le-Street, which has given rise to much complaint and great inconvenience for some years past, is in the immediate future to receive a welcome relief. Mr. C. Groves, builder, has secured a small estate in the West Lane, not far from the Front Street, upon which he is already building. When built upon the estate will contain 90 houses, in a most convenient and healthy situation. Messrs. Thos. Thompson and Son, builders, have also secured a freehold building estate, upon land of the lord of the manor, Mr. Chas. H. Jolliffe. This they intended laying out for detached cottages and houses with allotments ranging from a quarter to an acre in extent.

CWM PARK.—St. George's Church, which has just been built at the expense of Mrs. Llewelyn, of Baglan Hall, is situated in the centre of the village, and accommodates more than 400 worshippers. It comprises a chancel, nave, south aisle, porch, and massive tower over 60 ft. in height. The style adopted by the Architect, Mr. George E. Halliday, is fifteenth-century English Gothic. The walls are composed of native stone, while hard Doulting stone is used for the window tracery and other dressings; the hammer-beam roof is of pitch pine, left free from either stain or varnish. The internal face of the walls is of pointed rubble work. The pulpit and font are of green Bridgend stone. A noticeable feature in the Church is the reredos, which is of polished pink alabaster, richly carved. The contractors were Messrs. Knox and Wells. The Church is lighted by electricity.

DEWSBURY.—At the last meeting of the hospital board, it was decided to award the first premium for plans for a new infectious hospital, which it is suggested should be erected in the Soothill Nether district, to Alderman Fox, Architect, Dewsbury, and the second premium to Mr. John Lane Fox, Architect, Dewsbury. Alderman Fox's estimated cost was £32,000, and that of Mr. J. L. Fox was £35,395.

DUBLIN.—There is about to be erected, in Coote Hill Catholic Church, a side altar in carved stone and different coloured marbles. The altar, which is to be dedicated to the Sacred Heart, is in the Gothic style in keeping with the Church. The five panels are of white Sicilian marble. The altar table is handsomely moulded. On it rests a tabernacle of Caen stone, with marble pillars of rich colours, bases, and floral caps. The door is richly chased in brass, with coloured inlays. The tabernacle will be surmounted with the figure of the Sacred Heart in white marble, with a canopy of Caen stone, supported by pillars of Irish green marble. The design was the work of Mr. C. T. Taylor, Architect, and the contract was carried out by Messrs. Taylor and Sons, Sculptors, Dublin.

DUMBARTON.—The new buildings of the Young Men's Christian Association, situated in Risk Street, have recently been opened. The new buildings embrace a gymnasium, a reading room, and library; committee, secretary's, and dressing rooms; hall, capable of accommodating 250 persons, lavatories, baths, parlour, and keeper's house. The cost is estimated at £3,500.

DUNDEE.—Mr. G. C. Buchanan, Harbour Engineer, has submitted to the Works Committee of the Dundee Harbour Trust a report as to the proper equipment of the eastern wharves with new hydraulic machinery. It was expedient, the report stated, at an early date to make arrangements for the proper equipment of these wharves with hydraulic machinery. The engineer had carefully considered the schemes and approximate estimates forwarded by Sir W. Armstrong & Co. and Messrs. Tannett, Walker, & Co., and it appeared to him that Sir W. Armstrong & Co.'s proposal was the more suitable and at the same time the more economical of the two. The tender amounted to £3,365, which Mr. Buchanan considered moderate.

EDINBURGH.—The new premises of the Edinburgh Working Men's Club and Institute, in Infirmary Street, Edinburgh, were formally opened, on 22nd ult., by Mr. Wm. M'Ewan, M.P. The building, as altered, presents a handsome façade in the classic style. For the better lighting of the premises, the windows all round have been altered and enlarged, also transforming to a large extent the side-view of the building. The ground in front has been utilized for a portico entrance, and with the exception of that part and the committee-rooms, and heating chamber in the rear, which are of one story, the building is a three-story one. On the street floor, in the portico, there is the superintendent's room entering off the vestibule, in which registering turnstiles are to be placed. The reading-room and library are also on this flat, both having accesses from the entrance hall. Two large rooms for the use of the secretary and the committee adjoin the reading-room. To the upper flats there are two staircases, one for members, and the other for visitors. That on the right hand leads to the visitors' billiard-room, in which there are to be four billiard tables and one bagatelle table. Also on this floor, but approached by the other stair, are members' rooms for playing games, the larger of the two being for draughts and chess, and the other for dominoes. The whole of the top flat forms the members' billiard-hall, a special feature of which is the lighting, which is both by window and from the roof.

An important feature of the improvements now being carried on in St. George's Church, Edinburgh, is the filling with stained glass of the large window of three divisions looking to the west. By somewhat enlarging the height of the central opening, sufficient space has been obtained for the representation of the Ascension. The window was executed under the direction of the Architect, Mr. Leadbetter, at the studios of A. Ballantine and Gardner, George Street, Edinburgh.

FALKIRK.—The new Fever Hospital which has been erected on the Edinburgh and Glasgow Road, a short distance to the west of Camelon, by the Eastern District Committee of the Stirling County Council, has just been opened. The hospital consists of four large blocks—namely, one administrative, one for scarlet fever, another for enteric fever, and a laundry. There is accommodation for 22 patients. The two fever blocks are 100 feet long by 30 feet wide. The hospital, the cost of which is £7,000, covers three acres of ground, and has a terraced front to the roadway, which gives the buildings a handsome appearance.

GLASGOW.—By way of marking the completion of a somewhat extensive rearrangement and improvement of the Glasgow Liberal Club, an informal ceremony took place a few days ago. The work has been done at a cost of nearly £1,200. The dining-room, which is an exceedingly spacious apartment, effectively broken by Corinthian pillars, is now decorated in a scheme of green and gold with terra-cotta wall papering, while the smoking-room now takes the place of the large reading-room, while the reading-room has been placed at the head of the staircase in one of the smaller rooms, and the billiard-room has been enlarged to accommodate three tables. The electric light has also been fitted up throughout the building. The improvements have been carried out under the superintendence of Mr. R. D. Sandilands, Architect.

HEREFORD.—The infant school, built at the rear of St. James's Church, Hereford, has just been opened by the Bishop of Hereford. The buildings are well arranged and stand back from the road with a south aspect. A large playground is provided which extends on three sides of the building, while the offices are fixed in the rear. The exterior of the schools shows timbered gables filled with large mullioned windows all in harmony with the slated roofs and well-built brick walls, the line of the main roof being broken by a turret. The interior consists of a lobby, a cloak-room, a class-room, and a large school-room. The school and class rooms are finished with roof trusses and moulded wall plates, and the entire view of the rooms is free from any unsightly beams. The walls internally are lined to a height of four feet with glazed bricks.

LONDON, W.—The St. Marylebone Infirmary, situated in Rockham Street, Ladbroke Grove, W., was recently opened for inspection. The building has from time to time been extended until it now covers over seven acres. The Architect was Mr. H. Saxon Snell. The building now consists of eight blocks, each connected with fire-bridges, so that in case of fire speedy escape would be possible.

The cost, including the nurses' home lately erected, was £130,000, or about £175 per bed.

OLDHAM.—The Local Government Board has acceded to the application of the Oldham Town Council for permission to raise loans of £10,000 for electric lighting purposes and £1,050 for the construction of a public convenience at Rhodes Bank. In the early part of October, an enquiry was held into the subject-matter of these two applications, along with applications for power to borrow £55,000 for sewerage and sewage disposal works, and £9,000 for public baths at Robin Hill. The consent of the Local Government Board to the two last-named loans has not yet been received.

RHYL.—The Rhyl Urban District Council has completed the negotiations for purchasing the site of the old Royal Alexandra Hospital at the end of the east promenade. The sum of £3,500 has been paid for the site, and the hospital committee has agreed to pull down and remove the building within four months, so that the site will be clear by the opening of the season. It is proposed to lay out the site when cleared as a recreation ground. The Rhyl Urban District Council has also agreed to extend the west promenade towards the Foryd, with a sea wall in front. This is to be done partly at the expense of the ratepayers and partly by the private owners of adjacent land, the object being to open up a large tract of building land and to secure a better approach to the Marine Lake. Tenders for the work have been received, that of Mr. Jacob Biggs, contractor, Birmingham, being the lowest.

STIRCHLEY.—Mr. W. Hale's plans for the proposed new Church at Stirchley and the mission room for The Cotteridge, have been accepted, and Mr. Hale requested to invite tenders from most of the well-known builders. Subscriptions to the amount of £2,500 have already been received towards the £7,000 required.

STONEHAVEN.—The Church of the Immaculate Conception, Stonehaven, which has for some time past been in the hands of the painters, was re-opened last week. The four windows of the sanctuary, which formerly were of plain glass, have been replaced by handsome stained glass windows representing St. Joseph, the Immaculate Conception, the Sacred Heart, and St. John. The interior of the Church has been treated with a handsome modelled wall covering, with a design of wheat in pale blue and gold. Mr. Copland, of Aberdeen, has had charge of the work.

TIPTON.—At a recent meeting of the Tipton District Council, the General Purpose Committee reported that they had considered the plans for the proposed extension of the Public Offices, the erection of a fire station, reading-room, committee-rooms, technical instruction and lecture hall, at a cost of £4,000. The Fire Appliances Committee had previously reported that a drill hall was contemplated, and they had recommended that Captain Roberts should be communicated with on the subject of the rent. The report was adopted by the Council.

THE completion is announced of the Emden-Vigo cable, one for diverting the German traffic to the Iberian peninsula from the French wires. The cable is over 1,100 miles, and it connects the German system at Emden with the Spanish system at Vigo, and with the submarine cables of the Eastern Telegraph Company.

ATTENTION is being directed to the neglected condition of the Market Weighton canal, which discharges into the Humber midway between Hull and Goole. The waterway has, in its lower reaches, become silted up with sand from the Humber, and with deposits of sand from the feeders in the upper reaches. There appears to be some difficulty as to the question of liability, however. The North-Eastern Railway Company some years ago bought out the subscribers, and now take the tolls for the navigation. The drainage trustees have the power to clean out the canal and repair the locks, but they have no funds, as the dues and tolls are collected by the North-Eastern Railway Company, who repudiate any liability.

BELFAST CORPORATION WORKS.

THE annual return prepared by the City Surveyor's department gives some interesting particulars concerning the principal works erected during the past year. The return shows that in addition to the extensive works of maintenance and repair carried out during the twelve months, the following have been executed or are in progress:—Permanent paving has been laid in Corporation Square, Waring Street, Clifton Street, Howard Street, Long Lane, and Divis Street. Flagging has been laid down in sixty-seven streets. The number of buildings for which plans were approved in the year 1896 is:—County Antrim side, 2,879; County Down side, 849; total 3,728. The number of streets for which plans were approved during the year is:—County Antrim side, 67; County Down side, 18; total, 85. The number of streets or portions thereof completed and adopted is 75, of which 30 are macadamised and 45 paved and flagged. The total length of streets thus adopted is about 5⅛ miles. Block and sett crossings and street ends have been laid in Botanic Avenue, Ormeau Road, Pilot Street, Ravenhill Road, Woodstock Road; Ravenhill Road, between the park gates and Ravenhill Avenue, has been lowered and widened, and the gradient improved; railings have also been erected along the park frontage, in lieu of the old stone wall, where the road has been altered. The southern approach of the Victoria Park Bridge has been raised and the gradient improved, the adjoining owners having given the necessary facilities. An arterial sewer in connection with the high-level system has been extended along the valley of the river Blackstaff, as far as Surrey Street, and is now being completed to the city boundary.

A NEW SEWER

is also being constructed in Skegoniel Avenue in connection with the low-level system. The old sewers in Cullingtree Place, Cullingtree Lane, Railway Street, M'Gahen Street, and a portion of Ardilea Street, have been reconstructed so as to discharge into the main drainage system. Upright ventilating shafts have been substituted for surface ventilators in the following places:—Castle Lane, Boyle Street, Oban Street, Blythe Street, Osman Street, Townsend Street, Newington Avenue, and lane off Little Donegall Street. The various watering troughs and drinking fountains have been painted, repaired, and some have been improved as regards water supply. The pumping stations have been painted throughout. A new weigh-house has been erected at Rosetta. The Linen Hall site has been cleared of old buildings and the site sown in grass. A new fire escape station has been erected at Willowfield Street, and the escape station removed from Templemore Avenue to Middlepath Street. Several improvements have been made in the courts, cells, and offices connected therewith. At the abattoir, a cooling house fitted with modern appliances, has been erected. Five of the separate houses have been converted into one large apartment, lined with glazed bricks, and supplied with the most approved fittings. The entire drainage has been reconstructed and connected to the main drainage system. The new fish market has been completed and opened. The clock removed from Linen Hall has been erected over the entrance opposite May Street. The interior of Ormeau Avenue Baths has been improved and painted. A boring, 408 feet deep, has been made, which yields an ample supply of water. Peter's Hill Baths have been pointed, and other minor improvements carried out. Falls Road Baths have been supplied with fittings and furniture, and the basement and passages laid with tar pavement. The hall, staircases, and corridors of the Town Hall have been painted.

NEW OFFICES

have been erected and fittings made for surveyor's department. A considerable amount of furniture and fittings have been made and placed in the Town Hall, library, gas offices, public baths, electric light station, and new mortuary. At Ormeau Park a new ornamental entrance has been erected, also a new pavilion at the bowling green, and all railings painted. The improvements at Botanic Gardens Park have been completed, and the lodge gates and seats repaired and painted, and new seats fixed round some trees. In Woodvale Park an ornamental shelter has been erected and the lodge and seats have been painted. In Alexandra Park the seats and railings have been painted. In Falls Park the lodge has been pointed. In Dunville Park the superintendent's house has been painted. In Victoria Park a skating course has been partially made. The lamps and railings of Albert Memorial and Cooke Statue have been repaired and painted. The Cemetery Church has been repaired, pointed, and painted, and the superintendent's house has been painted.

"ART AND THE HOUSE."

IN her book bearing this title, Mrs. Marriott Watson laments that many people never think about such Art at all, and persons not insensible to the beauties of nature are quite indifferent to Art at home. Up to a certain date our ancestors decorated naturally, because they had time and unconscious taste, and a habit of carving on models gradually evolved out of mediæval Art. The rich, Kings, and the builders of the great country houses, procured Italian Artists and Architects. The poor had plenty of oak, time, and a natural turn for carving. Nobles made the Grand Tour and brought home antiques and pictures. Artists like Vandyke and Petitot were encouraged here. The East sent carpets and porcelain, lacquer and jade. Art went on evolving through periods of taste, down to the Adamses who decorated so many houses, large or small, at the end of last century, till we reached the heavy late Georgian mahogany, and then reposed among early Victorian gilt mirrors, and machine-made walnut wood, and green carpets covered with lilies and roses, and walls in white and gold. Art societies issued engravings, chromo-lithographs and curious copies of Greek vases called Etruscan. Then came William Morris, whose wall-papers were deemed necessary to Artistic salvation, aided by modern Venetian glass. There had been a yet earlier age of heavy modern Oxford ecclesiastical oak for chairs and tables. This was followed by a craze for "Chippendale," that is, for any mahogany furniture of the end of the last century. Its discomforts were tempered by fat, soft, shapeless sofas and armchairs, extremely comfortable, and not to be abandoned by persons of common sense. Blue china raged like a fever and, for some reason, was reckoned an immoral passion, in spite of the example of Charles Lamb, a very worthy man. Then appeared two malign influences—cheap, sham Japanese ware, black and gold, fans, and the "hand-painted" sprawling in festoons of roses over doors and tables. Every article was made to imitate something else, and that something else was incongruous. Very bad etchings were hung in black frames on Morrisian walls. Many houses now contain a separate dislocated strata of all these periods. Houses of the middle classes are furnished either by a general order to an upholsterer, which secures uniformity at least, or by "picking up" any old things which strike the fancy and are within the compass of the pocket. The result is not uniform or Artistic, but it may be picturesque, and the articles have their associations. This table came from the Quais at Paris, that chair from a cottage in Wiltshire, this writing desk has served a great novelist, the bookcase came from Christie's, and other shabby old chairs from undergraduate rooms. Those who have money, conscience, and opportunity, may consult Mrs. Marriott Watson. At least she may teach them to avoid hand-painted looking-glasses, "bedizened with distorted simulacra of iris and Mary lily," unless they like these things, or their decorators. Messrs. Bell & Sons are the publishers of this interesting book.

A NEW Conservative club has just been opened in Caldmore Ward, Walsall.

WE understand that the Safety Tread Syndicate, Limited, has received the order for the supply of Mason's Patent Treads to the "Tower" at New Brighton.

AN electric pneumatic system of signalling is now being adopted in this country after exhaustive trials in America extending over several years, and it is claimed that it renders all signal cabins unnecessary except at important junctions and busy yards.

AN HISTORIC STATUE.

ON the west side of Paris is a dusky old Church, dear to archæologists. For St. Germain-des-Pres holds a real treasure—a statue of the Madonna with centuries of history and pious association wreathed round it. Even the casual visitor, strolling through that ancient pile and knowing nothing of its wonderful story, must be struck by the sweet old image. No age but the Middle Age could have wrought so devotional a statue, and to the thirteenth century we must go for the origin of this one. At that time the Abbey of St. Denis, near Paris, being in need of a statue to crown the altar of its Lady-Chapel, the Princess Blanche de France, daughter of St. Louis, was resolved to supply the want. So she sought out a skilful artist—whose name, alas! is not as immortal as his work—to chisel in stone a statue of Our Lady and the Divine Child. She commanded that the features of Queen Blanche should stand for the semblance of Our Lady, and that the Divine Child should wear the features of the son of Blanche, St. Louis, whose picture as an infant was happily preserved. Thus, while rearing a shrine, she perpetuated the memory of those whose names will ever be a benediction upon France. During the five centuries that followed the statue was in great veneration, and amid all the vicissitudes of war it alone escaped hurt. But when the fury of the French Revolution burst forth, it was

WRENCHED FROM ITS PEDESTAL,

and carried as so much stone to the Musée Francais. There it remained for ten years, forgotten amid the spoil of many Churches. In 1803, the altars of St. Germain-des-Pres were again prepared for the worship of God; but the sacred vestments had been stolen, and the whole Church was deplorably naked of ornament. However, the Abbe Levi, who had once been preacher to the Royal court and Vicar-General of Aix, knew the treasures of the Church had gone, and demanded leave to choose from the ruins in the Musée Francais a suitable statue of Our Lady. His eye was at once caught by the beauty of the statue stolen from the Abbey of St. Denis; and though he knew nothing of its history, he lost no time in choosing it. Once restored to honour in a Parisian Church, the story of the statue could not long be hidden, and long accounts of the vicissitudes it had undergone were published in the French reviews. The canons of St. Denis sent a deputation to reclaim it; but no eloquence would be equal to such an occasion. The parishioners of St. Germain-des-Pres were already so much attached to the beautiful Madonna that neither justice nor compassion could move them to part with it. But they compromised by allowing the canons to make a plaster cast of the Madonna of St. Blanche; and this may be seen, where the original stood so long, in the Lady-Chapel of the Abbey St. Denis.

THE Finance Committee of Aberdeen Town Council has resolved to recommend that Mar Castle, Gallowgate, an old building of historical interest which projects into the Gallowgate thoroughfare, should be removed.

AT the late sale, at Brighton, of Irish industries, the Artistic wood-carvings produced by the Killarney School were especially admired. A carved bedstead has been ordered from the school by the Duke of Portland for Welbeck Abbey.

THE question of the Oldham Corporation laying gas mains from Street, in Crompton, to Grains Bar, a length of over a mile of high road, has been under discussion again. The Gasworks Committee has decided that the work shall be done provided the Crompton District Council guarantees the Corporation a return of 7½ per cent. on the outlay. The cost of laying the main, which is chiefly needed for the lighting of the road, will be over £300.

AN interesting archæological discovery has recently been made at Musselburgh. Workmen engaged in making excavations at Belfield House, which is close to the railway station, have unearthed several stone coffins, which, up to the present time, number six. These are of different sizes, ranging from about 5 ft. in length by 2½ ft. in breadth, to 14 ins. in length and 7 ins. in breadth. All of the coffins are in a good state of preservation, and betray tokens of crude and primitive workmanship.

SITE FOR THE NEWCASTLE INFIRMARY.

MR. WATERHOUSE'S REPORT.

IN connection with the proposed erection of a new Infirmary for Newcastle, the question of site has been advanced another stage by the receipt of the report of Mr. Waterhouse, the expert who was called in to advise the house committee on this matter. Mr. Waterhouse favours the erection of a new hospital on the present site, and a special meeting of the committee has been held to consider his report. It may be remembered that the members of the medical staff of the Infirmary first proposed a site on the Leazes, but though the Freemen assented, the Corporation objected, and the scheme had therefore to be abandoned. Dr. Gibb then recommended the construction of a new and up to-date hospital on the site of the present Infirmary, and this proposal was endorsed by the medical staff. It was by them recommended to the house committee, but that body, before coming to any decision on the subject, decided to seek the opinion of an expert, and the matter was accordingly referred to Mr. Waterhouse, who, in his report, reviews the advantages and disadvantages of the present site, and concludes that, on the whole, having regard to its open position, which facilitates the free passage of air, the site is the best that could be chosen under the existing circumstances. He considers it will afford ample space for the erection of a first-class modern hospital of 400 beds, with the necessary administrative buildings, and accommodation for 80 nurses. Mr. Waterhouse is further of opinion that the work of constructing the proposed new hospital may be carried on without in any way interfering with the work of the Infirmary during the period which will be required for the construction of the building. In remains now to be seen what view the house committee may take of the matter, and what proposals they may deem it expedient to put before the Governors. We believe there are some difficulties associated with the site in question which are beyond the scope of an expert's advice.

A YEAR'S BUILDING IN LEEDS.

THE building trade at Leeds has been very active during the year. Plans for about 540 villas, houses, and cottages have received the approval of the Council. Plans have also been approved for the construction of 24 new streets and back roads in Haxby Road and Fulford Road districts, showing sites for 300 or 400 houses; also for six new hotels or public-houses, but in two cases licences have not been granted. Several large structural alterations to business premises necessitating plans have been approved, and there have been many instances of the conversion of houses into shops or the modernising existing windows. The expansion of the city during the year has been in the following districts:—Leeman Road, Burton Lane, Clifton, Wigginton Road, Scarcroft Hill, and Acomb Road. Further extensions have been and are in course of being made at the Haxby Road Cocoa Works, Messrs. B. Johnson and Co., Micklegate, Messrs. Wales and Son, Ogleforth, Messrs. Richardson Brothers, Foss Islands.

THE Mahometans are proposing to build a mosque in New York. It is also intended to have a college in connection with the mosque.

PROMISES of support to the new Newport hospital amount to something like £8,000, and this, in addition to the gift of Dr. A. Garrod Thomas, makes altogether about £13,000.

THE Committee of the Aberdeen Town Council on Workmen's Dwellings has agreed to build six houses on the site in the vicinity of the Hardgate, at a cost of £3,000.

THE St. John's Hall, Whorlton, built at a cost of something like £300 in connection with St. John's Church, Whorlton, in the parish of Newburn, has just been opened.

IN the Cathedral of Genoa is preserved, and has been for 600 years, a vase of immense value. It is cut from a single emerald. When exhibited it is suspended around the neck of a priest by a cord, and no one is allowed to touch it but him.

Trade and Craft.

PORT DE MER OF BRUSSELS.

Belgium has not a Manchester with its ship canal, but the Port de Mer of Brussels is a scheme having many characteristics in common with the great Lancashire water-way, though, unlike the canal, for ever it would appear destined not to be accomplished. Unfortunately for the projected port, the site chosen for the maritime installations is also the most suitable for what is more urgently needed for Brussels, a new railway goods station. It is easy to be seen that a long time must elapse before the first sod is turned in the construction of the Brussels Port de Mer, and meanwhile, the bright visions of the enthusiastic Bruxellois, in which North German Lloyds, Red Star liners, and the greatest ocean steamers of the day came sailing up the Brussels canal, flying their pennants within sight and sound of the Hotel de Ville, are slowly fading away.

DEARTH OF BRICKS IN LONDON.

According to the Morning Post, there is every prospect of a serious crisis in the London building trade in the course of next summer. The cause will not be the ordinary one of a dispute between masters and men; it will simply mean a scarcity of bricks, and this will affect in the greatest degree those suburban houses which are rented at from £30 to £40 a year. It is nearly three years since it was decided that about a third more brickwork was to be put into houses of this class than had hitherto been worked into them. For many years, however, London builders have relied mainly upon Kent, with some assistance from Essex, and the output has been deliberately limited. When, moreover, the demand was made, the fields were unable to respond to it. Railways and sewers, and electric railways were all imperative in their demands. Millions of bricks had been ordered in advance, and the result is that prices are much higher than they were six months ago. Bricks, which could be bought for 34*s.* six months ago, have now risen to 44*s.*, and the cheaper qualities are unobtainable. The results are obvious. Theoretically, no one will regret the extinction of the speculative builder, but in practice the householder will have to pay. With a third more brickwork and a rise in wages, the prices of houses must go up, and the man who wants to buy a small suburban house will hardly care to pay an addition of, say, 20 per cent. House property, therefore, will probably increase in value for a short time, and rents will rise; but the demand for bricks will lead to the opening of new fields, and in two or three years we shall probably be confronted with excessive production, which will mean a corresponding fall in prices. It is stated that arrangements are already being made to open up a very large brickfield on the other side of the Channel.

THE BUILDING TRADE AT WHITEINCH.

The building trade has been exceptionally good during the past year, several large tenement blocks having been erected. The advent of the Lanarkshire and Dumbartonshire Railway, and the opening of the Whiteinch Branch of the North British Line, has done much to stimulate enterprise in this direction. As a proof that the proprietors have not been rashly speculating or providing for imaginary wants in the district, the new properties were almost fully let before being finished. The new shops have also been picked up, and a new block of co-operative buildings, with large shop frontages, erected recently.

ELECTRIC LIGHTING AT NEATH.

The Neath Sheet Steel and Galvanizing Company has just had an installation of electric light completed at the works, near Neath, by Messrs. J. C. Howell and Company, Engineers, of London. The plant affords some good examples of modern construction, and embodies all the latest improvements.

SHEFFIELD TRAMWAYS.

The negotiations between the Corporation of Sheffield and the old Tramways Company have now been finally settled. The company expressed their willingness to accept £28,500, and the Corporation as a final offer named £27,500 in full

settlement. This the company, at a recent meeting, agreed to accept. The amount includes the price of the company's lands, buildings, stables, horses, cars, works, fixed and loose plant, materials and equipment.

ELECTRIC LIGHTING AT CHELTENHAM.

The two street lighting sub-circuits are so far completed that an experimental run of the lamps has been made, the test being in every way successful. The thoroughfares affected, viz.: High Street, between Clarence Street and St. George's Square, Ambrose Street, Station Road, and Manchester Street, in which some fifteen lamps, attached to handsome pillars, are used — were brilliantly illuminated, the contrast between the electric-light and the gaslight in the connecting street being very striking. The lamps are of the Brush-Vienna pattern, with alabastrine globes, which are good in colour, and diffuse the light admirably.

A FALLING CEILING.

In the City of London Court, on Friday, before Mr. Commissioner Kerr, an action was brought by Mr. Thomas J. Howell, electrical engineer, of Warrior's Road, Kennington, to recover the sum of £50 from Mr. H. Finch, publican, 58, Bishopsgate Street Within, E.C., as damages for serious personal injuries. The plaintiff said that, on November 2nd, he went into the defendant's house, the Magpie and Punch Bowl, in Bishopsgate Street. While he was standing at the bar the ceiling came down, striking him on the head. He was rendered unconscious, and had felt very ill since. For the defendant, Dr. Wickham said that he did not think it could be asserted that the plaintiff's injuries were of a permanent character, so far as the hearing was concerned. Mr. Commissioner Kerr gave a verdict in favour of the plaintiff for the sum claimed.

EXTENSION OF DEVONPORT DOCKS.

Four years ago the Admiralty spent £8,000 in enlarging No. 3 dock in Devonport Dockyard, and made it the largest in the yard. It is in this dock that the "Magnificent" and other large vessels are placed for examination and repairs, and it has now been decided to make alterations in No. 2 dock, even far more extensive than those in No. 3. The drawings have been prepared, and to carry out the proposals already approved the sum of £33,720 will be required. As, however, further suggestions will probably be approved as the work advances it is considered likely that £50,000 at least will be spent on this dock before it is completed. The work will be commenced almost immediately, and in order that the contractors may not be unnecessarily interrupted (as was the case when No. 3 was undergoing alterations) the Admiralty has directed that the dock is not to be used except under very special circumstances. No. 2 dock is 432 feet in length, but when the enlargement is completed it will be sufficiently long to accommodate a vessel of 450 feet.

A WELL-DESIGNED lych-gate has been erected on the north side of the old Parish Church of Maresfield.

A MUCH-NEEDED addition to the existing accommodation for infants at the Micklefield Church Schools, erected at a cost of about £1,000, by Mr. Bland, of Kippax Park, was opened last week.

THE deputation appointed by the Gas Committee of the Blackburn Corporation, to inspect the electric tramways worked on the overhead-wire system at Bristol, Coventry, and Walsall, has presented a favourable report and it has been decided to proceed with the "overhead" system in Blackburn.

WITH regard to the new dining-cars which the Midland Railway Company intend running between London and the North, more attention than hitherto has been paid to the question of acoustics and vibration, and ingenious contrivances have been utilized to reduce noise and rattle to a minimum. These consist of the introduction between the underframe and the body of the car of numerous indiarubber springs of a new type. The floor, sides, and roofs of the car have been built up with felt and rubber, hair, and vulcanite between the woodwork.

SOCIETY MEETINGS.

Institution of Engineers and Shipbuilders.—The third general meeting of the fortieth session of the Institution of Engineers and Shipbuilders in Scotland was held recently at Glasgow. A long and interesting discussion took place on Mr. Sinclair Couper's paper, read at the preceding meeting, on the subject of "Internal Corrosion in Steam Boilers."

KEYSTONES.

A NEW chemistry section of the chemical laboratory of University College, Liverpool, was recently opened by Lord Derby.

THE window presented to Hawarden Church by Armenians, in memory of the victims of the recent massacres, will be unveiled to-day.

A fall of about 100 tons of rock recently took place on the Callander and Oban Railway, near he Falls of Cruachan Station.

THE Duke of Saxe-Coburg and Gotha has invested his civil engineer, Mr. G. Croydon Marks, of London and Birmingham, with the cross of a knight of the Ducal Order of Ernest.

A BRANCH public library has just been opened at Avonmouth for the convenience chiefly of the parishioners who have recently been included within the city boundaries.

THE Duke of Beaufort has granted a site of two acres adjacent to the town of Brynmawr for a school, the ground to be laid out to suit the scheme of the Architect when appointed.

IT is proposed to form a company for the purpose of constructing an underground railway from Bridge Road, Hammersmith, to Budge Row, Cannon Street.

TUMBLERS of nearly the same shape and dimensions as those employed to-day have been found in great numbers in Pompeii. They were of gold, silver, glass, agate, marble, and other semi-precious stones.

THE Paris Municipality has resolved to increase, from 98 to 400, the number of infant schools, or rather, places where young children are taken care of while their mothers are out at work. The cost will now be increased to 550,000 francs.

THE Exeter City Council is recommended to carry out extensive works for the rearrangement and extension of the water supply of the city. The estimated cost of the whole of the works is £25,000.

MR. HARRY W. SMITH, deputy borough engineer and surveyor of Bournemouth, has been appointed borough engineer and surveyor of Scarborough. There were 129 applicants for the post.

THERE has just been placed in the south side of Holy Trinity Church, Dobcrois, a stained glass window in memory of Mr. Abel Holmes. The subject is "The Prodigal's Return," which the Artist has developed in a pleasing manner.

THE Halifax Town Council has resolved to refer the plans for the adaptation of the Infirmary buildings, for a police court, &c., back to the committee, in order that the project of an entirely new erection may be further considered.

BEULAH Baptist Chapel, Bexhill, was recently opened. The present building, which has been erected as a memorial to the late Charles Haddon Spurgeon, is a school-chapel, the larger edifice not having yet been built.

THE Mansion House of Cross-Burn, Loans village, in Troon parish, has been totally destroyed by fire. The damage incurred amounts to £2,000. The building was undergoing repair for a new occupant.

AN exhaustive report, prepared at the instigation of the Douglas Town Council, by Mr. Thomas H. Nesbitt, town clerk, has been issued on the electric lighting of Douglas. It is strongly in favour of the electric lighting.

A LANDSLIP has taken place at San Fratello, in Sicily. An entire hill, called Rocca Forte, slid down and completely buried a village. The inhabitants had time to escape, but they have lost everything.

AS a result of the recent heavy rains the Rivers Tame and Anker have in many places overflowed their banks, and adjoining meadows are flooded. A road leading from Bonehill to Hopwash is several feet under water, and traffic on various bye-roads is completely suspended.

AT the site of some new buildings in Museum Street, Oxford Street, the other day, a large portion of the adjoining premises fell with a great crash, causing considerable anxiety and commotion among the inhabitants.

THE directors of the Taff Vale Railway have definitely resolved to close their West Yard at Cardiff, and remove the locomotive, coach building, and repairing yards to a place about five miles from the town. New works will be erected at an estimated cost of £50,000.

AN exhibition of objects of Science and Art was recently opened in the old Savings' Bank Building, Truro. The exhibition includes a very valuable and interesting collection of scientific and Artistic treasures, including a large consignment from the South Kensington Department.

ROBERT RUTHERFORD BUCKESETTER, a steeplejack, of Padiham, was ascending a new mill chimney at Great Harwood, near Blackburn, holding on to the rope only with his hands, when he fell a distance of 100 feet, death being almost instantaneous.

IT is stated that the fund being raised for the purpose of founding a memorial of the life and labours of the late Archbishop of Canterbury has now reached over £3,000, this including a donation of £100, provided that a portion of the fund is spent on the completion of the nave of Truro Cathedral.

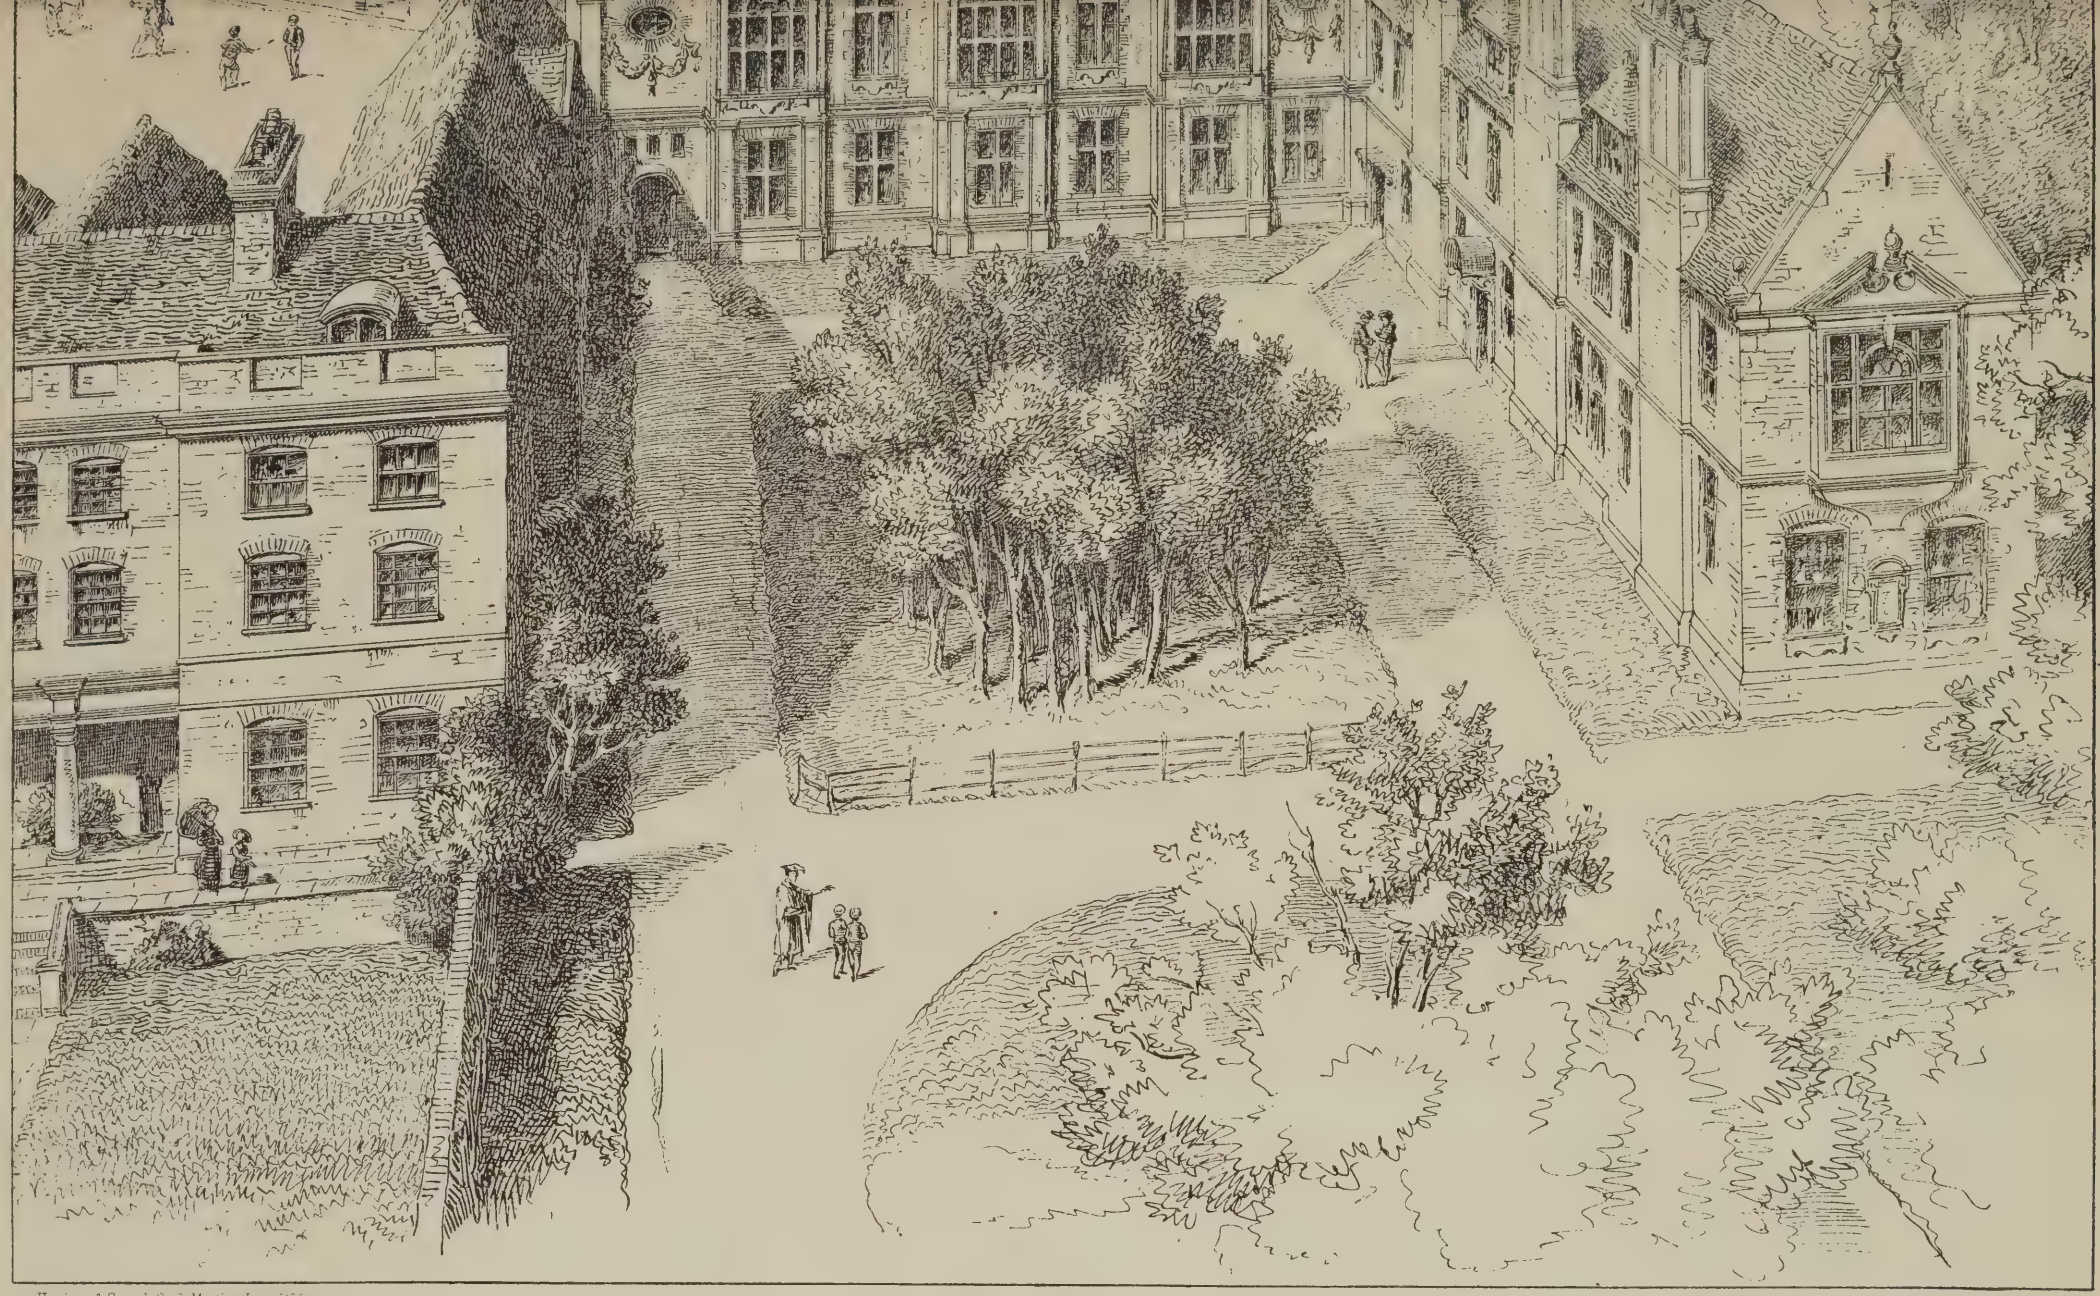
THE commencement of two undertakings of some importance to West Hartlepool is promised for the New Year, viz.: the proposed new post-office in Whitby Street, and the contemplated extension of the electric tramways to Foggy Furze and to Seaton Carew.

A GENERAL meeting of the North of England Institute of Mining and Mechanical Engineers was recently held in the Wood Memorial Hall, Newcastle, Mr. G. Baker Forster presiding. Mr. Morrison resumed the discussion on Mr. W. Blakemore's paper on "Coal Cutting by Machinery."

THE Bridgend and Cowbridge Board of Guardians has resolved to advertise for sites of eight to ten acres of land close to the town of Bridgend for the building of a new workhouse. The present building is overcrowded, and has long been found to be too small to meet the demands made upon it.

A MASSIVE memorial in gold-medal stone has just been erected in St. Edmund's Churchyard, Castleton, to the memory of Mr. Isaac Hall, who was well-known as guide to the Peak Cavern. The monument is of Norman design, and the pillars have been worked out of a solid block.

THE freedom and livery of the Plumbers' Company have been presented to ex-bailie Crawford, of Glasgow, in recognition of his public services in securing the registration of plumbers, and the active part he has taken in promoting sanitary legislation.



A PICTURE of a Church window was recently published in a Church paper, in which the counsellors of King Saul are Lord Salisbury, Mr. Gladstone, and the late Lord Beaconsfield. More astonishing still, the King is no less a person than the Sage of Chelsea—Thomas Carlyle—while David has the head and shoulders of Adelina Patti! Imagination plays no part in this remarkable window. All the figures are lifelike, and can be recognised at the first glance. The Church in which the window can be seen is at Elham, near Folkestone.

THE new operating theatre, which has just been provided at St. George's Hospital, is situated on a level a few feet above the second floor of the institution, and its arrangements, fittings, and lighting, and the provision of adjoining chloroform rooms, a sterilising room, and nurses' apartments, guarantee for this department of the medical work of the hospital increased efficiency and success. The walls and ceilings of the theatre are lined with white glazed tiles, while the floors are of marble mosaic.

IN the Civil Court at Leeds Assizes recently, an action was heard in which the Mayor and Corporation of Leeds sued Mr. William Robshaw for £437 for sewering and kerbing, executed during the construction of a road called Vesper Road. There was a counter-claim for land taken by the Corporation for the formation of the road. After the case had been partly heard a settlement was arrived at, and judgment was given for the Corporation on the claim, and judgment for the defendent on the counter-claim for £125, each party to pay their own costs.

"The Architectural Association again." MR. LETHABY has been telling the Architectural Association that, if the Association intends seriously to take up practical work, he will see whether some scheme cannot be devised for providing properly equipped workshops of an adequate size. The occasion on which this remark is stated to have been made was a "Workshop Evening" at the Architectural Association, and the member who reported the event, tells us that the Workshop Evening was a very pleasant evening, "despite the chopped fingers and the stone-dust in one's hair, and in every corner of one's clothes." The entertainment otherwise consisted in each member working a plain face on a rough block of stone, and its special usefulness appears from the report to have been that the members, "realised pretty clearly what working the harder stones really meant," while its success is evinced in the fact that there was regret that the two hours did not permit of the work being finished, and that the attendance was "really greater than the capacity of the room permitted." This brings us back again to Mr. Lethaby, and his suggestion for "*properly equipped workshops of adequate size.*" The event reminds us of another of twenty years back: of Mr. Ruskin and his road-making at Oxford. We also remember that the road was never finished. A disordered upheaving of the soil, arable or pastoral, was the exact sum total of the result of that enthusiasm; and we hope that no more damaging result to the prospects of the embryonic Architects at Great Marlboro' Street will be affected than the stained clothes and damaged fingers reported by the ecstatic journalist member. Though exceedingly young men may delight to throw off the humours of a long day of sedentary work with a tough bout of hammering, and rejoice that they break their fingers and suffer grit in their hair, in the cause of a holy enthusiasm (for is not all enthusiasm holy in extreme youth?), they cannot hope to win serious approval of the profession, except in that what they do is healthy and natural for those of their state and is inexpensive, and, for all the broken fingers, quite harmless. Mr. Lethaby is a coincident only. Like Mr. Ruskin, if there were two of him there would be one too many. Now we have all read our Vitruvius; in translation and in quotation probably, but we have read him, or enough of him, and we all know his receipt for an Architect. Besides being a philosopher and a metaphysician, and an Artist in music, sculpture, painting, and letters, with many other things; an Architect is to excel the masters of each particular craft of building. But however competent the human species was in the days of Vitruvius to supply specimens worthy of qualification for Architects after this measure, we may rest assured that that competency is now exhausted. The human race seems to have degenerated, for in these days we not only cannot find men who excel in more than one thing, but among Architects at least, we find that a serious attention to the details of craft and of the building trade, detracts from, and mars, those rarer qualities of breadth of Artistic feeling and constructive design which are the first attributes of a great Architect. An Architect in his designing needs not to be first a mason, then a carpenter then a plumber or bricklayer, as his pencil arranges one part or another in his elevations; in fact, it is true to say that so soon as a man is imbued with the actual technicalities of the fact of handicraft, the power of true design must pass from him. He becomes a builder. Our

THE SCHOOLS, OXFORD. T. G. JACKSON, R.A., ARCHITECT.

friends at the Architectural Association are certainly at liberty to ride their hobbies, but a man's hobbies should be apart from his formal education. The exercise and the mental recreation of labour, and particularly of labour that distracts the mind, is known to be of great value to men with instincts of high activity, but to obtrude the minute technicalities of craft into the Architectural education of a young Architect is a thing that can serve no advantageous end to the profession. In the high tension of the educational processes of our day, too, we must remember that every hour seriously given to testing the practicability of solder joints, for instance, is an hour seriously lost in the acquisition of other vital knowledge.

THE ARCHITECTURE OF DUBLIN.

BY THOMAS DREW, President R.I.A.I.

SPEAKING at a meeting of the Architectural Association of Ireland, Mr. Drew said that in the study of Architecture they had remarkable advantages in the city of Dublin. They lived in an old historic city, which contained many respectable monuments. There was a picturesqueness of Architectural effect, the study of which could not fail to be of the greatest interest. The city presented a strong contrast to new towns like Birmingham and others of the kind. London, of course, had great Architectural wealth, if the student could only find it. Westminster Abbey, St. Paul's, and other fine buildings presented most attractive features. Edinburgh also presented a fragmentary view of fine Greek Architecture—it was in fact an Architectural dream for the Architectural scene-painter. For his part he preferred Dublin before all the towns and cities of the United Kingdom for the enjoyment of the student of Architecture, if he only opened his eyes. It had good and ancient Architecture, and afforded groupings which might make the fortune of the Architectural Artist. Referring in detail to some of the buildings in the city, he said that in streets like Dame Street and College Green they had bold and various specimens of what he might call the

DUBLIN ARCHITECTURAL VERNACULAR.

The Architects who designed some of them were mostly still living, and he was accordingly debarred from criticism. There was, however, in that neighbourhood a great deal to be learned, and a good deal of refinement of design to be seen. The student after the current Architecture of the day could fall back on the main Architectural wealth of Dublin, among which would be found numerous specimens of the classic work of the eighteenth century. There was scarcely an example in Dublin which was uninteresting; there was an extraordinary variety of genius evinced, and boldness of design. In the matter of food for Architectural study Dublin had a great pull over the ordinary British towns of commerce in its picturesqueness and pictorial capabilities, and in what he might term its unsophisticated grouping, as distinguished from the slavish following of lesser ghosts after greater ghosts. Having spoken of draughtsmanship, and the necessity for a study of perspective drawing, he said there was no class of drawing more popular or more saleable than the painter's rendering of familiar street subjects. As an example the lecturer showed a London street subject

DRAWN BY ERNEST GEORGE.

Some people might ask where were they to get such subjects in Dublin? If they went to Nicholas Street, or to the neighbourhood of the old city wall at Back Lane, they would find excellent materials for such street pictures. A representation of squalid Patrick Street, with the extraordinary wares exposed for sale, could be made most interesting as a picture. He would advise students never to study Irish street subjects in wet or gloomy weather. In the Cathedrals the water-colour Artist would find a score of subjects. In the Upper Castle Yard there was not much Architecture, but work would be found there quaint and Dutch-like. Interesting groupings would also be found about the City Hall and Trinity College. Mr. Drew spoke at some length of the Architectural features of the old Parliament House, and in connection with its design mentioned the names of Richard Cassell, Captain Edward Lovett Pearce, and Robert Parkes. Among several Architects who gained fame in connection with old city buildings, the lecturer spoke of Thomas Cooley, who designed the Four Courts, and Gandon, whose great work was the Custom House. The latter building was something out of the common, and had much simple dignity. If they excepted the soup tureens which served as chimneys, many of the details of the building were worthy of study. The greatest of all the privileges open to Architectural students in Dublin lay in the two Cathedrals. Church Architecture in Ireland was, he thought,

AT A LOW EBB.

They had, in former years, much cleverer work, and the tendency was to go on repeating these clever features until they got a family likeness over the country, from which it was time to break away. It would be a good thing for the members of this Association to turn their backs on what was merely turned out day by day in the nearest Churches, and begin to diligently study in the books at their disposal what the mediæval Architecture of England had been. In past ages there was a vast variety, and the student might be able, from a study of English mediæval Architecture and French Architecture, to produce Church work not so cut-and-dried as what prevailed in Ireland at present. Christ Church Cathedral afforded a curious variety of thirteenth-century work. Patrick's Cathedral presented more material for study than anyone gave it credit for. It was a very beautiful plan, and a curious circumstance about it was that it was based on a system of equilateral triangles. There was much old and genuine work in the north choir aisle. St. Patrick's was quite a haunt for the student of water-colour delineation. It had a peculiar charm of picturesque lighting which made it the delight of the Artists who studied there. Having made a short reference to St. Audeon's, which, he said, had a good arcade and presented interesting features of mediæval Architecture, he went on to speak of the Architectural state of the first half of the present century, and said it was perhaps the worst epoch, from the point of view of Architecture, seen in this country in the course of six or eight centuries. He hoped, however, there was going to be a great revival, and he hoped that that Association would be the means of bringing it about. There was no place where those who wanted to study city buildings were more welcome to do so than in Dublin. They had the whole run of the town, and there was no obstacle to anyone who wanted to study, and if the members of the Association could not find work to do about Dublin he thought it would be their own fault.

THE Warrington Corporation has concluded the purchase of Old Warp's estate, Latchford, the property of the late Alderman Joseph Davies. The estate extends to 52 statute acres. The object of the Corporation is to transform it into a public park. The price paid was £10,000.

THE latest munificent gift to the town of Auchterarder, of an illuminated town clock and bell, placed in the tower of the hall erected to the memory of Captain Aytoun, of Glendevon, has just been formally handed over to the burgh authorities.

MR. EDWARD DAVIES, of Plasdinam, is now erecting, in the village of Llandinam, a village hall for the use of the inhabitants. Besides a large room for the holding of public meetings, the building contains two rooms for the meetings of the Society for the Promotion of Literature and Music. He also intends to add a village library.

THE Regina Hotel, where the Queen-Empress is to spend her spring trip, is nearly ready for the Royal visitors. It is a magnificent building, situated in its own grounds on a height that commands beautiful views of the Mediterranean and the maritime Alps, and the frontage is quite 200 yards long. The rooms that are being prepared for the Queen are very beautifully decorated in different styles, and the whole of that section of the hotel which is set apart for Her Majesty leaves nothing to be desired.

THE CENTRAL SCHOOL OF ARTS AND CRAFTS, REGENT STREET.

WORK has recommenced at the new Central School of Arts and Crafts, which was opened in October last, at 316, Regent Street, opposite the Polytechnic. The School has been established by the Technical Education Board of the London County Council, and is under the direction of the two Art advisers of the Board, Mr. George Frampton, A.R.A., and Mr. W. R. Lethaby. The object of the School is to provide for artisans, who are engaged in trades where Artistic handicraft is required, a training both in the principles of Artistic design and in the application of design to their specific industries. The teaching is throughout specially directed to the requirements of the trades in which the students are engaged, and the School is only open to those who are actually working at a trade. At present the School provides teaching mainly for those who are engaged in the silver trades and in those branches of the building trade where Artistic training is specially needed; but steps are being taken to provide for other trades, and it is not impossible that out of the nucleus which exists at the Regent Street School, there may eventually grow a complete system of Artistic and technical instruction, which will ensure for the artisans of the metropolis that sound and practical Artistic training which they require to enable them

TO HOLD THEIR OWN

in the industrial struggle with foreign countries. The instruction given to all classes of workers in the silver trade is very complete. The teachers are practical men who are themselves in the trade; Mr. Steward being the instructor in silversmiths' work, and Mr. Fisher in enamelling. The other important branch of the School is that which is devoted to the building trades. In this department the Board has secured as teachers the best men that could be found. Architectural drawing and design is taught by Mr. Halsey Ricardo, while in concert with Mr. Ricardo's course a series of lectures is given by Mr. R. B. Molesworth, on the "Mechanics of Construction." Mr. Roscoe Mullins gives instruction in Modelling, with special reference to its application to Architecture, and both he and other teachers give general instruction in drawing and design. The Architectural Modelling and Drawing studios are equipped with a large and varied assortment of casts and specimens, and they are open to students for practice during the daytime. As the students are usually engaged in their trades during the day, the instruction is given in the evening. Technical classes for special departments of the building trades are held in the following subjects: stained glass work, ornamental lead work, masons' work, and cabinet design; all these are taught by men thoroughly conversant with the special Arts, the stained glass work being taught by Mr. Christopher Wall, and the lead work by Mr. F. Troup. In order to place the School within the reach of those for whom it is intended, the fees have been fixed at a low figure. The ordinary fee (for all classes except the life class) is 2s. 6d. a month. Workmen who are in receipt of less than 30s. a week are admitted on payment of 1s. a month, and apprentices, learners, and improvers are admitted free. Full advantage should be taken of the opportunities offered.

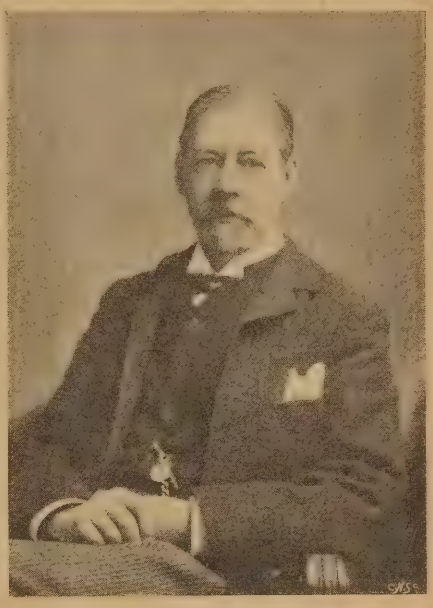
THE Great Western Railway Company proposes to construct a new bridge in substitution for the existing one carrying the Great Western road over the main line at Westbourne Park Station.

IN connection with the private view of Lord Leighton's sketches, it will interest Art-lovers to learn that the sum of £1,000 has been guaranteed in order that a selection of sketches may be purchased for replacing in the house.

A TERRIFIC gale recently blew over the South Durham district, and has caused much damage to property. At Wellington, a school building was blown down, and part of a new building shared the same fate.

MESSRS. WORKMAN & CLARK, of Belfast, who are building three new boats for the Cunard Company's Mediterranean service, will launch the first one early next month. These vessels are between 4,000 and 5,000 tons, and are, therefore, the largest that have yet been built for the Mediterranean traffic.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD



MEN WHO BUILD.

No. 48.

THE COLLEGIATE WORK OF T. G. JACKSON, R.A.

THERE is with us, at this latter end of the nineteenth century, a certain saying in criticism of our civilization which is becoming almost a tiresomeness to the ear, as though its truth from being so long obvious had grown at last a veritable blatancy by usage. The man who now writes for us to read, or tells to us, with the importance of delivering himself of an originality, that time passes very much faster now than it did in our grandfather's day, we probably set down as a humbug, or at best, if we are charitable, are indignant at being fobbed off with cold porridge with the flourish that should introduce the boar's head: there is little that is more ruffling in converse than the framing of an obviousness. This truism, nevertheless, this comment on our modern tendencies, was, when new, replete with suggestiveness, and, even now, may serve to point us to a pleasant fantastic introspection of the phases of our present order of living, by reminding us that the passing of time is the making of history, and that, in these active days, history is being reeled off at a surprisingly high rate of speed. History is now being made faster than it has ever yet been made in the level epoch of the history of humanity, and this brand-new fabric, which in a hundred years time will be unhumanised and reduced to dates, and names and facts, is now weaving in our midst.

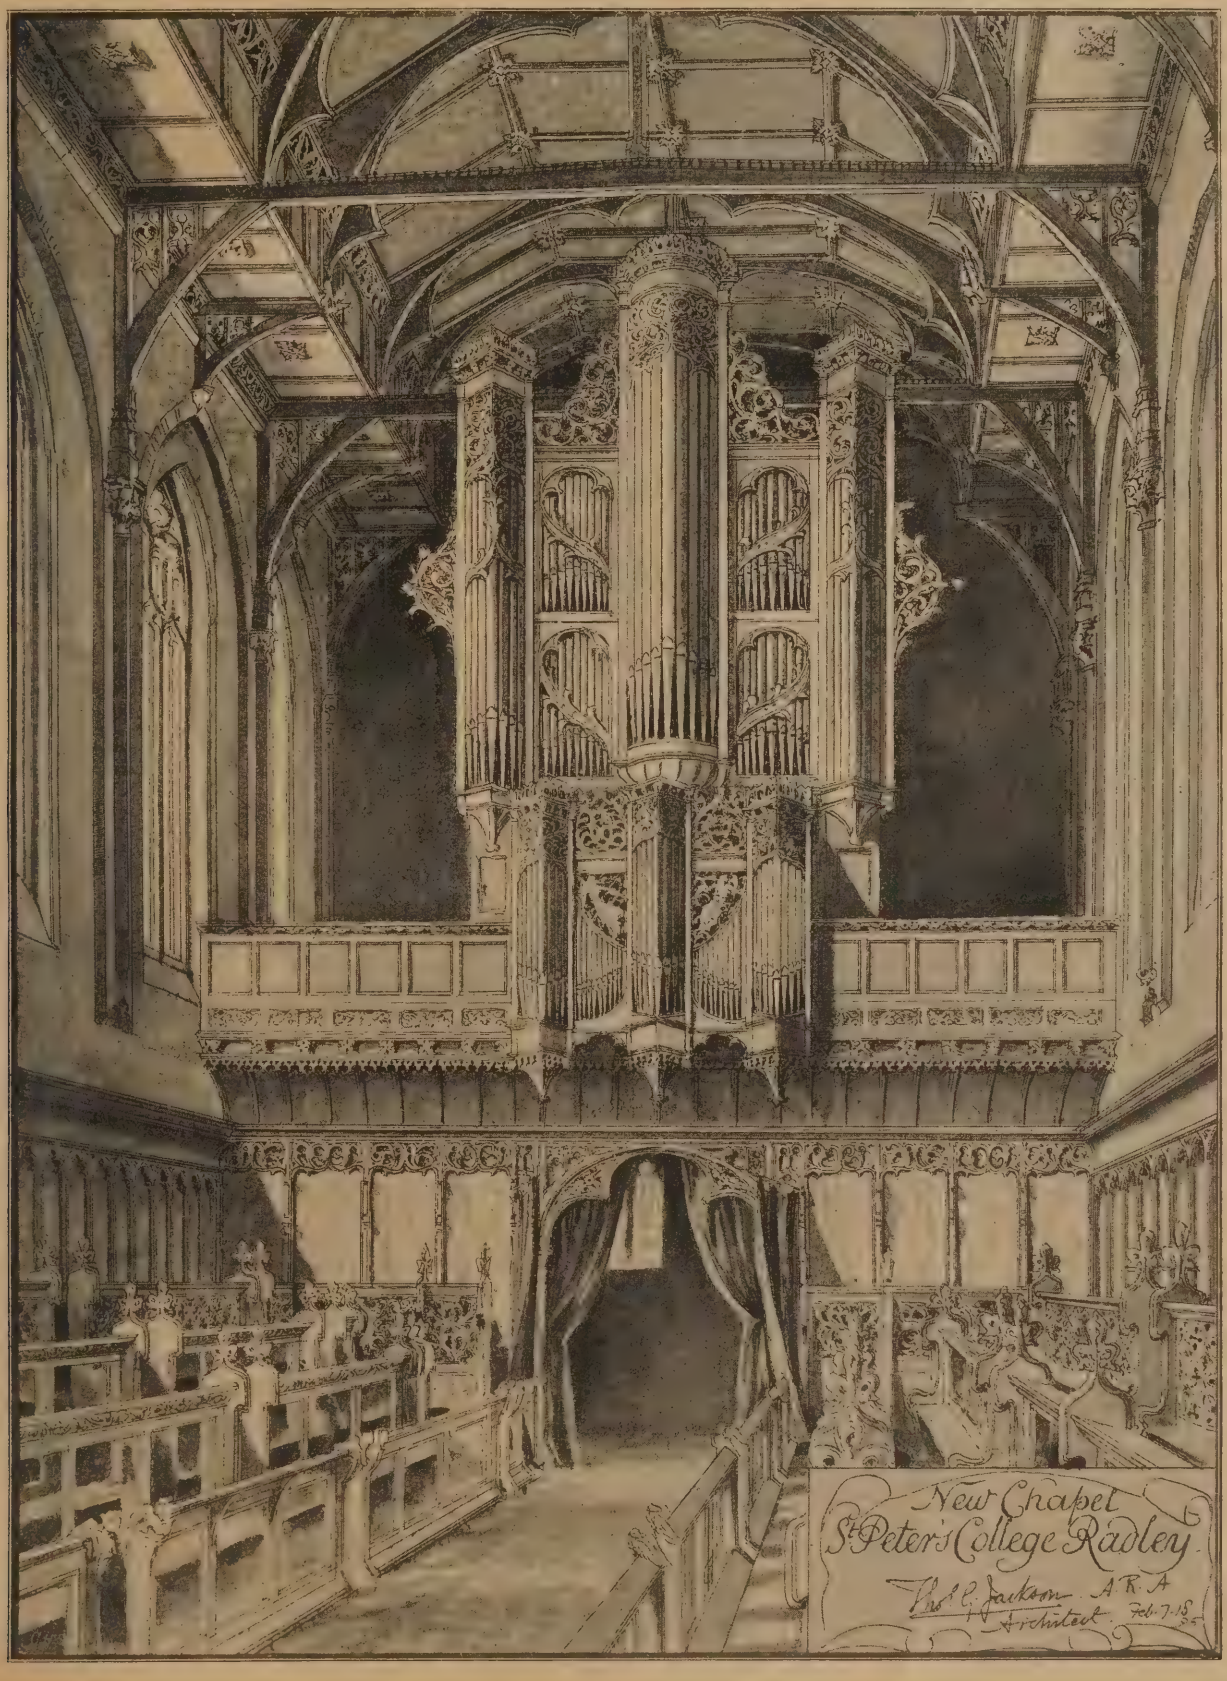
It must, however, be obvious that this prodigious activity in the manufacturing of history, does not extend to the Arts—nor, in particular, to Architecture. Mr. Frederick Harrison, indeed, in some of his latest essays, has shown that the Victorian Era will stand famous in the records of posterity for its researches, and for the names of its scientists. This same period, it is true, has been responsible for the entire writings of John Ruskin; but the wide stimulating activity evoked by Mr. Ruskin's books, both among those who joined in his views and enthusiasms, and those who depreciated and abjured them, has not left any very distinct mark in the development of Architectural history, if we except one or two particular buildings, such as Messrs. Deane and Woodward's University Museum at Oxford, which, however, are, in chief, remarkable as instancing how little the fact and letter of his teaching has been incorporated in our Architecture. We must rather look to where the voice of Horace Walpole, novelist and curiosity hunter, after immortalising itself in the perpetration of those grizzly inspirations at Strawberry Hill, has been slowly and gradually dissipating itself through the work of successive generations of Architects, much as a hereditary taint will fade to imperceptibility at the fourth or fifth generation. There is no doubt that the trend of England's Architectural history has been, and still is, upon this path that leads from Strawberry Hill. Carlyle has pointed out to us that the histories of nations are but the biographies of their great men, and if we consider

upon those living Architects whose professional lives follow out most exactly the diverging threads of the Gothic Revival, and who are, therefore, foremost in historical importance, the subject of this article, Mr. Thomas Graham Jackson, will be acknowledged to hold a leading place.

There is a certain fitness and reason in this. Mr. Jackson, so to speak, is a scion of the parent stem; his Architectural pedigree is irreproachable, for he became a pupil in Sir G. Gilbert Scott's office on the completion of his University career. This was in 1858, when the activity of the Revivalists was at its highest. Wyatt, Pugin, Barry, Scott, were all hard at work, and we are to believe that public opinion and criticism was in that day closely centred in the renovation, and Architecture, as rendered by these men and their opponents, was much more widely considered of the people than is the case now, or had ever previously been known in this country. Nor is this strange when we remember that there rarely is a thing Artistically inadequate or clumsily done with any flourish of pretension but the British public has up and clapped its hands. The idiosyncrasies of Horace Walpole have even provoked a light rattle of pleasantry from the big guns of Macaulay, who says—"with the Sublime and the Beautiful Walpole had nothing to do, but the third province, the Odd, was his peculiar domain." So also in the Architecture of Mr. Jackson's master, the Sublime and the Beautiful is still subservient to the Odd, and it is only as this same oddity of the Revivalists has faded from their designs, as accumulating experience has shown them in what the charm and fascination of Gothic Architecture is constituted, that public interest has turned away the countenance of its regard. Now that Gothic proportions have, in the work of the best Architects, grown to be balanced and just, and the detail to fall aptly with the rest of the design in that harmonious unobtrusiveness we know in the best Mediæval work, public interest has withdrawn even from Ruskin's "Foolscap in Freestone" at St. Stephen's, and turned to red tiles, and hips, and white bargeboards, and the works of Mr. Aubrey Beardsley.

Mr. Jackson earned public regard as an Architect and an Author so many years ago (his first book "Modern Gothic Architecture" being published in 1873), and has since, by a long sequence of conspicuous works in Art and Letters, held for himself a position of such distinction in his profession, that any intimate review of his career and his successes would seem almost superfluous. Six years after the completion of his term of articles, he became yet closer allied with the University, being elected a Fellow of Wadham, where previously he had held a scholarship, and it must seem a most happy casting of events that has made Oxford the scene of his most important works. Yet Oxford has been more than this to him. In his case she has been literally and

BRIGHTON COLLEGE, NEW GATEWAY AND BOARDING HOUSES. FROM THE ORIGINAL DRAWING BY T. G. JACKSON, R.A.



BRASENOSE COLLEGE, OXFORD. NEW FRONT TO HIGH STREET. T. G. JACKSON, R.A., ARCHITECT. FROM THE ORIGINAL DRAWING.

uniquivocally his *Alma Mater* in a fastidiously sincere and exact interpretation of the term. That Mr. Jackson, in his undergraduate days, was deeply imbued with the kindling sentiments of the place, and impressed by its wonderful beauties and charms, is sufficiently apparent in

ments of his career, we are not to suppose that in becoming the pupil of that eminent Architect, who, in his day, was most intimately associated with the revival of Gothic Art, he was any child of circumstance, but that his act was a deliberate choice. Oxford's lichened walls had already,

working details of the Brasenose College front on to the High Street. The Architect himself regards these buildings at Brasenose as his best work, and in particular holds the elevation between the tower and the porch of St. Mary's, with its four gables and its oriels, as his happiest and most

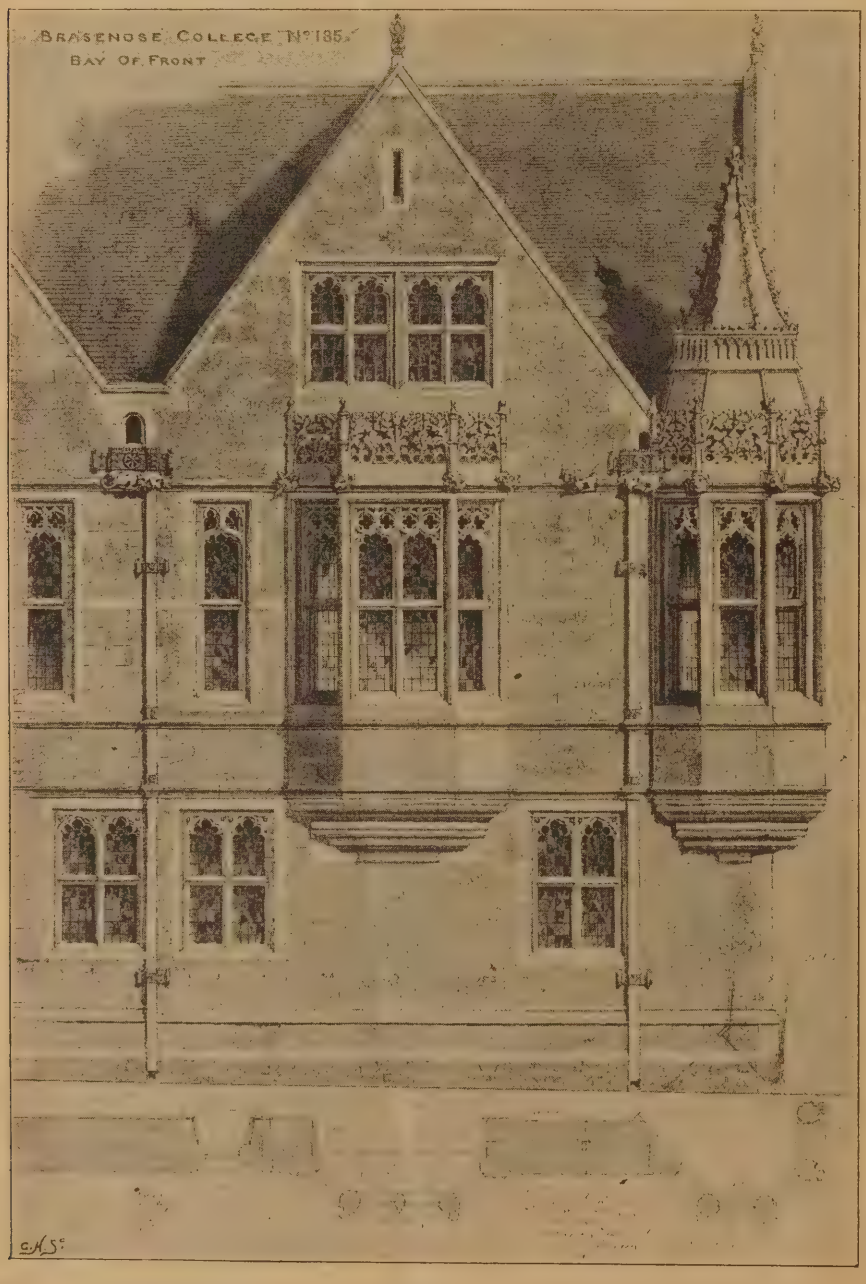
view of his early attachment to the place, and the direction in which he elected to develop his generous endowment of abilities, and in the precision with which he set himself to qualify as a Collegiate Architect. Mr. Jackson has built in many styles, he has written of several, in these respects he has shown the cosmopolitan tastes of the scholar, and from the subsequent develop-

nearly twenty years before, given their message to a very different temperament when they inspired the poetic nature of John Ruskin; in Mr. Jackson's case, their message was to a scholar.

The illustrations which accompany this article record some of Mr. Jackson's best inspired work and most admired buildings, and we are able, by his special permission, to publish one of his own

successful design. Perhaps Mr. Jackson, in discriminating thus, is conscious of a shade of incongruity in the tower of the Gatehouse: it is, in fact, not quite in technical keeping with the rest of the design. There is that quality in this front as though the Gate Tower were a relic of an earlier building; it stands accurately true in its detail to the traditions of English Gothic, while the

brattishing, or cresting, upon the oriels would alone distinguish that part of the building from having an origin in Mediæval design. This tower is literally exact to the traditions of the Oxford Gatehouse; there is no need of the characteristic angle turret to its identification, were we to meet with it even, let us suppose, in Asia, while in the frontage there is surely a delicate suggestion of something not unassociated with the Jacobean period. It is pedantic, and perhaps devoid of much meaning or interest, to identify the personality of an Architect with some past tradition of his Art, but if this be done it may be said that it is to this Jacobean feeling that our Architect leans in the design of much of his Gothic work; and it is by this term, "Jacobean," that such buildings as the New Examination Schools, Trinity College, and the addition to his own old college of Corpus Christi, are best designated. It may well be fancied that Mr. Jackson was touched by the charm of the quaint tower to the Gatehouse of the Old Schools, which he restored, together with the Bodleian Library, at a very early, and therefore susceptible, period of his career.



It has been said, with some fair balance of truth, that while depreciation of a bad work of Art is best conveyed, not by wholesale denunciation, but by particularising any meagre details of a better ordering, and contrasting them with the glaring inefficacy of the remainder; so a degree of excellence may be most fully relished if those special features which lack the distinctive quality of the work as a whole, are considered, and their shortcomings contrasted with its other admirable aspects. The recognition, also, which Mr. Jackson has won, is not confined to the scholars and Artists of this country only, and his success is otherwise so fully and steadfastly assured him that a frank analytical regard of his work is no other than he must expect. In the tentative work of a young man there is either an undue admiration of "cleverness" (which in Art is a sort of precocity) or an intolerant prejudice against what may appear his presumption and aggressiveness. It is, however, an attribute of well-merited success such as Mr. Jackson's, that it finds few concessions as it should arm no prejudice.

We have already characterised Mr. Jackson as a scholar, and it is in this quality of scholarship that there lies both his strength and his weakness. These qualities which achieved for him his Fellowship at Wadham, and which may be recognised in his writings, have given him a personal distinction that is very rare among Architects, but it is this same instinct of the scholar that has precluded him from cultivating that self-concentration which must ever be the vital genius of the great Architect, as it must be of a great Artist in any other calling. It was probably this same ability for acquirements of culture and distinction, that robbed the work of the late Lord Leighton of the higher qualities of a painter. It may be said with some truth of the Gothic Architects of a previous generation, that their stimulating motive was likewise that of the scholar, and that this is particularly the case with Pugin and with Scott, but their scholarships were of a very different nature to that of Mr. Jackson; their work was rather empirical than scholarly, they were rather experimentalists than students.

For these reasons, just as in the case of Scott and of Pugin (who, however, often made no pretence of practising what he so strenuously preached), we may notice in Mr. Jackson that same effort and lack of facility and felicity in much of his work which we find in Scott's, and which must always exist when an edifice is raised from man's conscious mind and feeling, rather than from those deeper spring of intuitive impulse which knows no why nor wherefore.

There is in Mr. Jackson's work a certain effort in the achievement of the proportions, and a lack of unity in the parts: a tentativeness, as though memory, and not conviction, directed him; the classic and the archiac, so to speak, are too often seen a-jostle in his elevations. It is, happily, growing an obsolete criticism to condemn a doormould because it shows in its origin an earlier or later tradition than those of the windows; still, a sense of anomaly must not be provoked. The taste in Architecture is an educated taste, which is as purely conventional as that of Music. If we travel far East we find both Architecture and Music which need in us a fresh education to their just appreciation. For this reason abruptness of originality is not admissible: the Architect should avoid obvious elisions and interpolations in the grammar of his Art, for unless these irregularities fall to combine in some noble effect that may carry them off, they must appear as mere Architectural solecisms. Mr. Jackson's archaic frieze below his cornice member, in the front of the new schools on to the "High" is a distraction from the merits of the elevation, and we may add a painful one; so also is the rough walling to the Trinity buildings. Those who have seen them will know that they keep pretty closely to the traditions of the Jacobean period, and the sentiment of this style is so closely allied with fine-cut ashlar and jointing, that the squared rubble Mr. Jackson seems to have used, as it has no ostensible purpose in giving texture to his design, suggests hurry and cheapness, qualities which, beside the vile instincts of so much building of our present day, are of all things most provocative of disgust. Perhaps his building in other environments would not occasion this passing offence, but in Oxford, which is, right and left, a breathing reality of the noblest inspirations of Architecture, a suggestion of falseness strikes home.

We may notice, too, in Mr. Jackson's buildings, an inclination to strong and abrupt projection. As we have been speaking of Trinity we may instance it there in the gables. Upon the comparatively unbroken surface of the walls, the columns and the mutules bearing them start out somewhat awkwardly. The same heaviness of detail may be seen in the Corpus building, while even the beautiful oriels of Brasenose have this fault. Oxford is full of oriels all sitting with a delicious snugness upon their respective walls, and it must be admitted that after passing up "the High" from Magdalen, Mr. Jackson's oriels seem to hang in a sort of desperation under his gables, clinging there like the nests of swallows. The comparison may sound picturesque, but a swallow's nest is a wonder, and it is an excrescence, and whatever holds such attributes in Architecture admits a blemish. We may see by the drawing published in these pages what the actual projection is, but the poise of an oriel is a subtle matter, and relies on more than may easily be judged from plan and elevation.

BRASENOSE COLLEGE. BAY OF FRONT. T. G. JACKSON, R.A., ARCHITECT.

MR. RIENZI WALTON, on behalf of the Local Government Board, has held an inquiry at the Guildhall, Conway, respecting an application to the Local Government Board to sanction a loan of £3,000 for sewerage works, £350 for street improvements, £450 for water supply, and £100 for the extension of the gasworks.

THE recent talk about the neglected mineral springs of the metropolis has led to the discovery—or, rather, rediscovery—that some of those by which the Hampstead ponds are fed possess undoubted mineral properties. The largest of them, it appears, rises in the Vale of Health, and yields about 100 gallons a-day.

THE ANCIENT CITY OF NIPPUR.

PROFESSOR HILPRECHT, curator of the Babylonian department of the University of Pennsylvania, has made discoveries, says a Philadelphia correspondent of the Chicago Chronicle, which push history, of which there are written records, back to 6000 B.C. He has written sight records that probably carry back human history to nearly 10,000 B.C., and is able to see beyond this period to a very ancient prehistoric period, which makes the chronology of Usher, printed in most Bibles, and which places the beginning of the world in 4004 B.C., look rather ridiculous. The discoveries of Professor Hilprecht were all made possible by the material gathered together by the University of Pennsylvania's Babylonian Exploration Expeditions, and these expeditions were made possible by the liberality of a mere handful of wealthy Philadelphians, who subscribed nearly 70,000 dollars to support what are now known the world over as the Nippur Expeditions. The explorations of the antiquities of Babylonia have been going on for eight years, and after a lull since last spring they will be renewed next spring upon an entirely new basis, and a new campaign to last three years will be begun, of which marvellous things are expected. The work of these three campaigns

HAS ALMOST REVOLUTIONISED

all ideas as to ancient Babylonian history, and will be the foundation for some of the most important volumes on Archæology ever written. At 4004 B.C. there was a very polished civilisation existent in the valleys of the Tigris and Euphrates, and which had been existent for many millenniums before. And of this very ancient civilisation Nippur had been the holy city, sacred to the god of these ancient peoples. A city marked by massive temples and showing a high state of civilisation, and yet of such antiquity that the story of civilisation as related by the legends of those who remembered Nippur and its greatness, declares there was a time when heaven and earth were not created and the city of Nippur did not exist. Nippur at present, then, easily figures as the most ancient city in the world, and it is through, in, and by Nippur that the discoveries have been made that have unlocked the secrets of the centuries and pushed the records of civilisation so far back as to startle even those who are accustomed to delving in the remote past. The spot that is now famous over the world is a ruined city, lying between the Tigris and Euphrates, about 150 miles south of Bagdad. The ruins form a conical hill, rising out of the level and marshy fever-breeding plain to the height of about 100 ft. The central portion of the ruins is about 45 ft. higher than the mass of the surrounding *débris*. Layard, the Assyriologist, who prospected in the Nippur ruins a number of years ago, was of opinion that nothing of value would be found there.

USING MODERN METHODS

of research, however, and cutting down by means of huge trenches, the University's workers have accomplished wonders. The way in which the age of the different inscriptions and finds is determined is the same as the method used in determining the age of the earth—by means of the superposition of the strata, that lowest of all being the oldest. Applying this method to the great ruins at Nippur, as the explorers gradually worked down into the mound they found various levels, which, by means of inscriptions, were identified, and these acted as keys to the determination of the whole mass. On top of all were the ruins of modern times, from the present down to the early centuries before Christ. The first great dividing line was the discovery of the platform of Ur-Gur (about 2800 B.C.), on which the great temple tower, which was rectangular in shape and about 197 ft. by 177 ft., composed of three terraces, the lowest story of which was about 21 ft. high. This temple tower was built of a solid mass of brick, and was called a zigurrat. Below this platform of Ur-gur was discovered the pavement of Sargon (3800 B.C.), built of huge burned brick. Below the pavement of Sargon the *débris* extends over 30 ft. before the

GROUND LEVEL IS REACHED.

Of this Professor Hilprecht says:—"If, roughly speaking, the discoveries above the pavement of Sargon represent the accumulation of about 4,000 years for about 40 ft. of material, then the 30 ft. below Sargon must represent at least 3,000 years of growth, as there being no great tower temple (zigurrat) to add to the *débris* by its crumbling the deposit of *débris* must have been much slower, and hence the age of the original first settlement at Nippur, one of the most ancient known to history." The determination of age and periods by means of strata is only one of the ways of getting at the secrets of antiquity. The other methods are reading of the inscriptions found, study of the Art works, and a minute comparison of all the details of life unearthed. Having gone all over this for years, Professor Hilprecht summed it all up by telling the story of Nippur somewhat as follows:—The most ancient inscriptions found show that over 8,000 years ago, probably 10,000 years ago, there was an advanced civilisation in the Babylonian plain, lying between the Tigris and Euphrates. The Persian Gulf came further inland then, and Nippur was near the sea-coast. Forests of subtropical character flourished, and the people lived a simple agricultural life, with the Arts quite advanced and writing considerably developed beyond the simplest forms of picture writing. This country was called Kengi, the land of the canals and the bulrushes, for agriculture at that early date was pursued by means of irrigation, and among the vegetables raised, the onion was highly prized. The people of the land of Kengi were not Semitic, but Sumerians, who had a curious language of a type something like the Finna Tartarian, a Turkish stock with a vowel harmony. As none of the modern forms of language are like it, deciphering the Sumerian inscriptions is

NOT A SIMPLE TASK.

Nippur was the centre of the religious worship of the Sumerians. This is shown by its great prominence in the records, and the fact that at Tello, a very ancient town in the south of Nippur, the gods are said to be the sons of the Bel (Baal) of Nippur, and the kings of Tello ascribe their election to the Bel of Nippur. In time, the Sumerians became effete—even at that early day civilisation wore out—and the Semitic nomads, who had been hovering for many years and through many dynasties on their northern border, were able to conquer some of the outlying towns. One of these was Kish, which was taken by the Semites about 5000 B.C. There was then on the border a mingling of the two civilisations. The invaders adopted the manners, customs, writing, and religion of the invaded, and in this way the Sumerians impressed themselves on their conquerors. When it is remembered that until recently both Maspero, the great French authority, and Winckler, the German *savant*, put the most ancient Babylonian civilisation known to history at 3500 B.C., the revolution in Archæology accomplished by the Philadelphia Babylonian Exploration Fund, which allowed Nippur to be dug up, can be easily estimated.

NEW BUILDING FOR CORPUS CHRISTI, OXFORD. T. G. JACKSON, R.A., ARCHITECT.

THE Leatherhead Water Company is about to construct an additional reservoir, with a capacity of 1,000,000 gallons.

THE Dean and Chapter of Salisbury Cathedral appeal to the general public for additional aid for the repair of the tower and spire of Salisbury Cathedral. Already £10,000 of the £15,000 required has been raised.

FURTHER experiments with a boom as a defence at the entrance to the harbours, &c., are about to be made at Portsmouth. At a heavily-constructed barrier, a torpedo boat makes a dash at full speed with a view to ascertaining if the craft can get safely over. A specially-prepared boom has been completed at Portsmouth for the purpose.

STUDENTS of the Renaissance will be pleased to know that Messrs. Smith and Elder are about to begin the publication of a new and cheaper edition of the late John Addington Symond's works. The first volume will be "The Age of the Despots," and there are to be seven volumes in all. The same publishers will also have ready, shortly, a volume of collected essays by Mr. St. Loe Strachey, the new editor of the "Cornhill." It will appear under the title of "From Grave to Gay."

THE LATE LORD LEIGHTON'S WORK.

AN UNIQUE EXHIBITION.

AT Burlington House, the present exhibition consists solely of the work of the late Lord Leighton, a man devoted in thought and word to the service of the Royal Academy. On the whole Lord Leighton's influence on the Academy was for good. He knew a great deal of men and pictures, and while he had a marked preference for one kind of painting, he was able to admire many different ideals and qualities of Art. Indeed, his catholicity of appreciation affected his own work, and not altogether advantageously. He weakened his idea by eclecticism, and much of his painting wins from many Artists only a somewhat cold admiration. It is not so with his sketches, with a few portraits, smaller canvases, and one or two larger works carried out in a spirit of unusual frankness and bravery. When we look at these we cannot help feeling that Leighton was a man of fine taste and wonderful gifts who somehow never learnt to do justice to his splendid powers. But while we admit this comparative failure, we should remember his surroundings, the late Art of England, the Academy of the sixties, and the public taste and opinion of some years ago. It was against the England of those days that pre-Raphaelites protested, and we must remember that they were not the only men who held themselves above anecdotic painting and other cheap views of Art. Leighton and Mr. Watts were amongst a select few who took a high view of painting, as something capable of expressing beauty, and not only fit to bring fame and money by allying itself to literary emotions and popular

IDEALS OF ILLUSTRATION.

Could Leighton have combined the fine suggestion of colour in his oil sketches with the expressive action of his black-and-white drawings he would have done ample justice to his Artistic ideal. As it was, he rarely, if ever, treated the details, drapery, or heads of his large pictures with the breadth and "go" of drawings such as the "Study for the Wise and Foolish Virgins" (221), or "Two Studies of Heads" (224). He has perhaps never equalled in his pictures the happy colouring, the limpid unity of the sketches "On the Nile" (116), "Captive Andromache" (115), "St. Mark's, Venice," and ever so many other charming instances. Leighton seems to us in this exhibition to have thrown away his talents and his opportunities in the pursuit of a hard, cold revival of certain old masters. Everyone, it may be said, has more or less co-operated of late in reviving the traditions of old mastery. But Leighton was almost alone in the kind of Art that he chose to cultivate. His taste inclined to Raphael, and yet perhaps Raphael was scarcely the man to draw out and foster Leighton's

NATURAL GIFTS AND POWERS.

He might have been many things, but scarcely what he most wished to be, a composer by line and the creator of large Raphaelesque designs. For instance, he might have been a landscape painter of classic grace and delicacy. He might have been a portrait painter with a gift of something at once quaint and dignified in his style. At any rate, whatever line he had chosen, he might have been an exquisite colourist if he had not sacrificed breadth to false finish, and freshness to smoothness and a hard definition. But when one criticises Leighton's work one must admit that he towered above most of the Artists of his day, at least in England, and that in international exhibitions his work appeared to most advantage because there one saw best his "Captive Andromache," as examples of his success in carrying out important canvases according to

HIS OWN IDEAL OF FINISH.

And yet we should be forced to admit that the sketch for "Captive Andromache" has more unity of tone and a more penetrating charm of colour than the larger picture in the Manchester City Art Gallery. But indeed it would be difficult to surpass Leighton as a sketcher, whether of landscape from nature or of figure-subjects intended to be afterwards executed on a larger scale. One may feel admiration for Leighton's catholic taste in Art, for his industry, for his sense of dignified composition, and yet one cannot help feeling sorrow that he never rose quite to the level suggested in some of his sketches in oil and black-and-white. In these his drapery looks alive and fluttering, his figures full of action, and his colour sparkling and exquisite, whereas in his pictures the drapery too often looks like tinted plaster, the figures like wax models, and the colour an academic tinting that lacks the unity of aerial truth. From his pictures one turns to his sculptures without feeling that one regrets in any way the loss of colour and environment. Indeed on this occasion, when one saw all his work set before one, choice seemed to lie between the sketches and drawings on one hand and the statues on the other. The "Athlete Struggling with a Python" appeared a much nobler work of Art, let us say, than "Jacob's Dream," or "And the Sea gave up its Dead which were in it." It is strange that Leighton should have done so well in sculpture, which was at that time in even a worse condition than painting in England. It is possible, however, that in this medium Leighton felt himself freer than in painting, and less under the eye of public opinion.

AMONGST THE PORTRAITS

and studies of heads in oil one may see some of Leighton's best, at least his most interesting work. Is there not something quaintly charming as well as powerful about "Miss May Sartoris (Mrs. H. Gordon)" that recalls the finer romantic work of France rather than the merely academical conventions common to all countries? The face is solidly painted, and as finely modelled as anything that Leighton ever painted. But it stands by no means alone, and we may mention with it "Sir Richard Francis Burton," "John Martineau, Esq.," "Miss Laing (Lady Neask)," and, better perhaps than all, "A Study," belonging to Mr. Val Prinsep. This small head is magnificently handled, with a freedom and force of touch which would do credit to any master. Since Leighton could model with this fine directness and vigour, one feels astonished that he should ever have submitted to a rule of style which led to a smooth and easy kind of finish, destructive of emotion and subtlety. At times, however, even in his large canvases with a decorative aim, Leighton, if he handled paint without emotion, at least attained a real beauty of composition and a certain quality of colouring. Perhaps we might single out "Flaming June," "Hercules Wrestling with Death for the Body of Alcestis," "Cymon and Iphigenia," "Actæa, the Nymph of the Shore," "The Bath of Psyche," "Clytie," and

TRINITY COLLEGE, OXFORD. T. G. JACKSON, R.A., ARCHITECT. FROM THE ORIGINAL DRAWING.

THE block of old houses in St. Andrew Street, Plymouth, which so suddenly collapsed a few days ago, is being speedily removed. With considerable alacrity the borough officials sent a gang of pick and shovel men to the spot, and, having boarded over the street to stop vehicular traffic, the work of removing the *débris* was commenced.

BERWICK TOWN COUNCIL has under consideration the altering of Berwick Bridge, or providing a new footbridge from Berwick to Tweedmouth. Messrs. Sandeman and Moncrieff, of Newcastle, the engineers, considered the making a one-sided footpath on the old bridge disadvantageous, and an overhead bridge so ugly that they would not engineer it. The committee is now to consider a cheaper plan than £6,000.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
January 13th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

OPERATIONS now in progress for the extension of the Edinburgh Municipal Buildings will obliterate Writers' Court, associated with which are not a few traditions of the olden time. The court took its name from the Society of the Writers to the Signet, who established their headquarters in it in the end of the seventeenth century, and continued there until they removed to their present palatial halls in Parliament Square in the early half of this century. The close, however, was in existence before the writers became the dominant proprietors in it and changed its name—a not unusual custom in those days. Situated on the west side of the Royal Exchange, Writers' Court was a short *cul de sac*, into which the sun rarely penetrated. Blocking up the end of it was a tall tenement, in which was a famous old Edinburgh hostelry—the "Star and Garter" tavern—kept by a man named Cleriheugh; on the east side was a tenement, in which was the Signet Office; and on the west side is the old Masonic Hall of St. James' Lodge. The end tenement, which has just been entirely demolished, is estimated by those who took it down to have been about three hundred years old, and the old Masonic Hall on the west side, is supposed to be of a more ancient date.

MR. EDWARD FALKENER, Architect and Archæologist, died at his house, St. Clears, Carmarthen, on December 17th, in his 83rd year. He gained the gold medal for Architecture at the Royal Academy in 1839. He travelled in Europe and the East for seven years, and was a most indefatigable student. In the spring of 1847, he had at his own expense a house excavated at Pompeii, called the house of Marcus Lucretius, in which all the loose articles were left where found. On his return to London he engaged in private practice, but the principal part of his time was devoted to publications on classical antiquities and to drawings of classical restorations, many of the latter being exhibited at the Royal Academy. He edited the Classical Museum, and contributed many papers to it. He published, in 1854, a pamphlet entitled "A Description of some Important Theatres and other Remains in Crete," in which was an account of the acoustic vases found in one of the theatres; and published "Dædalus, on Greek Sculpture," in 1860. In 1861 he issued a pamphlet on "The Hypæthron of Greek Temples"; in 1862, "Ephesus and the Temple of Diana"; and lately, "Games, Ancient and Oriental," and he was preparing a book on Greek houses until his last illness. Some of his sketches were used by J. Fergusson in his "History of Architecture." Shortly after the publication of his first three books he gave up practice and retired to South Wales. He was a member of the Academy of Bologna, of the Archæological Institutes of Rome and Berlin, a Knight of the Dannebrog, and J.P. for Carmarthenshire. He was this year made an Hon. Fellow of the Royal Institute of British Architects.

IT is to be hoped that the huge blocks of artizans' dwellings with which we are familiar in some parts of London will not be the "model" buildings of the twentieth century. They are abominably ugly, and, in spite of figures as to the death-rate of the residents, it is difficult to believe they are healthy. Greater facilities are required for conveying artizans to the suburbs, and this might be done by adopting electric traction for our tramways, the carrying power of which would thus be trebled.

VERY opportune is the report that Mr. Moore, the hon. surveyor to the City Churches Preservation Society, has presented in reference to the threatened Church of St. Mildred, Bread Street. He points out the beauties of the Church, mentions that the edifice practically remains in the state in which it was left by Wren, and declares that there is no earthly reason why so characteristic a specimen of an Augustan period in Church building should not be preserved. All who know the Church will cordially re-echo his closing words: "We have here, without going into matters of sentiment, a thing of intrinsic value, which no man with a cultured perception would think of touching with a destroying hand."

THE new offices of the Commission of Sewers facing Basinghall Street are not in accord with the principal Architectural features of that thoroughfare. The reason for this departure is not far to seek, as the Commission, under an injunction, unsuccessfully resisted by that body, has been unable to complete the original plans of the building. The question of ancient lights, which was raised by the opposite tenants, has proved fatal to the intention of the Commission to erect a handsome structure facing the street. Instead of having a compact structure rising in a line upward from the street, the new building will be erected in terraces, culminating with a steep roof at the rear. It is needless to say that much valuable space has been sacrificed in order to conform to the requirements of the injunction. The half-basement will be devoted to the clerks' strong-room, a room for the gas inspector, rooms for the sanitary inspectors, an office for the electrical engineer, and his testing-room. The ground floor will provide accommodation for the clerks. There is also a room for the accountant. The office for the medical officer will also be on this floor, and that for the sanitary clerk. The first floor will accommodate the rate collector's office, and a private room for the copying and general clerk in connection with the clerk's department. The principal entrance to the building will be from Basinghall Street, at the southern end, with staircase and a lift for passengers, giving access to each of the floors. A separate lift for books will also be provided. The offices now occupied by the engineer and his staff will be retained in their present position, and access will be given to them by a staircase and corridor leading from the new building.

AN account has just been published descriptive of the history of the old burial-ground in St. Pancras Road. Old St. Pancras Church of the twelfth century still survives in an excellent state of preservation, and another picturesque object prominent in the garden is a sun-dial erected as a memorial to the distinguished dead by the Baroness Burdett Coutts, at a cost of £3,000. It appears that in this cemetery rest the remains of many famous men, including those of Sir John Soane, who founded the museum in Lincoln's Inn Fields which bears his name; of John Flaxman, John Walker, author of "The Pronouncing Dictionary"; William Woollett, the landscape and historical engraver; and several members of the family of the Duke of Norfolk.

THE re-housing of the people who are turned out of their dwellings by the clearance of insanitary areas is a very onerous and expensive matter. The Hospital, in a recent issue, expresses an opinion that the burden might be greatly lightened by a proper development of the metropolitan tramway system, and urges the importance of this being undertaken without delay. The present plan of erecting block buildings is said to be defeating its own ends. They cannot be built as they should be in the central parts of the metropolis except at great expense, and consequent high rents, "and in the end this means that, instead of re-housing the people who have been displaced, the new buildings often only cater for a higher class of artizans—for people, in fact, who, but for the attraction of the flats, would go out into the suburbs."

So many public improvements are being effected in Nottingham just now, that it seems a good time, says a local contemporary, to take into account the subject of a new Town Hall. The present accommodation is very inadequate. In fact, it has been inadequate for many years, and had it not been for the long period of commercial depression through which the town has passed, steps would have been taken to provide a more suitable building before this. The present Council Chamber is large enough, no doubt, for the ordinary meetings of the Town Council, but it is of very little use indeed for public meetings or municipal functions. The whole building is, indeed, unsuited for every kind of public function, and in every respect it is a discredit to the town. We certainly do not wish to recommend expenditure which the town could not bear, but the erection of a new Town Hall will sooner or later be inevitable, and we question whether there will ever be a better or more suitable time than the present. The building operations now in progress will in a short time make Nottingham one of the most handsome towns in the whole country, and a new Town Hall would not only clear away an unsightly set of buildings which will soon be an eyesore, but it would add greatly to the attractiveness of the centre of the town, and harmonise with the other new buildings. It is doubtful, too, whether there will ever be a better time than the present for borrowing money. It can be obtained easily, and in almost any amount, at two and a half per cent., and it is difficult to believe that money will ever get any cheaper than that. In fact, there is just a chance that as years go on it may get dearer. It is not likely, therefore, that anything will be gained by further delay, while, as the trade of the town is now improving, and as the rateable value will have increased considerably before very long, the objection to incurring fresh expenditure, which was so very powerful a short time ago, is now disappearing. At any rate, the subject is now ripe for discussion both inside and outside the Council Chamber, and we venture to suggest, therefore, that it should be taken into consideration.

ON Christmas Eve, three-and-thirty years had elapsed since the death of Thackeray, so that there is an especial appropriateness in an article in the current issue of Scribner's Magazine on the "Haunts and the Homes" of the novelist. The article—which is from the pen and pencil of the veteran Artist, Mr. Eyre Crowe, A.R.A., himself a friend and companion of Thackeray's—brings to notice the fact that the only residence of the creator of "Vanity Fair" distinguished with the Society of Arts tablet is the house at No. 2, Palace Green, Kensington, which he built for himself. Here, it is true, he died, but he had lived there for less than two years, and the house is, in a smaller degree than any other in which he lived in London, linked with memories of the works which made him famous. His old residential chambers in Hare Court, with their suggestions of Pendennis and Fanny Bolton; No. 13, Great Coram Street, where he wrote many of his magazine articles, notably the one on Courvoisien; and 13, Young Street, Kensington, where "Vanity Fair" was penned—all call for at least as prominent a notice and as permanent an indication as the mansion in which the end came. The cost would be less than inconsiderable, and the rapidity with which historic London is passing away is quite sufficient to justify urgency in the distinction of relics of a great master of fiction.

IT is worth while recalling some of the more notable landslips which have occurred during the present century. The Rosenberg mountain behind the Rigi slipped down in 1806, burying the neighbouring villages with above 800 inhabitants. At Christmas, 1839, a strip of chalk cliff, three-quarters of a mile long, at Lyme Regis, in Dorsetshire, slid forward on to the beach, carrying with it cultivated fields, trees, and houses. A landslip at Naini Tal, in the Himalayas, in 1880, caused the loss of 200 lives; and, in the following year, over 150 persons were killed by a similar calamity in the Swiss Canton of Glarus. The most serious accident of the kind in England was the well-remembered Sandgate landslip in March, 1893, by which a large amount of property was destroyed, and many families were deprived of shelter and of all their belongings.

AT the historical Church adjoining Christ's Hospital, and known in the present day as Christ Church, Newgate Street, the Vicar, at a recent service, made appropriate allusion to the interesting anniversary they were celebrating. Exactly 350 years ago this edifice was re-opened after a cessation of service during the troublous times when Henry VIII. was dealing with monastic institutions. Two years earlier, in 1545, the King had handed over to the City of London this Church and other property belonging to the Grey Friars. A re-arrangement of parishes had also taken place, and the ecclesiastical district surrounding St. Nicholas (which even in those days was described as being in the "Flesh shambles") and that of St. Ewen, together with a portion of St. Sepulchre's parish, was taken to form the new parish of Christ Church. There is in the Grey Friars' records still extant an interesting entry which reads: "Item, the 3rd day of Januarii (1547) was sette opyn the churche agayen that was sometyme the Gray-freeres, and masse said at the auteres with dyvers prestes, and it was namyd Crystys Churche of the fundacion of Kynge Henry the VIIIth." In proof of the amity now existing between the old foundation and the Church authorities, the sermon was preached by the Rev. W. H. Branfoot, of Christ's Hospital.

IT is an earthquake that the American School at Athens has to thank for the opportunity of undertaking the excavations at Corinth, which have begun so successfully. Until 1857, modern Corinth stood on the site of the ancient city, but in that year it was shaken down by an earthquake. The new town was built about four miles north-east of the old site. The *débris* of the fallen city remains, and a village of a few hundred inhabitants still exists there. The ground is of little value, and excavators can purchase it outright. This would have been hardly possible when the town was standing.

AN exhibition of students' works was opened recently at Aston Manor Technical School. The work is uniformly good in quality and covers a wide range of subjects. It is also pleasing to notice that a large proportion of the work has a direct bearing on Art industries. The school would appear to be particularly strong in design. In this department of the work the students have combined Artistic ability and feeling with a careful regard for the requirements of the material in which the designs are proposed to be executed, while in some cases the designers have been also the workmen, and have produced articles such as etched metal finger plates, salvers, &c. There are also some admirably executed carved wood panels, a design based on the poppy, by Miss Agnes M. Thomas, being a clever piece of work, while another by Mr. W. G. Barber, based on the hazel, with a squirrel and nut-hatch introduced, is good both in treatment and execution. Of the other work executed by the students are some carefully etched door plates in copper, of quaint design, by Miss Allday. The exhibition includes modelled designs, modelling from the life and the antique, drawing from the antique in outline and chalk, designs for a variety of objects, painting from still life in oil and water-colour, painting from flowers, painting in monochrome, shading from models, and shading and outline from the cast. A competition in designs for a metal salver produced some good work, the prize being awarded to Miss M. S. Richmond. There are some good exhibits of painting from dead birds. Among the designs for stencilling, Mr. A. J. Darlaston submits a good set, which secured the prize in the local competitions. A set of designs based on the chrysanthemum, by Miss Alice Allday, are delicate in colouring and Artistic in treatment. This student also has some good work in painting in still life and from flowers. A good set of works from nature in flat washes applicable to decorative treatment, by Miss Richmond, is deserving of mention as being a step in the right direction, and a class of work which should be encouraged among the students.

A STAINED glass window has been placed in the side Chapel of Wantage Church, as a tribute to the memory of the late Dean of Lincoln, who for many years laboured as vicar of that town. It represents figures of three prelates—namely, St. Birinus, Bishop of Dorchester, who died A.D. 650; St. Wulstan, Bishop of Worcester, 1062; and St. Hugh, Bishop of Lincoln, 1186. These are the three dioceses in which the late Dean worked.

MANY of the historical landmarks of Old Westminster are disappearing, and of its better known thoroughfares probably few have suffered more severely in this respect than Great George Street. The rooms of the old National Portrait Gallery are closed, the Institution of Civil Engineers has built up for itself a fine pile of buildings, and the old houses, Nos. 12 and 14, for so long associated with the Surveyors' Institution, are in course of demolition, together with some even older premises in Little George Street adjoining. Outside the top windows of the latter there are some very curious wrought-iron balconies, besides many internal indications of antiquity.

A SYNDICATE has been formed in Aberdeen for the erection of a new theatre in the city, and a piece of ground on the east side of Rosemount Viaduct has been acquired from the Town Council. The site has 110 feet frontage, and 160 feet depth, and the yearly ground rent will be £88. It is proposed to build a theatre upon it of the most modern construction, and capable of accommodating over 2,000 persons. Tentative plans have already been prepared, and it is understood that the undertaking will be pushed on as rapidly as possible.

THE failure of the attempt to secure Holbein's great masterpiece of "The Incorporation of the Guild of Barbers with the Guild of Surgeons in the reign of Henry VIII." for the Guildhall Art Gallery will be heard of with general regret. The picture is one of the Artist's finest and most characteristic works, and it has long been thought that it ought to be placed where it could be more readily and conveniently seen than in the hall of the Barber-Surgeons' Company in Wood Street. It is paintsd on an oak panel, and the danger of fire arising from the nearness of the hall to the crowded warehouses of the Cheapside district led to a strong wish for its removal to a safer place. Barber-Surgeons' Hall, moreover, is badly lighted, and the picture is seen very imperfectly. An influential committee was accordingly formed, and the Company consented to dispose of their treasure for the not unreasonable sum of £15,000, which, it was hoped, would be speedily raised. The responses to the committee's appeal were, however, so meagre that the treasurer has been obliged to return the money to the subscribers.

LIVERPOOL'S new Post Office, in Victoria Street, is being pushed forward as rapidly as possible, although the completion of the building cannot be expected in a shorter period than some 18 months from the present time. Its style is Italian Renaissance, and its excellent proportions and imposing appearance, now that the scaffolding is partly removed, attract considerable attention. The Architect is Mr. Henry Tanner, of the Office of Works, and the contractors Messrs. Thornton and Sons. There will be no fewer than 18 emblematic figures, varying from about five to over seven feet in height, placed in conspicuous positions specially arranged for them, on and around the building. The whole of the sculpture work has been entrusted to Mr. Edward O. Griffith, in whose studio, in Kitchen Street, Liverpool, the figures can be seen. Ten of them, representing the British Colonies, will be placed on the Victoria Street elevation, where the front entrance to the Post Office will be situated. The figures, which are life-size, are carved out of Portland stone. In the centre of the ten statues will be placed four other colossal figures—two on each side of the entrance door—the pair to the right representing England and Scotland hand-in-hand, and the pair to the left Ireland and Wales. A pediment has also been carved out of the stone above the principal doorway, emblematic of electricity and engineering. The sculpture work in Sir Thomas Street and Stanley Street is as nearly as possible alike, being principally foliated work, capitals, panels, consoles, urns.

AT the last meeting of the Bournemouth Town Council the Surveyor's scheme for the construction of an undercliff drive and the preservation of the cliffs was considered. A resolution moved by the Mayor was carried by twelve votes to nine, approving of the scheme, and authorising it to be submitted for approval to Sir George Meyrick, the owner of the cliffs, and the directors of the South-Western Railway, to secure their co-operation in carrying it out. The cost is estimated at £60,000 for the whole sea-front, but only half can be proceeded with.

MR. WATTS'S "Wounded Heron," now exhibited at the New Gallery, is a picture with a past. It was exhibited at the Royal Academy sixty years ago—in the year of the Queen's accession—and there is perhaps no other picture by a painter now living of which a similar boast can be made. Moreover, this particular picture was sold by the Artist, and entirely lost sight of by him, when, after the lapse of many years, a dealer in the North wrote to him to say he had in his possession a picture that bore his signature, though perhaps it was not his work. Its price, he added, was about £5. Needless to say, Mr. Watts at once closed with the offer, and it was the greatest bargain in picture-buying that he ever made.

ONE of the best-known taverns in the metropolis—the "Elephant and Castle," at Newington—is threatened with demolition and removal. The demolition, however, is only preparatory to rebuilding, and as the removal amounts to a matter of but a few feet, the "Elephant," which gives its name to at least one railway station, is likely to remain, as it has been for more than a couple of centuries, a distinguishing landmark in South London. But the change which is in contemplation, though slight in itself, is of some consequence. Of the many cross-roads which meet at the "Elephant and Castle," one of the narrowest and one of the most crowded is the Walworth Road. Almost parallel with it runs Newington Butts, with its considerable width of roadway, and between them, and facing each of them, stands the tavern. What is proposed is to move the house a little to the westward, so as to admit of the widening of Walworth Road, and though this can only be done at the expense of a small strip of Newington Butts, the opinion of the local vestry is that exchange in such a case is certainly no robbery. The announcement that the trustees of the Newington Charity Estates, who are the owners of the "Elephant and Castle," were proposing to rebuild the property induced the local authorities to take prompt action.

THE "Elephant and Castle" has lost its glory since the days of the stage-coach, and is now principally known as a tram and 'bus centre, but its history is not altogether uninteresting. It stands upon what was once a waste piece of ground belonging to the Manor of Walworth, and what is now known as the Elephant and Castle Charity Estate. It was secured upon copyhold terms for the benefit of the poor of the parish of Newington as far back as 1658, and though there is reason to believe that the Elephant and Castle on the north and Short Street on the south do not represent the original boundaries, enough of the estate is left to bring in a revenue of nearly £2,000 per annum. There is evidence that in 1672 there was in existence upon the site of the present tavern an inn known as the "White Horse," from which the charity then took its name, and it was not until half a century later that, for some occult reason, both the inn and the charity adopted the sign of the "Elephant and Castle." It is said that in the process of digging—possibly at the archery butts which are once alleged to have existed at Newington—the bones of an elephant were discovered, and that on this account it was decided to discard the sign of the "White Horse." Another suggestion is that somebody connected with the Cutlers' Company may have had something to do with the estate and have induced the owners to adopt their sign—an elephant, with a tower or castle strapped to its back, in which are knights clad in armour. Whatever the explanation, the "White Horse" became the "Elephant and Castle" in the days when it was a low-built roadside inn, and it has been true to the name of its adoption ever since.

THE apartments which are being specially prepared for the Queen's use at the Excelsior Hotel Regina, at Cimiez, are in the west wing, and number some 150 rooms. The prevailing colours of the reception room are gold and white, the style being Empire. Carried out on Elizabethan lines, the rich red velvet is in pleasing harmony with the warm tints of the decorations.

EXETER CATHEDRAL. SCREEN TO CHAPEL OF ST. MARY MAGDALENE.

THE Chapel of St. Mary Magdalene, Exeter, which is situated on the north side of the Lady Chapel, was originally built by Bishop Marshall in the Norman style about 1194. It was, however, partially reconstructed by Bronescombe between the years 1257 and 1280, who, at the same time, restored the Chapel of St. Gabriel, which is opposite to it on the south side of the Lady Chapel. Further work was done by Quivil, who, in 1284, enlarged the east windows of both Chapels. The screen, of which we give an illustration, was added by Bishop Oldham, who also built eight others and enclosed the choir. The Chantry of Prior Sylkes (1508), in the north transept, is also credited to him. These screens were built between the years 1504 and 1519, and were the final touches bestowed to the Cathedral in the latest age of Gothic Architecture.

SOUTHEND hopes soon to extend its sea-front. Southchurch, which lies between Southend and Shoeburyness, will, if the sanction of the Local Government Board can be obtained, be merged into its more populous neighbour, and extensive pier improvements are already in progress. At the preliminary inquiry, conducted by Major-General C. Phipps-Carey, Mr. Charles Herbert Smith, counsel for the Southend Corporation, urged the approval of the scheme on the ground that it would increase the attractions of the place as a pleasure resort. The Town Clerk stated that the Corporation are expending over £20,000 on pier extensions, and that during the last four years there had been a profit made from the existing tolls of over £7,000. This sum had been employed in relief of rates.

THE death is announced of Mr. Alexander Milne Dunlop, a well-known land agent and surveyor. The deceased, who was senior Vice-President of the Surveyors' Institution, and acted as Surveyor to the Board of Trade, was head of the firm of Dunlop, Lightfoot, and Wallis, of Manchester and London. He acted as agent for the Ship Canal Company in the purchase of lands and settlement of compensation cases arising out of the construction of the canal, and was agent for many large estates.

ALTHOUGH it has been decided to build a new Royal yacht for the Queen, the plans have not been prepared, and it is pretty certain that the new vessel will not be ready for the naval review to be held in celebration of the longest reign. The "Victoria and Albert" is the oldest royal or imperial yacht in Europe, and although there is none that compare with her for grace and beauty of lines, she is hardly the yacht to represent in the present day the first navy in the world, as in magnificence, cost, and accommodation she is surpassed by the "Hohenzollern," the "Pole Star," and the "Standart." This is not to be wondered at when it is remembered that she was built as far back as 1855, when the then "Victoria and Albert" became the "Osborne," to be displaced twenty years later by the yacht that now bears that name. On several occasions her timbers have been patched up, but now that boilers and timbers are in a state of decay, it has been decided to build a new yacht.

AT the Dudley Gallery, the "Landscape Exhibition," now open, has one or two merits of a rather unusual sort. It is limited to the work of only six Artists, and is, therefore, of a convenient and agreeable size; it is pleasantly varied, and yet the pictures it includes are sufficiently in sympathy to give the collection as a whole an air of right relation, and contains nothing which is in the least unworthy of attention. The most attractive contributions are those of Mr. Leslie Thomson and Mr. J. S. Hill, both admirable observers of nature and skilful in technical device. Mr. Peppercorn is represented by several studies in low tones, quite characteristic of him. Mr. R. W. Allan's works are curious in their variety of manner, and in more than one instance are strongly reminiscent of certain of the great French landscapists. Mr. E. A. Waterlow's somewhat artificial method of interpreting out-of-door subjects assorts but little with the general tone of the show.

THERE is not much to record in the way of new movements in Art during the past twelve months. The rank and file of living Artists have, perhaps, occasion to congratulate themselves upon a slight improvement in the market for modern pictures; but the good times for which everyone has been hoping are still little more than a possibility. A few assiduous workers have had cause to rejoice over a stroke of luck, and an occasional millionaire has scattered some crumbs of comfort in a limited number of studios, but the general cloud of depression seems curiously disinclined to disperse. Meanwhile, prices for pictures by deceased masters have run higher than ever; no less than £11,025 was given in the summer for a portrait by Romney, and sums almost as disproportionate for other canvases of the same class. The only really hopeful sign is the increasing demand for English pictures abroad. The authorities of the Louvre paid a little while ago £3,000 for Lawrence's portrait of Mr. Angerstein, and works by Mr. J. H. Lorimer and Mr. G. W. Joy were acquired by the French and German Governments In America, too, British Artists are steadily making their way.

THE imitative nature of the Japanese has led to some queer mechanical productions. A lighthouse is now being erected at Kagoshima, which is to have, when completed, a height of 100 feet. The lighthouse in question will consist of an iron tower, which will carry at its summit an illuminating apparatus of the first order. The scaffolding is made entirely of ropes of braided straw. All these ropes are interlaced with one another, crossing in all directions to form a structure of great firmness. An inclined plane is used for the transport of materials. It is held firmly by ropes of braided straw. The construction, thus made, presents a very odd appearance.

AT Durham House, Withington, the death took place of Mr. Alderman G. Clay. Mr. Clay has been for many years a familiar figure in Manchester public life, and was the son of the late Mr. Thomas Clay, of that city, and, unlike many "Manchester men," was born in it. His father commenced life in the poor circumstances of a working stonemason; but by sheer pluck and industry rapidly rose to be one of the great master-builders of the city. He will be chiefly remembered as the contractor who took out the foundations of that magnificent building, the Manchester Town Hall, and who was afterwards engaged, in somewhat of an emergency, to take down the scaffolding. Mr. George Clay inherited from his father all his distinguishing traits.

THE German Emperor has designed and drawn the tower of the German Protestant Church in Jerusalem, which will be finished by the beginning of next year. The original plan of the Church was drawn in 1875 by the head of the Prussian official Architects, Professor Adler, and the cost was estimated at half a million marks. But the first design has been considerably altered, and the building will cost about 300,000 marks more. It will be built on the Muristan, which was given to the late Emperor William by the Sultan in the sixties, and was taken possession of on his behalf by the Emperor Frederick, then Crown Prince, who visited Jerusalem in 1869. The form of the building is similar to that adopted for Churches in Palestine and Syria by the Crusaders. They are all alike in being large and stone-built. The neighbouring hospital for female pilgrims will easily be converted into a large hospice for German Protestants, for whom that of the Order of St. John has long been insufficient. The oldest Protestant Church in Jerusalem is the English one, which was begun in 1842, and consecrated by the name of Christ Church in 1849.

WORKS in connection with the Royal Dublin Society's new theatre in Kildare Street are rapidly approaching completion, and it is expected that early in the month of April the contractors, Messrs. Bolton and Son, of Dublin and Rathmines, will be in a position to hand them over to the Society. The three or four months' strike in the building trade last year seriously interfered with their progress, but since its termination the greatest activity has been manifested. The outside of the building is of quadrilateral form, and there will be two entrances to the theatre. One for the public will be exactly in the place of the side door at the old portico, and the other, which leads from the main building of the Society's House, faces a grand staircase, to which the door first mentioned also opens, and by which the seats in both the lower part of the auditorium and the gallery will be approached. This staircase is placed in a lofty vestibule, having a glazed roof, and around are niches ready to receive statues.

THE townsmen of Peterborough do not profess to be antiquaries or Artists; but at least they should be acquainted with their own Cathedral, the ground it stands on, and the stones it is built of. And the local feeling appears to be strongly in support of the abused Dean and Chapter. At a recent meeting of the Restoration Committee the contractor declared that he would not risk the lives of his men in carrying out the scheme proposed by the Society of Antiquaries, and a vote of confidence was carried in favour of the original plan. To a certain extent there may be "wheels within wheels;" but, apart from all other questions, it is not the interest of the town in general, or the tradesmen in particular, to do anything which would check the flow of tourists in search of the picturesque. In spite of lying on two great railways, Peterborough is a sleepy little place, and its staple industry is the Cathedral.

IT is in contemplation to pull down the Victoria Bridge, which spans the St. Lawrence at Montreal. The bridge, which is of the tubular type, is to be replaced by one of more modern design, which will afford better facilities for the conveyance of traffic. The present structure was designed by Robert Stephenson, work being commenced upon it on May 25th, 1854, and it was opened by the Prince of Wales on August 25th, 1860. It is only about 60 yeards less than two miles in length, and the cost of its erection was £1,700,000.

ANTIQUARIAN discoveries of interest are frequently being made at Carlisle, which is fruitful in Roman remains. These now appear chiefly to consist of sepultural relics, and Chancellor Ferguson last week had submitted to him a vessel which goes to prove the correctness of his theory as to the locality of the chief Roman burial-ground at Carlisle, which he believes to have lain to the right and left of the London Road, from the top of Bochergate to the River Petteril. The "find" in question has been made at the top of Bochergate, a little to the south of the Red Lion Hotel, in some excavations for new buildings. It consists of an urn of plain red clay, containing the cremated bones of a child from four to six years old. The ground bottom of another vessel had served as a lid, but the neck being broken the lid had fallen inside. The urn also contained a small grotesque figure of a man, in an enormous head-dress like a Guardsman's busby, this is carved out of bone, and has been burnt. The urn is about seven inches in diameter at the maximum breadth, and three at its base, and it now stands about five inches high, but the upper part is broken and lost.

IN his description of the new portion of the Record Office, in Chancery Lane, Mr. Maxwell Lyte, the Deputy Keeper of the Public Records, says: "The rooms in the northern part of the new block have been fitted with steel presses and slate shelves for the reception of documents of different departments of State. The rooms in the southern part are for the use of the Deputy Keeper, the Secretary, and other members of the staff, who were formerly located in Rolls House. On the ground floor is a library of printed books for the use of officers of the Department. A room on the first floor, immediately over the gateway, will serve as a museum of documents of special beauty and interest, until the completion of another block of the Public Record Office. Two statues have been placed in niches over the gateway on the eastern side — that of Henry III., who founded the House of Converts on this site, and that of Edward III., who united the office of Keeper of the House of Converts with that of Keeper of the Rolls of Chancery."

A COMMENCEMENT has been made with the demolition of Mar Castle. According to Mr. A. M. Munro, in his book on "Old Landmarks of Aberdeen," the tradition attached to the house is that it was built by the Earl of Mar for his town lodging. The "Castle," adds Mr. Munro, which stood within the port, has lost much of its original character by repairs executed upon it about half a century ago, when the lower floor was completely modernised, and what remained of the corbelled mouldings originally adorning it has been completely hid by successive coats of harling. It is

one of the many houses in which Samuel Rutherford is said to have lived when he was banished to Aberdeen in 1636. In the title-deeds the property is described as "these two tenements of foreland and tenement of inland, with the close garden, summer-house and office-houses"; and there are citizens who can still remember the old-fashioned summer-house with the garden which stretched away to the Common Highgate, now the Porthill. At the back all this is changed, however, and almost every foot of the garden is now occupied by houses scattered about in picturesque confusion.

THE old and mutilated cross standing in the Churchyard of Timberscombe, Somerset, under the shadow of the great yew—both relics of long bygone times—has been restored. The cross, like most other Somersetshire crosses, was broken, and the upper part lost. The old and rotten base has been removed, and a new one of grey Dartmoor granite put in its place. Upon this stands another square block, part of the original structure, from which rises the octagonal shaft. Only about half of this was standing, the upper part being broken off, and the shaft with its head has now been completed, the design being after what was probably the original form. The upper part bears the figure of our Lord upon the cross, with a gabled canopy above, the whole structure being 10 ft. 3 in. in height.

A BRIDGE of telegraph wires crosses the Jhelum (one of the rivers of the Punjab), at Kohala. It was erected rather more than a year ago by Major Aylmer, on the site of the bridge that had been destroyed by the floods, and is on the Murree and Baramula route to Cashmere. Lieutenant-Colonel Gallrein, during one of his expeditions in the Soudan, encountered with his troops the river Kokoro, which runs for long distances between banks some 36 feet high, and descending almost perpendicularly to the stream. Lieutenant Willis, in this fix, borrowed from the telegraph department of the column several coils of stout wire which were made into ropes, and fastened to enormous beams on each side of the river. Across these were placed blocks of wood attached to each other, and among cheers and fears the column crossed the stream successfully. Near Freyburg, in Switerland, is a wire bridge connecting two mountains. The depth from this bridge to the chasm beneath is about 180 feet, and the distance from one side to another is over 900 feet. The way in which this bridge has been made is one of the wonders of the century, holes have been bored in solid rocks and the wires on which it is suspended pushed through. Over 1,000 wires have been twisted together to form the bridge.

ON Christmas morning, when the Rev. Bernard M'Cartan, parish priest, Hannahstown, visited Derryaghy Catholic Church, in his parish, he found about a dozen windows smashed. Other signs showed a carefully planned attempt to wreck the sacred building.

THE tower of Hinderclay Church, with its fine peal of bells, has for some time been in a critical condition. It was lately inspected by Mr. W. Fawcett, F.S.A., of Cambridge, and by his advice, and at the urgent entreaty of the parishioners, the work of restoration was immediately undertaken. The parapet has been taken down and stored away, and by the end of another week it is expected that temporary shoring will have been erected. In the spring it will be under-pinned and a foundation of concrete and gravel inserted, and, should the money be forthcoming, the parapet will be re-erected. The cost will be about £200.

IN connection with the excavations consequent on the erection of a new post-office at the junction of High Street and Scott Street, Perth, a curious discovery has been made. The earth removed to make room for the foundation of the post-office was carted to the outskirts of the city and formed into a "bing," and, while several children were at play on the bing, one of them found in a box over 30 golden pieces of various countries — Spanish, Portuguese, and French, while one was a British coin of the time of Henry VIII. On several of the coins are four *fleur-de-lis* in the shape of a cross, and on the obverse is a crusader's shield surmounted by an imperial crown. The inscription round the margin shows, so far as could be made out—"Vincit X.P.S. Rannent, X.P.S. Imperat."

Professional Items.

ABERDEEN.—The plans of the following new buildings have been sanctioned:—Three dwelling-houses on the north side of Broomhill Road, for Mr. James Duncan, builder, per Mr. Alexander Wallace, builder; two dwelling-houses on the south side of Lilybank Place, for Mr. Joseph Shirras, builder; two cottages on the south-east side of Elmfield Avenue, for Mr. Robert Mitchell, builder (further amended plan); dwelling-house on the north side of Church Street (Woodside), for Mr. George Mackie, surveyor; dwelling-house on the west side of Holland Street, for Messrs. D. Mowatt and Sons, chilled iron and sand makers; alterations and additions at No. 9, Diamond Street, for Mr. Charles Campbell, post-horse master, per Mr. George Bruce, builder; dwelling-house on the south side of Castle Terrace, for Mr. A. Edwards, Customs messenger, per Mr. A. Winchester, Architect (amended plan); two dwelling-houses on the south side of Rubislaw Den (South), for Mr. Charles A. Boddie, insurance agent; alterations at No. 325, George Street, for Mr. J. H. Stephen, engraver; wash-house and drying-loft in connection with Beechgrove House, for Mr. John Fyfe, granite merchant; three dwelling-houses on the east side of Holburn Street, for Mr. Robert Taylor Adam, house proprietor, per Mr. Duncan Hodge, Architect; eight dwelling-houses on the west side of Gray Street, for Messrs. John Gammie and Co., builders; three dwelling-houses on the north-west side of Menzies Road, for Mr. John Rust, Architect; six dwelling-houses on the east side of Grosvenor Place, for Messrs. Ellis and Wilson, Architects.

ABERDOUR.—A new public school, erected by the School Board of Aberdour, was formally opened last week. The site is opposite the Fleming Hall, and the principal approach to the new buildings is from the square of the village. Entering by the main door, which is at the west, the lobby, to the right and left of which there are teachers' retiring rooms, is reached, and it leads into the central hall, measuring 40 feet by 27 feet by 24 feet high. It is lined with bird's-eye maple, and is well lighted. From the hall the various class-rooms are entered, also cloak and retiring rooms. Outside shelter shades have been provided for boys and girls. The cost of the buildings is about £3,500, and they are built from plans supplied by Mr. Watt, Aberdeen.

ALSAGER, CHESHIRE.—The new Church of St. Mary Magdalen, at Alsager, was opened on the 8th inst. The Church will seat at present 450, but when the full scheme is carried out there will be accommodation for 700 people. The cost of the present portion will exceed £8,000, and an additional £1,500 will be required for the completion of the tower and spire. The Church is built of Alton stone throughout, the roofs and seats and dadoes being of pitch pine, and the chancel seats altar-rail, and altar-table being of wainscot oak. The Architects were Messrs. Austin and Paley, of Lancaster, and the builder Mr. John Fielding, of Alton.

BARRY.—The contract for the construction of a new dry dock for the Barry Graving Dock Company, to be made on land adjoining the company's works at Barry Dock, has been entrusted to Mr. Wills, of the firm of Messrs. Price and Wills, who are at the present time carrying out the new East Dock at Barry. It is stated that the new dock, which will be situated on the opposite side of the workshops, will cost about £20,000. Mr. Wills executed a portion of the Manchester Ship Canal, and the firm are at the present time engaged in constructing new railway works on Barry Island, new harbour works at Fraserburgh, in Scotland, as well as a 19-mile line of railway from Lincoln to Tuxford, forming part of the East Coast Railway. The work in connection with the new dry dock is to be commenced forthwith.

BARTON-ON-HUMBER.—The well-known old Church of St. Peter's, Barton-on-Humber, the tower of which was built about the time of the Norman invasion, and is well known to antiquarians, is about to be restored. The work is to be put in hand at once, under the superintendence of Mr. C. Hodgson Fowler, of Durham. The scheme comprises the building of an organ chamber on the north side, a new clergy vestry, restoration of the tower, renovation of the interior walls, and the purchase of a new organ. It is further proposed to re-hang the bells, and to add two new ones to make up a peal of eight. The cost is put down at £2,000.

BELFAST.—The first of the Hugh Henry Boyd's endowment schools, Belfast, has just been opened. It has been erected in Mayo Street, Shankill Road, at a cost of over £2,000, and consists of a suite of rooms admirably suited for educational purposes. The trustees have spared no pains in the effort to carry out the intentions of the late Mr. Boyd, and they are to be congratulated upon the success of this the first school-building under the scheme. In point of structure and arrangement it will rank among the best educational establishments in the city.

CANTERBURY.—The Canterbury Town Council has resolved to apply to the Local Government Board for sanction to expend a sum of £23,000 in laying down municipal electrical works. Mr. Robert Hammond, by whom the scheme was prepared, mentioned that out of 115 electric light undertakings in England, 66 are in the hands of municipal authorities, the capital invested amounting to about three millions sterling.

CHELTENHAM.—At a recent meeting of the Cheltenham Town Council the Town Improvement Committee made a report on the proposed kursaal, &c., for the town. The committee stated that they engaged the services of the Architect, Mr. E. R. Robson, who had had several interviews with the committee, and that he had prepared plans for the erection of a kursaal and baths at the south end of the Winter Garden, and for the conversion of the existing Winter Garden into municipal offices and a winter garden. Mr. Robson estimated the expenditure to be as follows: viz. £50,000 if all the work was done at once, and £53,700 if done in sections. The committee was of opinion that the proposals and arrangements, as shown in the plans and drawing submitted by Mr. Robson, were admirably adapted for the purposes for which they were intended, that the buildings would be a credit and an ornament to the town, and that it was the most efficient and useful way in which the existing lands and buildings could be utilised. The committee therefore recommended that tenders for the erection of the buildings be advertised for. It was, however, decided to adjourn the meeting to a special meeting of the Council.

COALVILLE.—The new Conservative Club, Coalville, the foundation stone of which has just been laid, is situated almost opposite the railway station, and when completed will be an attractive and substantial-looking building. The Architect is Mr. W. T. Hampton, and the contractors Messrs. W. Beckworth, of Whitwick.

COCKSHUTT.—On Sunday week three stained glass windows, recently placed in the Cockshutt Parish Church, in memory of the late Charles B. Robinson, Frankton Grange, were dedicated. The windows were designed by Kemp.

DARLINGTON.—The Church recently built in Bedford Street, Darlington, is of wood, with a corrugated iron roof, and was constructed by Messrs. Boulton and Paul, Rose Lane Works, Norwich. It is a very substantial structure. The contract was for £750, but it is estimated that the building, which will accommodate 300 persons, will eventually cost £900.

DEANSTON.—A new school, which has been in process of erection for nearly a year, was opened at Deanston last week. The school is built of light-coloured stone, with highly ornamental gables artistically decorated with dark brown painted wood. The roof is ornamented with fancy red tiles, and in the centre there is a large ventilator, surmounted by a gilded weather vane. The infant department is separated from the higher class rooms by a through passage. The infant school has accommodation for 62 scholars. There are three higher-class rooms, separated by glass sliding partitions, and the place can be converted into one large hall at will. The entire school has accommodation for 190 scholars, and there are extensive lavatories. The Architect was Mr. John

Murray, Kirkcaldy, and the contractors were—for mason work, Messrs. A. Ferguson and Sons, Doune; joiner work, Messrs. Reid and Hutchison, Doune; plumber work, Mr. John Kerr, Dunblane; slater work, Mr. Balfour, Doune; painting, Mr. G. A. Taylor, Lochgelly; plastering, Mr. A. Williamson, Largo; fencing, Mr. R. Campbell, Doune.

DUNDEE.—Plans and sections of proposed new buildings, &c., in Dundee, have been lodged with Mr. William Mackison, F.R.I.B.A., &c., Burgh Engineer, to be submitted to a meeting of the Works Committee of the Town Council on Monday, as follows:—(1) Ferry Road and Grove Street, W.C.'s and ashpits, &c., for the Scottish House Property Investment Co., Limited; (2) Forfar Road, byre, stable, &c., for John G. Sibbald; (3) Forfar Road, villa for James Foggie and Son.

GARDENSTOWN, N.B.—The new police station at Gardenstown is almost completed, and arrangements have been made for its occupation on the 24th inst. It is built with freestone corners, and the front is finished with blue stone from Tarlair. The contractors for the work were:—Mason, Mr. R. Morrison, Macduff; carpenter, Mr. John Gordon, Macduff; plasterer, Mr. Gibson, Banff; slater, Mr. Liddel, Macduff; plumber, Mr. A. Strachan, Banff; and painter, Mr. Forbes Watt, Banff. The Architect was Mr. M'William, Portsoy.

HALESOWEN.—At the last meeting of the Halesowen District Council, an hour was occupied in considering tenders for the construction of sewerage works in the districts of Halesowen, Cradley, the Lye, and other districts. It was eventually decided to accept the tender of Mr. J. Mackay, of Hereford, for £6,348, for the construction of works at Halesowen, Hasbury, and Hawne, and of Messrs. Cruwys and Holrough, of Gloucester, for £10,960, for the carrying out of works at Cradley, Lye, and Wollescote.

ILKLEY.—At a meeting of the Ilkley District Council, last week, eight ratepayers attended as a deputation with regard to the proposed purchase of a site for the Town Hall at a cost of £6,270, and urged that the quantity of land acquired was too much and the price too high; that a Town Hall was not needed; that a less costly building would provide the Council with suitable offices; and that the present site should be sold.

INVERURIE.—The fever hospital which has been erected at Inverurie, is now ready for occupation, and will in the course of a few days be brought into use. The hospital has been built by the Garioch District Committee and Inverurie Town Council, and it is intended to serve the whole of the district, including the burgh of Inverurie. The place where the hospital is built is about 300 yards from High Street, from which an approach road has been made. The situation is an open one, and a considerable distance from any other house. The hospital, of which Messrs. Jenkins and Marr, Aberdeen, were the Architects, consists of a ground floor and attics, and is divided into two entirely separate houses, entered by different doors. The smaller house includes two wards, which can be thrown into one, and which are at present fitted with three beds each. The other part of the building is by far the larger, and occupies the whole of the west or cross wing as well as part of the main structure. The west wing includes a large and small ward, which can be thrown together by opening the folding doors. In the large ward there are at present seven beds, while in the small one there are three beds. Additional beds, however, could be put in in case of necessity. In the main structure are the kitchen, matron's room, bathroom, etc., and in the attics are several bedrooms. The cost of the hospital has been about £2,000. The contractors were;—Mason—Mr. Wm. Lauder, Inverurie; carpenter—Mr. James Milne, Inverurie; plasterer—Mr. Robert Moir, Inverurie; slater—Mr. S. Christie, jun., Dyce; and plumber—Messrs. Laing and Sons, Inverurie.

KIRKLEY.—On Thursday, foundation stones were laid of a new mission hall and schoolroom to be built in connection with the Kirkley Friends' Adult School, on St. George's Road, Upper Kirkley, Mr. J. Gill being the contractor.

LERWICK.—At a recent meeting of the Burgh Commissioners of Lerwick, plans of a proposed new water scheme, which had been prepared by Messrs. C. and A. Leslie and Reid, Edinburgh, were submitted. The present water supply has been found insufficient for the requirements of the town, and, besides the deficiency of the supply, great difficulty has been found in getting off the peaty deposits in the loch. The new scheme provides for the erection of three new filters and two large settling ponds, also the laying down of an additional six-inch main and other necessary works. It is also suggested that the old pipes should be scraped, which would further increase the supply of water. The cost of the whole works was estimated at nearly £4,000. It was resolved to approve of the plans with some modifications, and steps were taken with the view of having the work carried out in the course of the present year.

LIVERPOOL.—At last week's meeting of the Mersey Docks and Harbour Board, the retirement of Mr. G. F. Lyster, Engineer-in-Chief to the Board, was announced. Mr. Lyster, who has been recommended a retiring allowance of £2,500 per annum, has occupied the position of Engineer to the Dock Board for 35 years, and during that period he has virtually transformed the entire dock system of Liverpool, the vast works which he has successfully carried out having, it is estimated, cost about nineteen millions sterling. For some years Mr. Anthony George Lyster has acted as assistant to his father, and the Works Committee now recommend him for the post of Engineer-in-Chief at a salary of £3,500 per annum. Mr. W. H. Le Mesurier has been recommended for the position of Principal Assistant Engineer, his salary being stated at £1,500 a year. The appointments, as well as the matter of Mr. Lyster's retiring allowance, will come up for confirmation at the next meeting of the Board.

LOWESTOFT.—The voluntary school accommodation at Carlton Colville, near Lowestoft, has been considerably enlarged, and last week the building recently erected was formally opened. The Architect is Mr. F. W. Richards, of Lowestoft, under whose direction a substantial school has, at a cost of £1,110, been built. Mr. W. J. Scarle carried out the brick, and Mr. A. G. Beckett the wood work. The interior of the building is 98 feet by 22 feet, divided by a sliding partition, both girls and boys being accommodated. It is constructed to hold 200 children, but 250 can be received, and there is ample room to extend in the event of future requirements.

NEWMILNS.—A new Town Hall at Newmilns, Ayrshire, was formally opened last week. The hall, a lithographic plate of which we published in our issue of August 26th last, is erected in memory of the late Mr. Hugh Morton, and is named the "Morton Hall." The building, which is of stone, is in the Scottish baronial style, the Architect being Mr. Arthur Harrison, of Birmingham. The hall will accommodate 1,000 persons, and is provided with rooms for the Town Commissioners.

NORTON FITZWARREN.—The Bishop of Bath and Wells has opened a village club and hall at Norton Fitzwarren, which have been erected and presented for the use of the inhabitants of the village by Mr. Wilfred G. Marshall, of Norton Manor. The buildings are of a commodious character, and include a large hall for concerts, &c., (which has comfortable seating accommodation for 250), reading room, smoking room, recreation room, and library. The building is of brick, with dressings of Ham Hill stone, and is situated at the junction of the road to Milverton with that leading to the railway station.

NUNEATON.—At last week's meeting of the Nuneaton Urban District Council, the appointment of a surveyor was considered. The district includes seven parishes, and there were six applications for the position, the salaries asked varying from £50 per annum to £80. The Council unanimously elected Mr. Arthur Moreton, of Nuneaton, at a salary of £50 per annum.

OMAGH.—A meeting of the executive committee for the new Infirmary for Omagh has been held in the Boardroom of the Tyrone Infirmary, Omagh, to consider the advisability of proceeding with the work of the new Infirmary owing to the contractor, Mr. Colhoun, having refused to take the contract on the original terms. Mr. Owen, Architect, was in attendance, and submitted reduced plans, which were considered by the committee, who thought it advisable to adhere to the original plans, as the alteration would produce a very inferior building at a saving of about £1,000 or £1,500. The committee decided to increase Mr. Colhoun's contract by £234, which would raise it to a total of £8,000, added to which the Architect's fees and heating would bring the total to about £10,000. The secretary stated that there would be a deficit of about £4,000, which, it was to be hoped, would be made up by generous subscriptions throughout the county. On the motion of Colonel Buchanan, seconded by Mr. Herdman, a resolution to this effect was passed, and it was understood that Mr. Owen, the Architect, should have an interview with Mr. Colhoun, the contractor, when the contract would be definitely signed.

SMETHWICK.—Mr. Charles Barnard, proprietor of the Theatre Royal, Aston, proposes to erect a theatre in Rolfe Street, Smethwick, at a cost of £8,000. The building will cover a site of 1,500 square yards, and afford sitting accommodation for 2,300 persons. The principal entrances will be in Rolfe Street, the galleries being approached from a side road. Each part of the house is to be provided with two separate exits; the gallery is to have an outside iron escape staircase on either side the building, which may be used in case of panic. In all, therefore, there will be four staircases from the gallery. The stage will be 63 ft. by 44 ft., and 50 ft. high to the gridiron, and will be on the most modern principles. The whole structure is to be made as nearly fireproof as possible, and will be lighted by electricity. The front elevation is in the classic style, and will be executed in Ruabon bricks, with stone dressings. An ornamental iron verandah will extend over the footpath the whole length of the building. The internal decorations will be of an ornate character. Messrs. Owen and Ward, of Birmingham, are the Architects, and Messrs. J. Harley and Son, of Smethwick, the contractors.

ST. MICHAEL'S.—The foundation stone of the new boys' school for St. Michael's parish, was laid on the 7th inst. The building, which will accommodate 168 boys, is to be of a plain description, and is on a high and commanding site at the crest of the hill, and adjoining the wall of the Fort. It takes in a peculiar piece of Architecture, which is thought to be a huntsman's arbour, used in the old days of the chase. The cost of the site was £360, and the contract was let for £1,275, which, with extras, exclusive of the site, amounted to about £1,400. In the new school a place is to be found for a capital bust of the late Mr. B. Wilson, who was at one time a master of St. Michael's Schools, and it is a capital specimen of the work of Mr. James Havard Thomas, who was at one time a pupil of St. Michael's, and is well-known as the sculptor of the Morley and Burke statues in Bristol.

WEST BROMWICH.—At a recent meeting of the West Bromwich Town Council a long discussion took place with reference to the proposal to pull down Meyrick House and erect new buildings to accommodate the police at Hill Top, and also to provide a reading-room, at a total cost of £2,000. It was explained that the estimated cost of altering Meyrick House was £750, but when tenders were invited for the work the lowest tender was nearly £1,200. Since then further subsidences had taken place, and it was thought best to have a new building on a site nearer the road, which would not be likely to give way. It was mentioned that the old house would fetch £200, so that the cost would only be £1,800. It was also explained that the Parks Committee had consulted a mining engineer, who assured them they would be perfectly safe in building on the site proposed. The recommendation of the committee was ultimately adopted.

CHESTER.—The three commodious new class rooms, which have been added to the British Schools in Victoria Road, Chester, have just been opened. The schools were founded 30 years ago, in 1867. They commenced with 130 scholars in

two departments. Additional class rooms for infants were provided in 1873 and 1877, and others for boys and girls in 1881. The Education Department, some years ago, required new cloak rooms, &c., but neither land nor money were then available for carrying out their suggestions. Some time ago, however, the London and North-Western Railway Company claimed a portion of the playground for widening their Saltney line; and on being released from the liability to purchase the whole of the school premises, they provided a plot of ground on the west of the schools, and allowed the managers £750 to rebuild the infant class rooms and provide the required cloak rooms, besides replacing the old crumbling wall by the splendid new wall in front of the schools. The work has been efficiently executed by the contractor, Mr. Thos. Mayers, of Rowton, from the designs of Messrs. T. M. Lockwood and Sons. Another class room being needed for the large boys school, it has been built, at a moderate cost, over one of the new infant rooms.

DONCASTER.—A portion of the Great Northern Schools, near the St. James's sidings, having been destroyed by fire, the Company has erected a new school for girls on the old site, and a school for boys at the junction of Green Dyke Lane. The schools have cost £4,500, and the boys' school has accommodation for 252, and the girls' for 310. Messrs. Brundell, Simmons, and Brundell were the Architects, and the contractors Messrs. Arnold and Son, of Doncaster. A clock-tower has been erected on the St. James's School, at the cost of the Great Northern directors, and cost £90, and the clock, which has been supplied by Potts, of Leeds, and cost £90, has been placed in the tower at the cost of the workmen, in memory of the late Mr. J. Shotton, manager of the works. The clock was handed over to the school by Mr. Geeson, and started by Mr. Small, on behalf of the subscribers.

GLASGOW.—The ceremony of laying the memorial stone of the imposing range of building erected by the Lancashire Insurance Company, in Glasgow, was performed by Sir Donald Matheson last week. The structure, which forms an important feature to the Architecture of the city, has a frontage of 60 feet 9 inches to West George Street, and of 108 feet 9 inches to Renfield Street. It is five stories in height, with a basement and attic floor, and on the Renfield Street frontage there is an entresol. The Company's offices will occupy the ground floor in West George Street, with a fine central portico for the entrance, surmounted by the arms of the Company. The other portions of the buildings will be occupied as shops and business chambers of first-class style, fitted with the most modern appliances, including a passenger hydraulic lift for the whole upper flats, entering from West George Street. The style of Architecture is Venetian, enriched by polished granite columns, and the stone used is red freestone from Locharbriggs Quarry, near Dumfries. Mr. Thompson was the Architect.

THE War Office authorities have decided to build a fort at Coomassie.

DIDIER SEVESTE is soon to figure among the effigies of the illustrious dead that adorn the house of Molière.

A LARGE structure known as Bretas Saw Mills, in Oystermouth Road, Swansea, has been destroyed by fire.

THE re-opening of St. Saviour's Collegiate Church, Southwark, has been definitely fixed for Tuesday, February 16th.

THE Vicar of Hampton is appealing for funds to repair the organ of the parish Church, which was the gift of King William IV. to the Church 66 years ago.

A BRASS tablet is to be placed in Bovey Tracey Parish Church, Devonshire, to the memory of the late Bishop Knight Bruce, who was vicar of the parish.

IN consequence of the recent strike in the engineering trade, a serious delay has taken place on the work of the second class cruisers "Arrogant" and "Furious," recently launched at Devonport.

THE cupola of the Church attached to the Military Hospital of the Trinity, at Naples, has fallen, burying two corporals, two soldiers, and two women beneath the *débris*.

RELICS FOUND AT THE DEMOLITION OF THE ROLLS CHAPEL.

IN the report of the Deputy Keeper of the Public Records, just issued as a Blue Book, the whole story of the Rolls Chapel, including its demolition, is told. There was a thought at one time of incorporating the old Chapel in the new block of the Public Record Office, removing only the roof, which, being made of wood, could not be permitted to remain part of a building which had to be fireproof. There were at least two precedents for such a course, one at Southampton, where a Norman house was incorporated in the town walls of the fourteenth century, the other at Rimini, where the walls and windows of a mediæval Church show under the Renaissance arches erected by Alberti for Sigiamondo Malatesta. This scheme was, however, abandoned when it was found that the old walls were thoroughly rotten, stonework and mortar having alike decayed with age. The rubble walls were, in fact, rent with long fissures, and there was no Architectural work that could be "restored" without being altogether re-made, mostly from entirely new designs. Under these circumstances, the First Commissioner of Works decided, it is said, with great reluctance, that the Chapel should be pulled down. Special treatment, however, has been promised to that portion of the new building which will occupy its site, and the old monuments and stained glass will be refixed therein. So the Chapel was pulled down, and Mr. Maxwell Lyte certainly gives one reason for the demolition of an ancient building which is unfamiliar. He can give a detailed account of the structure, which could not have been done if the walls had not been demolished. There were more prosaic and ruthless men in the days of the old Chapel of the Rolls than the Dean and Chapter of Peterborough. Seven years ago, as a consequence of successive alterations and repairs at the Rolls Chapel, there was not a particle of

MEDIÆVAL WORK

visible within or without. The inner roof was of lath and plaster, put up about 40 years ago, and the inner walls were lined throughout with plaster. The external walls were covered with a thin layer of flint, except in places where there were patches of comparatively modern brick, stone, and stucco. The buttresses had been removed or mutilated, and the four large windows were devoid of tracery. A mean and ugly building, says the Deputy Keeper, entirely without Architectural merit, and interesting mainly on account of its monuments and panels of stained glass. This was before No. 1, Rolls Yard, was taken down and revealed the walls, which it was thought, for a time, might remain. But when the actual demolition went on, all sorts of antiquarian relics were discovered. A window, for example, apparently dating from the time of Richard III., had, at an early date, been filled up with brick within and with rubble without. Still later, the tracery had been demolished and the upper part of the window filled up, partly with brick and partly with rubble, in which were found fragments of some of its former mullions. Again, there was a

WINDOW OF EDWARD I.'S TIME.

The jambs and mullions were of Caen stone, which had suffered little from age, but had been barbarously mutilated when the window was closed up, presumably in the middle of the seventeenth century. A fine chancel arch of the time of Henry III., the existence of which had never been suspected, was found in the east wall. The apex of it had been removed to make room for a window, but the stones were found in the north and south walls. The space under the arch could not be cleared to its base, which was two feet below the pavement, without destroying graves. The arch was therefore taken down. Every stone of it was, however, numbered and put away, and the intention is to re-erect it on a higher level near its original position, completing it with the fragments which were discovered in the north and south walls of the Chapel. There were buttresses of probably Henry III.'s reign, resting on brick arches of George I.'s day. In the north wall were found remnants of Architecture of Edward I.'s time and of Henry III. The Deputy Keeper of the Records gives a detailed description of the

MONUMENTS IN THE CHAPEL.

The history of the Rolls Chapel itself is cleared up by Mr. Lyte. It was originally the Chapel of the House of Converts founded by Henry III., for the reception of Jews who had embraced the Christian faith. The keepers of the House of Converts came also to be the keepers of the Rolls of Chancery, and the Chapel of the House of Converts came to be known popularly as the Rolls Chapel. There was a Master of the Rolls with the name of Sir Julius Cæsar, who, here in 1815, married Mrs. Hungate. The bride was given away by her uncle, Sir Francis Bacon. It is a popular error, propagated by Pennant's account of London, that Inigo Jones rebuilt the Chapel in 1617. There is no evidence to connect Inigo Jones with the Rolls Chapel, and he was not the ruthless restorer and reconstructor of that building in the seventeenth century. It is supposed to have been injured by the Great Fire of London.

KEYSTONES.

AT a meeting of the Wolverhampton Board of Guardians on the 8th inst., the General Purposes Committee presented a report recommending the Board to take immediate steps to secure a site for a new workhouse. No decision was arrived at.

A CHURCH is to be erected in the populous North-West Ward of Scarborough, which at present is situated in the parish of All Saints. A gentleman has offered to defray the cost of the edifice.

THE widow of Baron Maurice Hirsch, of Vienna, has resolved to present 2,000,000f. to the Pasteur Institute as a memorial of her husband. This will enable the building to be enlarged by chemical and biological laboratories, which it is estimated will cost 800,000f. Some of the professors, moreover, at present receive little or no salary.

THERE will presently be completed a new jetty at the north end of the Liverpool landing stage, which will enable the Irish and Scotch boats in future to be loaded or unloaded at any state of the tide. The new jetty will be connected with the harbour dock lines, which in turn connect with those of the various railway companies in Liverpool.

AN influential committee of clergy and laity at Sunderland have just resolved that a company shall be formed, with a capital of £10,000, for the purpose of pulling down some of the worst property in the town, and erecting model dwellings, reading rooms, institutes, and model lodging-houses in their place. In addition, the Sunderland Town Council is busy with a scheme for erecting about 450 workmen's dwellingss, at an estimated expenditure of £20,000.

THE construction of the Gouthwaite Compensation Reservoir is making satisfactory progress. The gauge basin beyond the great dam, and the training walls for conducting the river thence to its ordinary course, are practically completed, and early next year the Nidd, which has already been diverted from its original course from one side of the embankment to the other, will be led through the culverts in the dam, and the dam can then be continued on the side where the river now runs. The whole of the work at Gouthwaite will be finished in about three years.

AN inquiry has been held by Mr. W. A. Ducat, an inspector appointed by the Local Government Board, in the Manchester Town Hall, into the application of the Markets Committee of the Corporation for permission to borrow a sum of £12,000 for the purpose of purchasing property for the extension of Smithfield Market. It was stated that the Corporation had ample borrowing powers in connection with their markets, only £7,000 having been borrowed of £200,000 which they had power to borrow. The property it was now proposed to acquire was bounded by Oak Street, Scholes Street, and Foundry Street, near to the market. The reason the purchase had become necessary, was that so much produce was now brought to the market for disposal that it overflowed into the adjoining streets. He was instructed to ask that the Local Government Board would allow the full period of 50 years for the repayment of the money. The actual purchase-money amounted to £11,500, and the additional £500 was for expenses connected with the purchase. After the inquiry was closed, Mr. Ducat made an inspection of the property.

BRADFORD ART GALLERY.

At the close of the present photographic exhibition in the Bradford Corporation Art Gallery in Darley Street an Artists' loan exhibition of paintings will be opened. The list of works already promised shows the importance which Artists attach to Bradford as an Art centre, and shows that the sympathy and assistance of the Artistic world will not be lacking if the Corporation can be induced to lend, by the erection of an Art gallery, some substance to the movement about to be inaugurated for the celebration of the fiftieth anniversary of the incorporation of the borough. The display of works from members of the Royal Academy will be greater than at any previous exhibition. The successive Presidents of that body for some years past have contributed works to the annual exhibition at Darley Street, and Sir E. J. Poynter, P.R.A., has promised to follow in their footsteps by lending his important picture from last year's Academy, "Horæ Serenæ." Mr. G. F. Watts, R.A., will be represented by a very fine work entitled "Iris," which is lent by Sir William Agnew, to whom it belongs; Mr. H. Stacy Marks, R.A., sends his characteristic picture, "Old Schoolfellows"; and Mr. Frederick Goodall, R.A., a very uncharacteristic work—a large landscape in the south of England—which will be the more interesting from the infrequency with which Mr. Goodall chooses his subjects elsewhere than by Mediterranean waters. Mr. J. B. Burgess, R.A., Mr. Briton Rivière, R.A., and Mr. W. B. Richmond, R.A., will also be among the holders of full academic rank to exhibit. The last named, who is among the last to attain this dignity, sends his "Persephone and Psyche." Mr. David Murray, A.R.A., one of whose works was last year bought by the Corporation, sends two landscapes again this year; and Mr. Stanhope A. Forbes, A.R.A., will be represented by his work, "The New Calf," which will certainly be among the most popular pictures. It already has found an owner in Bradford, for it belongs to Mr. Daniel Delius. Another work of the highest interest is "The Annunciation," by Mr. Arthur Hacker, A.R.A., a picture which was bought out of the Chantry Fund. A good specimen of the work of Mr. J. W. North, A.R.A., who was a good deal talked about in Artistic circles a year or two ago, has probably never been seen in Bradford hitherto, but the exhibition will contain one very fine work of his. Pictures of Mr. George Clausen, A.R.A., and Mr. J. M. Swan, A.R.A., will also be included; and among the sculptures, which, owing to the unfortunate smallness of the gallery, will be few in number, will be a bronze bust of Mr. George Henschel, the musician, by Mr. E. Onslow Ford, R.A. Among the most eminent of the outsiders represented will be Mr. J. J. Shannon, Mr. H. H. La Thangue, and Mr. C. W. Furze.

EASTBOURNE IMPROVEMENTS.

A COMMENCEMENT has been made with the Marine Parade improvement at Eastbourne, an important work which will have the effect of connecting the east and west esplanades and of greatly adding to the attractiveness and enjoyable character of the Eastbourne sea promenade and drive. It was hoped by some members of the Corporation that it would have been possible to carry out this work for a sum materially below the Surveyor's estimate, namely, £9,800. But those who eagerly seized upon the fact that a tender much under the estimate had been presented as some ground for attacking the committee on its administrative policy in relation to the drainage works, were grievously disconcerted when this tender was withdrawn. As a matter of fact the tender of Messrs. Cooke and Son, which has been finally accepted, is only £200 below the Surveyor's estimate. These contractors have recently carried out some very important drainage works at Brighton in a highly satisfactory manner, and the committee is persuaded that they have placed the work in good hands. Again, as to the complaints which have been made on the score of unwarrantable delay, the committee is able to answer that it has obtained from the contractors a promise to proceed promptly with the work. The period named in the contract for the completion of the undertaking is six months from the date of signature.

SOCIETY MEETINGS.

Royal Institute of British Architects.—The fifth general meeting of the present session of the Royal Institute of British Architects was held on Monday, the 11th inst., at 9, Conduit Street. The President, Professor Aitchison, was in the chair, and business of a private nature was transacted. The result of the competitions for the Institute prizes and studentships of 1896–97 was announced as follows:—The Institute silver medal and twenty-five guineas (essays): subject, "The true value of tradition and precedent in Architectural Design." Full prize not awarded, but fifteen guineas was voted to J. J. Cresswell for an essay under the title "Things Old and New." The Institute silver medal and ten guineas (drawings): subject, "Measured drawings of ancient buildings in the United Kingdom"—F. G. Wass, device within circle (6 strainers). The Soane Medallion and £100 (for Continental travel): subject, "Design for a provincial market hall"—J. A. R. Inglis, Russet (6 strainers). A medal of merit was awarded to J. A. Swan (*Labor ipse Voluptas*, 6 strainers); and a certificate of honourable mention was given C. H. Holden (*L'Elephant d'Argent*, 6 strainers). The Pugin Studentship: Medal and £40 for travel in the United Kingdom (drawings)—W. Hayward (5 strainers); a silver medal was awarded to C. de Gruchy (6 strainers); and a certificate of hon. mention to Walter E. Dobson (6 strainers). The Godwin Bursary: silver medal and £40 for travel outside the United Kingdom (drawings)—R. Stephen Ayling (6 strainers). The Owen-Jones Studentship and £50 for travel and study of colour (drawings)—A. E. Henderson (5 strainers). Oldwinckle Studentship—Arthur T. Griffith (6 strainers). The Grissell Gold Medal and Ten Guineas, for design and construction: subject, "Design for a bay of a Church"—S. K. Greenslade; device, Heart and Shield (1 strainer). Ashpitel Prize—T. Denton Brooks, Doncaster. The Tite Prize, certificate and £30 (for travel in Italy): subject, "Design for an Italian villa and ornamental garden." The prize was not awarded.

Birmingham Architectural Association.—At a meeting of this Association, on Friday evening, Mr. E. Preston Hytch (Secretary to the School of Art) gave an address, entitled "The Architect as a Teacher." It was the duty of the Architect, he said, to stimulate work in the allied Arts. He could render to the community great service by facilitating the employment of worthy sculptors, mural decorators, wood carvers, and others. In this way his influence would also penetrate beyond those craftsmen working immediately under his supervision. This intimate connection between the Arts was clearly recognised in America. The attendance of young Architects at the various classes of the Birmingham Municipal School of Art was fraught with advantage to all concerned. It would be worse than a paradox if a community which spent large sums upon Art education should itself erect unworthy buildings. The possibility was considered of appointing, in connection with the First Commissionership of Public Works and Buildings, an advisory council of leading Architects, chosen on representative lines. Precedents could be found for the establishment of such a council. Giotto would not have done his great work at Florence had he not been appointed master of the works of the Cathedral and Architect of the city wall and of the towns within her territory. Attention was also called to the fact that, at least since 1885, no member of the Birmingham City Council was, in the municipal diary, described as an Architect. Birmingham did not stand alone in this matter, which was noticeable in view of the development of local duties and of their interest and importance to Architects. In conclusion, the lecturer summarised the work of the Municipal School of Art. A hearty vote of thanks was passed to him on the motion of Mr. Henman, seconded by Mr. H. T. Buckland, and supported by Mr. W. H. Bidlake.

Bradford Historical and Antiquarian Society.—Mr. Samuel Margettson, of Calverley, delivered a lantern lecture at the Church Institute, on Friday, the 8th inst., before the members of the Bradford Historical and Antiquarian Society, his subject being "Church Notes from Various Countries." Mr. J. N. Dickons (president) occupied the chair, and there was a large and appreciative audience. After remarking that village Churches were distinguishing features of English scenery, giving to it a character of its own, the Lecturer gave a resumé of the various styles of Church Architecture, from Saxon to Perpendicular, and then described and illustrated the typical Church in all its parts, giving views of the ancient lychgate, the churchyard cross, exteriors and interiors of Churches, porches, towers, roofs, fonts, benches, pulpits, lecterns, rood screens, stalls, piscinas, sedilia, reredos, monuments, and other features found in old Churches. Over 130 illustrative slides were exhibited.

Sanitary Inspectors' Association.—Before the members of the Sanitary Inspectors' Association, meeting at Carpenters' Hall, Dr. A. Newsholme, the Medical Officer of Health for Brighton, recently read a paper on "The Prevention of Tuberculosis." Mr. W. W. West occupied the chair.

Correspondence.

EXETER CHURCH COMPETITION.

To the Editor of THE BUILDERS' JOURNAL

DEAR SIR,—We notice in your paper of Jan. 6th, in reference to the Exeter Church Competition, that you ask for other competitors to send their drawings "with perspective sketches." Now, as by the competition instructions, perspectives were not allowed, and the successful drawings were published as sent in (geometrical drawings), we think it is hardly fair to illustrate perspective views. Only the drawings as submitted for competition should be published—that is, if a fair comparison is to be made. Everyone knows how perspectives can be, and are, made attractive to the eye, and every Architect knows how misleading they can be made.

We think, therefore, for the purpose of showing up the competition, only the drawings that were submitted should be published. If any competitor wishes, he can afterwards make a perspective for publication. COMPETITORS.

Notice.

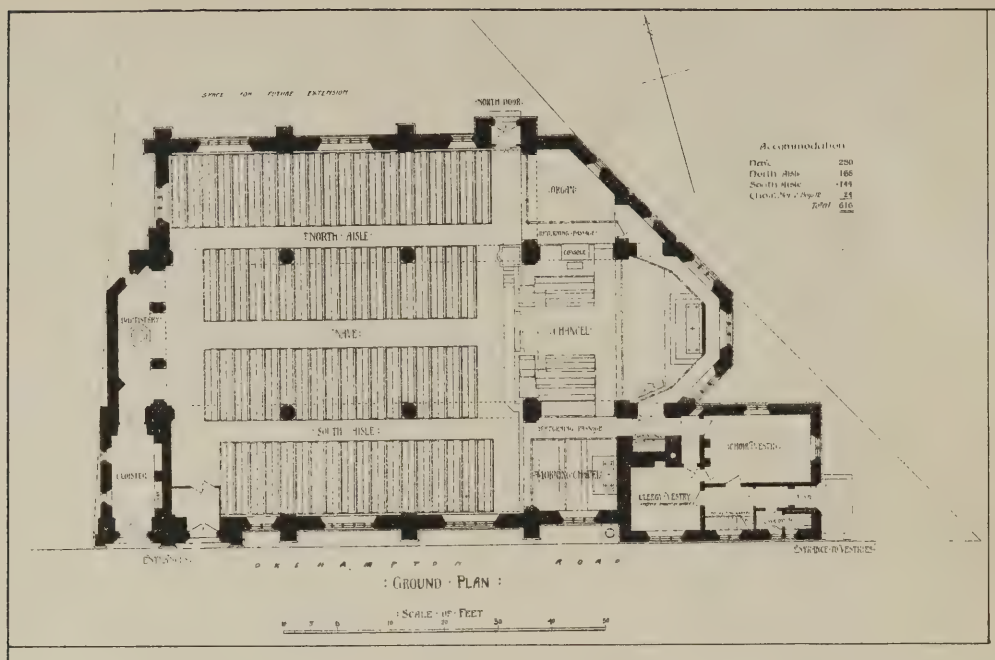
IN consequence of pressure upon our space, the further illustrations in connection with the Exeter Church Competitions are held over until the next issue.

A SITE has been secured at Nelson, near the South Park, on which the Roman Catholics intend to build a new school, at a cost of £2,000.

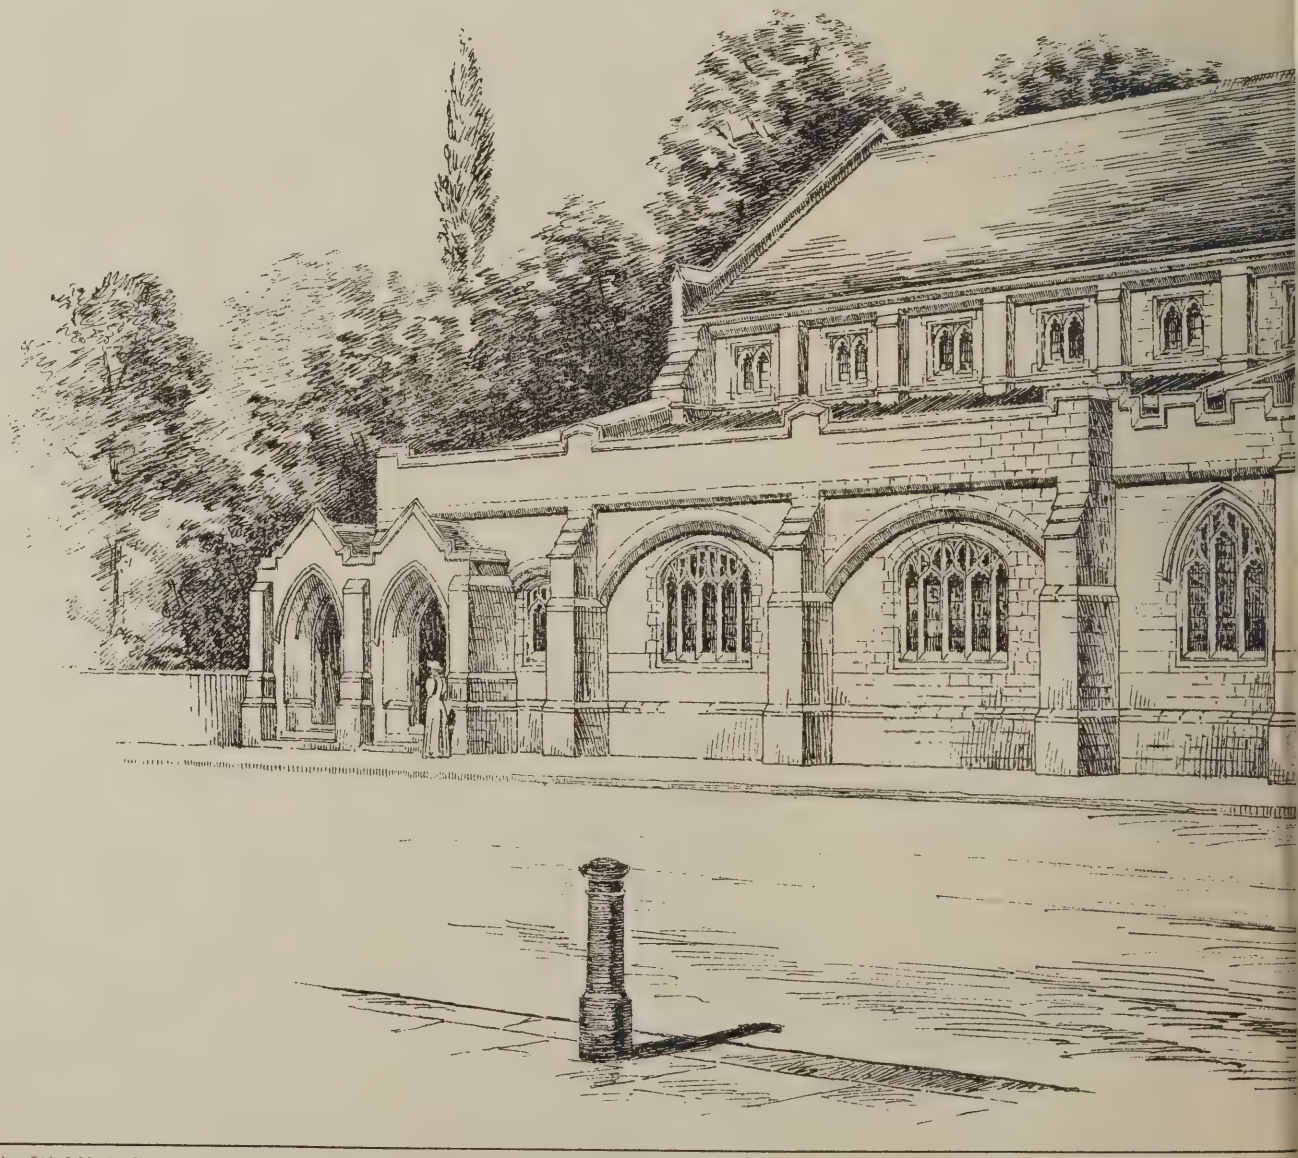
ALDERMAN HARDING'S offer to provide, at his own expense, a central equestrian monument and eight bronze figure lamps for the Leeds City Square has been accepted.

The plumbers' strike at Swansea terminated last week, the employers conceding the demands of the men for 9*d.* per hour for 48 hours during winter months, and 8*d.* per hour for 54 hours during the summer months.

MR. H. J. DOBSON, R.S.W., of Bradford, has been awarded the first prize of £100 in Mellin's Art competition, for his picture entitled "The New Toy," which was in the last Academy Exhibition.

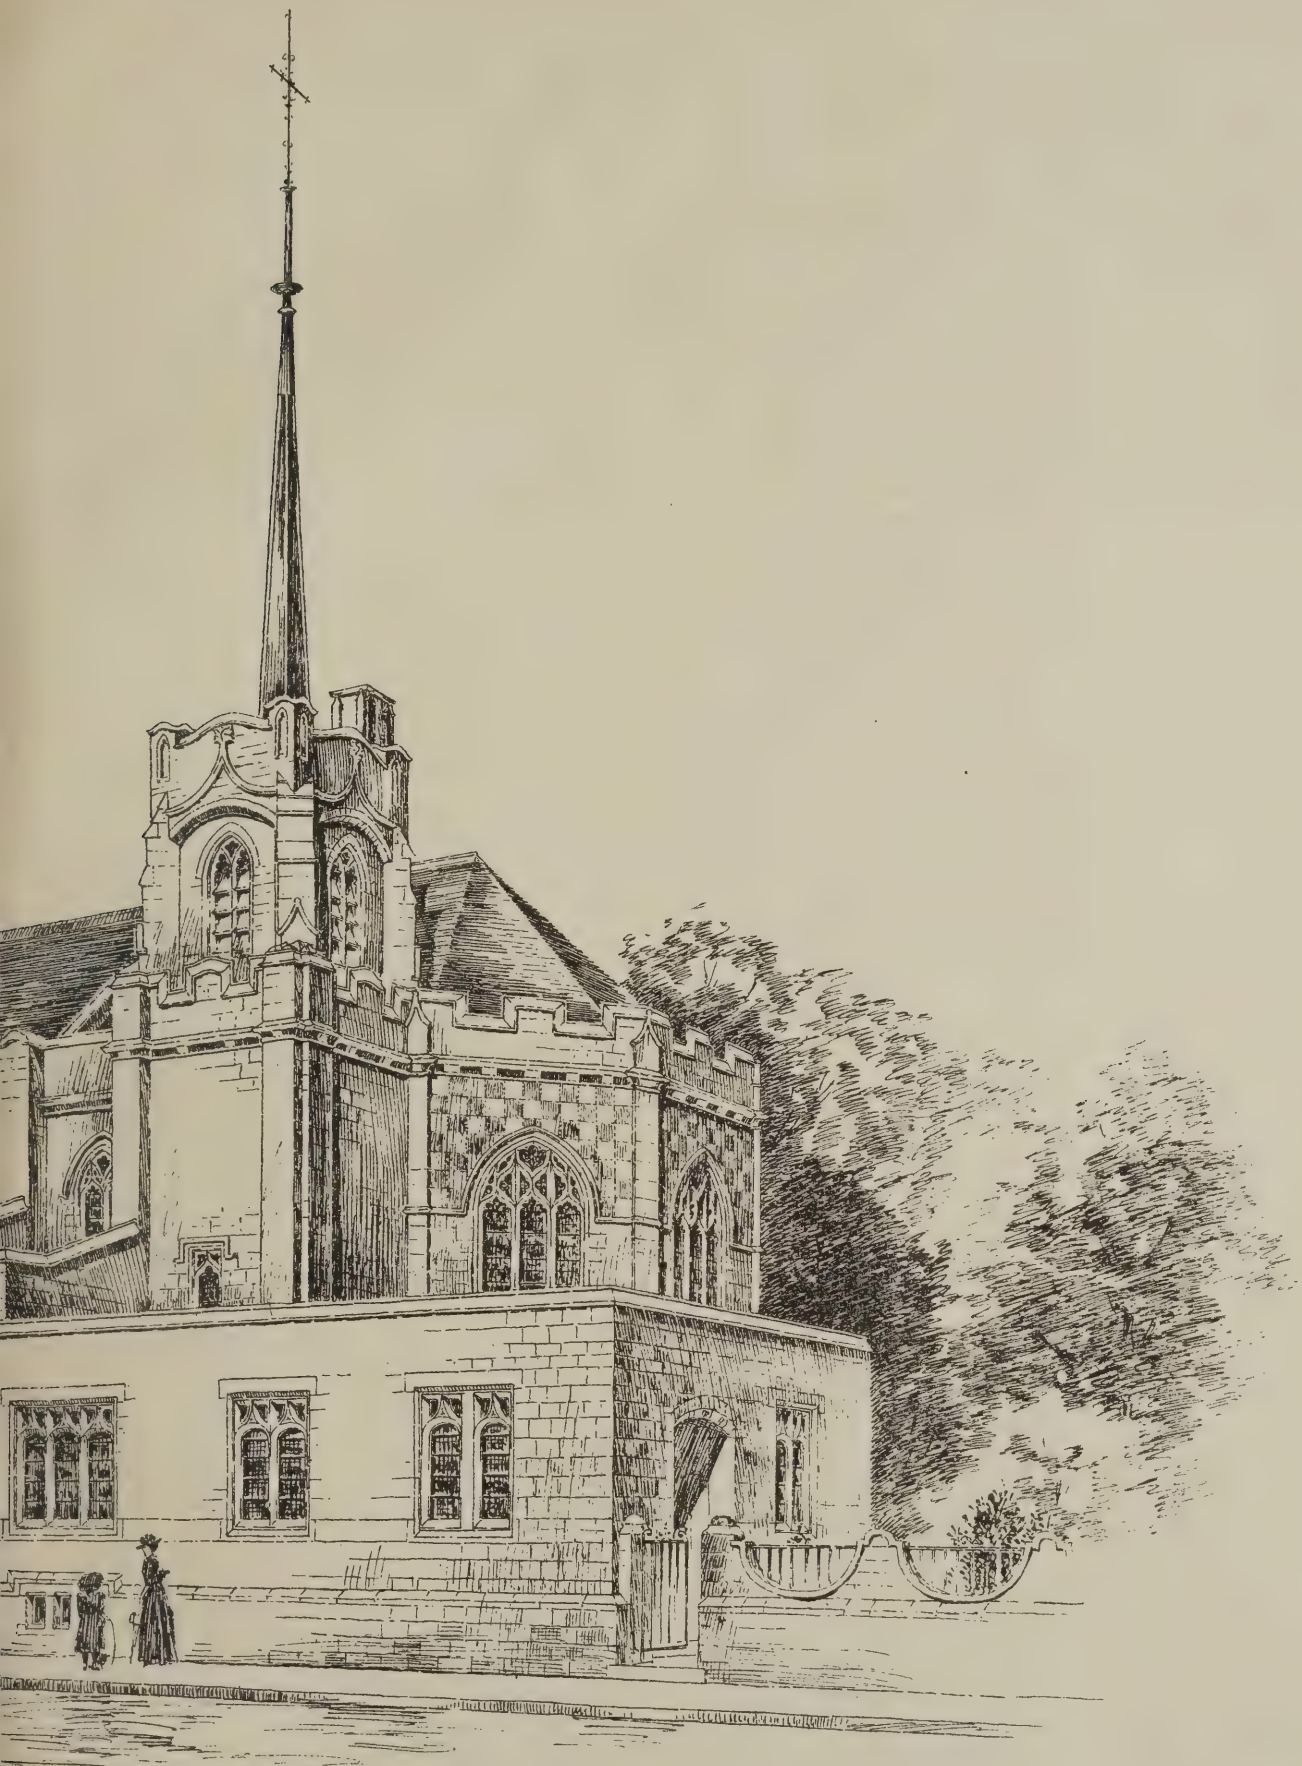


THE old station at Merrion, Ireland, has now been replaced by a handsome red brick structure, situate some hundred yards nearer to Booterstown. The railway company has now provided well-fitted waiting rooms and roofed the platform.



WHILE several men, employed on the Central London Railway Company, at Wood Lane, Shepherd's Bush, were pulling down houses a few days ago, one of the walls of one of the houses collapsed, injuring five men.

THE appointment is announced of Mr. C. R. Rowlandson as chief engineer to the M. S. and L. Railway Company in place of Mr. Alexander Ross, who recently accepted the position of engineer to the Great Northern Railway Company.



MR. W. J. WETENHALL, J.P., L.C.C., on Wednesday opened a Roman Catholic Chapel, which has been built at the cost of the St. Pancras Vestry in that part of the parish cemetery at East Finchley reserved for Roman Catholic interments.

The Institute Awards. The exhibition at the Royal Institute of British Architects, of drawings submitted in competition for the prizes, seems hardly up to the usual level this year. The first thing that strikes one on looking at the designs sent in for the Soane medallion, "A Market Hall in a Provincial Town," is a certain wildness of aim and inability to grasp the essential character of the subject, combined with, in most instances, a striving after novelty for its own sake, which gives the designs an air of pretension and vulgarity by no means pleasing. We see features thrown in without any regard to their appropriateness or value, in some cases without any suggestion from the plan, and in other cases we see the plan forced and distorted to obtain them. One of the partial exceptions to this general rule is the prize design by Mr. Inglis, and, if for no other reason than this, we would be inclined to agree with the award. This design, in its general conception and treatment, is perhaps one of the most suitable for its purpose, and is treated with a certain dignity and simplicity, though it is not altogether free from the prevailing faults. One cannot help feeling that the projections, both at the sides and the ends, including the segmental portico, have been introduced chiefly for the sake of effect ; that there is no sufficient reason for them, and that their features and details are far from satisfactory, and beneath the level of the general design. The principal staircase is too small and cramped for its purpose, and would not improve the general appearance as seen from this side. The elevational drawings are charming, but the perspective, while being in a manner pleasing, is weak, out of tone, tricky, and unscientific, not showing the design to its full advantage. This design, though perhaps a little too magnificent in style and not sufficiently studied in plan, is by far the most satisfactory on the whole. A medal of merit has been awarded to Mr. J. A. Swan, for a design which is illustrated by a rather striking coloured perspective. The plan is not very satisfactory, and seems needlessly complicated by the introduction of a fire-engine shed, which does not appear to have been asked for. The staircase looks like an after thought, and is too cramped for the exit from a large hall. The two elevations not shown would probably not look so well as those drawn, and this is noticeable in most of the designs ; though there is no reason why a building, standing in the middle of a square, should not look equally well from all sides. The design to which has been awarded an honourable mention, does not possess the solid qualities of the one placed first, and it is doubtful whether its selection for special approval is altogether wise. It exhibits, in a marked degree, that self-conscious affectation of originality which is always foredoomed to failure, and which in this case never rises above the eccentric, and which, while it may or may not please individual tastes, entirely overrides and destroys all the Artistic expression. The general plan and conception of the building—while it could, no doubt, be used for its purpose if absolutely necessary—is not the natural expression of the requirements, and so cannot strictly be called Architecture. The clumsy tower, with its flight of steep steps, is altogether unnecessary, and is simply a feature introduced, for its own sake, from caprice, and the plan is spoilt in consequence. Such features as the door in the tower, with its archway cut through a frieze of figure sculpture, and its voussoirs jointing into the figures ; the sculptured panels over the arcade, destroying the construction and effect of the arches below and supporting columns above ; and the large buttress taken up through the end window, where it is not wanted, are simply novel (if they are that) because they are bad—simply the originality of the man who talks bad grammar. It would have been better if the time and ingenuity expended on such details, and on the background of the perspective, and the eccentric motto, had been spent in studying the plan and the general composition. This design shows a certain feeling for Art, and is drawn in a free and confident manner, and is an example of that cheap form of success open to any man who permits himself to

FRIEZE PANEL. DESIGNED BY E. P. WARREN. EXECUTED BY L. A. TURNER.

override all principle and common sense. We have discussed this design at some length, because we feel that it is not advisable to single out such productions for special reward, that it creates a bad precedent, and is not altogether fair to other competitors, who might possibly have been able to produce just as interesting a design, if they had allowed themselves a similar license. There are other designs to which these remarks apply with equal or greater force, but then they have not been selected for honourable mention. Several designs exhibit good and simple plans, entirely ruined by the desire to make a show and introduce imposing and pretentious features; such is the design with the device of the scallop-shell, and those under mottoes "Artifex" and "Bumble." "Briton" has an entirely different rendering of the plan to the others. He places his Market Hall on the first floor, and utilizes the ground floor for shops. This plan is very simple and unpretentious; and though the elevation is out of proportion, and the general shape rather clumsy, yet there is something about the simplicity of this scheme which pleases by contrast with its surroundings. With a little study this might be made into a very charming building. The design under motto, "'Neath Southern Skies," is perhaps the worst example of a reasonable plan, entirely ruined by the superstructure. There is something pathetic in the contemplation of so much wasted energy and misdirected enthusiasm. The drawings are most careful and elaborate, even the chairs in the hall being drawn in, but there is not the first idea of design—simply an accumulation of inappropriate features. The designs for the Tite prize—an Italian villa with garden—are but two in number, and the prize is not awarded. These two designs are very unlike in character and in quality. That under motto, "Gondola," is a simple and straightforward attempt at a characteristic building, and is, to our mind, distinctly pleasing. Though it is not, perhaps, carried very far, it is good as far as it goes, and on the principle that an inch in the right direction is better than a mile in the wrong, we think this design might have obtained some recognition. The Grissell Gold Medal, for the best design for "One Bay of a Church," is awarded to Mr. Greenslade, for a very slight and dainty drawing—so slight that it hardly does justice to his rather original design. Mr. Greenslade, while not neglecting the construction altogether, seems to have devoted his principal energies to the Artistic side of the problem, as opposed to most of the other competitors, who have laid most stress on the construction. We notice that many of them have covered their drawings with notes of the materials and workmanship, such as "3 coats oils," "inodorous felt," etc. If this is what is wanted, would it not be better to have a complete specification submitted with the designs for this competition. For the Pugin Studentships are submitted several sets of drawings very unequal in merit, though there is perhaps little to choose between the winning set and that placed second, both of which contain some very good sketches. We cannot help thinking that some of these elaborate drawings, in which there is a great repetition of detail, take up more time than is justifiable, that the student does not learn sufficient to compensate him for his trouble, and that it would be possible to select the most promising student otherwise. We notice that the old-fashioned method of blacking in windows and sections has not yet entirely disappeared, and also the method of tinting the outline of full-size sections of mouldings with a line of colour or ink parallel to the curve of the section, which entirely destroys their character and effect, especially when the mouldings are small and the line of colour is wide. The set of drawings by Mr. Dobson, to which has been awarded an honourable mention, contains drawings of the South Porch of Lincoln, a delightful rendering of a most delightful subject. The silver medal for measured work is awarded to Mr. Wass, for an elaborate set of drawings of Melrose Abbey. These drawings are very careful, but to us they are terribly hard and inartistic, and we must say we prefer those of St. Mary-le-Strand, by St. Mary, though there is not so much of them. Mr. Corlette, last year's Owen Jones student, has devoted himself entirely to the study of the Abbey Church of St. Savin, near Poictiers, and we are not surprised at his evident delight in his subject, for it is certainly a magnificent old building, and we envy him for the good time he has had. His drawings are most elaborate, and seem to give one a good idea of the original. This system of colouring the elevational drawings seems a much more sympathetic way of reproducing an old building than a precise line drawing in black-and-white. The sets of drawings for the "Owen Jones" and the "Aldwinckle" studentships, contain one or two very interesting and careful studies, but the average does not seem very high. There are on view a few sets of drawings, called "Testimonies of Study," which call for no special remark.

SEWAGE PRECIPITATION, WITH A SIMPLE AND CHEAP METHOD OF PURIFICATION.

THIS was the title of a paper recently read by Dr. G. Carrington Purvis before the Edinburgh Royal Scottish Society of Arts. First, he said he wished to consider briefly some of the various methods of sewage purification by chemical means; and, secondly, to introduce a simple method of sewage purification by precipitation, with an analysis of the effluent. A glance at the literature on the subject showed that some of the proposers of new methods had little or no knowledge of elementary chemistry. Others were in the dark as regards cost of chemicals and materials required; whilst a third class seemed bent on making improvements on previous methods, many of which were of a rather questionable nature, the idea of the improver being to obtain a patent and then try to dispose of it as speedily as possible to a company or syndicate. He mentioned various methods now in operation, and also some of the precipitants used in these processes. Amongst the disadvantages of the lime methods were that the effluent was strongly alkaline unless mineral acids were already present in the sewage, some of the organic matter in suspension was rendered soluble, there was putrefaction of the effluent, there was apt to be a disagreeable scum on the surface of the effluent, and there was apt to a choking of the filters. The object he had in view was to discover something simple and cheap, and something that would not interfere with the existing methods of precipitation. He also desired to obviate the presence of free lime in the effluent, to remove the added chemicals, and to use non-poisonous substances, so that the sludge could be used for manurial purposes. These results he obtained by simply passing carbonic acid into the sewage and adding lime to it in slight excess. Under his system twelve grains of carbonic acid and sixteen grains of lime per gallon of neutral sewage was necessary. The advantages claimed for the system were that the alkalinity of the effluent was not due to free lime, that no scum was formed, and that the precipitate, being of a flaky nature, it concentrated more and more while standing, and was most likely to entangle and carry down micro-organisms. In addition, no organic matter in suspension could be rendered soluble, as was said to be the case with free lime, and nothing was added to the sewage which was not again completely removed from it. In the discussion which followed, Dr. Stevenson Macadam said he was not satisfied that the process described by Dr. Purvis was a safe or practical one, nor did he think that the doctor had been able to throw what might be called practical light on the question of the utilisation and treatment of sewage.

FAMOUS MONUMENTS OF ART.

By Sir Benjamin Stone.

AT the annual distribution of certificates in connection with the Saltley and Bloomsbury Branches of the Birmingham Municipal School of Art, Sir Benjamin Stone, M.P., delivering an interesting lecture on "Famous Monuments of Art" said, his lecture was designed to show how Art came to be such an important feature in the world's history, and to do this it was necessary to go back, to a remote period and take a very comprehensive view. In the times which we called Pagan, people worshipped all kinds of objects, which to them were sources of mystery and awe, and all through the history of these forms of worship the main inducement was to expend wealth and labour and thought on the erection of some kind of fabric which should be an honour to the deities worshipped—whether it was in the famous temples of the Sun, the ruins of which had come down to our own time, or the most perfect forms of Ecclesiastical Architecture which were the product of mediæval times, the great incentive was to expend as much labour and effort as the people could command in erecting glorifying edifices to the gods they worshipped. And when this sentiment was most pronounced then the buildings erected were the most beautiful and most worthy of notice. Another most important motive which operated side by side with the religious or ecclesiastical motive was the embodiment of emblematical design, and this

Adaptation of Emblems

was so far-reaching, that at this day we were distinctly under the influence of efforts made in such remote ages, that their history had actually been lost. Thus the sun was the emblem of heat and power, trees of life and renewed life, objectionable animals, such as the serpent, of mischief and trouble, and so on; and this use of emblems had played a most important part in the teaching of humanity and the development of education to its present high condition. The very first form of language was put into shape by letters which were emblems, and right through the history of the human race they had exercised a most potent influence. In no other period was it so pronounced as in mediæval times, and in the Ecclesiastical Art of that time it reached its highest point. Emblematical design formed one of the chief motives of the decorative Art of that age, as evidenced in the magnificent Cathedrals and Temples erected then throughout Christendom. Another great motive of all ancient Art was preservation of the history of the dead, and its influence was traceable from the earliest efforts of the Egyptians down to the tombstones in our English churchyards. In addition to all these, there was the motive of domestic decoration, and we found that this influence was most effective in the great times of Ecclesiastical Architecture.

The Palaces of the Kings,

the castles of the great, and the dwellings of the rich were then most beautiful—not only in the times of the Romans and Grecians, but in both earlier and later times was this so, and the evidences ensured in the beautiful Guildhalls, the Trade Halls of Belgium, and the Town Halls in all parts of Europe, as well as in the buildings of an ecclesiastical type. In our own times we were not so much influenced by either the ecclesiastical or the emblematical motive; we had arrived at a better and more satisfactory condition of things, and loved Art for Art's sake. We encouraged its spread and the lessons to be derived from it, because the average of the human mind had risen to a point of culture and refinement unknown to our predecessors. In earlier times, Art was an exotic, made to flower and flourish under artificial conditions, but the Art of to-day stretched over a much wider area, and even among the poor there was a sense and knowledge of the beautiful and the refined, or, to use a common expression, of what is "nice." And the world was the better for it, because it must have a refining influence.

VAUXHALL BRIDGE has been re-opened for vehicular traffic, the slight breach or subsidence in the carriage-way on the Pimlico side which recently occurred having been repaired.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

Decorative Plaster Work.

With Illustrations.

By E. PRIOLEAU WARREN.

AMONG the subsidiary Arts with which the Architect has to deal there are few of more general application in importance than that of the plasterer. So much of our construction nowadays is of necessity concealed, and plaster is so handy a means of concealment, and indeed, when rightly used, so excellent a one, that its use in the interiors of buildings is inevitable.

It is a material so sympathetic and lending itself so easy to decorative treatment and the repetition of ornamental design, that a vast amount of decorative plaster work—good, bad, and indifferent, and I fear that the last two adjectives are fully entitled to qualify two-thirds of the work—is daily done. There are none of us who can well escape its use even if we wish to do so. It therefore behoves all of us who have to do with building and decorating to consider and to learn what can and should, or what cannot and should not, be done with plaster work; and it is much more with a desire to direct the attention of the younger members of my audience to some of its uses and abuses, than with any hope or intention of giving technical instruction, that I venture to appear before you.

One of the first considerations that borders the subjects of plaster work is that of its fatal facility—which constitutes a great decorative danger, its comparative cheapness, its possibilites of rapid workmanship, and the endless and easy opportunities of reproduction that it affords—in a word its immunity from the natural and powerful restraints that cost and structural necessities impose in most other building material, seem to me in the case of plaster work to render self-imposed restraint and careful discrimination more than ever necessary to the designer.

We are all of us, unhappily, familiar with the incontinent cornices of amazing horticultural suggestion, with their basketwork and lattices, their vines and passion flowers insecurely supported by internal vines, which bedecked the chief chambers of our fathers. We all know, and none of us, I hope, love the weirdly confectioned "centre flower" with dependent "gasalier" that formed the cherished ceiling ornament of the British householder in the '50's, the '60's, and even the '70's, and dropped in intermittent fragments into his tea cup or his soup tureen—so fearfully and wonderfully made, so all-pervading were these adornments, that they begot a natural nausea in time, a nausea that—as often happens in such cases—communicated itself in mental connexion to the innocent material that they vulgarised, causing sober folk to foreswear ornament of any kind in plaster work, to find a safe and wholesome refuge in absolute negative, absolute plainness. This was, of course, only a partial revulsion, and was accompanied or followed by "revivals," as they are called—of many types in plaster work, and in all Architectural design. The beautiful ceilings and friezes of the 17th century, which made our country famous for its plaster work, were studied to good purpose by the very few, to evil by the very many, and "Elizabethan" and "Jacobean" travesties became nearly as rife and rampant as the exuberance of the centre-flower period. "Revival" of Italian, French, Saracenic, indeed of all and every bygone manner, have been practised, and there are many eminent plaster shops where you can buy a "reach-me-down" design in imitation superficially correct of any style you please, at so much—the term is apt—"per superficial foot." These things have had a great vogue with the uninstructed, they please because they offer a romantic suggestion of a possibly romantic original, or of the manorial or seigniorial appurtenances of romantic fiction. A suggestion only, for even as copies they are poor, with their dead-level, floated grounds, their railway-line rigidity of "run" mouldings, their sharp arrises, and mechanical "repeats." What a contrast they offer to the originals they travesty! Any one who examines, with eyes of discernment, a good seventeenth-century English ceiling, will see that beautiful as the plan of design and forms of ornament may be in themselves, they only count for a portion of the total sum of beauty. The hand of time, and recurrent coats of whitewash, have often done much in contribution of effect, but the intrinsic, ineffable, underlying charm of handiwork is of human pleasure and interest, if "handling" is there.

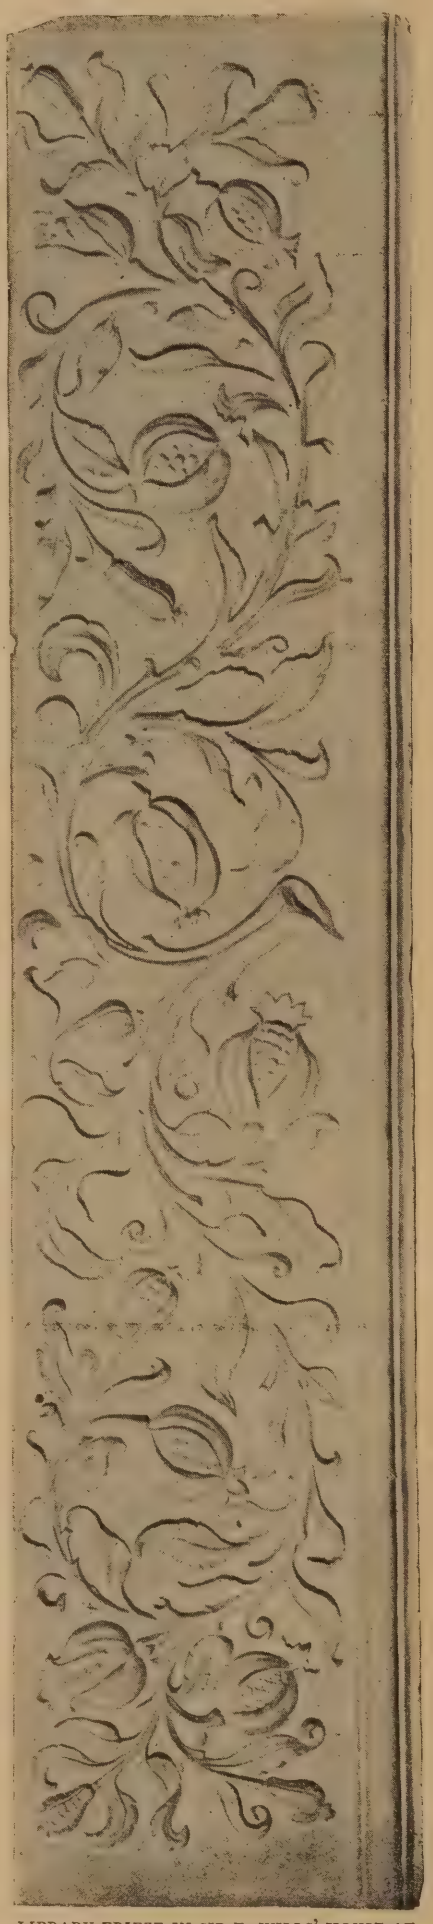
PANEL OF SANCTUARY CEILING, GROOMBRIDGE CHURCH.—FIBROUS PLASTER. DESIGNED BY E. P. WARREN. EXECUTED BY L. A. TURNER.

The plain surfaces are not hard and level, they are full of slight undulations, the ribs or "strap work" have no mechanical rigidity, they are by no means accurate at their intersections, they are softly and pleasantly moulded, and usually undulate somewhat with the uneven surface of the ceiling.

The ornamental foliations—bosses, roses, and the like—when they repeat, do not do so with regimental exactitude; awkward corners caused by irregular wall lines, chimney breasts, etc., are lightly and nonchalantly dealt with; there is no strained attempt at fit, begotten of the drawing-board; the design is curtailed, expanded, chopped off, or twisted to meet the emergency in a manner that would look queer on a smart office drawing, but is delightful in reality.

Experts differ very much as to the methods of preparing the plaster used for these old ceilings, and as to the way in which they were put up. It is, of course, well known that some were rendered in lathing, some on rough withies, and some on reeds or rushes. It is obvious that casting was employed in many instances for the ornamental foliations and bosses, and it is stated that a sort of stamp or pressing-mould was employed for repeating ornaments of small size, such as the roses in the beautiful ceiling at Chastleton, one or two of which I was able to examine closely, as they had fallen down. They certainly seemed to me to have been squeezed into a mould. There are many indications that a good deal of the rib-work was formed by pressing into the plaster ceiling, while still damp, lengths of rib in a similar damp condition. One finds awkward joins and curious failures to fit to a centre, in the case of radiating ribs, which warrant that idea.

If you examine a fallen bit of plaster from one of these old ceilings you will generally find it very thick and coarse—often very earthy, and sometimes full of little bits of gravels, &c., the kind of stuff the conscientious Architect would have to condemn. But its very coarseness helped the effect of the plain surface by giving them texture, a quality we so often miss nowadays. How the elaborate and complicated ceilings were designed and set out we do not know with certainty, but there was probably a rough plan, which was all that a well-skilled workman needed he had his tools, his models, and his traditions. That he had models of ornaments for ceilings and friezes we



DRAWING ROOM CEILING IN HOUSE OF SIR F. WILLS, BOURNEMOUTH. DESIGNED BY E. P. WARREN. EXECUTED BY L. A. TURNER.

know, as we find exact repetition not only in different rooms of the same house, but in different houses. And you will often find ornamented designs, obviously intended for a ceiling, formed into a frieze or used to decorate the spandrels left between the horizontal frieze and the end of a vaulting ceiling, as in the library at Merton College, Oxford. It is probable, however, that much if not most of the decorative design was modelled *in situ* on the ceiling itself, partly with tools, partly with fingers.

When fingers were used upon the actual plaster it is obvious, as any plasterer will tell you, that the lime used cannot have been as sharp as that we use now—it must have been old or deadened, or the man's fingers would not stand it.

There are many lessons to be learned from the abundant examples to be found in almost every county of England, of beautiful old plaster work, while Scotland, Wales, and Ireland have their characteristic examples, and one of them is the extreme importance of plain surfaces of texture. I am glad to know that within the last few years that lesson has been taken to heart by one or two Artists who have turned their attention to plaster work. There were some striking instances of the fact in the work of Mr. Ernest Gimson, at the last Arts and Crafts Exhibition, work full of charm and feeling and quiet originality, and delightful in uneven surfaces, roughish texture, and broad unlaboured modelling; work as different in spirit from the average mechanical plaster work of to-day as was that of the Elizabethan or Jacobean plasterer. I believe that the first essential of success in plaster work of frieze or ceiling is the treatment of the ground. It will be difficult but necessary, if we are to succeed, to wrest from the modern workman his ideal of perfect even-floated and set levels, innocent of the faintest undulation as fresh thin snow over a sheet of ice, and looking just as cold and hard. It is amazing with what skill a good and conscientious plasterer, armed with his float and straight-edge, will arrive at that result. It is neat, it is smart, it is difficult to do, and he is proud of the achievement, and I do not blame him: he does well what is expected of him, and satisfies his conscience, we will hope. When his ceiling is to be subdivided by ribs, or decorated with ornament of any kind, he still appears to be ruled by the instinct for sharpness and rigidity. He starts with a billiard table surface, the ribs are "run" with a zinc mould *in situ*, or are cast in a "run" reverse mould and put up subsequently, the ornaments are cast from sharp, feelingless models, and the work reaches a wonderful perfection of mechanical accuracy which, to the mind of an Artist, is its glaring imperfection. The arrises are sharp as razors, the beads are round and smooth as glass tubes, a correspondence religiously exact is maintained on both sides of a certain line. The cornices are run as accurately, as mathematically as the rest, and the drawings and details are faithfully observed. The result is naturally as unsympathetic as the method. I speak of the average. I am well aware that, fortunately, there are exceptions—I am happy in believing that they are many, and the number seems likely to increase rapidly, as Architects increasingly devote more time and thought to what is one of the most interesting and important crafts amongst the many that they rule. What we need, it seems to me, to fit us for a more competent control of plaster work—as of so many crafts, is to draw less and model more. Fortunately, within the last few years a good many sculptors of talent have turned their attention to decorative plaster work, and beautiful ceilings, friezes, and panels in low relief, stand to the credit of several men whose names are well known to you. There is an increasing demand for decorative work in plaster. People, even of moderate means, are no longer generally content with the blank white lids of the boxes they live in. This discontent is exemplified in many ways, one of them is that suburban joy, the patterned ceiling paper; other indications are the patent substitutes for modelled ceilings, whose illustrated catalogues, with their alluring titles, are lavished in the letter-box and waste-paper basket of every Architect. A design for decorative friezes is also prevalent, and is exemplified by precisely similar instances. If this discontent is responsible for many queer results and unlovely makeshifts, it is not in itself ignoble. It is our business to divert it into wholesome channels. The instinct to enrich the ceiling or the roof is, I think, a natural and an obvious one—the roof is surely as worthy of adornment as the walls. In a Church or great hall it is, or should be, the crown and glory of the whole scheme. In domestic work, in the home of the average comfortable Briton, the cheap substitute for modelled plaster work obtains a readier acceptance on account of the fact that we dwell—most of us—like hermit crabs, in other people's shells. The leasehold condition of our occupancy has begotten a leasehold type of decoration. The householder wants something that will "last my time, don't you know"—or, at any rate, suffice for seven, fourteen, or twenty-one years. So he not unnaturally shrinks from permanency, which implies cost, and he thinks the real thing costly; but, as a matter of fact, it is by no means necessarily so. With care and thought, and a little ingenuity, it is possible to get good decorative results in plaster at small cost. There are many ways, for instance, of redeeming the absolute bareness of a plain plaster ceiling without much expenditure. You can have a well-moulded cornice and divide your ceilings into plain panels by means of shallow ribs. At very little extra cost, if your design "repeats," you can put some simple little ornament into the panels. You can dispense with ribs, and have ornamental corner-pieces and a centre; or you can have the general field plain, and have an ornamental circle next the cornice, and modelled in low broad relief. Where your conditions make it possible, and, I should say, in a longish room or corridor, you can drop the cornice a little way down the wall, and form your ceiling to a shallow curve. This may be delightful in itself, even if quite unrelieved, or can be very effectively decorated with light ribs at intervals and simple flattish ornaments. There is really no end to the simple and effective possibilities of very slightly decorated ceilings. I have seen an old ceiling in a low room at Oxford which has four corner ornaments and a centre, very simply indented in a highly conventionalised grape-vine design—and it wants nothing more—but the plain surface is such as would horrify the skilled plasterers of to-day.

LIBRARY FRIEZE IN SIR F. WILLS' HOUSE AT BOURNEMOUTH. DESIGNED BY E. P. WARREN EXECUTED BY L. A. TURNER.

The ceiling under an ordinary collar-rafter roof frequently gives a pleasant opportunity for plaster decoration. You can accept the splayed side between ceiling and cornice, and treat it as a sort of sloping frieze, ornamenting the flat under the collars more simply and sparsely, or you can fix out and form a curved or vaulted ceiling, as I have suggested before; and a vault is one of the most delightful fields for decoration.

When cost is not a closely restrictive consideration, the range of possibilities is wide for ceiling, frieze, decorative panels in chimney breasts, or such like positions, or for the treatment of the walls themselves. It is sometimes desirable—in a hall or a ball-room, for instance—to treat the walls with a permanent Architectural decoration that precludes further adornment by means of pictures, wall papers or hangings, and this, if you use low relief and have a good protective base or dado, can well be done with plaster work, by means of pilasters, decorated panelling, reliefs, &c.

If pilasters are used, it is generally advisable to enclose the plaster relief in a wooden frame, for preservation's sake. Whatever the field of your decoration, it is necessary, of course, to use restraint, to avoid over-crowding and fussiness, to aim at a broad decorative result, to remember that you will cheapen your devices by over-repetition, and spoil your ornament by over-elaboration. The eye wants some unornamented spaces to rest upon. It seems to me in most cases wise to have rather plainly treated walls and a simple frieze, for instance, where your ceiling is elaborate, and a simple ceiling where you want an elaborate frieze. It is hardly necessary to say that your plaster work should be "plastering" in effect, found and soft, and should not imitate the treatment of any other material.

The ceiling, frieze, panels, or whatever form the plaster work may take, should fall into the Architectural scheme of the interior they contribute to, they must be in coherent relation to the rest. The scale must be preserved. And there are many considerations to be taken into account in designing a frieze or ceiling. The proportion of the room, of course, first. It is obvious that the same design would be inappropriate, in one instance, if applied to two rooms, one of which was 10 ft. high and the other 20 ft.,

and that a long, low room needs different ceiling treatment to a high square one. Then the lighting must be taken into account. Where the tops of the windows reach nearly to the ceiling, and especially where a longish room has such windows pretty evenly distributed along one side

MODEL OF A CHURCH CEILING, BRADFORD, YORKS, BY GEO. FRAMPTON, A.R.A., E. P. WARREN, ARCHITECT.

only, very delicate relief will tell at a considerable height. In the same room if the windows are low, or so small as to give inadequate lights, the relief will require to be bolder in order to tell. A room lit from two opposite sides, giving a strong cross light, is the most difficult to treat successfully. The cross light defeats the shadows and spoils the effect of relief; in such a room greater emphasis, greater sharpness of modelling is advisable. All these remarks are intended to apply to daylight effects, but artificial lighting should be considered too. In great reception rooms, chiefly used at nights, and in all rooms intended to be brilliantly lit—say, by electric light—it is well to keep the relief rather softer and more delicate than in rooms of more ordinary character in illumination.

As a rule, in an averagely lighted room, up to 13 ft. or 15 ft. in height, the relief of ceiling-mouldings or ornaments does not require any great projection if the ceiling is left white or nearly white, as relief looks exaggerated. Ribs, I think, are but rather broad and shallow in form, and with a tendency to round members rather than sharp arrised ones. Their size, of course, must depend upon the scale of the room, the heights at which they occur, and the effect arrived at. Constructional beams, dividing the length of a ceiling, frequently helps the design greatly, and are capable of very effective treatment in themselves. In many a splendid old ceiling the ornament was confined entirely to the beams and the cornice with which they intersected.

When there are no beams, I am personally inclined to prefer detachment between the decorative design of the ceiling and the cornice. This helps you if you wish to leave the ceiling whitish, and to colour the cornice; and, generally speaking, the cornice must be regarded as the crown of the wall and not as the beginning of the ceiling.

However, that is, after all, a matter of design or circumstance; it is risky to generalize too freely. But it is safe to say that too much attention cannot be bestowed, first, on the ground surface—whether of ceiling, frieze, or panel; and, second, on the modelling of any ornament, whether simple rib or foliated or arabesque design. If you cannot be sure of getting good modelling, have none at all: find safety in plainness. If you wish to avoid sharpness and hardness, have ribs and cornices modelled, not run. Keep them simple and broad, not liny and wiry. Generally speaking, I believe, that for ceilings, a more or less geometric basis for the leading lines, gives the happiest effect; the arrangement should, at any rate, be ordered, if not formal. But whatever the basis and whatever the treatment, the design should essentially be a ceiling design, the ornamentation of a flat surface, to be seen from below, and in a room where it is intended to be seen from all points, it should "read," as it is called, in all directions equally well, though it may have a main longitudinal or lateral tendency. It is, perhaps, hardly necessary to counsel the avoidance of any obviously unsuitable type of design for a ceiling, such as sways and festoons, suitable, perhaps, on a vertical surface like a frieze, where the sense of vertical dependence is appropriate, but inappropriate and awkward as a ceiling. A frequently effective treatment for a tallish frieze is to have some form of ornament repeated at widish intervals, the interspaces being either quite plain or filled with a plain moulded panel. Up to this point in my paper, I have so far dealt with the consideration of plaster work for the interiors of private houses. Great mansions and great civic buildings differ in degree rather than in kind from these, and, as regards their internal plaster work, the principles applicable to smaller buildings apply to them. Where deep-beamed and coffered ceilings are used, greater structural supporting is needed for them, and bolder modelling and moulding of course, to preserve their relation in scale to their Architecture. They often present the decorative problem of the treatment of domes, of which in a civic building, I have not yet seen a strikingly original treatment in plaster-work. I have seen, however, dozens of domes treated with diminishing coffered panels, whose framework ascends on converging radial lines. Wren left us many fine instances of these. The dome of St. Stephen's, Walbrook, is, I think, the most beautiful instance I know. In this dome there are four tiers of diminishing coffer panels, the second above the cornice, and the final one having panels corresponding in width to those of the first and third. And, indeed, Wren's Churches, and those of his pupils and immediate successor, provide abundant field for study of a certain type of design in plaster work, mannered and formal very often, but full of vigorous character and excellent workmanship.

A great deal of the plaster-wash, which is by no means confined to the ceilings of our city Churches is, of course, subject to the criticism of being in direct and purposeful imitation of classical Italian models in stone or marble. The coffered soffits of the arches of St. Bride's, Fleet Street, and St. Katherine Cree, show this strongly, and it is observable that in St. Paul's Cathedral stone and plaster details are of precisely the same character. In St. Stephen's, Walworth, there is much fine plaster work beside the dome, there are light and narrowish arch soffits with running patterns of roses, &c., and the transverse arches of the vaulted roof, mark the plain vaulting bays, unrelieved except by a large centre boss, with a boldly-modelled band of convoluted foliage ornament. The Churches of St. Mary Aldermary, and St. Katherine Cree, both have groined Gothic ceilings in plaster, very reprehensible theoretically, but distinctly picturesque. And at St. Mary's Aldermary, the arch spandrels of the nave arcade are charmingly filled with coats-of-arms, and flowers, and fruit, &c.—a good instance of the effect of confining ornament, using it to give special emphasis to particular features of construction—the wall above the arches being perfectly plain. Christ Church, Newgate, shows a sparing use of plaster adornment. And the beautiful little interior of St. Anne and St. Agnes, Aldersgate, shows in its large decorative panel borders, its shallow arch cofferings, and the enriched soffits of its corner spaces, some graceful and delightful examples of this Anglo-Italian Architectural style of plaster work.

It has been reserved for the last few decades of this century, and the devotees of the "Gothic Revival," to find that plaster work is inappropriate to the interior of a Church. In the seventeenth and eighteenth centuries, and until near the end of the first half of the nineteenth, plaster ceilings were the rule and not the exception in Churches.

A great many very charming ones have disappeared before the hand of the restorer, but several seventeenth and numberless eighteenth-century examples remain. I am glad to see that plaster work is regaining its place in Church interiors; it provides, at any rate, a pleasing variant to ceilings of stained or painted deal, or to open roofs with timbers of a small scantling and wrought "die-square." For the enriched ceiling of sanctuary, chancel or side chapel, I think it is a most excellent material; and the invention of fibrous plaster makes it possible, with little difficulty and comparatively small cost, to use enriched plaster work, not only for ceilings, but for other decorative purposes in Churches.

The slabs of plaster which bear portions of the design, or completely fill separate panels, are put up like woodwork, and screwed to the rafters or firring pieces, put to receive them. Each slab should be composed of thinnish plaster, embedding layers—usually two in number, I believe, of very wide-meshed canvas; the plaster being worked well through the meshes. They are stiffened with laths and battens, and can be worked to any required angle or curve. If the relief is not great, they are very light. When a number of slabs have to be joined to form a ceiling, without intermediate ribs, it is customary to pack damp canvas between their meeting edges, which not only protects them, but forms a stiff setting when it dries; the fissures are subsequently pointed in with plaster. Brass screws should be used for fixing, and the screw-holes, of course, must be stopped in. If steel screws are used, the heads require to be coated with japan or paint, to prevent the inevitable rust from staining the plaster.

I put up a panelled ceiling of this kind over the sanctuary at Groombridge Church some two years ago. I believe that many of you have visited that building. In that case the panels were each in one slab, and their edges were clipped by the overlapping oak ribs and fillets.

In the Church of St. Clement's, at Bradford, I had the good fortune to secure, for the decoration of the chancel roof, the services of Mr. George Frampton, who modelled the fibrous plaster ceiling, and of Mr. Anning Bell, who coloured it.

In this case Mr. Frampton was first provided with a model, to a scale, I think, of one-quarter full size of one side of the covered inner roof. On this he modelled his first sketch, which with some other details of the ceiling, he afterwards exhibited at the Arts and Crafts Exhibition two years ago. He then set to work on a full-sized model of the eastern bay, and upon the repeating ornament of shields and rose trees, and the frieze of cherubs that fill the rest of the ceiling. Casts were made from his models and were screwed up, joined, and stopped in the manner I have before described. The ridge, cornice, and vertical ribs are of deal, and are painted and gilded with the rest of the ceiling, which was dry and paintable within a day or two of fixing.

The use of fibrous plaster enables one to escape the flatness and rigidity I have spoken of as due to floating surfaces and running mouldings. The casts bear the direct impression of the modeller's handling. The use of this material is not without its artistic dangers, the chief of which is that its modelling is not as a rule done upon the actual ceiling. It is possible, of course, to model *in situ*, and then cast from the models elsewhere, and that, I fancy, would be one of the safest ways in which to prepare the design for a fibrous ceiling; for nothing can quite come up to the actual position and the actual lighting of the building for which the work is destined. The next best

method is to arrange your model in the workshop at as nearly as possible the height that the ultimate casting will occupy, approximating as far as possible the conditions of light and surroundings, and modelling the ceiling from below. If you cannot manage this, it is wise, at least, to get your model either conveyed to the site it is to occupy, or hoisted up in some similar position for your judgment of effect.

It is essential in case of a ceiling with a cornice, and divided by plaster ribs, to have cornice and ribs cast from models also, not run. In the case of ribs this can be efficiently done by casting a reverse from the first model and pressing the clay into it to form ribs for the model section of the ceiling. The laying of the moist clay ribs into the ground surface of the model insures the avoidance of rigidity. I have said that it is impracticable to mould with the fingers the actual plaster so as to avoid casting altogether, unless that plaster differs very much from what we generally use. But that difference is now obtained, as I am told, by the use of old or deadened lime, and some special kind of sand, and ceilings and other decorative work are modelled in plaster and in position. That, it seems to me, must be the best plan possible when the object is to avoid repetition, and when cost admits of it; further, where exact repetition can be avoided the better will be the result.

The consideration of decorative plaster work for the exteriors of buildings is almost a subject by itself. As you know, a great use of it was made in certain districts, the eastern counties especially, in the fifteenth, sixteenth, and seventeenth centuries. "Sparrow's" house, at Ipswich, is a striking instance of rather coarse and crude, but very picturesque, adornment. A good deal of external plaster work (using that term to cover work in cement and selenitic mortar) has been done, and is doing, in our time, as several of Mr. Norman Shaw's buildings testify. Until quite recent times the old traditional and delightful "stick-work" was done by village plasterers in rendered cottage fronts, but I fear that tradition has gone the way of many others.

One suggestion I would make with regard to external work in low relief, is that the relief should be stronger on the north side of a building than on the others.

I have now only a few words to say as to the treatment of finished plaster work. When the plaster—fibrous or otherwise—is perfectly dry, it can be treated with a thin coating of wax dissolved in turpentine, wiped or rubbed here and there with a rag; this gives it a pleasant, soft, ivory-like appearance that is more agreeable than the even tint of distemper. (At Cambridge I had the shields and emblems entirely gilded, and then glazed over partially with thin oil colour, the whole of the remainder being waxed.) If heraldry is employed, the coats-of-arms must of course be coloured, or the blazonry is incomplete. There are some good instances of the effect of emblazoned coats occurring in a general field of toned white plaster in the cloisters of Corpus College, Oxford. It is a contrast of which I am fond, that of richly-toned heraldry and toned white plaster-work. In Church work it is likely that colour over the whole surface of the work may be needed, and this presents difficulties either in the case of oil colour or distemper; in the latter case the suction of the plaster will probably need to be stopped with a coat of priming. I referred just now to the effects of a cross-light. In my opinion a ceiling lit from both sides requires colour, and perhaps gilding, more imperatively than one lit from side or end only, when the relief gets its full value through shadows.

Plaster reliefs may, of course, be readily used for decorating wall-spaces or arch spandrels in Churches. There is, in fact, no end to its decorative applicability. Time, and your patience, would fail me if I endeavoured to cover all the ground of my subject. You will notice that I have omitted all consideration of Sgraffito work and Scagliola, which certainly come under the head of decorative plaster work. I did so advisedly, for the cornice subject alone would readily fill the limits of a paper like this.

For similar reasons I have not treated of foreign work—Italian, French, Spanish, or Mauresque, European or Asiatic; the subject is really a tremendous one. If I have succeeded in arousing any interest or enthusiasm for a very attractive craft, I have realised the full intention of my paper.

(*Discussion on this Paper next week.*)

LONDON CLAY.

In the course of a long article "On the Distribution of Towns and Villages in England," contributed to the Geographical Journal, Mr. George Chisholm points out that the London clay deposit is generally characterised by the small number of towns and villages to be found on it. For the most part, the sites preferred either belong to other members of the so-called London tertiaries (in which sands, gravels, loams, and conglomerates predominate), or such as have the London clay covered by more recent deposits of glacial or other origin. The reason for this is, he says, no doubt the fact that water is generally difficult to obtain in this deposit. Professor Prestwich has pointed out that the difficulty of obtaining water retarded the growth of London towards the north until water was conveyed thither in pipes, and caused the suburbs to spread rather west and north-west, where there are extensive deposits of glacial gravel and sand. To the north-west and north of London, Edgware, Stanmore, Bushey, and Harrow-on-the-Hill, are the chief places on the London clay. Pinner lies on a patch of the Woolwich and Reading beds; Totteridge, Chipping Barnet, and Monken Hadley occupy patches of pebble gravel of uncertain age; Finchley is situated on boulder clay, Southgate on glacial gravel and sand; Hampstead and Highgate are on the Lower Bagshot beds; Tottenham, Edmonton, Enfield, Hoddesdon, and Waltham Cross on gravel and sand to the west, and Watham Abbey on a similar deposit to the east, of the alluvium of the Lea. While Epping and Hainault Forests are both chiefly on London clay, the town of Epping lies on a deposit of brick-earth overlaying that formation; Chigwell is situated chiefly on a patch of glacial gravel and sand; Brentwood and Havering-atte-Bower lie on patches of the Lower Bagshot pebble beds; Barking, Great and Little Ilford, and Romford, all on gravel and sand, the last immediately adjoining London clay. Further east, in Essex, the only towns or considerable villages on London clay are South Benfleet, Leigh, and Burnham, (the last partly on brick earth). To the north, Dunmow, Braintree, Colchester, and Hadleigh (Suffolk), lie on glacial gravel overlying London clay.

South of the Thames

only recent London suburbs (Brixton, Streatham, Norwood, Sydenham) are on London clay; while in the south-east, Eltham, Bromley, Chislehurst, and Hayes are on the Oldhaven beds; Orpington, the Crays, Bexley, and Crayford are on a narrow strip of gravel and sand; Dartford, Sutton-at-Hone, Darenth, Horton Kirby, Farningham, Eynesford, Lullingstone, and Shoreham, all on a similar deposit or on chalk. In the south-west, Morden and Hook are the only considerable villages entirely on London clay, although many others on the borders straggle on to this formation. All the villages already mentioned as lying on or near the north border of the chalk between Guildford and Croydon, where not on the chalk itself, have their nuclei on a narrow strip of the Woolwich and Reading beds or on recent gravel, while outside of, but on or near the north margin of the London clay in this quarter lie Merton, Wimbledon, Esher, Cobham, Ripley, Send, and Worplesdon. Since the laying of the railway, Wimbledon has descended to the London clay low grounds, but Old Wimbledon is confined to the upper gravel flats. In many cases the presence of river alluvium and recent marine deposits, has manifestly determined the precise situation in which early settlements grew up. For the most part, alluvial sites are avoided, and many of the towns found on such sites are of

Comparatively Recent Origin,

and some have been deliberately created on account of special advantages of position, in defiance of the disadvantage of the site. Of course, alluvial deposits are not absolutely uniform in character. In some places they are drier and more firmly consolidated than in others, and in alluvial plains very slight inequalities of surface will favour the drainage and consolidation of the higher parts, and all the more when the inequality of the ground is due to some firmer subjacent deposit, which has had the effect of thinning the covering of alluvium. Moreover, it is to be borne in mind that the unsuitability of an alluvial site as a foundation for building is not the only reason for avoiding such sites, when others of a different kind are available in the vicinity. The very richness of alluvial deposits is a reason for not covering them with buildings, and for establishing the villages on adjoining deposits. On both banks of the Thames and its estuary below London, the marshy nature of the littoral alluvium is the chief cause of the comparative paucity of towns and villages, most of which stand on sites where deposits of another kind are met with on the bank.

On the North Bank of the Thames,

the presence of chalk at Purfleet, and gravel and sand at Grays Thurrock, has allowed of the formation of settlement, while chalk comes very close to the shore at Tilbury, and gravel and sand at Southend and Shoeburyness; on the south bank Woolwich stands on the Oldhaven beds, Erith on Thanet beds, and Greenhithe and Gravesend on chalk. The surface of the Isle of Sheppey is entirely alluvial, but it gradually rises towards the north, where the alluvium overlies cliffs of London clay, above which the villages of Minster and Warden (formerly further inland) are situated. The town of Sheerness, and the older, but now decayed town of Queenborough lie on softer alluvial sites, but both of these towns took their origin in works erected for defensive purposes. The town of Queenborough, named after Queen Philippa, grew up round a castle, built, in 1364, by her consort, Edward III., and a well, 200 ft. in depth, had to be dug for water, which, even at that depth, was brackish, pure water not being obtainable till the well was dug 80 ft. deeper in 1729. Sheerness, again, hardly existed as a town before the erection of the defensive works begun by Charles II., and its site is in a large measure artificial, composed of piles and the carcases of old ships.

KEYSTONES.

During some excavations on Hope Hill, Baildon Moor, in connection with the Yorkshire Gannister Company's works, the workmen came across a large earthenware jug, supposed to be of Roman origin.

A serious gas explosion occurred last week in the public buildings at Penzance, and considerable damage was done to the north-east corner of the building. The glass, ceilings, plastered walls, and doors of the Geological Museum, the staircase, ante-rooms, and corridors, were shattered and broken.

At a meeting at Bristol, to consider the best means of celebrating the Queen's long reign, the Mayor suggested the erection of a public Art gallery, at a cost of £25,000. Mr. W. J. Storrs-Fry suggested that a sanatorium should be erected in connection with the medical charities, towards which subscriptions, including one of £1,000. would be at once forthcoming.

It has been decided to add another large block of buildings to the Portsmouth Sailors' Rest. Miss Weston has secured a site in Arundel Street, once used as a newspaper office, which will be attached to the Rest by a bridge across Chandos Street. The new block will provide sleeping accommodation for 200 men, thereby bringing the total number of berths at the Rest to about 500.

Willesden Board of Guardians has completed the purchase of 68½ acres of land on the Twyford Abbey estate, Acton Lane, at a cost of £14,000, for the purpose of erecting a new workhouse, the total expenditure on site and buildings being estimated at £100,000. A proposition to build cottage homes for the children is also under consideration, and the requisite offices and board room for the meetings of the guardians will be provided.

The Secretary of State for Foreign Affairs has received a dispatch from Her Majesty's Consul at Corunna stating that tenders are invited by the Spanish Ministry for Public Works for the improvement of the Port of Llanes, in the Province of Asturias. Sealed tenders will be received at the office of the Minister of Public Works up to the 26th inst., and will be opened on the 1st proximo. Conditions, plans, and estimates may be seen at the general office of Public Works at Madras, and at the Public Works Department of Oviedo (Province of Asturias).

DURHAM AND ITS CATHEDRAL.

(With Special Illustrations.)

By A. LINDSAY MILLER.

MY first impression of the *Town* was unfavourable: closer inspection did not alter this opinion. In the earlier days, when quaint half-timber fronts would face the narrow, winding, hilly streets, which makes the town ugly and inconvenient, would then only add to its quaintness.

As a Border town, Durham figures on several occasions in the wars between England and Scotland. Edward I., in 1296, brought from Scotland the Black Rood, the sanctifying relic round which David I. of Scotland raised the House of Holyrood—and gifted it to Durham Cathedral—and Bruce, in 1312, surprised the town, slew all who resisted him, and reduced a great part to ruins. The Castle, however, resisted his efforts, but the rest of the city was sacked, and so great was the spoil that the inhabitants, dreading a repetition of the visit, paid blackmail. In 1346, David II. made a raid into the bishopric and plundered the place, but was afterwards defeated, taken prisoner and sent to the Tower of London. Leaving out further consideration of the town, we wander up the narrow steep street leading to the Cathedral. We reach the Cathedral and proceed at once to record its beauties with the camera and the pencil.

The history of this Cathedral is very exact and complete, owing to the documents connected with its erection and maintenance having been carefully preserved, so that little difficulty is found in fixing the period of erection of any portion, along with the name of the bishop-builder who erected the several portions.

In a notice of the Cathedral it would not do to leave out the interesting account of its foundation. The patron Saint (St. Cuthbert) like so many eminent men then and since, was born in Scotland; he first saw the light on the southern edge of the Lammermoors, and at the age of 8, found shelter in the house of an old widow in the village of "Wrangholm."

Slowly his longings settled into a resolute will towards a religious life, and he made his way at last to a group of log shanties in the midst of an untilled solitude, where a few Irish monks from Lindisfarne had settled in the mission station of Melrose. Afterwards, on foot and horseback, he wandered amongst the rough inhabitants of the mountain villages, and through a large part of Northumbria, which then extended to the Frith of Forth. Of sweet look and full of humorous good sense, backed by a vigorous frame, he was well fitted for his work as a missionary. Against his will he was made Bishop of Hexham, but shortly afterwards was transferred to Lindisfarne, of which he was elected Bishop, A.D. 685. For this position he was well qualified, as he had a conciliatory spirit, kindness, firmness, patience, and self-control, besides being skilful to rule. After a beneficent reign of two years he died on the great Farne, A.D. 687. When dying, he expressed a wish to be buried in front of the Oratory at Farne, but the abbot prevailed upon him to allow his body to be buried at Lindisfarne. He consented, on condition that his body should be buried within the Church, in order that they might have the opportunity of visiting his grave at pleasure; at the same time he made the request that if ever they were compelled to leave the place, they were to take up his bones and remove them to whatever place God might provide. He was buried in a stone coffin and remained there for eleven years, when, from a wish to elevate his bones above ground to receive proper veneration, a carved wooden coffin was prepared.

On a recent examination of the grave, portions of this coffin were found in a state of preservation, and are now in the library attached to the Cathedral.

Passing to 875, a period when the Danes landed and harried the coast of Northumbria, the monks fled—leaving, however, the body of the Saint behind. Returning some time after, they were delighted to find that the Church, though stripped of every valuable, *still possessed the body of St. Cuthbert*. Carrying with them then the valuable body of the Saint, they travelled over a great part of the north of England, also over a considerable portion of the south of Scotland. This wandering state of affairs continued to 883, a period of eight years, when they settled at Chester-le-Street. There are a few relics left of their sojourn there, in the shape of portions of crosses decorated with sculpture, the design being an elaborate interlacing pattern, common to the period. There the monks rested till their removal to Durham, in 995.

The superior position of Durham was, no doubt, the reason why it was selected for the site of the Cathedral. The site is a plateau of moderate extent, but enclosed by the steep banks of the river which runs almost entirely around it, assuming a horse-shoe shape, and in those days would be practically impregnable, a matter of great importance. This sensible way of looking at the situation differs from the legend which runs as follows:—After having brought the body of St. Cuthbert as far as Wardelaw, somewhere east of Durham, on a sudden, by a weighty miracle, the vehicle containing the body became fixed, so that the whole Diocese could not move it, by which they perceived St. Cuthbert did not want again to be carried to Chester.

The Saint made a revelation to a devout monk that Dunholm was his place of pepetual rest, and the weight was then lifted off the cart. The place named by the Saint was not known to the monks till they heard one female enquire of another whither her cow had strayed; her reply, "down in Dunholm," immediately pointed out the place to the wanderers.

In support of this, there is pointed out in a niche on the north-west angle of the nine altars, a sculpture representing two maids and a cow, but the historians of Durham consider they were placed there by Bishop Flambard, as emblematic of the wealth of the Church. Billings states that the present cow was carved during Wyatt's restoration, and not in imitation of the original.

SOUTH VIEW OF DURHAM CATHEDRAL.

WESTERN TOWERS AND CLOISTERS.

Returning to the site, let me quote a description of it:—"No grander one can be conceived. Rising high above the surrounding river, which clasps it about in its protecting embrace, upon steep, rocky and wooded banks, in near connection and combination with the neighbouring but not rivalling castle, it forms a picture scarcely to be excelled, and whose beauty few other scenes can efface. There is a reflection which will naturally occur to you when you review this position; you will recall the site of many other great monasteries and contrast them with this at Durham. The contrast is indeed great. As a rule, the chosen place for the settlement of a monastic house, if it was not in an already existing town, was in some retired and low-lying spot, on a rich and sheltered piece of land, by the banks of some river well stored with fish, and where the surrounding hills closed it in from the blasts of inclement storms, and from the eye of the world without. All spoke there of peace and contemplation, of seclusion from the ordinary life of strife, trouble and unrest, and for a longing of calm and repose to come. Here at Durham was the very opposite, the Church fronted the world as if in defiance, alike regardless of the tempest which beat against its massive walls. The castle, also, so near, so intimate, suggests another reflection. At Durham, we cannot sever the connection between the Bishop and the monks.

The unity of the old congregation of St. Cuthbert still lingers about the place, and the monastery takes its stand alongside the castle, on the rocky height, as part of a great defensive work, equally against a spiritual as against an earthly foe.

Before leaving this introduction, let me notice another great man who lies buried in Durham Cathedral, viz., the Venerable Bede, the author of the life of St. Cuthbert. Bede was a student of great learning, living a life of unselfish piety, a great writer, and, in his "Ecclesiastical History of the English Nations," he became the first English historian. All that we really know of the century and a half that followed the landing of St. Augustine we know from him. Whilst still young he became a teacher, and six hundred monks, besides strangers that flocked thither, became his pupils. First amongst English scholars, theologian or historian, it is in the monk of Jarrow that English literature strikes its roots. In the six hundred scholars who gathered round him for instruction he is the father of our national education. He died at Jarrow, in 735, and was buried there, a pious monk at

Durham, who had charge of the body of St. Cuthbert, being of opinion that two such men should be together at death, brought Bede's body to Durham.

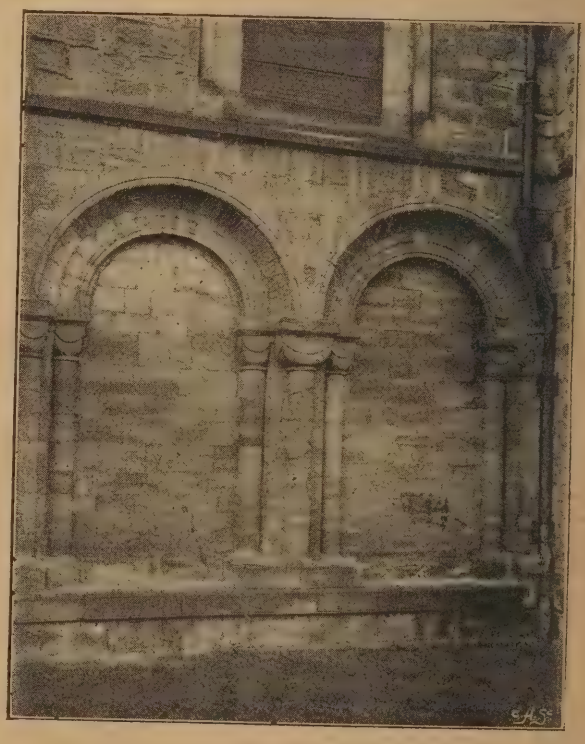
DURHAM CATHEDRAL: DOOR TO CLOISTERS.

The monks having settled at Durham, commenced to erect a Church, first a wooden Church, till, in 999, Bishop Aldhun completed a stone Church. This building remained till after the Norman conquest, till William of St. Carilef became Bishop, in 1081. He became a party to the rebellion against William Rufus, in 1088, and was for three years an exile in Normandy. Normandy, at that time, would be full of large and noble Churches, some lately erected, and his religious zeal, fired by their beauty, would make him emulous to raise at Durham something worthy of the service of God; and probably he would make a careful and earnest study of the best examples and mature plans to be carried out on his return from exile. At all events, on his return he commenced the present structure, and on the 11th of August, 1093, the foundation stone was laid, the old Church having been taken down, and as the Bishop had been accumulating money for his building, it went on rapidly, and he appears to have completed the choir, as far as the first compartment of the nave, before his death, about 1096, a period of only three years. The eastern end of this Church was afterwards removed, to give place to the Chapel of the Nine Altars. It was a matter of doubt how the choir originally terminated some time ago, but it was discovered that the finish of the central portion of the choir was apsidal, and it was suspected that the termination of the choir-aisles would be the same. This question was settled some time ago by the discovery of the walls indicating a similar termination to the centre of the choir. It is worthy of notice that the refectory is of older date than the choir, as from records we find that during the Bishop's exile in Normandy the monks resident at Durham built this part of the Abbey.

After the death of Bishop Carilef, Bishop Flambard, who was elected in 1092, continued the work, and completed the nave as far as the vaulting, including the side aisles and their vaults, and probably the lower portion of the western towers. In addition to this, Bishop Flambard added considerably to the domestic buildings of the monastery. During the five years which elapsed before the accession of Bishop Rufus, the work was carried on by the monks, who erected the west side of the transepts and the vault of the north one.

Bishop Rufus, 1133 to 1140, completed the chapter-house, which was demolished in 1796.

Passing over a few years, to 1153, we come to Bishop Pudsey, who, though a young man when raised to the chair, effected a number of additions. He commenced the erection of a lady-Chapel at the east end, but, as we will see later, changed his plans, and ended the Galillee at the west end, where were placed the bones of the Venerable Bede, in 1370. In 1242, Prior Melsanby commenced the erection of the Chapel of Nine Altars at the east end, and the work was completed in 1280. The Bishop's Throne was erected by Bishop Hatfield, 1345–1381; to this period also belongs the screen at the high altar. The stalls and tabernacle work were erected in 1660–1672, and in 1796, at the hands of Mr. Wyatt, it underwent restoration, as they termed it then.



These few remarks indicate, in a general way, the history of the Cathedral.

It has been remarked that the Cathedrals of England differ considerably from those on the continent in the proportion of their breadth to their length, a difference difficult to explain, unless when they retained the form of some older Church. They at least display individuality, and whilst probably not so suitable for an audience to listen to addresses from the officiating priests, they certainly increase their picturesque appearance, and are much more impressive to the visitor than their continental neighbours.

This extreme length and breadth was modified in the case of Durham, where the choir and nave are more nearly of a size; the length of the nave being about two and a-half times the width over the aisles, and the choir to the back of the Chapel of Nine Altars being about twice the width. It has been also claimed for Durham that the builders from the first seemed to have in view the stone vaulting of nave and choir, and the great strength of the piers and arches would bear out this idea; and I have given, in the introduction, the early dates claimed for the vaulting, but I fear the date when vaulting was first tried in England, early in the thirteenth century, will hardly support this idea. This, however, might be said, that as we know vaulting of a simple form was in use at a much earlier period on the continent, Bishop Carilef may have been acquainted with it, and desirous of carrying it out at Durham, but was hindered by the constructive difficulties in the way. Even in early Norman work, when the side aisles might be vaulted, the nave was covered with a wooden roof. My own opinion is that the vaulting of the choir belongs to a later period than the rest of the building, and the only portion that would make me doubt this idea is the vaulting of the north transept. One thing may be said, however, that the bold mouldings of the early wooden roofs, when replaced by stone, gave vigour to the vaultings as the vigorous lines of the timber were reproduced in the stone, there being an absence of that stringiness which offends in the vaulting of continental Cathedrals. In Prior Melsanby's work, in 1233, at Durham, we have one of the earliest examples of vaulting in England.

Noticing the several portions more particularly, we have already seen that Bishop Carilef finished the choir and the aisles with an apsidal termination; this becoming dangerous, Prior Melsanby obtained an indulgence remitting thirty days of penance to all who would aid in the erection, by gifts or otherwise, of the new portion, *i.e.*, the Chapel of the Nine Altars. This document, after alluding to the incorruptibility of St. Cuthbert, says:—"Above his sepulchre devout men of old ended a vaulted roof of stone, which at the present day is so full of fissures and cracks that its fall seems to be approaching; seeing, therefore, our venerable brother, Lord Bishop of Durham, wishing to obviate so manifest a danger, is disposed by the aid of God to erect a new building at the eastern end of the Church aforesaid; we exhort and admonish one and all of you, that ye be willing out of your goods tenderly hearted to give the assistance of your charity." This Chapel comprises nine compartments, the central one consisting of a single bay, the side one of three bays each. In the Chapel of the Nine Altars the central compartment has three lancet windows and in each of the side bays there is a window,—this gave nine spaces for altars,—hence the name, "Chapel of Nine Altars." The floor of this Chapel is lower than that of the choir by a few steps—I fancy for the purpose of giving greater dignity and better proportion. Along the lower walls there is an arrangement of arcading which reaches from the floor to the sill of the windows, the two centre columns being stopped at a level to correspond with the height of the altar. There is an indication at the side of accompanying photo of an arrangement of the clustering columns dividing each bay, the dark columns being marble. One feels naturally that this work belongs to the best period of Early English, as the grace of the trefoil arches with their deeply undercut mouldings clearly indicate; the effect seen at present is very much injured by the insertion of marble tablets. This arcading runs right round the lower walls of the Chapel, and forms a beautiful feature. There are some very beautiful capitals in this chapel, and the "Joseph Window," at the north end of the Chapel, is interesting with its double set of tracery, joined at intervals by stone bars. The groined roof is also interesting and unusual in form, but the general arrangement has a beautiful effect, and the height obtained by lowering the floor gives it great dignity and elegance.

In this Chapel, immediately behind the high altar, and on a platform at the level of the choir is a slab covering the remains of St. Cuthbert. Entering the choir, which is in two divisions, each division being again divided into two bays, we have several features worthy of notice.

ARCADING ON NAVE OF NORTH FRONT.

1st. The High Altar and Screen.—Billings considers this screen as the most remarkable in the kingdom, either as regards magnificence or richness of detail. The whole is of Dorsetshire clunck, very rich in detail, and was formerly ornamented with 107 statues, some of life size, which were placed in niches. These statues were all richly deco-

rated, and the removal of them hurts the general appearance of the screen, which looks rather stiff and stingy. The two doors in the lower part of the screen gave access to the shrine of St. Cuthbert, which though now a plain slab would doubtless at one time be covered over with a Gothic shrine, as it was in a later period (as shown in Billing's) covered with a classic one which was removed.

DURHAM CATHEDRAL. CHOIR LOOKING SOUTH.

In the north-east and south-east piers of the choir are the closets or aumrys in which the vessels of the altar were deposited. A portion of the screen dividing the choir from the aisles, like the stalls, is 17th-century work, executed during the episcopate of Bishop Cosin, 1660-1672, the design being attributed to James Clement, Architect, of Durham. It is debased Gothic, general effect rich, but on inspection of the detail disappoints us.

An interesting feature in the choir is the Bishop's Throne with its richly decorated arch, under which lies the effigy of Bishop Hatfield, who erected it. The wall of the stair is richly panelled, and the brackets indicate that figures once filled the panels. The parapet railing which is comparatively modern, replacing an older one, is of wood, but rather classic in treatment. This throne we are told was once richly decorated in gold and colours, traces of which still remain.

The rose window in the east end of the Chapel of the Nine Altars is one of Wyatt's improvements in 1795, and replaced one possibly put in by Prior Messington, 1416 1466, and whilst good enough in form is, I consider, too light and delicate to appear so prominently as a feature in the dignified Norman choir. The screen which divides the nave and choir is of quite modern date; it is entirely out of place both in form and detail and offends the eye. The designer of it has evidently not been in sympathy with his surroundings. The pulpit has the same fault as the screen, as, however excellent as a design, it is out of place and looks weak and insignificant amidst the massive Norman piers which surround it. The lectern is a rich and elaborate piece of metalwork of considerable size, the termination being a swan, and not the regulation eagle.

Returning to a description of the Church proper, and looking at the transepts and the nave we find that each transept has two compartments of two bays with only one aisle on the east side. The transepts as we have seen were erected about the same time as the nave, but, as to the vaulting, Rev. Mr. Greenwell writes: - "You will recognize a difference between the vaulting ribs of the transepts; those of the north corresponding with the Norman work of the choir and its aisles, whilst those of the south have more in common with the nave." In his opinion (and appearances certainly bear it out) the north transept was vaulted earlier than the south. The general appearance of the nave is very impressive, all in admirable proportion and suggesting grandeur and majesty. It is divided into four compartments, each with two bays. The piers, like those in the choir and transepts, are cruciform in shape and the intermediate columns are round with great square bases. The circular columns are grooved in lozenge, spiral and diaper patterns not usual in work of this period. The effect of this grooving on one of the pillars of the south transept, being similar to the grooving at Dunfermline, has the appearance of altering the proportions of the column from different standpoints. In front of the piers are a group of columns which rise up to near the top of the triforium, and from which the vaulting springs.

There is an almost total absence of ornament on capitals and arches, lending greater dignity to the building. Another feature which adds dignity to the interior is the division of the height of the building between the arches of the nave, the triforium and the clerestory; a due care in the proportioning of these parts makes or mars the general effect of the interior. Durham, like several of our best Cathedrals, has the proportions of one half of the height to the nave arches, and the other half divided about equally between the triforium and the clerestory. A change to any considerable extent in these proportions would have altered the general appearance for the worse.

(To be continued.)

KEYSTONES.

WE beg to notify that Mr. John A. Gill Knight has removed to 21, Godliman Street, Doctors Commons.

THE celebrated painter, Karl Koechling, has just finished a large oil painting from a sketch and details furnished by Kaiser Wilhelm. It is destined for the mess saloon of the Officers' Club of the 1st Guards Regiment. The painting depicts the attack of the regiment on St. Privat, on the evening of the 18th of August, 1870.

THE Darlington carpenters and joiners, society and non-society men, have passed a resolution to the effect that owing to the activity of the building trade in Darlington, and the improvement in trade generally, an increase of 1*d.* per hour should be asked for from April 19th next, three months' notice being given according to rule.

THE St. Andrew's Parochial Boys' Schools, Dublin, which have just been completed, are the largest in the city, and will accommodate 1,200 boys. The fine structure is now almost, if not completely, free of debt, and the chief remaining burden arises from the heavy obligation incurred in regard to the purchase of the site.

THERE was celebrated, at Queen Anne's Mansions, at St. James's Park, on the 11th inst., the twenty-first anniversary as an institution of the "Flat." The mansions were started by Mr. Hankey, the banker, whose enterprise, now so successful, came to be known as "Hankey's Folly." The mansions turned out to be one of the most successful experiments in a new form of household life, however. Electrically lighted throughout, they are fireproof, and have been re-decorated throughout by Messrs. Waring.

WORKING CLASS DWELLINGS IN BIRMINGHAM.

ACCORDING to a report of the Improvement Committee of the Birmingham City Council, 193 dwellings suitable for the artisan class, at rents varying from 5s. to 6s. each, with three bedrooms, have been erected in the vicinity of Ryder Street. The committee having provided so many houses of this class, would like to supply a dwelling suitable for that portion of the working class who are earning a labourer's wage. Drawings have, therefore, been submitted by the committee, showing such suggested dwellings, from which it appears that it is proposed to erect upon the Milk Street site 64 dwellings, each having a living room 12 ft. 6 in. by 11 ft., bedroom 12 ft. 6 in. by 9 ft., bedroom 11 ft. 3 in. by 8 ft., w.c., scullery to every two houses 10 ft. by 8 ft. 6 in. These houses are designed on the dual-house system—viz., one house built upon another, access to the upper tier of houses being obtained by a balcony running the whole length of the rear of the dwellings, and are estimated to cost £6,250. The rent proposed to be charged is, for the lower houses 4s. 3d., and the upper 3s. 9d.; but these rentals have been calculated upon the basis that no charge is made for sinking fund on the cost of the site, and that the repayment of the loan on the cost of dwellings and land is granted for 50 years. It is absolutely impossible to erect, without loss to the ratepayer, dwellings within the city suitable for the labouring classes, at the rents above-mentioned, unless upon either this method or the flat system. As with the Ryder Street dwellings, these houses will be under the direct control of the committee, and while care will be given to the comfort and well-being of the tenants, every precaution will be taken to guard against overcrowding. Although in accordance with the requirements of the Local Government Board, only one-half of the site has been cleared for building, the remaining part is wholly unoccupied, and the materials in the buildings are rapidly disappearing; under these circumstances it is suggested that the scheme be carried through in one contract, and the committee, therefore, recommends that the proposed scheme be approved, subject to such modifications as is deemed advisable, and that the Finance Committee be authorised to borrow a sum not exceeding £6,250 for the purpose of carrying out such scheme.

CHOIR LOOKING EAST.

THE Trustees of the Bedford Infirmary have decided to commence building a new county hospital at a cost of about £33,000. Towards the sum required £27,000 is already in hand.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
January 20th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gildea ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

FOR the proposed Purdysburn Asylum the Architects of Belfast were recently invited to send in plans in competition, but only eight Architects have responded. The Asylum is to be erected upon a very uneven site, and will be in two sections, one for curable and the other for incurable patients; at present it is proposed only to erect the building for the incurables—the total accommodation will be for 1,000 patients, and the cost is expected to be not less than £125,000, or £125 per patient, but in the first instance it is proposed to expend not more than £50,000, or to provide for more than 360 patients. The plans will be publicly exhibited shortly.

WRITING to the Times with reference to Lord Rosebery's recent question touching the Whitehall cock-pit, Mr. H. W. Hoare says his inquiries show that the pit, "which had escaped the destructive fire of 1697, was probably demolished when that part of the present Treasury buildings which faces the Parade was built, in or about 1733, by W. Kent. Kent's plans are not forthcoming. The Office of Works cannot trace them, nor can the Office of Woods, nor can the Treasury. The Horse Guards (built at the same time by W. Kent) have no copy of the plans, and their index gives no clue to them. The Record Office can only testify that it existed. No light on the subject can be thrown by the Department for MSS. in the British Museum. After the cock-pit had ceased to be used for cock-fighting it was in occasional use down to the reign of Charles I. as a theatre for dramatic and for musical entertainments, but the records of the Lord Chamberlain's Office have no reference save to the supply of lights for it. Lord Rosebery was, I think, under a misapprehension in supposing that the site could no longer be identified. From Fisher's well-known map, dated 1680, and from drawings in the Soane Museum, its *locale* can be fixed, and this has been done by Mr. Taylor, of the Office of Works. The Chancellor of the Exchequer and the Secretary of the Treasury occupy rooms just over the old site."

HAVING now obtained the permission of the Local Government Board to deal with the insanitary property in the neighbourhood of York Street, and also that at Camp Field, the Leeds Insanitary Areas Committee has resolved to recommend the Council to proceed with schemes for dealing with the whole of the two areas. It is the committee's intention to demolish much of the crowded and unhealthy property at present existing in the locality; to cut two or three broad streets through the property, and, eventually, possibly to make York Street and Marsh Lane each 60 feet wide. The latter idea has not yet, however, taken the form of a written recommendation. As to the smaller area in Camp Field, the Corporation appears only within the last few weeks to have obtained the necessary sanction of the Local Government Board to proceed with the work, and this permission is granted conditionally, the Local Government Board stipulating that the Corporation shall provide the artisans' dwellings in the neighbourhood of the property demolished.

MANY people have doubtless been wondering when the block of buildings flanked by the entrance and exit to the Hotel Cecil in the Strand is coming down. For a long time the windows of these shops have borne bills notifying the speedy departure of the tenants and demolition of the structure itself. When the alteration will take place is not yet known, for the management of the hotel, with whom the matter rests, are awaiting a favourable opportunity, and are only keeping their tenants on at a weekly notice. When finally the present set of buildings is razed to the ground, the new erection will be pushed back some four feet, thus widening the Strand.

IN a recent number of the City Press Mr. Funston asked why chalk was used as a building material in olden times. Builders generally concur in the opinion that it was cheap, and easily wrought and obtained. From the quarries near the Thames it was loaded into barges, and being brought to the City was carted to the required spot at a far less cost than that at which bricks or stone could be laid down. In the "Buried City Church" of Leadenhall Street, the inside filling of the cellar walls was chalk, in a proportion of two of brick to one of chalk. Lambeth Church and many other old buildings have also walls "filled in" with chalk, which material lends itself admirably to a solid bond. In excavating for the Grand Surrey Canal, east of the Old Kent Road, in 1809, the labourers cut into an old Roman road, some 15 feet wide, the bed of which was formed of squared chalk secured by oak piles. From the 250 yards broken up between 400 and 500 cart-loads were removed. In Lambeth Marsh more chalk foundations were found, which would seem to show that the use of that material where it was "out of sight" was done on the score of cheapness as well as because of its easy carriage by water to the vicinity of the work, and its adaptability for "working." One other very general use of chalk is as a paving for the foreshore of the wharves along the banks of the river. Laid in large blocks it makes an admirable pavement which will not chafe a barge as stone would, and the greasy Thames mud hardly sticks to it at all. Again referring to the Leadenhall Street crypt the walls were almost all torn down—no slight job, as the front wall was some four feet thick, and very solid—and the stone arches shared the same fate. Amongst other rubbish found in digging was a tombstone with a date of 1560.

ONCE again comes a cry of vandalism from Richmond Hill. It is alleged that some Richmond Vandals harboured the idea of "improving" the terrace by decimating a hedge which enhances the rusticity of the scene, and substituting what was described as an excruciatingly formal "hair-pin" iron fence. At a meeting of the Town Council, last week, the subject was discussed, and a memorial received, signed by Sir Edward Poynter, Sir James Linton, Mr. Alma Tadema, Mr. Val Prinsep, and a large number of members and associates of the Royal Academy and other Artists protesting against the proposed change, and pointing out how void of beauty was an iron fence compared with holly and hawthorn. In the course of discussion it was contended that the intentions of the innovators towards the hedge were strictly honourable, their proposal being merely to strengthen the weakness of Nature by placing a low iron railing, 2 ft. 9 in. high, behind the shrubs. They had got advice on the subject from Mr. Nicholson, curator of Kew Gardens, and what they were going to do was really in the interests of beauty. Much debate followed, and an amendment, negativing all interference with the hedge, was ultimately withdrawn on an assurance being given that the Council had no intention to erect a "hair-pin" fence of an unsightly kind.

AN attempt has been made recently to bring about the reopening of the Grosvenor Gallery. Certain eminent painters who were among the most distinguished supporters of the gallery in the old days made overtures to Sir Coutts Lindsay in the hope that he might be persuaded to devote the spacious rooms once more to the uses for which they were originally intended. Sir Coutts could not be induced, however, to entertain the proposal, and for this year, at all events, the doors of the Grosvenor will remain closed to the general public. Few will find fault with the proprietor's decision. There are already too many picture galleries in London, and the New Gallery and the Grafton together more than fill the gap which was caused by the closing of the Grosvenor six years ago.

THE greatest treasure possessed by the historic Church of St. Mary Overy, better known perhaps as St. Saviour's, Southwark, is the peal of twelve bells, pronounced by many experts to be the finest in the world for quality of tone. The tenor, weighing more than 24 tons, and nine other bells were recast in 1735 from an older peal made in 1424 out of the metal of seven earlier bells. This testifies to the respectable antiquity of the metal of ten out of the twelve bells at present hanging in the tower. They have been silent since the Church has been in the hands of the restorers, but it is to be hoped that the future Cathedral, which is being so carefully renovated, will not lack its most distinctive and unique feature for want of funds to put the peal in order.

RECENTLY the Central London Railway Company made an application to the City authorities for permission to make a new surface opening at the north end of Walbrook, close to the Lord Mayor's private entrance to the Mansion House, in connection with the construction of the new terminal station at the Bank. The Commission of Sewers offered to allow an opening at the south end of the widened portion of Walbrook, near the back of the Mansion House; but at last week's meeting of that body a reply was read from the company stating that this would require the driving of a special tunnel at a prohibitive cost. The company therefore renewed its application to be allowed to make an opening at the north end of Walbrook, but this was met by another refusal, Mr. Deputy Cox remarking that he believed the Lord Mayor would be inclined to move out rather than submit to such a monstrosity in front of his private entrance. Should the company persist in the application, the matter will have to be referred to arbitration.

THE ninth annual drawing of the Crystal Palace Art Union (under the sanction of the Board of Trade) will take place at the Crystal Palace on the 29th inst. Twenty prize pictures have been selected by the committee, the first prize being a painting, value £100, entitled "In the Meadows at Noon," by T. Sidney Cooper, R.A.; the second, a water-colour drawing, value £75, entitled "Found by the Sea," by A. M. Rossi; the third, a painting by Haynes King, R.B.A., value £60, entitled "Overhauling the Nets"; and the fourth, a painting entitled "Cupboard Love," by Miss Edith Hayllar. The pictures are now on view on a screen opposite the Concert Room, and a full list of the prizes, with all other particulars, may be had from Mr. C. W. Wass, the superintendent of the Crystal Palace Picture Gallery. The subscription list closes on the 27th inst.

DURING the nine months which have elapsed since the last public announcement, considerable progress has been made with the work of the Huxley Memorial Committee. The full-sized model for the statue, on which Mr. Onslow Ford, R.A., is engaged, is well advanced, and will shortly be completed; and the trustees of the British Museum of Natural History, at South Kensington, have accepted the offer of the monument itself, which will be executed in marble and ultimately placed in the central hall of the institution, near that of Darwin. The design for the Royal College of Science medal has been obtained by prize competition among persons resident in Great Britain and Ireland, and the selection has fallen upon that of Mr. L. Bowcher, who has produced a highly-successful work of Art, and is now engaged upon the dies.

AMBITION to have new and palatial offices has placed the Commission of Sewers in a very unenviable position. That body determined to spend £40,000 on them, and leased from the Corporation a site in Basinghall Street at £900 per annum. But the unexpected happened. When the new building had reached the first floor a protest was raised by the owners of offices opposite, and the Commission was at once confronted with the question of "ancient lights." An injunction was applied for and granted, and work was brought to a full stop. For several months nothing has been done, and in consequence the contractors entered a claim for compensation, which has just been settled by arbitration, the

award being £2,738. The sum of £3 16*s.* 2*d.* per day has also been fixed by the arbitrator as payment due to the builders until work is resumed or the contract ended. The matter is further complicated by the fact that the Corporation has promoted a Bill for the dissolution of the Commission of Sewers as a separate and distinct body, the object being to invest the former with the municipal powers at present possessed by the latter. In the meantime the Sewers are behindhand with their rent. The original building plans have been modified considerably, in order to bring the new offices within the limits of the injunction, and it is expected that in the course of a few days the work of rebuilding will be resumed.

A PLEASANT little collection of landscape paintings is now to be seen at the Dudley Gallery, the work of six artists, Messrs. R. W. Allan, J. S. Hill, Hope McLachlan, Peppercorn, Leslie Thomson, and E. A. Waterlow. The pictures, various in merit, are marked by a certain likeness of feeling and intention, and the general impression is, as it should be, one of unity and concord. Were it not for the catalogue it would not be always easy to tell the work of one painter from that of his neighbour, though to obviate confusion each artist has hung his own productions in a group by itself. The largest picture is one of Mr. Waterlow's, which won a prize medal at Berlin last year, and is an able and solid piece of landscape work, painted in a higher key than most of the other canvases here. The subject, a wide stretch of river in bright sunlight, whose locality it would not be difficult to identify, is also more likely than most of the others to please the popular taste. But Mr Peppercorn, in this friendly rivalry of fellow-workers, will be admitted to take the first place. He exhibits ten pictures, mostly subjects of the kind already familiar to the admirers of his work—sombre, meditative pastorals, showing strongly, no doubt, the influence of Corot, but without Corot's airy, dreamy grace and lightness—Corot's, as it were, which have crossed the Channel and have caught, a Frenchman might say, something of Britannic spleen.

IN Leeds, twenty years ago, a destructor was erected on a site in Beckett Street, and since that time others have been constructed in Armley Road and Meanwood Road. As the one at Beckett Street is now somewhat out of date, it has been decided to have it re-modelled, and plans for this purpose are being prepared by Mr. T. Hewson, City Engineer. There will be no difficulty, we are informed, in effectively dealing with the solid refuse of the city during the time that the Beckett Street destructor is undergoing alteration. What refuse cannot be treated at Armley Road and Meanwood Road will be tipped on suitable ground, of which the Corporation has ample on the outskirts of the city. The cost of dealing with the refuse at the destructors is estimated at about 2*s.* per ton; the cost of tipping at 1*s.* per ton.

GREAT progress is being made with the large group of prison buildings at Fresnes, a borough in the southern suburbs of Paris beyond Sceaux. These constructions are intended to replace the old city gaols of Mazas, Sainte-Pélagie, the Grande-Roquette (outside which executions take place), and the Central Infirmary of Prisons. The works were begun over a year back, and the buildings will not be finished until the early part of 1898. The cost is estimated at 10,600,000 francs, or £424,000. Fresnes is a somnolent old place, and, like its neighbour Rungis, would seem to be at least 50 miles from Paris, although it is comparatively close to the fortified zone of the city. When the new prisons are built, those Parisians who want to see the guillotine at work will have a comparatively long journey to make.

GREAT BRITAIN can no longer boast of possessing the longest railroad bridge in the world. The bridges over the Tay and the Forth have lost their pride of place, for a new bridge over the Danube at Czernavoda has just been completed. The length of this structure, exclusive of its approaches, is 13,325 feet. The principal spans crossing the river itself, are respectively 620 feet and 455 feet. The remaining spans run over some nine miles of ground, which is for a lengthened period of the year subject to inundations. The height of the bridge at the centre of the main channel of the river is sufficient to allow the biggest vssels frequenting the Danube to pass under even at high water. It will be remembered that the length of the "Tay brig" is 10,725 feet, and that of the Forth 7,800 feet. America has the Mississippi Bridge, which is 10,600 feet.

AMONG the local supporters of the Dean and Chapter in their rebuilding scheme is the Mayor of Peterborough. It may be well, therefore, to state that his Worship is a builder by trade, and that he is to have the job in question. He is, we should add, very well known as a Church builder, and indeed his firm has, we believe, carried out most of the Cathedral restoration work in the country for the last 30 or 40 years. He was also the builder of the Royal Holloway College, the Church House, and Glasgow University. This is the fourth year of his office as Mayor.

WHAT may possibly prove to be the preliminary step towards adopting the electrical overhead system of tramway haulage for the whole of Leeds was taken at a meeting of the Leeds Tramways Committee on the 11th inst. It was reported that the rails on the Headingley, Chapeltown, and Hunslet tramway routes were in a bad state of repair, and required renewing. This raised the question as to what kind of rails, in view of possible eventualities, should be laid down. After a lengthy discussion, the committee resolved to relay the tram lines, on the three sections named, in such a way that they can hereafter be used for either electric cars, or for the ordinary cars, drawn by steam engines or horses. By this resolution, the committee does not bind itself to adopt any particular method of haulage; all they do is to prepare for a form that may be adopted. It is estimated that about 3,000 tons of rails will be required. The question of where these are to be purchased was left over for consideration to another meeting.

IN the Surveyor, of January 8th, which is an excellent number, is an addition to the usual number of pages in the shape of a twenty-page supplement devoted to the municipal works projected for 1897 by different local authorities in the United Kingdom. There is an interesting article on asphalte carriage-way pavements in America, with illustrations. Other articles are—"The Legal Precedents of 1896 in Relation to Municipal Engineering," by J. B. Reignier Conder; "A Survey of the Legislation of 1896 in connection with Municipal Engineering"; "Our New Paving," by G. Manville Fenn; and "The Collection and Removal of House Refuse." It is well printed, and forms quite a bulky volume.

THERE are two errors that threaten Art—the theory that it is an imitation of nature, and the theory that would make self-worship its ruling law, and has created the formula of "Art for Art's sake," says the Echo. The first would deprive it of all spontaneous individual life; the second breaks the link that binds it to the universe, and leaves it to wander like a sick man's dream, guided by no law, destitute of all mission or aims, at the bidding of every new sensation. The first theory renders Art useless, the second dangerous; both condemn it to sterility. Art does not imitate, but interpret. It searches out the idea lying dormant in the symbol, in order to present the symbol to men in such form as to enable them to penetrate through it to the idea; were it otherwise, what would be the use or value of Art? Nature is for Art the garb of the Eternal. The *real* is the finite expression and representation of the true; *forms* are the limits affixed by time and space to the power of life. Nature, reality, and form should, all of them, be so rendered and expressed by Art, as to reveal to mankind some ray of the truth—a vaster and profounder sentiment of life. The opposite theory reduces the poet to a level with the photograper. Art is not the fancy or caprice of an individual. It is the mighty voice of God and the universe, as heard by the chosen spirit, and repeated in tones of harmony to mankind. Should that omnipotent voice strike too directly upon the mortal ear, it would stun and suspend all human action, even as Pantheism crushed the ancient Oriental world. Art is no isolated, unconnected, or inexplicable phenomenon. It draws its life from the life of the Universe, and with the Universe it ascends from epoch to epoch towards the Almighty. It owes its power over the souls of men to that collective life—even as the trees and plants draw their life from earth, the common mother; and its power would be destroyed should it attempt to forsake its source.

HISTORICAL students have often been grateful to Mas-Latrie, but probably not many who have had recourse to the long array of volumes bearing his name in the British Museum, ever thought of him as a living man. Count Mas-Latrie has only just passed away, however, at an advanced age. His "Chronique des Papes, des Conciles Génévaux, et des Conciles de France," was published so long ago as 1837. Another monumental work, the "Tresor de Chronologie, d'Histoire, et de Géographie du Moyen-âge," is of much later date. His History of Cyprus under the Lusignans, and the Treaties of Peace between the Mohammedans of North Africa and the Christian Powers are less known, but they are mines of information on the subjects of which they treat.

THE progress of Harrogate during the past twenty years is remarkable, and has witnessed many important improvements. Miles of paved and asphalted footpaths have been provided. The cost under this head has been not less than £20,000 during the period. Including the acquisition of the rights of the commoners on the Stray, a similar sum has been expended on parks and pleasure grounds. The electric light has been provided at a cost of £25,000. Upon a farm and works for the disposal of the sewage of the town from £30,000 to £40,000 has been spent. The extensive new baths, with the pump-rooms, and the conservation of the waters, will entail an expenditure exceeding £100,000. In addition to the cost of maintenance of streets and public buildings, the capital outlay from 1877 to 1897 upon improvements completed and in hand has been not far short of a quarter of a million sterling. The finances have meanwhile been put on a satisfactory basis. The borough had no irredeemable debt, and the Corporation was able, a few years ago, to consolidate the debt, pay off all loans at high interest, and borrow money at less than 3 per cent. The amount of the debt at the audit in March last was £190,000, but the provision of the electric light and the erection of the new baths will entail a considerable increase of it. The estimated value of the town's property is more than double the amount of the debt, and the revenue from it will no doubt continue to increase with the growing popularity of the town. It is impossible to give the number of visitors annually, but it is computed that the number of those who take baths and drink the waters has increased threefold during the twenty years. More than £11,000 was paid for baths and waters last year, and this represents from 50,000 to 60,000 baths, and from 200,000 to 250,000 daily drinkers of the waters. The borrowed capital is to be repaid in twenty years, so that by 1925 the existing properties will be free from debt. At present the Corporation has other schemes under consideration. These include the acquisition of the waterworks and the Spa Concert Rooms estate. In order to protect certain mineral springs, it is likewise considered desirable that the town should possess the land adjoining, and it is further urged that the area of the recreation grounds might with advantage be increased. The present municipal offices are not all that could be desired, and no doubt the erection of a Town Hall, for which a site has been provided, will some day be seriously considered. The extensive improvements at the railway station by the North-Eastern Company should prove of advantage, and the proposal to provide an alternative route to Leeds, by utilising a portion of the line from Leeds to Wetherby, has been seriously considered.

THE late Prince Henry of Battenberg Memorial Fund, is being devoted to the restoration of a portion of the ruins of Carisbrooke Castle, I.W. The work, which has already been commenced, will consist in remodelling the gatehouse, and transforming the guard-room and portcullis chamber into a museum for the reception of objects of interest associated with the history of the Isle of Wight and the Castle. The guard-room and portcullis chamber are at present roofless ruins, but they are to be covered with flat roofs, the floors are to be of English oak, and the whole of the work is to be carried out in a manner so as to be in character with the surroundings. The museum will measure 45 ft. by 20 ft., and there will be steps leading from the museum to the

turrets. An old plan of the Castle, bearing the date 1583, has been discovered, and it is intended to follow this plan in the restoration of the portion to which the memorial fund will be devoted.

THE new buildings which have been erected at the Sheffield Court House in Castle Street and Waingate, have just been opened for police business. Considerable extensions have been made to the old building, which, after years of service under the style of the Town Hall, is now to be known as the Court House. A site of 670 yards of land in Waingate has been leased by the Town Trustees to the Corporation for a term of 470 years, at an annual ground rent of £240, and upon this site the extensions have been erected. The new building includes an additional Court, about the same size as the existing large Court, and similarly arranged and furnished in oak, together with a solicitors' room and a room for consultation purposes, and a large corridor for waiting witnesses. All these rooms, together with the Court itself, are on the ground floor, and are entered from the far end of the hall, facing Castle Street. Additional offices are also provided for the Stipendiary Magistrate, the general body of Justices, and the Clerk to the Justices. The entrance to the building from Waingate, to be used by the magistrates, has been enlarged and greatly improved by the building of an entrance hall and a more imposing staircase. There are 20 lock-up cells for prisoners under the court, together with two large cells for the accommodation of prisoners awaiting trial. This portion of the building is in easy communication with both old and new courts, while a covered van-way passing under the court and through the building from Waingate to Castle Street admits of prisoners being removed from cell to prison van in privacy. Careful arrangements for ventilating the new building have been provided, and the heating apparatus is of an improved description. The electric light is installed throughout. In almost every respect the new court is fitted up on the lines of the old one. Before the building was commenced the Chief Constable and the Architects, Messrs. Flockton, Gibbs, and Flockton, visited the most recently erected courts and police cells in the kingdom, and came to the conclusion that the arrangements of the old city courts could not be improved upon. Between £17,000 and £18,000 is the estimated cost of the buildings, which have been designed in the simplest style, both externally and internally, in order to harmonise with the old premises. Messrs. Flockton, Gibbs, and Flockton are the Architects, and the contracts have been carried out by Mr. James Fidler, builder, Eckington; Mr. J. H. Lilleker, joiner, Queen Street; Messrs. Corrie and Sons, plumbers, Carver Street; Messrs. C. Chadwick and Sons, plasterers and slaters, Victoria Street; Messrs. Renton, Gibbs, and Co., of Liverpool, the heating; Messrs. Longden and Co., of Furnace Hill, the wrought-iron gates and grilles; and Messrs. Johnson and Appleyards, the furnishing.

THE Royal Society of Antiquaries of Ireland held its annual general meeting in the Royal Dublin Society's premises last week. The annual report stated that the roll now contains the names of 200 fellows and 1,160 members—in all 1,360 names, being 50 more than at the close of the preceding year. The quarterly meetings for the year 1897 have been fixed as follows:—The annual general meeting in Dublin, on Tuesday, the 12th of January; the second in Kilkenny on Easter Monday, 19th April; the third in Munster in June or August; and the fourth in Dublin in September. In connection with these meetings there will be an excursion to Drogheda on 13th January, the day following the annual general meeting, and excursions will be arranged in connection with the other meetings. On the 1st of December the following nominations were duly made for the honorary offices now falling vacant, in accordance with the rules of the society:—For president, The Right Hon. The O'Connor Don; for vice-presidents, Thomas Drew, R.H.A. (retiring president), for Leinster; W. J. Knowles, for Ulster; the Rev. F. M. ffrench and the Right Hon. A. H. Smith-Barry, for Munster; and Edward Martyn, D.L., for Connaught. For seats on the Council:—Deputy Surgeon-General King, M.A.; W. R. Mollok, Fellow; and J. J. Digges La Touche. Also as honorary president:—His Grace the Duke of Devonshire, K.G., Fellow. As the nominations have not exceeded the number of vacancies no ballot will be necessary. Papers were read as follows:—By Mr. Knowles, "On portion of an ancient harp from the Crannoge of Carncroagh, County Antrim"; by Dr. Frazer, on "Irish Gold Ornaments"; by Rev. Mr. Lett, on "The Dorsey, County Armagh"; by Major-General Stubbs, R.A., on "The Monastic History of Dromiskin, County Louth."

A DETERMINED effort is to be made to preserve the Church of St. Mildred, Bread Street, notices for the demolition of which have been served by the solicitors of the Central London Railway Company. A similar effort, it will be remembered, was successfully made on behalf of St. Mary Woolnoth, Lombard Street, the existence of which was threatened by the same railway. The original St. Mildred's was destroyed by the Great Fire, and subsequently it was rebuilt.

M. FLOURENS, an expert and enterprising civil engineer, has for some time past been endeavouring to persuade the Russian Government to undertake the previously mooted project of connecting the Baltic with the Black Sea by a ship canal. The preliminary surveys of the route and approximate estimate of the cost of construction have already been made, and M. Flourens is now seeking a concession for a French syndicate which is anxious to carry out the scheme. It is still an open question whether the Government will proceed with this project during the present century, or, if they do, whether they will give the concession to a foreign country. In principle, it is said, the Tsar has practically resolved upon the eventual consummation of this highly important inter-oceanic waterway, which would largely disrate the presen strategetic character of the German North Sea Canal.

THE excavations that have taken place at the ancient Caledonian hill-fort discovered about a year ago on the summit of the Hill of Dumbowie, in the valley of the Clyde, are now concluded. Many of the finds have been of unique value, especially in the significance of their relations to palæolithic and neolithic man. Antiquarians place the date of the fort at a very early pre-Roman period, and the productions found in it, as well as the type of structure, make it one of the most valuable of recent antiquarian discoveries. Among the principal objects found were stone grinding mills, spears, arrow-heads, hammer-heads, harpoons, scrapers, fire-stoves, an anvil, chisels, an anvil or chopping block, cup and ring, ornamental stones, trinkets, and gravers, the bones of the great red deer, badger, horse, wild boar, rabbit, and hare, and the shells of the oyster, cockle, mussel, and limpet. No crockery of any kind was discovered, nor a vestige of any metal or wood; but great masses of charred bones, charcoal, and organic earth go to prove the occupation and habitation of the fort for a long period. The fort is 32 feet in diameter, nearly circular, with walls 13 ft. 9 in. thick, built of freestone, without lime or earth, and having a doorway to the east, with two guard chambers, one on each side. Since the conclusion of the operations, within the last few days, the fort has been turfed over and restored to its former condition. Following up the antiquarian research of the Clyde valley, the Helensburgh Society has, says the Daily Graphic, made a beginning on Chapel Hill, a knoll near the village of Kilpatrick, long associated with the end of the historic Roman wall on the western side. This work is being regarded by Scottish antiquarians with great interest, as it is expected to settle the long-disputed point as to the termination of the Roman wall, and also as to the designation of the knoll as Chapel Hill. The site is on the confines of the traditional birthplace of St. Patrick.

A MR. ROGER, the owner of three shops, with houses and a small piece of land, fronting the Kentish Town Road, has been awarded £5,852 compensation by a jury in the London Sheriff's Court, owing to the property having been acquired compulsorily by the Midland Railway Company.

AT a meeting of the Sewerage Committee of Aberdeen Town Council, it was decided to recommend that £10,000 be expended in laying a new sewer between the foot of Portland Street and one hundred yards south of the Victoria Bridge, taking in the area on which the curing yards are built.

PLYMOUTH AND WORKMEN'S DWELLINGS.

AS it is now proposed to stop, at any rate for the present, the erection of more dwellings on the Corporation estate at Prince Rock, it may be useful to supply a few extracts from an article which recently appeared in the Lancet, on "Sanitary Reform at Plymouth." "The most important action taken by the municipality has been the purchase of the Prince Rock Estate, comprising 29½ acres of land on the outskirts of the town. Here 62 model cottage artisan dwellings have been built, and will be open to tenants in a few weeks. The authorities there will be able at once to demolish a condemned area. . . . Rarely have been seen such deplorable, ruinous, overcrowded, damp, dark, and noisome dwellngs. The houses which actually stand condemned represent but a very small proportion of the unhealthy dwellings of this town, but it is proposed to condemn and to destroy only in due proportion with the building and completion of other and better dwellings. To replace these horrible rookeries the municipality will gradually erect a new town on its estate at Prince Rock. Already many streets are laid out and sewers built. The new cottages are well worth a visit, if only to compare these structures with the jerry-built cottages that may be found in the immediate neighbourhood. The municipal cottages have, on the ground floor, a front sitting-room with a fireplace provided with a low, slow-combustion grate. Behind there is the kitchen with stove and copper, and a sink by the window discharging over a disconnecting gulley outside. A special narrow window in the store cupboard will enable provisions to be kept fresh. There is a small bedroom upstairs without a fireplace, and two larger bedrooms with fireplaces, and each has two well-built cupboards for hanging clothes. Each of these cupboards has a separate door. The windows have double rebated sills, which prevent draughts and add to the solidity of the structure. The bearings or pulleys for the ropes of the window sashes (generally made of cast iron, and which, therefore, tend to rust and to break) are of gun-metal, and will last any length of time. All angles or sharp corners are rounded off and made of Portland cement, instead of the soft wood or more fragile plaster generally employed. There are no breakable plaster mouldings, but strong wood beading. The work is all plain, but of the best and most substantial quality. The water-closets are outside, and the soil-pipes are trapped and ventilated throughout. Cottages thus built naturally cost more than the jerry-built structures which so many persons are compelled to inhabit; but there will be much less money spent for repairs, and the habitations are thus rendered more healthy and comfortable." It may be added, that the contract for the dwellings erected has been rather under £15,000. The roads and main drains on the estate have been made under the direction of the borough surveyor.

A WELL attended meeting of ratepayers of Colne has passed a resolution in favour of promoting a Bill in Parliament for the construction of two compensation reservoirs in the Wycollar district costing £100,000, providing a recreation ground, the construction of a new road through the North Valley, purchasing a refuse destructor, and a new cattle market and abattoirs.

AFTER negotiations lasting over a year, the difficulties have been adjusted between the Belgian Government and the syndicate responsible for the conversion of Brussels into a seaport. At a meeting between the representatives of both sides, M. De Smet de Naeyer, Minister of Finance, declared himself ready to fix the new docks as originally proposed near the Allee Verte in the north-east quarter of the city. The work will be shortly commenced.

THE Crum Memorial Library, Thornliebank, which was erected by public subscription in memory of the late Mr. Alexander Crum, has been opened. The library occupies a site given free by the Thornliebank Company, Limited, who have also provided a beautiful garden terrace in front. About £2,000 was subscribed, and £1,200 devoted to the building of the library, the remaining £800 being set aside for the provision of an annual income.

PETERBOROUGH.

ATTITUDE OF THE ANTIQUARIES.

THE Society of Antiquaries of London has issued a long statement *apropos* the action of the Society for the Protection of Ancient Buildings for the preservation of the west front of Peterborough Cathedral. A specification showing not only how the northern gable and its supporting arch can be repaired, but how the same principle can be applied to the strengthening and securing from further dilapidations the whole of the west front, is appended to the statement, and bears the signatures of Thackeray Turner, W. R. Lethaby, Detmar Blow, Philip Webb, J. T. Micklethwaite, whilst amongst those who have not examined the west front of Peterborough Cathedral from the scaffolding, but are of opinion that the methods proposed in the specification are eminently practical, and are such as we should recommend for repairing work of this nature are Robert Weir Schultz, F. W. Troup, Edward S. Prior, F. Inigo Thomas, Halsey Ricardo, Mervyn Macartney, P. Morley Horder, J. A. Cossins (Birmingham), H. Wilson, Ernest Newton, E. Guy Dawber, C. R. Ashbee, J. J. Stevenson, F.R.I.B.A., Chas. H. M. Mileham. The history of the controversy is recapitulated in the Society's statement, and in alluding to a few suggestions made by the S.P.A.B., "as to the way in which the more important repairs should be undertaken after the foundations have been secured," it states:—Premising that everyone would agree that "nothing should be done (which could by any effort be avoided) to alter" the beautiful appearance of the front, the Society suggested that, besides the addition of the metal ties proposed by Mr. Pearson, the fractured spandrels of the great arches should be made strong and secure. This cannot well be done from the outside, nor by grouting alone, but by gradually removing from behind, by small sections at a time, the disintegrated rubble walling, and building up the holes back to the facing stones with sound bonding material. By this plan, the disintegration of the walling could be made good without *disturbing the facing stones*, an important consideration. "Shoring, strutting, and in every other way preparing to avoid accident," are, of course, pre-supposed. It will be seen that by the method here suggested, only an outline of which has been laid before the Dean and Chapter and their Architect, the present

APPEARANCE OF THE FRONT WOULD BE ABSOLUTELY RETAINED,

and no trace of such a repair would be visible externally. The foundation of the northern of the two detached piers should first receive particular attention, says the specification, though the southern pier would also have to be looked to in the same way. With these piers is of course included the strengthening work of the interposed porch.* The difficulties of

STRENGTHENING OLD FOUNDATIONS

are necessarily considerable; still, in this particular case, they are less so than might have been supposed, for the weight of material balanced on the pier in question is comparatively trifling, and the opportunity afforded by the open character of the situation would allow of ample security being taken to avoid misadventure; but these precautions should be both extensive and particular. Before in any way opening or disturbing the ground about the foundation of the northern of the two piers, a carefully designed framework and centering of timber to this pier and its northern arch would have to be set up, which should effectually support and sustain the superimposed weight of the work resting on the capital of this pier and the pier itself. Centerings should also be at once applied to the other two arches, for the purpose of steadying them while dealing with the northernmost pier and arch. Care must be used in preparing heavy timber cills properly arranged, and bedded on the ground level, on which the timbers supporting the cradling and centering are to be erected, bearing in mind that sufficient space be allowed for getting at the foundations of the pier itself and of the porch attached to it. The pier in question would then have to be in every fit way supported, secured, and protected from injury, as also the pier, archway, and window opening of the porch itself. Two continuous lines of horizontal timbering would have to be applied extending the whole length of the front on the inside of the narthex†; one against the western wall‡, the other directly against the piers. They should be supported on upright and diagonal beams, probably at the level just under the capitals of the pier shafts. This horizontal beam work inside the narthex should be in right relation to a parallel beam and support work, of the same kind, on the outside; three longitudinal beams in all. These should be connected by cross and diagonal timbers and iron tie-rods, so as to become one continuous stiffening of the whole front of the building. The centering to the ribs of the vaulting of the narthex would also have to be made in like manner, and, with the centerings of the arch itself, be supported from the horizontal framework described above. As we attach great importance to every part of this supporting framework and centering, it would not only have to be carefully designed, but should be adapted to the exact peculiarities and irregularities of the work against which it would be set up. It must be clearly understood that the whole of the foundation of this pier, and that of the attached porch, must be

COMPLETELY UNDERPINNED;

for, if only parts of it were so treated, a very mischievous difference in the support to the work above would occur, and cross strains be set up which would gravely endanger the substance of the main pier itself. We now come to the very important point in connexion with the present repair of the front, the manner in which the great arches can be safely and securely strengthened, *without having recourse to rebuilding*. It has already been noted that the internal parts of the walling of the northernmost arch have expanded from east to west during the slow settlement of the detached pier below; and in a lesser degree this is probably the case in the other arches also. The substance of this walling must therefore, to a greater or less extent, be in a state of disintegration, and its removal and replacement by sound masonry are essential to the permanent stability of the narthex. The manner in which this may be done without risk or danger either to the building itself or to the men engaged in the work, is as follows:—in the rubble walling, which has no ashlar facing at the back of the arches, beginning at the lowest point, a hole or tunnel, just wide enough for a man to work in, would be slowly driven by short sections at a time. The sides and roof of each section would be made absolutely secure by timber framing before beginning the next one, and the hole would be gradually carried through the wall to the back of the facing stones of the wall itself. The hole would in no case exceed six feet in length. Any possible danger from the running of disintegrated material would be met by the prompt application of short lengths of 3-inch planking, thickly coated with wet clay, and held in position by workmen while props with expanding screws are applied to the ends, so as to press each plank well home and keep it in place. Moreover, only one tunnel would be made at a time, and this would be filled and pinned up (with sound material, as hereafter is described) before another one is begun; it would therefore bear but a small proportion to the area of the wall bored into. The new filling would thus support the work above it until that in its turn was removed. Clearly, when doing this underbuilding in the spandrels of the arches, the chief danger in underpinning foundations, namely, the great superincumbent weight, would practically be nonexistent, owing to the comparatively slight structure of the gable above. The only danger to be faced, the possibility of the sides or roof of the holes falling in, would be effectually guarded against by the precautions already described, The process of

CONSOLIDATING THE WALLING

of the west front, above the piers and overlying the arches, is simplified by the great thickness of the walling at this part of the work under consideration; and the foregoing indication of a very complete system of timber support to all the weight and thrust of the work above the springing line of the arches, shows that any disturbance caused by the execution of the work would be met at all points by the counter support. Extra support in detail would have to be supplied from time to time, so as to make sure that no further dislocation of material would happen, as the supporting framework would be brought into action as soon as the slightest movement took place. The principle underlying this working by tunnel into the walling from the inside, at the back of the ornamental ashlar stonework on the outside, is that of applying horizontal bands of very hard material at certain distances apart vertically, so as to become, as the work proceeds upwards from the springing line of the arch, something analogous to "cantilever" construction used in modern iron bridges; that is, a corbelling out right and left from the central axis of the piers below till the bands from opposite sides meet over the centre of the arch between its two piers. The bands of hard horizontal material thus act as ribs, and the filling in between them as support to the ribs. The kind of materials to be employed in re-coring and bonding together old walling is a very necessary condition for ensuring permanent success. As is well known, underpinning, in the ordinary sense, is done at the base of the walls, and mostly underground, the materials used being either sound brick or tough stone, with Portland cement and coarse, clean sand for the mortar, and thin material, such as tiles or slates, for pinning and wedging. Doubtless, as the work proceeds from time to time, at the different parts of the walling, any scheme set down on paper now would have to be modified to suit the peculiarities of the various works as they become disclosed; caution while each part was being dealt with would have to be insisted on, and special contrivances put in practice to suit all situations.

* The Interposed Porch, a construction built in between the two piers, about the end of the fourteenth century, to steady and stiffen these two important supports.

† The Narthex, which is a triple-arched vestibule standing some 16 or 17 feet (inside measurement) in front of the west wall of the Church, carried by two triangularly planned piers, and supported by two stair turret wings at the north and south angles.

‡ The Western Wall of the Church to which the narthex is attached.

We have received a copy of a circular, which we give below in full at the desire of the signatories.—ED.

To the Dean and Chapter of Peterborough,—We, the undersigned, Architects and Surveyors of Leicester (being the largest town in the diocese), having full confidence in the judgment of your Architect, Mr. J. L. Pearson, R.A., and knowing, from what he has done in the past, that any work he does to the west front of Peterborough Cathedral will be of the most reverent and conservative character, beg to forward a subscription of £71 towards the fund you are raising for the restoration of this unique portion of the Cathedral of our diocese.

Professional Items.

BRADFORD-ON-AVON.—A building for the purposes of a Technical Institute for Bradford-on-Avon and neighbourhood has just been completed in Junction Road. The total cost is about £3,900. The frontage is 75 feet to Junction Road, with a depth of 45 feet. The style is a form of English Renaissance. From the centre of the hall a wide staircase runs to the first floor, stairs beneath communicating with the heating chamber and store rooms. On the left of the hall is the women's department, fitted with a suitable range for cooking, with a scullery and store-room adjoining. On the first floor is a chemical laboratory, and the lecture theatre is also on the first floor, in the centre of the building, and adjoining the chemical laboratory, provision being made by specially ventilated fume closets for carrying off the gases emitted from chemical experiments. There is also, on the first floor, a large room to be used for the teaching of drawing, building construction, and other technical subjects. The cooking room and lecture theatre are to be fitted with raised galleries for the convenience of the students, and special arrangements are made for efficient ventilation and heating.

CARDIFF.—Messrs. J. P. Jones, Richards, and Budgen, Architects, Cardiff, have prepared a new plan for laying out the Cathays Park, provided it can be acquired for the erection of municipal and other public buildings. They divide the park by two boulevards, running north and south, and two cross roads, into six sections. One of the boulevards, which runs parallel to the North Road, is practically formed already by an avenue of trees, and on the plot between it and the North Road it is proposed to place, first (commencing from the town end) the Town Hall, then a picture gallery, and then the technical school and the boys' intermediate school. On the Park Place side (coming from the southern end) will be a national Welsh museum, the university college, the theological college, the offices of the Welsh University, and the girls' intermediate school. This arrangement will leave the centre of the park available for winter gardens or other means of recreation which the Corporation may decide upon.

CARLTON COLVILLE.—Last week new Church schools were opened at Carlton Colville. Plans were by Mr. F. W. Richards, Architect, of Lowestoft, and the contract was entrusted to Mr. W. J. Searle; Mr. A. G. Beckett executed the woodwork, and Mr. James Curtis, of Oulton Broad, the plumber's work. The school stands on high ground on the Carlton Road. It is built of red brick, black pointed, and relieved with white brick dressings. The interior is 96 ft. in length, and 22 ft. in width, with an average height of 17 ft. 6 in. to the ceiling. The room is divided into two by Stone's patent half-glass swivel partitions. It is well lighted, and ventilated by Shorland's patent ventilators. The warming is provided for by approved school stoves, supplied by Messrs. Waller and Smith, of Lowestoft.

DRIFFIELD.—At the last meeting of the Driffield Rural District Council, the sanitary committee presented a report respecting the water supply of Wetwang. The committee had had an interview with Mr. Fairbank, civil engineer, of York, who had drawn up a second scheme for providing for a storage of 30,000 gallons of water, the power to be by a windmill. An estimate given showed that the total cost and annual expenditure of the two schemes was as follows:—"A" scheme: total cost £1,036 0s. 10d., annual expenditure £65 18s. 7d.; "B" scheme: total cost, £1,052 14s., annual expenditure £61 7s. 7d. After some discussion as to the details of each scheme, it was decided to submit "B" scheme to the Wetwang Parish Council for consideration.

DUNDEE.—In the erection of the Parish Church Hall a slight alteration is to be made upon the line of the street at Mid Kirk Style, necessitating the removal of the old town well, which has for nearly 70 years occupied a position in the Church wall at the corner of Tally Street and Mid Kirk Style. When the specifications for the hall were framed a clause was inserted reserving to the city the stones of which the well is built, and the interesting suggestion has now been made that the well when removed from its present site should be erected in Dudhope Park and used as a drinking fountain.

GLASGOW.—An electric lift, capable of carrying 15 passengers, is now being fitted up at the Kelvin Bridge Station of the new Glasgow District Subway. The work is in the hands of Messrs. Easton, Anderson and Goolden, Limited, of Erith, who were the makers of the large lifts now in constant use at the stations of the Mersey Tunnel Railway.

HALIFAX.—A new Infants' Board School, at Caddy Field, Halifax, was opened on the 10th inst. Mr. F. Smith (chairman of the Sites and Building Committee), who took a leading part in the ceremony, was presented with a silver key by the Architect (Mr. Joseph F. Walsh). The total cost of the building and site was £3,200. The plans adopted were selected in competition, the original scheme providing for 315 infants. At present only a portion of the scheme has been carried out, to accommodate 165 children. The premises included a central hall, or assembly room, 41 ft. by 22 ft. 6 in., three class-rooms, 18 ft. by 16 ft., and a teachers' room. The whole of the works have been carried out by local firms, with two exceptions. The contractors were Mr. I. Firth, mason; Messrs. F. Greenwood and Son, Queensbury, joiners; Messrs. John Naylor and Son, plumbers; Messrs. Rushworth and Firth, slaters and plasterers; Messrs. George Greenwood and Son, concreting; Mr. John Berry, iron and steel work; Mr. T. Rushton, painting; Messrs. P. M. Walker and Co., ventilating; the Westminster Flooring Company, London, wood block flooring; and Messrs. William Truswell and Son, Sheffield, heating apparatus.

The extensive buildings at Halifax, to be known as the Warley Road Board Schools, were opened last week. The site of the building has cost nearly £1,200, and the building and site together £13,200. The entire cost was £16,000. Provision is made for the three departments—boys, girls, and infants—furnishing accommodation for 1,132 scholars.

KIRKCALDY.—Messrs. Curror Brothers are about to erect new malt-barns, etc., at their works, Victoria Road. Messrs. Swanston and Legge are the Architects.

LIVERPOOL.—At the recent fire at the Court Theatre, Max Clarke's patent protected curtain, for the third time, kept the fire confined to one side of the proscenium wall, showing plainly the advantage of such a means of closing the proscenium opening.

LOUGHBOROUGH.—Through the resignation of Mr. A. W. Cross, who has obtained an appointment at King's Norton, Birmingham, the Loughborough Town Council invited applications for the post of Borough Surveyor. In response, 78 applications came in, and the following six applicants were requested to attend a meeting of the Council, sitting as a General Purposes Committee, viz.:—Mr. A. H. Walker, chief assistant to Messrs. G. and F. W. Hodson, Loughborough; Mr. F. Worrall, engineering assistant, borough of Leicester; Mr. F. D. Sharpe, resident engineer, Loughborough section, M. S. & L. Railway extension; Mr. W. White Cooper, engineer and surveyor, District Council, Bedlington; Mr. H. J. Weaver, assistant city surveyor, Gloucester; and Mr. J. S. Hendry, chief assistant engineer and surveyor, West Bromwich.—After consideration the first-named candidate was appointed.

NEWCASTLE.—The new offices of the Newcastle and Gateshead Water Company, situate in Pilgrim Street, have just been opened. Mr. S. D. Robins was the Architect.

PAIGNTON.—The new schools recently opened will accommodate 400 girls, and have besides a capacious central hall, commodious class rooms, and a spacious playground, with every sanitary and other convenience complying with the requirements of modern times. The total cost has been about £5,000. Messrs. Bridgman and Bridgman were the Architects, and Messrs. Rabbick the builders.

SWANSEA.—The ceremony of laying memorial stones of a new Welsh Congregational Chapel, now in course of erection in Henrietta Street, Swansea, took place on the 11th inst. The Church, which has been erected to supply the place of Capel Seton, in High Street, is of Romanesque style of Architecture, and it is built of native stone, the dressings being of Bath stone. The interior will be decorated in accordance with the style of Architecture. There is a circular gallery and organ chamber, and, in the carrying out of the internal arrangements, all the latest appliances and conveniences have been taken advantage of. The Architect is Mr. W. Williams, of Wind Street, and the contractor Mr. Billings.

NEW SEWERAGE WORKS AT SOUTHAMPTON.

AN inspection recently took place of the works now in progress for the disposal of the sewerage of the Eastern districts. The new destructor was first inspected, and particular attention was paid to the working of the same, together with the forced draught, and the water-tube boilers from which the steam is to be supplied for operating the new sewage pumping engines, the fuel being the house refuse of the borough. The new engine-house is to have four compound condensing engines installed for lifting the sewage. The precipitating tanks have been completed up to the ground level. These tanks extend over a large area, having a capacity for the treatment of three million gallons of sewage in 24 hours. The system of treating the sludge by pressing in pneumatic sludge presses was also explained. The committee also visited the wharf adjoining (late Gannaway's), recently purchased by the Corporation as a site for the construction of additional tanks for the treatment of the sewage of the western districts, including that from Shirley and the Platform. The works have, notwithstanding the recent unfavourable weather, made good progress. Mr. Bennett, the borough engineer, has presented a report in respect to the various contracts completed or still in hand, of which the following is a brief summary. Contract No. 1: Refuse destructor, completed; working satisfactorily. Contractors, Messrs. Goddard, Massey, and Warner. Amount of tender, £2,669 4s. 6d.—Contract No. 2: Engine house, pump wells, &c. Contractors, Messrs. Jenkins and Sons. Amount of tender, £1,889. This contract is completed with the exception of the flooring, which is left until the engines are erected.—Contract No. 3: For engines and pumps. Contractors, Messrs. J. Simpson and Co. Amount of tender, £2,565. These engines are nearly completed, and the contractors are delivering the same.—Contract No. 4: Sludge press house, air compressing house, sludge reservoir, and sludge ejector chambers. Contractors, Messrs. Jenkins and Sons. Amount of tender, £2,337. This contract was practically completed on the 14th November, and now awaits the erection of the air compressors and ejectors.—Contract No. 5: Precipitating tanks. Contractors, Messrs. Playfair and Toole. Amount of tender £7,135. The contractors have made favourable progress with this section of the works.—Contract No. 6: Pneumatic machinery, comprising new air compressors, ejectors for Northam district, and sludge ejectors are well in hand. Contractors, Messrs. Hughes and Lancaster. Amount of tender, £4,898 16s. The contractors have commenced to deliver, and their men have arrived to erect the machinery.—Contract No. 7 comprises the storm-water drainage of the district shown upon the plans. The tender of Messrs. W. H. Saunders and Co., of Bournemouth, was accepted by the Council on the 9th December, 1896, for the sum of £3,250. The work has just commenced. The following work yet remains to be let by contract:—Main sewers, estimated cost of £12,500, which will be advertised in the early spring, the weather being more favourable for such work; engineering works, sludge-pressing machinery, outfall ironwork, &c.: this will be advertised at once.

THE fine old mansion, Dunipace House, located between Denny and Larbert, the residence of Mr. John A. Harvie Brown, the eminent naturalist, has been destroyed by fire.

ART AND SCIENCE AT LEEK.

MR. GEO. C. HAITÉ'S ADDRESS.

THE annual distribution of prizes to the students of the School of Art, Science, and Technology, at the Nicholson Institute, Leek, and the delivery of the presidential address by Mr. George Haité, R.B.A., of London, took place in the Town Hall, Leek, on the 11th inst. In opening his address, Mr. Haité said, "Few of even the largest manufacturing towns, if any, can boast of such an Institute to meet the inevitable and serious competition which must soon be reached in all the Art industries of Great Britain by foreign countries, and particularly in the manufacture of silk goods. Our generosity as a nation and our hospitality has brought, and will yet bring, with it a condition of things we must be prepared to accept, and equally prepared to meet. The Japs have been not only studying and acquiring knowledge of our language, our laws, and constitution, but our methods of warfare, but last, and not least, our

INDUSTRIAL ARTS AND MANUFACTURES.

They have been gauging what is called the "taste" of the buying public, soon to set up their own looms and supply the demand. They will send into our markets silk, plush, and tapestries, free from the Japanese flavour that, now the craze is over, would retard its sale in any quantity. They will send designs, colourings, and varieties of material of such a nature that it may well seem hopeless to compete against, and that, too, at a price which to us will be incomprehensible. We must either confess ourselves beaten, give up the industry, or put a prohibitive and protective tariff on all such imported goods, or, by the aid of these Schools of Art and Technique and the advantages of social education be prepared to compete with it. If anything can be done to meet it, nothing, it seems to me, is so likely to be so efficacious as the skilled training of our Artists and artizans. Fifty years ago, when it was realized how far behind we were in design and the skilled handicrafts and Art industries, the Government undertook to change the order of things, and the national schools of design were established, and became from the first schools of painting (which could very well have looked after themselves), and launched on the world a multitude of individuals "with a trained misunderstanding of painting," as Bret Harte puts it. As for design, the very term was forgotten, and the Department was called, as it still is, South Kensington. It was

A PITIABLE FAILURE.

It could hardly have been anything else; the governing body were carefully selected from the Army, Navy, and Civil Service. Even if the Department had been successful in design to its full measure, the problem would not have been solved, for what we required—what we still in a great measure require—are skilled artizans capable of carrying out the work in a satisfactory manner. The Art of design was then at its lowest ebb, and the workmanship equal to the standard, and it is useless to claim our position at the present moment as the result of State aid. The result has been gained by the efforts of men who worked on without recognition or any such aid. In those days one might almost say there were absolutely no iron workers, no *repoussé* workers, no leather workers. The silversmith's work was vitiated by traditional borrowed ornament, and the character of the metals used was utterly lost sight of and destroyed. Stained-glass efforts were triumphs of ignorance, and absolutely brutal in colour, fitness, and limitation of the material was ignorance, and all effort directed towards reproducing in a fragile material the delicacies of a painting. But fortunately, even in those days, a limited number of men were working in neglected devotion, but whose influence was to do more than all the wealth of a State could lavish; notably, E. W. Godwin and the late Bruce J. Talbot, followed a little later by Morris, Walter Crane, and others, still with us, anxious and willing to work for and with the State, if the representatives of the State in their wisdom will permit. Art in its broad sense is far too wide a question to touch upon, no matter how briefly, in the time at my disposal; besides, most phases of it have, during the last few years, received the attention of the ablest exponents. Therefore, my remarks will have reference chiefly to that phase of Art expression known as design, and particularly design for application. As design in its fullest sense it is true includes all Art expression, in its more restricted sense it may apply more closely and profitably to this institute than perhaps its sister Arts of Painting, Sculpture, and Architecture. I am well aware that there were numbers of able Artists and Art writers—and there may be still—who objected to Art as applied. They, however, lived in the glamour of the past when the condition of things was as diametrically opposed to what they are now as light to darkness. It is natural to desire the work of the hand only—be it in stone, iron, or the loom. Not that I object to good machine work where repetition of ornament is not only necessary but desirable, but because I feel that work should always be found for those ready and able to do it. The competition I have referred to will come not so much in the sister Arts of Painting, Sculpture, and Architecture, but in design and what is called applied Art, and have a far graver consequence, not only on our wealth but on our civilizing influence. It will be keener and more direct than it was 50 years ago, for the reason that our insular prejudice and patriotism, so characteristic a feature of those times, has gone, and gone for ever. The good time is no longer coming, it is here with us now, and we have to do and keep that place which it is admitted that we have now acquired as foremost in decorative and applied Art. The Royal Academy can no longer be pointed at as representing only a few of the more popular phases of Art. It numbers among its body representative men in all branches of Art expression. Herkomer, Swan, and Richmond are something besides Painters; Thornycroft, Gilbert, Onslow Ford, and Frampton are something besides Sculptors, and several are decorative Artists. And the time would have surely come when a designer, as such, would have been elected. I said would have, because it cannot be now. For a man to be a great designer he must of necessity be a worker in other mediums, too, and such are the leading designers of to-day. The opportunities and facilities of the time must result in creative activity, and what we want is a competent body of skilled workers, capable of carrying out the ideas of the master mind, thus giving to thousands with strong Artistic appreciation, but not necessarily imaginative capacity, the ability to exercise the skill of their hands, their sense of colour, and their expression of cultivated taste. We who have been and are so great in Painting, Sculpture and Architecture, must be equally as great in manufacture and design, which I venture to declare to be, in my opinion, the most important of all phases of

NATIONAL ART EXPRESSION.

A man may no longer be content to be a painter—he must be an Artist, and the designer must be content with nothing less than both, and there will no longer be excuse for him if he be not a craftsman too. You may rest assured of recognition now. The honours which were once absorbed by the painter only will be open to all. Those who maintain and increase our national wealth and reputation cannot and will not be ignored by a public who have been educated to at last realise the importance of our manufactures. The designers themselves have already formed themselves into a society. To quote their own rule:—"The objects of this society shall be to advance the Arts of design and the status of designers." We have in the Architectural Review, a monthly Art magazine, the most remarkable of its kind yet published, the proprietor of which has assured me of his intention of having all phases of current Art represented. The only pathway to success spells work, work and application. My faith is a simple one—to seek to know what to do and do it; to do and know how much remains undone; and to finish better what were well begun. We cannot and must not rely upon the work of others. We must rely upon our own efforts. Who can teach? Yet it is possible to direct, and by a word of warning and advice spare the worker a multitude of wasted hours, futile aims, and mental anguish. Beware of the absorbing worship of the actual; it is a question if there can be a great work of Art without idealism. The study of design compels the cultivation of the ideal, since all natural forms must comply to the exigencies of ornament. It is the neglect of idealism and the disproportionate devotion to realism that leads to false views of beauty and of morality; that stultifies the judgment and vitiates the taste. Be true to yourselves in Art as in life, simple and unaffected in your work; and beware of false hero-worship and desire to imitate. Be sure the imitators will but emphasize the smaller and petty qualities of the master which the master himself deplores. Avoid the vulgar error of forcing your originality in order to be ahead of others. You may achieve your aim, but possibly at a cost others wiser may not care to pay. Above all, beware of affectation or eccentricity, which is only another name for conceit. For eccentricity in Art is what slang is to Literature, and as certain to lead to license. Prove your right to the title of Artist, as much by your selection as your achievement. Art may and should ennoble all it touches, but in the spirit in which it is so often used should be added "Art is most particular what she does touch." If you lack imagination and cannot obtain some sense of beauty in your work, it will be either your misfortune or your training. Despise humbug, refuse to have foisted upon your judgment views and aims which you find are opposed to your reason and common sense. Be enthusiastic in your work and for the work of others, and not too discouraged over your own failures. Work steadily on, and there shall be not one so humble amongst you but shall do more to glorify Art and humanity than most of those who shout their merits in the highways, but who are despised for a time and then forgotten."

R.I.B.A. PRIZES AND SCHOLARSHIPS.

PRESIDENT'S ADDRESS TO STUDENTS ON MONDAY NIGHT.

THERE was a pleasing variation in the usual procedure, at the meeting of the Royal Institute of British Architects, on Monday evening. It was the annual distribution of prizes for the session 1896 7, and, in addition, a presentation was also made to Mr. Arthur Cates, formerly chairman of the Board of Examiners. Prof. Aitchison was in the chair. The first business was the reading of a memoir of the late Mr. Joseph D. Brandon, by Mr. Warren, who announced that the deceased member had willed £1,000 to the Royal Institute of British Architects, free of legacy duty, and—as stated in the will—"to be added to the funded property of the Institute, and income arising therefrom, to be applied at the discretion of the Council at the time being, towards the advancement of Architecture." A few biographical details of the donor followed—it being mentioned that the deceased was a Senior Fellow of the Institute at the time of his death—and in proposing a vote of thanks to the surviving relatives for the very munificent gift, the Chairman said, almost every one present had known Mr. Brandon, and esteemed him for his many gentlemanly qualities. During his life-time he had shown his deep interest in the welfare of the Institution by according it financial support in the way of meeting certain liabilities. The vote of thanks was carried with acclamation, and Mr. A. Waterhouse, R.A., was then called upon to make the presentation to Mr. Cates. The examinations which were conducted in connection with the Institution, Mr. Waterhouse said, were a serious and anxious undertaking, and some idea of its importance could be gathered from the fact that 780 candidates had already passed examinations, whilst upwards of 1,000 others were at present engaged in preparing for the second or third of the three progressive stages into which the examinations were now divided. When they compared the old voluntary examinations with what followed they found that 436 passed between 1863 and 1881, and that since 1882, when the examination to qualify for associateship became obligatory, 737 passed. The work of the Institution was, no doubt, a very great ordeal to those who submitted to it, but it seemed to have attractions after all, and when they considered the advantages appertaining to the examinations, independent of the intrinsic advantages, they ceased to wonder at the enthusiasm displayed by the students in this matter. A great amount of the work of management had fallen upon the shoulders of Mr. Cates, who had shown a great interest in the subject so early as 1855, having actively identified himself with the examinations in 1877 and 1882, having been appointed chairman of the Board of Examiners. A few years after his appointment he propounded the scheme for progressive examinations, and continued to preside over the deliberations of the

Board until last year, when considerations of health enforced his retirement. Mr. Waterhouse proceeded to eulogise Mr. Cates and the testimonial of which he was to be the recipient - a large and handsome silver bowl—had been subscribed for exclusively by past and present members of the Board of Examiners as a sincere expression of their personal regard and their admiration for the way in which he had presided over their deliberations for fourteen years. Dealing with the question of the examinations, Mr. Waterhouse said some people were scandalized when it was first proposed that they should test candidates in their knowledge of design. Had they been forcing some particular school of Architecture upon them, there might have been some ground for anxiety, but all they wanted was to discover, beyond good draughtsmanship, some appreciation of what makes for a good design—some idea of the fitness of things, adaptiveness of means to ends, and so forth—they wanted to keep the great end of Architecture in view—that of promoting the amenities of human life. Mr. Cates warmly acknowledged the honour, remarking that he had worked in the most perfect harmony with his colleagues for fifteen years, and the reception of Mr. Waterhouse's remarks, endorsing as it did the sentiments expressed, greatly enhanced the present in his eyes. His individual efforts in the matter of introducing obligatory examinations would have been of little account, however, had he not had the assistance of others; the support he received from the Board was most cheering and encouraging, and he was glad the Board adopted the policy of gradually stiffening examinations until they had reached a standard which, high as it was, would, he hoped, be still further increased in the future, so that the good results of the past would also be increased. The speaker acknowledged the prominent part Mr. W. H. White had played in the initiation and subsequent management of the obligatory examinations, and thanked Mr. Herbert G. Taylor for great assistance. Proceeding, he compared the condition of Architectural education to-day with what it was when he first entered the profession, and traced the advancement of the Architect, not only in England, but in other countries, especially in the United States, where an effort to obtain the special recognition of Architecture in the University course had proved successful. The system of examination involved a peril which he hoped would not be realised. There had been an uniformity of expression in support of the individuality and originality of the work of English Architects, and the peril lay in the tendency of academic influence to destroy this individuality and originality. And looking at the advantages of the examinations, they did not make any claim that these (the examinations) would make Architects. But they did enable the candidate to acquire the power to study, and the knowledge obtained in preparing for the examination would be the basis for future studies which would render him a worthy member of his profession and of the Institute.—The President delivered his address to the students at the conclusion of Mr. Cates' speech.—In his opening remarks, Professor Aitchison said that though he might be inferior to some of his predecessors, he yielded to none in his ardent desire for the improvement of English Architecture. He went on to urge that untiring diligence was absolutely necessary to the successful student, and as an illustration of this, he called the attention of the students to the work of the late Lord Leighton, the exquisite perfection of whose productions they would see, was the result of a most careful and accurate study of Nature. There was not a form, or extremity, or piece of drapery put upon his canvas which was not thoroughly studied before it was painted. But even with the greatest diligence, the longest life was far too short to enable them to become complete masters in the Art they professed, which embraced so many branches that a combination of qualities was essential to their complete mastery, which was rarely found in one man. It was a great saving of time to have a map, a compass, and knowledge of the reefs and sand banks before embarking, not only in order to avoid shipwreck, but in order to obviate any waste of labour by covering unnecessary ground. It was for them to map out the structure of their future studies, and then build with an earnestness which must ensure success. Architecture was a structural Art, and until they realised and acted upon this, he did not think any material improvement was likely to take place. They endeavoured to train the eye in the matter of proper proportions by studying classical buildings, and when they began to build it was necessary that they should have an arrangement which would obviate any waste of room. Man also wanted an outward appearance to a building which would give some indication of its character and use. Then skill was necessary in combining junctions, and this was done by mouldings which gave them varieties of light and shade. He would say nothing of sculpture, for they could not expect sculpture from Architects as sculpture was a branch of Art which required a man's life-study, and a bad Architect and execrable sculptor was not an object to be proud of. Of other points he might dwell upon there was the influence of the age, and in this connection he discredited those people who thought that "ridiculous antiquarianism" would ever take the place of Architecture. Our age was not Roman, or Gothic, or Renaissance, and if the Architect of the age was to charm the age, he must discover and embody in his work the desires of the age The President went on to speak of statutes of great statesmen, great inventors, leaders in industry, painters, sculptors and Architects, &c., whose work would make the nation live in the memory of the world, when its greatness and glory had departed, being introduced into our public buildings for the promotion of Art. Architecture could only but slightly be a reflex of the age, but if invention in Architecture was extinct, they must try to re-create. Another point he wished to bring before the students, and that was the study of the methods employed by the great Architects of the world to effect the emotions proper to the use of buildings, and particularly those dedicated to the adoration of the Almighty. Students were naturally apt to seize upon features in a building they admired and use them in the most incongruous way—to apply a feature of a Church to a business store for instance. But he hoped that the students would all strive assiduously towards advancement, and there could be no doubt, that just as examinations in surgery and medicine had greatly furthered those sciences, so the examinations in Architecture would have the result of materially benefitting that branch of Art.—Mr. Fawcett read a lengthy criticism of the students' work, the meeting closing with the announcement that Mr. A. Gilbert, R.A., would read a paper on "The Sculptor's Work of the Renaissance," at the next meeting of the Institute, to be held on the 1st prox.

SOCIETY MEETINGS.

The Architectural Association.—At a meeting of the Architectural Association, on Friday evening, the Chairman (Mr. Beresford Pite), announced that Mr. W. H. Seth-Smith, in furtherance of the suggestion made in his paper at the last meeting of the Association, had forwarded some suggested conditions for the competition, for which he offered a prize of 10 guineas. The conditions would be considered by the committee in due course, and a further announcement made on the subject. The Chairman also announced that Mr. Fellows-Prynne had been nominated by the committee to fill the vacancy caused by the resignation of Mr. Begg, and it would, therefore, be their duty, in accordance with Bye-law 35, to nominate some one at the next meeting to fill the vacancy in the committee which Mr. Fellows-Prynne's election to the post of vice-president would cause. The member who was the first unsuccessful candidate for a vice-presidency at the last election could be nominated.—Mr. A. S. Flower will read a paper at the next meeting, to be held on February 5th, on "An Unwritten Chapter in Architectural History."

The Edinburgh Architectural Society.—The annual smoking concert of this Society was held in the Imperial Hotel, on the 6th inst. There was a large attendance. The opening meeting of the present session was held in the Rooms, on the 13th inst. There was a good attendance, Mr. J. A. Williamson, A.R.I.B.A., President, in the chair. The minutes of previous meetings having been read, the Hon. President, Mr. R. M. Cameron, delivered an opening address on "The Dean of Guild Court" and "Hints on Valuation." He pointed out the necessity of attending minutely to the requirements of the Court in the preparation of plans so as to avoid any unnecessary delay in passing such plans, also indicated the limit of the powers of the Court, besides giving some very interesting instances where the Court had used its utmost powers to the advantage of the annuity of the city. He afterwards gave some very valuable hints on valuation of property, pointing out that valuation may not be learnt from books, but must be gained by study of sales of property, land, etc., combined with forethought and common sense. At the conclusion of his address Mr. Cameron, on the motion of Mr. Cumming, seconded by Mr. A. R. Scott, was awarded a hearty vote of thanks.

Liverpool Architectural Society.—The fourth ordinary meeting of the forty-ninth session was held at the Law Library, Union Court, and a paper was read by C. E. Mumford, Esq., on "Belgian Churches," illustrated with limelight views. Among those present was Mons. E. Séve, Belgian Consul-General to the United Kingdom; Mons. E. Versprecüwen, the Belgian Consul; and Professor F. N. Simpson, of Victoria University College. Mr. George Bradbury, President of the Society presided. Mr. Mumford, in his opening remarks, said Belgium was without doubt one of the countries of Europe where the Fine Arts had flourished, and were still flourishing, with the utmost vigour. The long series of great painters who succeeded each other for more than four centuries had not alone brought her the renown which she so justly enjoyed. Architects and Sculptors had contributed their part. The devotion and intellectual culture of the Flemings had been shown in the vast number of Churches of high Architectural merit which were to be found in the country. Few of the older buildings now in existence date back beyond the beginning of the 13th century. It was not until the Gothic style was firmly rooted in the adjacent countries that it came to be adopted by the Flemings. All the vast wealth of ornament accumulated in these Churches up to the middle of the 16th century was destroyed by the Calvinist iconoclasts, and then there perished a wealth of Art, the loss of which was irreparable. About the commencement of the 17th century, the country again becoming prosperous, Art and Architecture received a new impetus, and many new Churches were erected. The builders of Belgian Churches, whilst striving successfully after the beautiful, always kept the practical utility of their work well in view. About 150 slides, photographed by the lecturer, illustrating Churches in the towns of Antwerp, Lierre, Malines, Brussels, Namur, and Dinant, were shown on the screen. The proceedings closed with votes of thanks to the lecturer and the chairman.

FURTHER progress will shortly be made with the widening of Angel Street, Sheffield, the Corporation having now acquired the freehold site at the corner of Angel Street and King Street.

Announcements.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

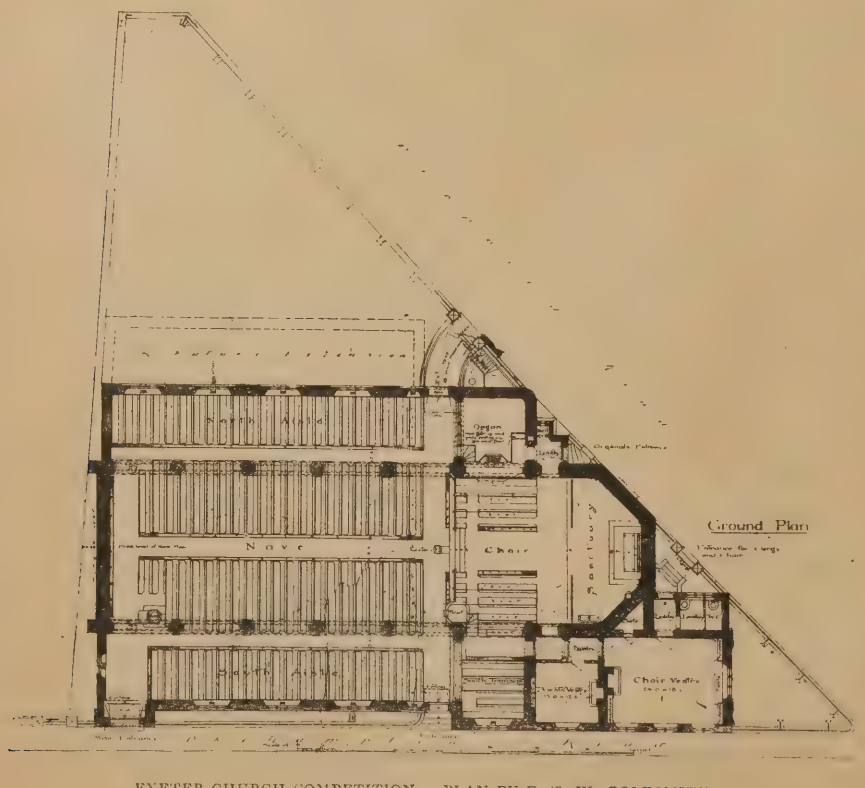
Humour in Exeter. Unlike Drumtochty, we have a natural aptitude for gaiety, consequently we are always grateful to anyone who is good enough to offer us some humorous entertainment, such as a correspondent kindly provided us with, in a Devonshire local paper a few days ago, on the subject of the recent competition for the Exeter Church. We said some time back in these columns, there were to be found few things so diverting as the "Art criticism" of those who are not Artists. We were mistaken however; there is yet another critic more amusing still, and that is your large contributor to a local paper, instructing his "fellow-townsmen" in Art in general, and specially on the Art of Architecture. For genuine humour on Architectural things, he is unsurpassed. And we should say in passing, it is only for that engaging quality on the part of this particular individual we make use of him here and thank him accordingly. He is writing what he imagines to be a criticism on our exposure of the Emmanuel Church Competition, and concludes we have not given any evidence of the unfairness of the award. With the exception of one or two designs, as we have said, the work has not been so strong as we had wished, but we are sure Artists will agree with us when we say that it most certainly has reached a far higher standard of merit than that set by the assessor in his award, which latter showed an utter want of appreciation of even the most elementary principles of Artistic design. Says this unconcious humourist of Exeter, "This is all a matter of taste. Just so—" Also "just so." It is "a matter of taste." It is a matter of good taste or bad taste. The man who prefers the selected design in this competition to any of those we have praised in our pages, only reveals the fact that he has an inartistic mind, an uncultivated taste, and that he has not the least idea of what he is talking about. What better proof of this could there be than this amusing remark of his?—"I know nothing about styles of Architecture, but I do know the sort of buildings I like." Again, "just so." If he had known "anything about the styles of Architecture," or even had had the faintest glimmering of the principles that obtain in Art generally, he would never have given himself away in such an entirely funny manner. He tells you of his ideas on what he thinks is "Art" in such a frank and engaging way that you can read his mind completely. He tells you (though not in words) that he prefers the Strawberry Hill Gothic of Batty Langley to anything William of Wykeham ever did. He "fancies" the "Architecture" of Belgravia, before anything Athens has to show; it is so much more "substantial," and, finally, you are quite sure he would like better the popular pretty paintings of to-day than any of the masterpieces of Velasquez or Rembrandt. And—this is the most amusing part of his humour—he tells you all this so clearly, at the very same time he

EXETER COMPETITION. DESIGN BY F. T. W. GOLDSMITH.

thinks in his poor blind way, he is posing as an authority on good taste in Art. He has never a notion he is advertising his own distressing want of knowledge. Of course we cannot argue with anyone like this, it is but waste of time to try and reason with incompetent critics any way, but we should say that his description of our attitude towards the award as "hinting at its unfairness," is hardly a life-like rendering of our own impression of it as "one of the worst-conducted competitions of recent years." His notion, too, that those who have to pay the piper have a right to settle the question of the Art of the building is also too good to lie unearthed. According to this, Lord Grimthorpe is justified in his awful mutilation of what was one of the finest of the Abbeys of England, because "he could pay the piper." Because the local committee at Exeter can do the same as it, the right to inflict on its suffering fellow-townsmen one of the cheapest and most ordinary versions of regulation Gothic we have seen for many a long day. With one thing we are in entire agreement with our funny "critic." He says the committee has exercised a wise discretion in not entering into communication with "rejected contributors." We think so, too, but for totally different reasons. Doubtless, by now, the humourist will wish he had followed the committtee's example.

DURHAM AND ITS CATHEDRAL.

IN consequence of the pressure upon our space the conclusion of this article is held over until the next issue.



AT the monthly meeting of the Mytholmroyd Urban District Council, the plans and scheme submitted by Mr. Sam Shaw, civil engineer of Dewsbury, for sewerage and sewage outfall works at Greenhills, Mytholmroyd, were approved, and it was resolved to forward them to the Local Government Board, and that application be made to borrow £12,500 for the purpose of carrying out the proposed works.

MR. VAL PRINSEP ON "THE PERMANENCE OF ART."

BOOKS, said Mr. Val C. Prinsep, R.A., on Thursday night, at the annual distribution of prizes at the Clapton Art School, are of little use to Art students, because only the doings of great men are chronicled in them, and not what the young students themselves can do. Two men may have exactly the same talents, but one would probably fail hopelessly if he tried to work upon the ideas of the other. The pupil must first obtain a thorough knowledge of Art, and then render his own feelings, which he alone can find out. There are many Arts—painting, music, Architecture, literature; in fact, their name is legion. Art is the expression of a man's feelings, reproducing the visions and fancies which visit the brain, and to which the Artist gives form and expression. Different men produce these ideas in different ways, as witness the various works of great painters, writers, and sculptors. In every case the Artist has to present the work clothed with his own individuality, if that work is to be of any value. Of all these branches literature is, perhaps, the most powerful, for it grows up with each one from the earliest years. But all of the Arts need to be stamped with the individuality of the Artist. The actor renders the works of others in his own way. The orator makes his words sublime by his manner of delivery and his eloquence. To those who live in succeeding generations the plays which delighted their ancestors are dull without the magnificent power of a Garrick, who led his audiences to admiration and enthusiasm. But Garrick is now little more than a name. With painting it is different. A painter cannot hope to excite the enthusiasm which an actor, a musician, or a literary man evokes, because the public who view his works are not so easily moved. There is, however, this advantage—his works last, and those who succeed him can see those masterpieces, the actual work of those who called them into existence. In one good picture can be seen what volumes cannot show. He called the attention of the young Artists to the exhibition of the late Lord Leighton's works, remarking that there was the same finish about the last works of the late President of the Royal Academy as about those executed forty-five years ago.

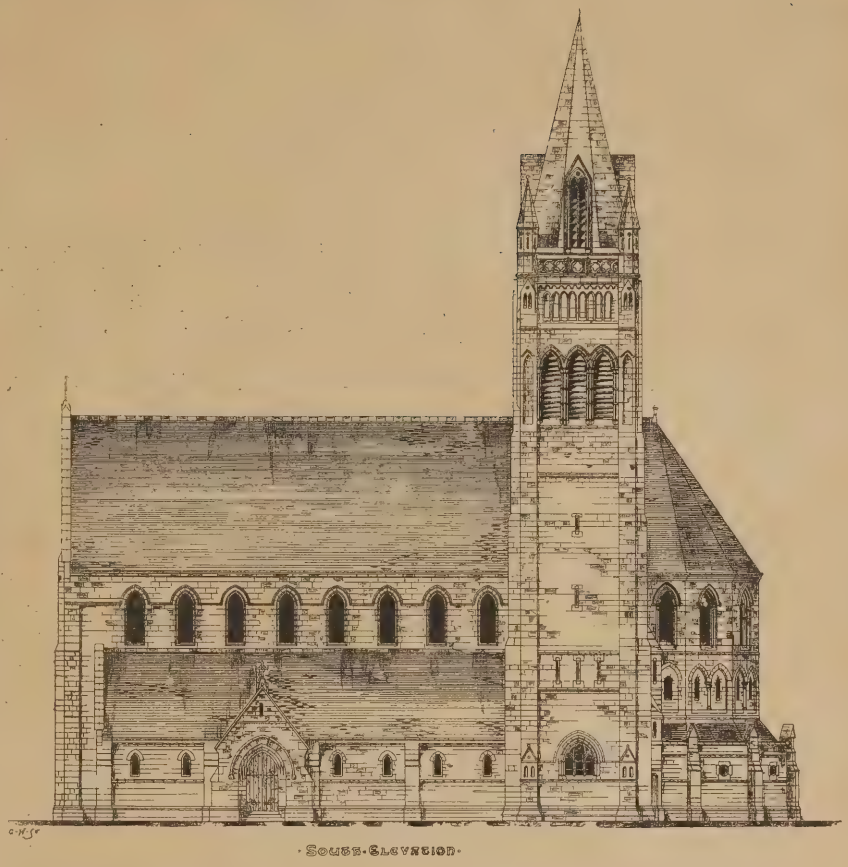
QUEEN'S COLLEGE, BELFAST.

THE Students' Union building of the Queen's College, Belfast, which was designed by Mr. Robert Cochrane, of Dublin, compares favourably with the other buildings on the grounds, the elevations being arranged to harmonise with them. The structure is of brick, with white stone dressings at all jambs and angles. Annadale bricks are used for facing, and the stone is from the Giffnock Quarries in Scotland. One of the chief features about the building is the cut-stone tracery windows. The building is sunk eight feet below the surface level, thus forming a basement which has been utilised for caretaker's apartments, heating-chamber, kitchen and culinary apartments, lavatories, and a large billiard-room. The gas fittings have been done by Messrs. Richard Patterson & Co., and the heating by Messrs. Boyd, Paisley. The building contract was placed with Messrs. J. and R. Thompson, Thompson Street, Short Strand. The work, including fittings, has cost £8,000. The principal elevations face University Square; the building is approached from the grounds by the existing drives, and a broad flight of cut-stone steps leads to the principal entrance on the ground floor. These are separated from the students' quarters, which contain a billiard room. Adjoining are the apartments containing the lavatories, baths, and students' lockers. These rooms are separated from the kitchen and offices by a vestibule. This basement is approached from the grounds outside at low level, and also from the grand staircase on the principal floor. The principal apartment will be used for public meetings. The hall measures 40 feet by 30 feet, and contains accommodation for about four hundred people on the floor and gallery. The gallery runs round three sides of the hall on the upper floor. The apartment is lighted at each end by large five-light traceried windows, and at the side by the large recessed bay window, and is amply ventilated by the turret ventilator on the roof. The dining-room is reached from the hall, and is over the kitchen, from which it is served by lifts. There are pantries and stores adjoining this department, also served by lifts from below. The upper floor contains smoking-room, approached from the main staircase, lighted on three sides, and ventilated through the roof. The Architectural style chosen is a somewhat free treatment of Gothic of the Tudor period.

EXETER CHURCH COMPETITION. PLAN BY F. T. W. GOLDSMITH.

DISCOVERY OF A "CIMABUE."

A DISCOVERY is reported by the London correspondent of the Manchester Courier as having recently been made at the residence of Canon Harford, in Dean's Yard, Westminster. Canon Harford has long been known as a great collector. During 1862 and 1863, when living at Charles Street, Grosvenor Square, he was visited by the Marchese Di Balzani, who insisted upon the Canon putting his own price upon certain pictures which were intended as souvenirs. Canon Harford declined any gallery pictures, but accepted some small pictures which the agent of the Marquis described as worm-eaten and destroyed. Among these were a Giotto and a Fra Angelico. There was also a Madonna and Child, evidently an altar-piece, in a gable frame, which covered a large part of the picture. Having removed the frame, Canon Harford restored the picture, removing three robes, as Mr. Richmond, R.A., removed three crowns from the head of a king in Westminster Abbey. This picture, after careful examination, has been pronounced by Sir E. Poynter, P.R.A., and other experts, to be an undoubted Cimabue. Mr. Eadie Reid, who has been entrusted with the work of restoration—a work of the greatest importance and delicacy—has made some interesting discoveries. The drapery, which was a mass of black, has been made to reveal the original lines, and the original texture of the picture has been restored. The heads of the Madonna and Child alone have remained untouched since the picture was painted, 1240-1260, probably owing to a familiar superstition. At present there is only one example of Cimabue in the National Gallery.



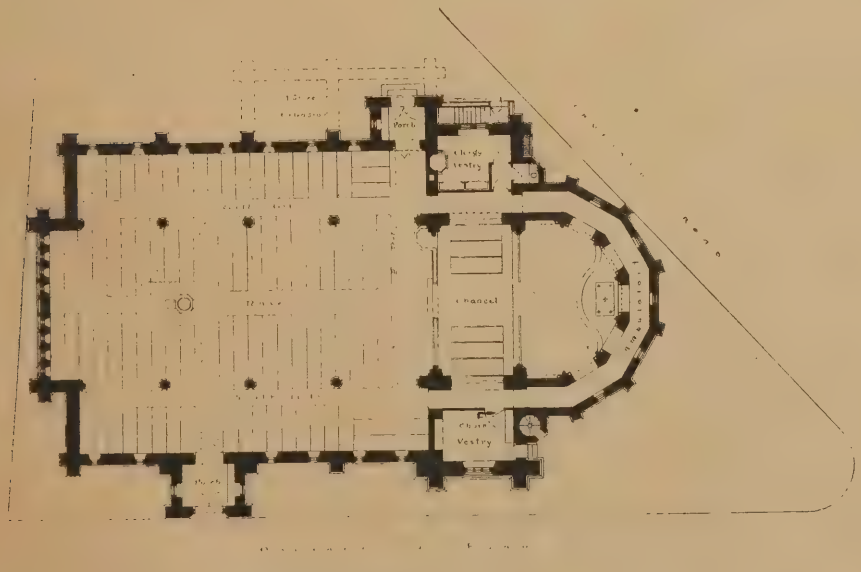
THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

The Exeter Church Competition Fiasco.

Final Notice.

OF the designs we publish this week, that by Messrs. Wimperis and East is the best Artistically, and is also the best adapted to the site and local conditions. The plan is excellently well arranged, and there are points in it we wish the authors would illustrate in perspective, as there are, judging by the plan and sections, many interesting pictures to be obtained from it.

As we have already said in a former issue, we think the exterior is an admirable example of scheme as to strength in design, and marked by much Artistic feeling in the treatment and scale of the various parts. We have only one small grumble to make, and that is against the undignified finish to the tower, which would be a picturesque enough feature in the cottages on the right-hand side of the perspective, but is not at all the sort of thing for the covering of a Church tower. Not to finish with a complaint, we should like particularly to call attention to the external treatment of the nave windows, to the internal arrangement of the nave piers and arches —we think the effect of these would be excellent. It is a great pity this Church is not to be built, but we hope the Artists may have an opportunity, sooner or later, of seeing their work realized. The design by Messrs. Hall, Cooper and Davis, of Scarborough, is, as will be seen on comparing the perspectives, on a much more grandiose and elaborate scale. Indeed, the comparison at first sight between these two versions of the same subject is remarkable. The design by Messrs. Wimperis and East appears as a village Church by the side of the other one, which has more the air of a small Cathedral—in fact, there are Cathedrals on much more simple lines than this Church.



No. 4.

South Elevation.

MR. W. TARRING'S DESIGN.

We mention this, because it seems almost impossible that the two designs could have sprung from the same conditions.

Apart from the question of suitability to the local requirements and the site, this is undoubtedly an able and well-studied composition, and shows an appreciation for scale and proportion. The tower particularly has been well studied in this respect. There the proportion of window and wall space, with the carved band under the belfry windows to redeem the whole from a slight feeling of hardness, is well managed and is probably the best part of the whole design, although the treatment of the west end, with the big traceried window, and the small towers which flank the gable end on both sides, is good and interesting. We think the entrance porches the most unsatisfactory parts of the work. They appear somewhat wanting in proportion of parts, and their general effect is a little lumpy. The plan of this design generally is very good and well thought out, but we think it a pity that the dignity of the east end (that quality should certainly be expressed there, if anywhere, in a Church), should be marred by the projecting buildings of the clergy vestry, &c., which spoil the lower parts of the exterior of the chancel considerably. But this criticism applies, we admit, to most of the designs, and the fault is probably more due to peculiarities of the site than anything else.

Ground Plan.

PLAN BY MR. W. TARRING.

PROSPECTIVE BUILDING AT SWANSEA.

THIS year will be characterised by several large building undertakings in Swansea. As to new buildings, the most important will be the new post-offices on the site of the old Mackworth Hotel. The plans for the new buildings have not yet been completed, nor are they likely to be submitted to the Corporation for approval before the Treasury has sanctioned the expenditure of the money—probably £40,000. The new Swansea post-office will be at least equal in Architectural design to that of Cardiff, and will be situated in a more open thoroughfare. Next come the schemes for improving the hotel accommodation. The Swansea Hotel Co., Limited, will in all probability proceed with the rebuilding of the George Hotel and adjacent premises on an elaborate scale. The proprietors of the Cameron Arms intend to proceed at once with the rebuilding of that hostelry. The probability is that the company will be formed after the rebuilding. Then again, Messrs. R. E. Jones, Limited, have already given out the contract for extending the Mackworth Hotel, in High Street, on the site now occupied by Capel Seion. The contractors are Messrs. Lloyd Bros., and the cost of the extension will total up to about £4,000. Work will be commenced next week.

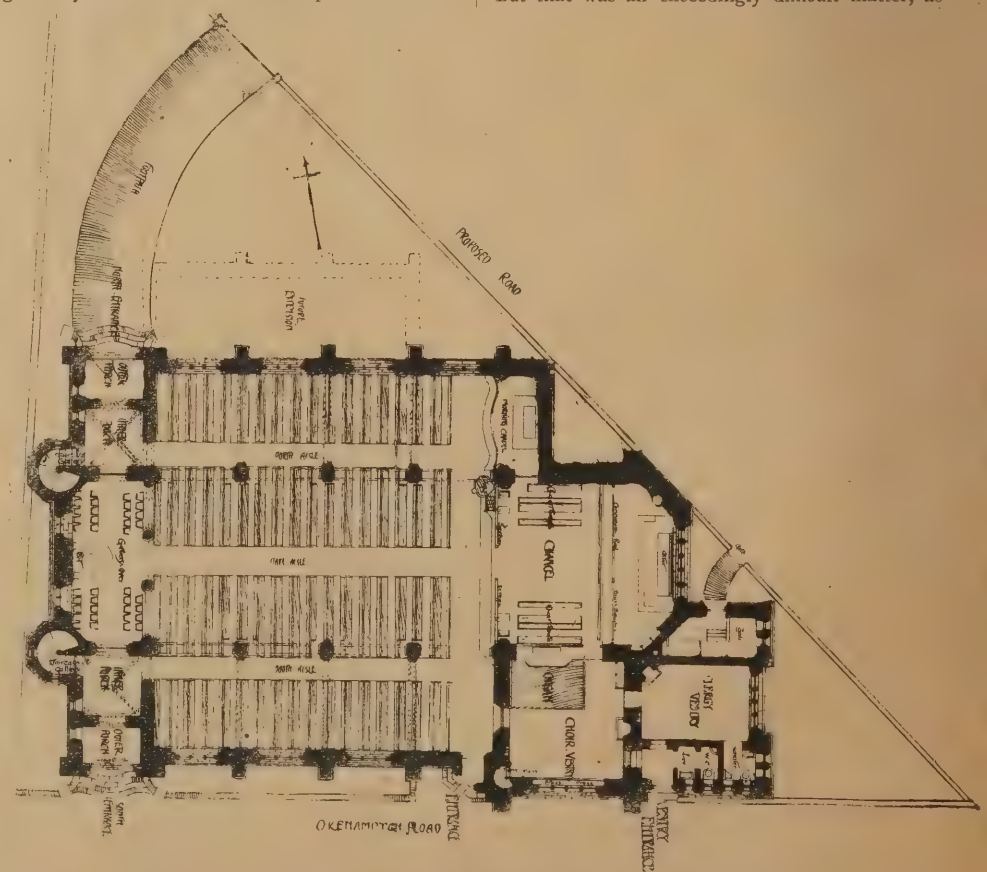
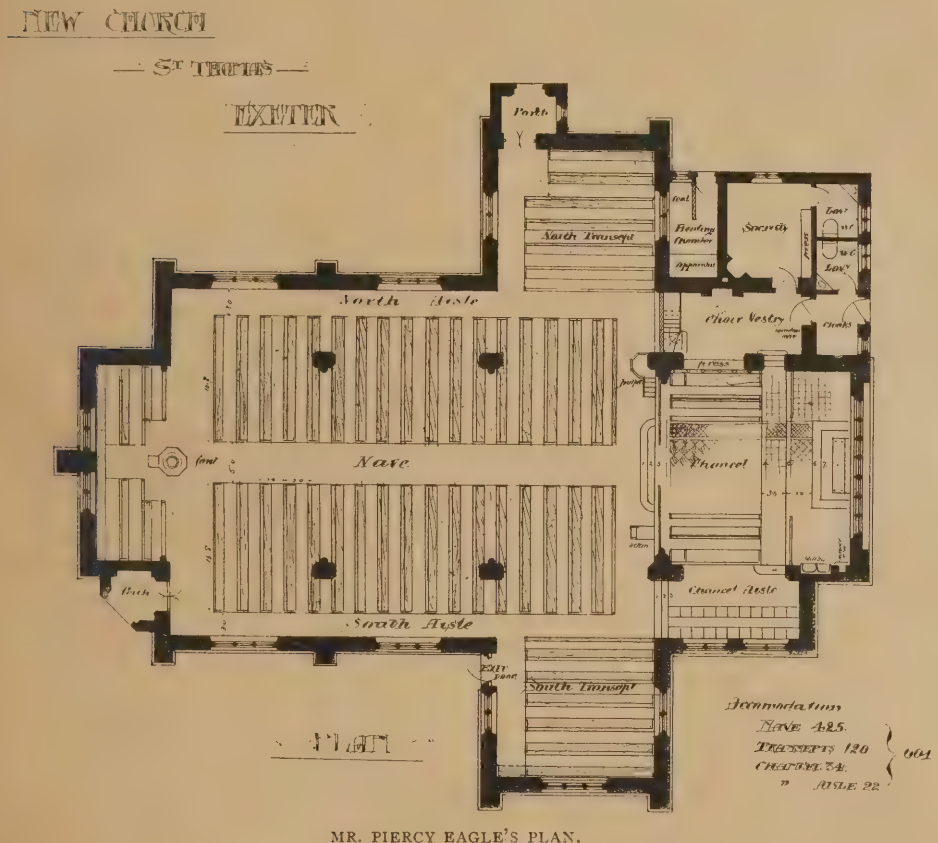
THE ARCHITECTURAL ASSOCIATION.



DISCUSSION ON MR. E. P. WARREN'S PAPER.

AT the close of the Paper, read by Mr. Warren, which we gave in our last issue, Mr. L. A. Shruffrey, a former president of the Class of Design, said he thought Mr. Warren had two points of practical importance. But, first of all, he would like to say one thing about Adams; his was not plaster work. It was a composition, so that it did not afford much exercise for the modeller's Art. And, as for fibrous plaster, which had been much alluded to by Mr. Warren, it had its virtues and disadvantages. For instance, it did not afford the same resistance



EXETER CHURCH COMPETITION. PLAN BY MESSRS. WIMPERIS AND EAST.

touched upon all the points of the subject if they drew the line at the type of plastering of which they had examples in the room. Plastering went a good deal further in England, however, as exemplified in the work of Adams, about whom they had heard nothing that evening. Personally he thought there was a good deal of beauty in Adams' work — many of his adornments were exceedingly beautiful—but the work ought to be looked at in a slightly different light to that indicated by Mr. Warren. His ideas as to an undulating surface would get them into great trouble, even in the execution of latter-day plastering, if they were not very careful. For his own part, he thought a plain ground answered the purpose very well, for it afforded a contrast when the model work was put upon it. And a "tip" of practical importance on this subject had reached him, and it might, he thought, be of benefit to others. When modelling ornaments on the ground, no matter whether in plaster or clay, a little bit of clay rubbed along the edge where the model work intersected the ground, would do a great deal of good in taking off the hardness. This, however, would not be necessary in some work where everything was sharp. One of the charms of Adams' work, for instance, in a great measure lay in the sharpness of the modelling; the old mouldings, they would notice, were frequently set up edges, very square from the ground. It seemed to look well, but the specimen they had in the room was not one of the best; the circles did not seem to have any connection with Adams' work. He (the speaker) would particularly like to lay stress on one of the points raised by Mr. Warren—the value of the ground. There was no doubt that very little ornament indeed could be made to go a long way, and one often found that one had taken a great deal of trouble to model an ornament that would be better swept out of the way. He ventured to assert that a model frieze designed by Mr. Warren, which was exhibited in the room, would be improved by the removal of a considerable amount of the ornament, and as this was a matter which added appreciably to the labour and cost, it ought to be borne in mind. He begged to propose a vote of thanks to Mr. Warren for his paper.—Mr. Miller said, he wished to point out one or to sound as lime plaster, owing to its thin nature, neither was it so reliable because it was backed up by wood, and, therefore, was not nearly as fire-proof as plaster laid on stone walls. It was generally believed that fibrous plaster was a modern invention — something like 50 years old—but, whilst at work in Paris, he had discovered a book on Architecture, the result of a visit to Egypt by two French Architects, who stated that there (in Egypt) the workmen worked with fibrous plaster so far back as the fourteenth century, and worked in the shop and benches in much the same way as that of to-day. And going still further into the remote past, the speaker found that fine linen and plaster were used in the decoration of coffins. Even the mummies were swathed in it, plaster being used in just the same way as in modern surgery, where it was required to keep a broken limb in position. Therefore, there was nothing new in fibrous plaster, although, as he had said, it certainly had its recommendations. It was very useful, for instance for ceilings, though there was no doubt they could not use it for all work. It was also very useful when dealing with old ceilings in cases where it would be a disadvantage to remove the old plaster. In such a case, providing the timber was good, they could execute a new design without disturbing the old plaster. Then again, fibrous plaster had the advantage in theatrical decorations because it was so rapid; there was no waiting for the drying, and, as illustrating this point, he mentioned the case of a large building being erected in Holborn in which the plaster work was fixed before the roof was on, though of course, some temporary protection from wet had to be provided. On each floor, in succession, plaster was fixed as soon as the walls were nicely up. The subject was a wide and interesting one, and it had been well treated by Mr. Warren. Mr. Hampden W. Pratt seconded the vote of thanks to Mr. Warren. With all the plaster work done now, he said, one was surprised to notice how conservative the speculative builder really was, particularly having reference to the persistent way in which he clung to the old-fashioned centre-flower decoration. If there was one thing the speaker was brought up to abominate, it was the customary ornament in the centre of the ceiling. But Mr. Warren had rather spoken of it as a legitimate type of decoration. He dare say that it could be executed very nicely, but they had to get the prejudice against the centre flower which used to be screwed up against the ceiling, out of their minds. With regard to the modelling of the plaster, it was essential that it should be worked out to suit the light in the building of which it was to form a decoration. But that was an exceedingly difficult matter, as

EXETER CHURCH COMPETITION. MESSRS. HALL, COOPER, AND DAVIS' PLAN.

Mr. Warren had told them, more especially when they had to consider daylight and artificial light. It was a question to-day whether they ought not to consider or reconsider their modelling in view of the fact that the electric light was now the common illuminant of so many buildings, and having regard to the increased light which was now thrown upon the ceilings. The speaker was glad Mr. Warren had made reference to the use of the sway. They certainly had good authority for using it. It was used every day, but really it did seem very ridiculous. And as to treating the cornices as part of the ceiling instead of part of the wall: it was true there was a difference in the case where they had a panel divided by ribs, but, generally speaking, he thought that a room was very greatly improved when they started the work of decoration with the idea that the cornice was a part of the wall and not a part of the ceiling. This form of decoration had been affected more in recent years on account of the great use made of the frieze; the frieze was such a common thing that if they worked a cornice they were bound to make it part of the wall. The temptation to do too much in plaster decoration was no doubt very strong, and one had to study very carefully reservation in all these matters in order to obtain a good effect. With regard to external decoration, he wished Mr. Warren would give some further information whether it was possible to get external plaster work that was weather-proof without having to resort to Portland cement, and, further, if he knew of anything which could safely be relied upon when used for positions in half-timber work instead of Portland cement. He had pleasure in seconding the vote of thanks.—The Chairman said he thought there were a number of other little matters they might ask for further information about. He would like to know if Mr. Warren would recommend any specification of the proportion of materials for ornamental plaster ceilings. He had given them a very careful and accurate account of some specimens of old work he had examined, but he thought it would help them more if he could give any recommendations as to the proportion of sand, or give a proper description of the sort of lime best suited for the work, or any hints necessary to the workmen employed. Then there was the question of the advantage or disadvantage of using old lime. He did not think Mr. Warren had mentioned Parian lime, and he (the speaker) was under the impression that Parian was easy to use with the fingers. (Mr. Miller here interposed to say that Parian cement really was a very good thing to model with, and its subsequent hardness was obtained by the application of acids. With Parian cement sufficient time was allowed to properly manipulate the material.) The Chairman, resuming, said this was an interesting and important point. A ceiling was done for him some years ago, in which was a fair amount of decoration, and which was floated in Portland, then set in Parian, and afterwards the Portland was cut out and the Parian run in. The Architect drew on the Parian the model he required, and the modeller worked it up with a knife, and thereby got just the amount of freedom which was required. He would like to know whether Parian was less hurtful to the hands than the ordinary plaster, which burned to such an extent that it could not be modelled by the hand. Mr. Warren had wisely confined himself to one class of work. It seemed to him that in the domestic plaster work of England, from the Elizabethan period down to the beginning of the Adams' time, no one worked on the relations to and freedom of the ornament. There were cases where it was valuable to have it, and cases where it was valuable to be without it, but, as a general rule, it seemed that sharpness and uneven surface must in a measure be regulated by the degree of light and shade. He did not wish anyone to suppose that because a thing was uneven and rough it was beautiful, or, on the contrary, that because a thing was even and smooth it was beautiful. During the Association's excursion this year—and it was well to drag in the excursion wherever possible—they saw a good deal of very interesting plaster work in the heart of Kent. They saw a remarkable ceiling in King Charles the Martyr's Chapel at Tunbridge Wells, which was very instructive, because the main part of it had been executed at the building of the Church. It was a fine ceiling, with some dish domes let into it, and ornamented further with some representations of fine pine-apples. About 50 years ago the Church was enlarged and the design was repeated. The contrast, however, was most marked and instructive. It had lost a lot of life and vigour, and time. Reference had been made to Groombridge, but besides the interesting work of Mr. Warren, there was a very fine ceiling to be seen in Groombridge Place. It contained some very charming ornament. Then at Holmeshurst there was an interesting ceiling which had not been completed. Some of the Association's æsthetic young men—or old men—imagined that this had been done on purpose. It was a magnificent idea; the ceiling was only half finished but it was evident that this was not the original intention, because, on examination, he had found a geometrical pattern had been prepared but had never been fully executed. The ceiling really had an interesting and picturesque effect, but it was a mere accident. With regard to plaster domes, the speaker suspected he had no definite information on the point—but he suspected that a great many of the charming little domes in the Bank of England were of plaster. Now the Bank of England was within reach—some of them had no doubt made its acquaintance ere this, when they had paid their dividends over the counter—but he urged the younger members not to wait for dividends, but to go as soon as possible, and walk from one end of the building to the other, observing the domes as they went. There was one ceiling which was particularly effective; its little moulded ground looked like a sheet of crumpled note-paper, which had been obviously done for a little Artistic effect, and there was no doubt it had been well attained.—The vote of thanks to Mr. Warren was carried with acclamation, and, in replying, Mr. Warren said he was much obliged for the kindly way in which they had greeted his paper, and was glad to think he had succeeded in rousing some interest in the subject. With regard to the questions asked and points raised in the discussion—first, the omission of any mention of Adams' work—he wished to say that his paper was intentionally quite unchronological, and not at all historical, otherwise it would have been necessary to have gone very much further in the past, and the subject would have become too great for a single paper. He had not omitted mention of Adams' work slightingly, and though he agreed that some of it was very interesting, he also recognised that it was mere imitation, and the swags, umbrella patterns, and so on, were repeated over and over again. If they went to Rome they would see Mr. Adams' work in abundance, executed long before Mr. Adams commenced any of his designs. Mr. Adams' work so strikingly resembled this work in Rome that it really looked as though casts had been taken and a pure imitation produced, just the same as Chippendale practised with his furniture, by obtaining Italian models. Had he adopted a historical line he should also have had to mention a great deal of Queen Anne work and Carrolean work; his object was merely to put forth his view of things which the Architect practising in England might aim at and hope to achieve. He agreed with Mr. Shruffery that the design he had made, and which was exhibited in the room, was too full, and an improvement would be made if the vines were pruned. But in this case the design had been made for a room which would not be too brilliantly lighted. Then Mr. Shruffrey had commented upon his remarks with regard to flat grounds. Well, he must say that even in a ceiling of the Adams type, a flat dead ground was unpleasant.—Mr. Shruffrey: I should like to ask how you are going to do what you suggest?—Mr. Warren: Well, you must wean the workman; but in the case of fibrous plaster there is no difficulty whatever, because you cast for a model ground and that is what leads me to advocate the use of fibrous plaster. It has its disadvantages, but you can get clean away from the ground. You can use it freely on undulating surfaces. Continuing, Mr. Warren denied that he favoured the use of the centre flower, and as to the effect of the electric light on mouldings—that was an effect which they had got to reckon with. He did not think electric light improved our ceilings artistically, but it had no doubt come to stay, and a slight difference in the execution of a design would be in many cases desirable. As to external plaster work, personally he had used Portland cement, and had afterwards obtained the required colour by using wash. He knew of nothing better. As to the other questions they would be better answered by Mr. Miller; but one or two other points had suggested themselves during the discussion. The first was as to the treatment of surfaces. There was no doubt that it was exceedingly easy to overdo it. He had overdone it himself in one particular case, and the only safeguard, he supposed, was experiment and experience. Then a second point was to employ an Artist as efficient as possible to execute the ceiling and other plaster work, leaving the design in his hands as much as possible. The

MR. PIERCY EAGLE'S PLAN.

Architect's business should be to direct merely the leading lines and the general scheme of what he required, leaving the plasterer's technical knowledge and skill to supply the detail.—Mr. Miller, in answering the other questions which had been put to Mr. Warren, said there was no doubt that lime, like wine and the violin, improved by age, and the old Romans forbade the use of lime which was not at least three years old. He could not see any objection to Portland cement, because it was the strongest cement in the market, and could easily be coloured to any requisite tint. They could almost model in Portland cement; in fact, he had himself made some small external decorations in it, and had found it almost as easy to deal with as clay, although they could not leave it for a while as they could clay. Fibrous plaster for internal decorations afforded greater opportunities for variety, and as regards cost he thought it would be as cheap as the ordinary plaster, which had to be modelled, then cast, and afterwards fixed. And with fibrous they obtained better effects of light and shade. He hoped there would be a revival of plaster work by hand.

In our last issue, the name of Mr. Joseph D. Brandon was mentioned as the donor of £1,000 to the Royal Institute of British Architects. This should have been Mr. David Brandon.—ED.

LIVERPOOL IMPROVEMENTS.

AN EXPENDITURE OF £285,000.

AFTER a long discussion, the City Council has decided on an important street improvement in Liverpool. Two schemes, dealing with the widening of Renshaw Street and Berry Street, have been submitted—No. 1 being that of the Health Committee, and No. 2, that suggested by Mr. Boulnois, the city engineer. The first was formally approved by the Council on the 26th October last, and is the one which has now been adopted; and the consideration of the second, which is now abandoned, was postponed on the 6th January this year, and it suggested the demolition of certain property on the west side of Renshaw Street. Owing to the narrowness of Renshaw Street and Berry Street they have frequently been referred to as the "bottle-neck" streets through which the greater portion of the traffic from the south end had to pass in order to reach the heart of the city. The scheme provides that Renshaw Street shall be continued in line with Lime Street, from the parapet in front of the Adelphi Hotel to the frontage of the premises, No. 3, in Leece Street. This will mean that the shop and houses now standing on the east side of Renshaw Street, together with one or two establishments at the corner of Mount Pleasant and Leece Street, will be demolished. At the present time, the width of Renshaw Street at the Adelphi end is 49 feet 2 inches, but by this scheme it will be increased to about 100 feet; at the Leece Street end, Renshaw Street is 44 feet wide, but when the improvements are carried out it will be about 66 feet wide. With respect to Berry Street, which is also to be set back on the east side, it is intended to make the new parapet run in a line with the parapet on the east side of Great George Street, and consequently this improvement will also necessitate the demolition of a large amount of valuable property, from the corner of Upper Duke Street to Bold Place. The present width of Berry Street, at the Bold Place end, is 43 feet 6 inches, but by this scheme it will be increased to some 66 feet; and the present width of Berry Street, at the Upper Duke Street end, is 44 feet, whereas the improved width will be—as at the other end—66 feet. It is roughly estimated that the improvements resolved upon will cost about £285,000.

THE parishioners of St. Martin's, Potternewton, Leeds, intend raising a fund to erect a memorial to the late Vicar. The memorial, it was suggested, should include the putting in of a window in the west end of the Church, and the completion of that portion of the building. To carry out this scheme about £1,000 will be necessary, towards which subscriptions were announced amounting to about £440.

MR. MOUNTFORD'S REPORT ON THE PROPOSED NEW TOWN HALL FOR COLCHESTER.

HAVING been instructed to submit a report to the Corporation as to the advisability of utilising the old premises or erecting a new Town Hall entirely, Mr. Mountford reports as follows:—"The present building is in very bad condition, and the badness of the foundations is only part of the mischief. Trial holes showed that the interior of the walls is practically only rubble, with a half-skin brick upon each side, and there is little or no bond. The stone used in the building is decayed badly. The ashlar work is in a similarly unsatisfactory condition. The floor of the Town Hall chamber itself is weak, and of very bad construction, and could never have been safe for the purposes of crowded meetings. The insufficient strength of this floor is only characteristic of the whole building. The roof is the best part, but even there the workmanship is not of the best. The balustrade might at any time fall, especially during a gale or snowstorm, and if that occurred the cornice must come with it. In reference to a new Town Hall, a hall to seat 500 persons, a Council chamber, Mayor's parlour, Committee-rooms, and sets of rooms for all the Borough officials, together with Quarter and Petty Sessions Courts, cloak-rooms, retiring-rooms for persons engaged in the business of the Courts, would be absolutely necessary, and he considered the total area required was 14,860 square feet, to which, as the principal chambers would occupy the height of two floors, must be added a further area of 5,300 square feet, and, allowing for halls, staircases, &c., this would make a grand total of 24,192 square feet of required floor. To meet this there was at disposal the site of the existing hall, Joslin's premises, a store building, engine house, yard, and police offices, which left little to spare, and careful planning would be required to get the proposed building on the space available. It seemed to him that the present Town Hall must go; indeed, it was hardly worth retaining. Internally it had no Architectural merits, and was altogether unworthy of the town, and was in such a condition that to pull it about would be dangerous and costly. Supposing the existing building to be retained, the cost of necessary additions and alterations could not be less than £14,000 or £15,000, while the result would be unsatisfactory. As regards the style of building, he favoured the free classical treatment, red bricks for the fronts, the principal fronts being treated in a simple and broadly dignified manner, such money as could be spared being spent in employing a good sculptor to illustrate the town's history, an idea carried out with good effect at Sheffield, Northampton, and elsewhere. A perfectly new building, exclusive of fittings, would cost between £18,000 and £20,000.

A PROPOSAL is on foot to provide a cottage hospital for Featherstone and Purston, Pontefract.

THE Galashiels Unionist Club has accepted contracts for the erection of a club house, to be built in High Street, at a cost of £2,000.

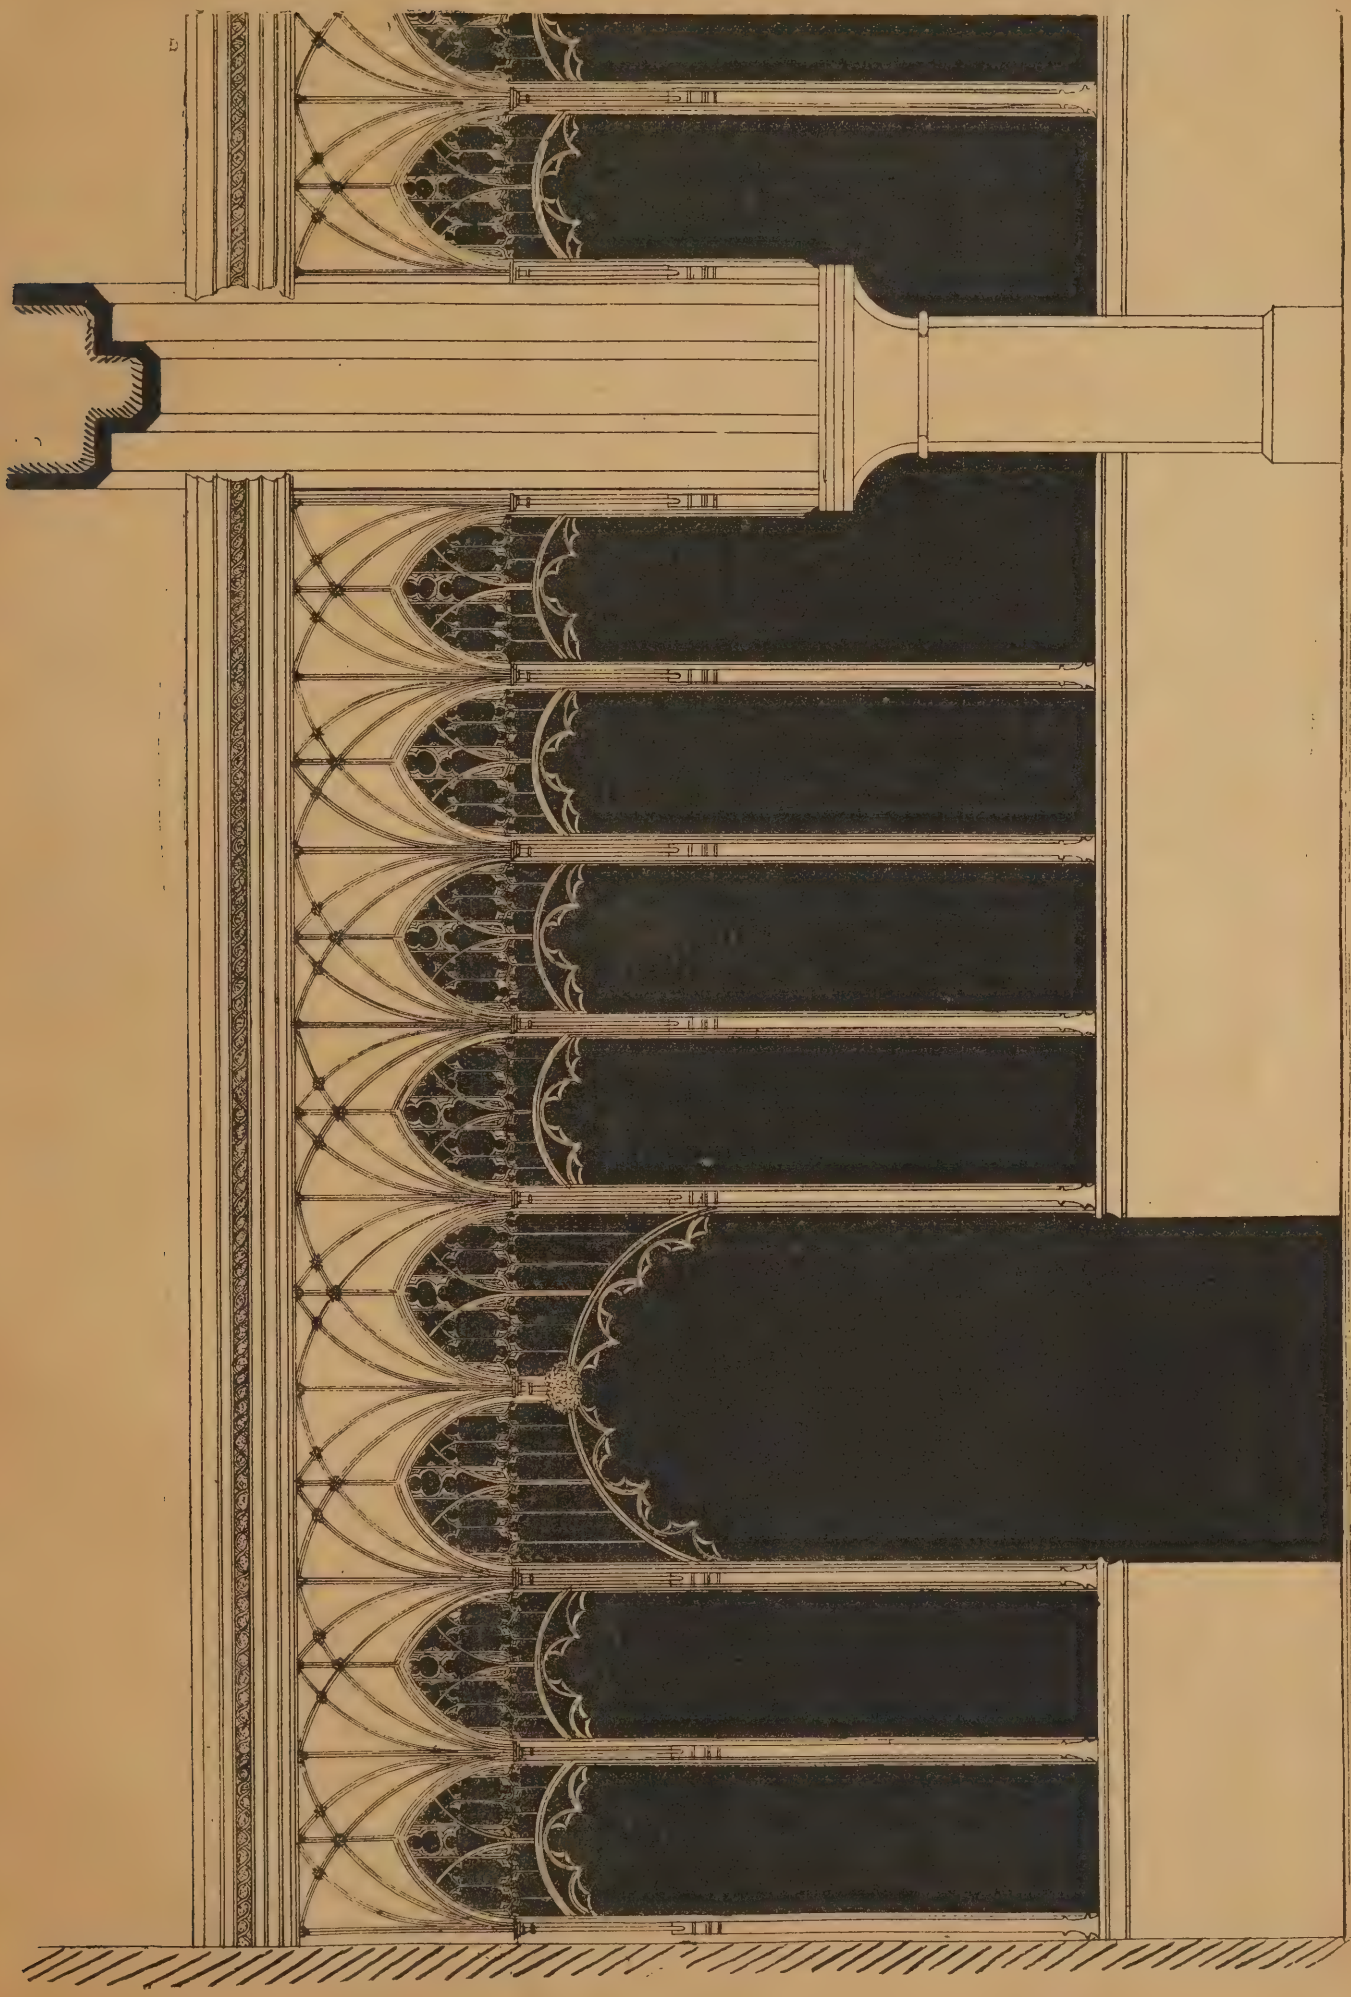
IT is proposed to erect a memorial to the late Right Hon. Edward Stanhope at Horncastle, in the shape of a large and solid granite drinking fountain.

DURING the north-easterly gale at Sunderland a large chimney at the yard of the Sunderland Shipbuilding Company collapsed, and fell on to a frame-turners' shed. The damage is estimated at £600. A number of hands are thrown idle.

AT a meeting on Friday, of the Streets and Buildings Committee of the Town Council, it was resolved to recommend, on a report by the Burgh Engineer (Mr. Cooper), the Magistrates and Council to authorise the reconstruction of several of the public main sewers in the city, at a probable cost of between £3,000 and £4,000.

AT a meeting held at Norwich on Saturday, a resolution was adopted to the effect that the 60th year of the Queen's reign should be celebrated by the erection of a new Jenny Lind Institution for Sick Children, to take the place of that established by the great singer many years ago. Lord Leicester, who presided, headed the list of subscriptions with a donation of £2,000.

Bricks and Mortar.



EFFINGHAM HOUSE, ARUNDEL STREET,
January 27th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gildea ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

PALACE YARD, so well known in Earl Street, Coventry, has been purchased by Alderman Singer, and is believed to be destined to be converted to some public object. The site, which is partially covered by quaint old timbered buildings, comprises about 2,800 square yards. It has been the hostelry of several royal visitors, particularly in the seventeenth century. In September, 1687, James II. was entertained there by Richard Hopkins, a citizen. In December, 1688, Princess Ann of Denmark lodged there. In 1689 Mr. Hopkins was elected a member for the city, and in the following year Prince George of Denmark was his guest. The buildings have of recent years been used as builder's premises and as offices and warehouses. They adjoin the Technical Institute, and front the site of the proposed new municipal buildings.

ONE of the most ancient churches in Derbyshire, that dedicated to SS. Mary and Lawrence at Bolsover, was completely destroyed by fire on Sunday. Bolsover is a mining village between Chesterfield and Welbeck Abbey, and is mainly the property of the Duke of Portland, who is lay rector and patron of the living. Tradition says that on this same spot was a Druid temple. A Christian Church was erected about the year 665, and the first stone Church was built in 1020. Less than 200 years later this building was demolished and the structure destroyed last Sunday was then erected. It was a large, plain structure, partly in the Norman style intermixed with later English, with a tower surmounted by a low spire in the style that is called "broached," and is so common in the Peak of Derbyshire. Here has been the burial place of the Cavendish family since 1618, a Chapel and vault being added to the Church in that year. Within the Chapel—and this is the only portion of the building saved—are two costly monuments, one to Sir Charles Cavendish, who died in 1617, and to his wife, and another to the memory of Henry Cavendish, Duke of Newcastle. The fire originated in the vestry, which was situated at the north-east end of the building, and directly over the heating apparatus. A beautiful stained-glass window, presented by Mrs. Charlesworth, was utterly destroyed, much of it being melted by the intense heat. No sign is left of the organ and pulpit, nor of a handsome carved oak screen.

ACCORDING to the Manchester Guardian, the inside of the Lady Chapel at Gloucester Cathedral is being "grimthorped" in secret. The outside, which needed repair, has been subjected to wholesale renovation. But promises were given that the inside, which did not want anything done to it, should be respected. A few days since, a visitor to the Cathedral was told that orders had been given that no one was to be admitted to the Chapel, and the vergers were forbidden to speak about it. Nevertheless he saw into it, and found "restoration" in full career. The tile pavement, the largest and most perfect of its kind and date in England, was all torn up, and the place spread with concrete. Whether operations had begun upon the reredos he was not able to see. It will be remembered that this reredos, though terribly shattered, is to the Artist and antiquary a most important monument, for nothing of the same kind is to be found anywhere else. We understand that the professional direction of the work

DETAIL OF OAK SCREEN, ST. MARY'S, USK, MONMOUTHSHIRE. MEASURED AND DRAWN BY E. P. PHILLIPS.

at Gloucester, is with Mr. Waller of that city, and Mr. J. L. Pearson. It may be interesting to explain that the Lady Chapel was built in 1457-98. It is partly seen, through screen work, at the back of the modern reredos. It is cruciform in plan, and elaborate later English in character To all intents it is a separate building from the Cathedral. From within the Cathedral it is not visible, the entrance being a low arch from beneath the great Perpendicular east window, "a single window to the eye, though bent to a three-sided shape; a wall of glass, 72 feet high and 38 feet wide; the largest window in the world," whose original glass has been preserved through five centuries. The Lady Chapel is cruciform in shape and Perpendicular in style, the windows occupying so great a share of the wall space as to suggest a house of glass. Its western window faces, on a lower level, the east window of the Cathedral, and the space between is curiousiy bridged by continuations of the Cathedral triforium, forming an upper connection between the two buildings, and popularly known as the "whispering gallery," from the fact that the slightest sound produced at one end is clearly heard at the other.

IT is to be hoped that by the end of February the mosaics in the choir of St. Paul's may be completed, and already the scaffolding is put up under the north-east section of the dome. When the decoration of the cupola is at all advanced the progress in the whole scheme will be much more apparent, as the choir, except on unusually bright days, is so gloomy that the effect cannot be judged from the nave. Meanwhile, there are signs of activity outside the building as well as within it. The scaffolding is up round one of the large southern windows, the iron work will be removed, the existing window taken out and a temporary one placed in front of it, while the stained glass given by the Duke of Westminster is being set up. The Duke is donor of the northern window as well, the one commemorating the Kings, and the other Bishops. The Wellington Monument is also to be surmounted by the equestrian figure.

THE great structural alterations contemplated in Whitehall and neighbourhood, are just now engaging the attention of the Office of Works. Negotiations are proceeding satisfactorily for the acquisition by the Government of the leases of the block of houses in Parliament Street, the demolition of which is to effect the widening of that thoroughfare. It is probable that action will be taken in the ensuing session with a view to a commencement being made with the scheme for the new War Office in Whitehall Place. When this building is finished and ready to receive the military authorities, there will be considerable changes of situation of several Government departments. New quarters will have to be found for the Commissioners of Works, probably close to the new Admiralty buildings.

A SUGGESTION has been made by the Charity Organization Society for the establishment of a central hospital board for London, upon a representative basis. The suggestion ought to receive very careful consideration. Something must be done to rescue the most necessary of these public institutions from the state of chronic debt and difficulty out of which they never emerge, and by which their energies are crippled and their usefulness impaired. The expedients resorted to to raise money are often not such as can be commended, and frequently they are objectionable, and the constant lack of funds leads to bad management and disorganization. There is far too much money spent in administrative expenses. The public, if it had a central representative body to which it could look with confidence to control the expenditure of its gifts, would give more generously.

IN New York, a very important change is to be made on Fifth Avenue between Forty-First and Forty-Second Street. This is the removal of the reservoir adjoining Bryant Park, one side of which fronts Fifth Avenue, as another does Forty-Second Street. A recent meeting of the Board of Aldermen has assented to the removal of the reservoir, the Board of Fire Underwriters having withdrawn its opposition, in consequence of a large water supply having been made available by the laying down of new mains in Fifth Avenue. The high walls of the reservoir will give place to the new city library which it is proposed to erect, and the building will, no doubt, be in keeping with the Architectural condition of the large edifices in the neighbourhood.

Early in March, the foundation-stone will be laid of the new tower of Flamborough Church. The name of few villages is better known than that which contains the famous lighthouse, and the tower to be built is designed to take the place of that blown down in 1615, and which had been built at the end of the twelth century to strengthen the Church and make it a place of refuge for the inhabitants in case of need. In those days, Churches had a military as well as an ecclesiastical purpose, and apparently the one tower was not sufficient to resist the constant invasion of the northmen, and especially the troublesome Scotch, for in 1352, we find that Edward III. granted a license to Marmaduke Constable to build a tower for the fortification of his manor-house, which lay within a stone's-throw of Flamborough Church, and the ruins of which are still to be seen. Royal licenses to crenellate were issued by the sovereigns between A D. 1256 and 1478, and the castles of that period are known as Edwardian, to distinguish them from the earlier ones. So, it will be 550 years since last a tower was built in Flamborough.

SOMERSET HOUSE does not look like the home of romance or mystery, the stately, smoke-stained, classical façade which frowns upon the Strand. Yet there are memories enough hanging about the site to fill a volume, says the Globe. Here the Protector, Somerset, raised one of the most splendid palaces of the Strand, sweeping away Churches and Chapels and cloisters for the purpose; here was the dower-house of the Queens of England; here dwelt Henrietta Maria, and beneath the pavement of the quadrangle are still the vaults of some of her French attendants; here General Monk lay in state; Cromwell, too, with such magnificence of display that the populace threw mud upon his escutcheon by night. But the old palace has gone with the rest of the mansions that fringed the river; to point morals, perhaps, on the mutability of human affairs, or at any rate to supply amusement to the antiquarian; and where once it was, now stands the building vaguely associated in the minds of men—not with courts, and pomp, and splendour, but with death duties, and excise licenses, and probate of wills; a dismal and confusing labyrinth, whereof the key is Red Tape, occupied and guarded by "officials." Yet still it is no ill place for the "contemplative man," who will take his recreation in London rather than in the manner which Isaak Walton has prescribed for him. He need not dig up the relics of a dead past, or recall, with laborious pensiveness, scenes that have perished away; there are still on the site of the Protector's palace, some of the quaintest aspects of that quaintest of beings, man, to be observed, not amid the splendour and magnificence of a Tudor court, but in the more sordid and commonplace surroundings of a public office.

A GANG of 60 men, under the direction of the engineers of the Great Eastern Railway Company, recently achieved a phenomenal task in connection with railway bridge-making. In several instances, bridges have been pulled down and others erected in their stead in the course of a single night; but on this occasion one was removed and another pulled into its place by the same operation. Over the River Lea, at Tottenham, was an iron bridge of 77 feet long, weighing 100 tons, and it has been replaced by one 84 feet 9 inches long, weighing 130 tons. The new structure had been erected on cross-staging side by side with the old, and the first work was to cut the old bridge at both ends and raise it bodily 18 inches, so that it could be mounted on wheels, as the new bridge was. Then the two were hauled along until the new bridge occupied the place of the old. This was successfully accomplished by eight o'clock in the morning, the hauling having been completed in exactly an hour. Then the new bridge had to be raised for the removal of the wheels. This was done by a huge travelling crane, and the new viaduct was gently lowered into its place. The permanent way was restored, and the first train passed over the bridge at 2.20 P.M.

IN publicly stating what is really being done at Carisbrooke Castle, Mr. Percy G. Stone, F.S.A., says "roofs and floors are being placed in the well-known gate-house to adapt it to its new purpose—a museum. Externally, absolutely nothing is being attempted. Its picturesqueness will remain unspoiled. I have heard of no general restoration scheme. I came across, in 1891, among the State papers in the Public Record Office, the 1583 plan. It is a very superficial affair, and not a plan of the castle. It was drawn by Richard Popinjay, 'the Queenes Mai's surveyr. of the towne of Portismowth,' who got out a scheme, at the request of the then Captain of the island, Sir George Carey, for providing him with better accommodation. On this plan a flight of steps, enclosed with thick-and so ancient—walls, is shown, leading from the outer ward to the gate-house. This scheme I adopted as my approach to the museum, though I found no signs of such steps till quite recently, when, in grubbing up the roots of a tree it was necessary to remove, I came upon them. Needless to say, I now propose to make these steps serve their original purpose."

THE name of Lord Leighton is to be given to the Free Art Gallery and the Technical Institution which is to be opened in Camberwell. Lord Leigh on was for many years the president of the South London Fine Art Gallery. The people of Paris name their streets after the great men of France, and a most becoming practice it is. Their example seems to have been followed in several of the buildings being erected round London. Next March the foundation stone of the Lamb and Keats Library will be laid at Edmonton. Next autumn a like ceremony will take place in St. George's, Southwark, in memory of Sir Henry Layard and Sir W. Molesworth, both of whom represented Southwark in Parliament. The inhabitants of the district only lately adopted the Act. Then there is the University Settlement at Bloomsbury, to be associated with the names of Emerson and Jowett, in which case the titular connection is not local. It is, however, in the case of the Alleyn Library, the foundation of which was lately laid by Sir Henry Irving.

HIGH buildings which were a novelty in American Architecture only a few years ago have reached the point where they overcrowd the narrow streets of large cities. Public opinion, which first marvelled at these lofty structures, and regarded them rather in the light of an experimental anomaly, is becoming intolerant of the continuation and elaboration of the sky-scraper style of Architecture. A law fixing a limit to the height of buildings was enacted in Illinois a year or two ago in order to prevent further encroachment of this sort on the streets of Chicago. The same question is at the present time under discussion in New York city, and the Legislature of that State will doubtless be asked to regulate the future erection of the buildings to the end that a fixed height shall not be exceeded.

AT a meeting of the Brighton Town Council on Thursday, considerable discussion took place with reference to a report submitted by the Works Committee, containing a scheme prepared by the surveyor for the defence of the eastern foreshore, at an estimated expenditure of £36,000; the scheme included the provision of a sea-wall and the reclamation of about two acres of land. The motion for the adoption of the scheme was met by an amendment that groyning only should be carried out, at a probable cost of from £10,000 to £16,000; but this was afterwards altered, so as to call upon the committee to prepare plans and specifications for the protection of the foreshore by means of groynes without a sea-wall, and carried by 35 votes to 13.

WITHIN a year after the auction of Lord Leighton's celebrated town residence, the home of his next successor in the presidential chair of the Royal Academy is to share a similar fate. The house in Palace Gate, however, cannot compare, in point of interest, with that in Holland Park Road. Its chief feature, excepting the historical studio, is a fine landing on the first floor paved with marble and fitted with a marble fountain. The house, which was built for the late distinguished owner, will, we understand, be brought to the hammer at Tokenhouse Yard on March 11th.

SIGNOR RICCARDO AURILI, of Florence, has commenced the bust of the Queen, which he has been commissioned by a Committee of Italian residents in London to prepare as the gift to Her Majesty upon the occasion of the celebration of the 60th year of her reign. The modell ng of it will be finished by the 20th February, when it will be handed over to an Italian foundry to be cast in bronze. It is said that the bust will first be exhibited at the forthcoming Royal Academy Exhibition.

THE Improvement Committee of the Cheltenham Corporation has submitted a scheme involving an expenditure of £45,000, on municipal buildings and a kursaal. The proposal is, briefly, to convert the present Winter Garden—which the town recently acquired for £13,000, but which cost £20,000 in its construction—into municipal offices, and to erect at the north end of the garden a kursaal. The council chamber, also on the same level, would be located immediately underneath the dome; it would be an octagonal room, amply large for the purpose. The ceiling of the offices and council chamber would form the floor of the palmery, and would mark the commencement of the glass superstructure, which rises higher even than the lofty rooms beneath. To bear this new floor the walls of the Winter Garden will have to be strengthened, and it is intended to case them with Ruabon brick, relieved by terra-cotta mouldings. Other improvements will be effected to render the building of a more attractive appearance than at present. The kursaal will also be of red brick, and its principal entrance will be facing the promenade and close to the Queen's Hotel.

THE student of Oriental Archæology would do well if he paid a visit to the Guildhall Museum, where, among the many and interesting relics of ancient London, he would find some specimens of Art from Babylonia and Nineveh. There are two fine statues of the King Gudea (B.C. 2500), executed in green diorite, but alas! like most of the monuments of this kind, they are both headless. One of these is represented in a sitting position, similar to the famous statue of this king in the Louvre. The other is standing, clothed in a long robe reaching to the ankles. It was at one time thought to represent the god Nebo, or the goddess Ishtar, but this view can hardly be upheld when compared with other monuments. There is also a sun-dried brick, inscribed with the names and titles of Nebuchadnezzar II., B.C. 539. These bricks are found in large quantities all over Babylonia, and were used for building purposes. Nineveh is represented by two large slabs of alabaster from the palace of Assur-nazir-Pal, representing one of the Igigi or spirits of heaven, and one of the Anuna Ki, or spirits of earth, in attendance before the sacred tree. Across both of these slabs is a twenty-line inscription in Assyrian, setting forth the names and titles of Assur-nazir-Pal, and a prayer to the great gods of Assyria.

BENVENUTO CELLINI'S two treatises on goldsmiths' work and bronze-founding have been translated for the first time into English by Mrs. George Simonds. The text used is that published in Florence in 1568. The work will be valuable not only from a technical point of view, but as literature, for everything Benvenuto wrote was stamped with his strange personality—a fascinating one in spite of its cynical badness.

IT is expected that in a few months the new subterranean system of main drains, now being constructed in Paris, will be complete and ready for use. At present the work is being carried on between the Clichy Gate and Trinity Place, close by Trinity Church, a distance of about 1 3·5 miles. This canal will tap all the sewers and aqueducts from the heights of Menilmontant, the districts of Belleville, La Villette, La Chapelle, and Montmartre, and the intramural quarters of St Martin, St. Denis, Marais, and Vivienne, as well as the Place de l'Opéra and the Boulevards. The tunnel, which is about 6 yards in height and 5 wide, is being bored by machinery similar to that employed in London in making the tunnels for the electric railways. The men work in a chamber with a shield at one end, which is forced forward by the action of six screw-jacks worked by electricity. As the shield advances the masonry is built up, and the completion of the tunnel thus advances by a few yards every day, the average being 6½ yards daily.

THE Simplon Tunnel can hardly be begun before the end of 1897, or early in the year 1898. It is estimated that the actual period of operations will cover a space of only two years after the work of piercing the main tunnel has once been begun. International traffic will only require one line of rails at the beginning, but provision will be made for laying a second line throughout the tunnel and along the whole length of the system.

SOME alarm has been caused at Conington, near Huntingdon, in consequence of the threatened fall of the Parish Church. An examination of the edifice has been made by Mr. Thompson, of Peterborough, who reports that a very considerable and serious settlement has taken place practically in all parts of the Church, including the fine old tower. The whole of the north wall and its buttresses have had to be underpinned, and it is feared that a storm of wind might at any time blow down the greater part of the Church, which is of great historical interest with the Scottish Royal family, for it contains a monument of Robert Bruce, King of Scotland, who died A.D. 1339. Prince Henry of Scotland, who became Earl of Huntingdon, was possessor of the manor of Conington, and his monument is also in the Church.

THE Edinburgh Carlyle Memorial Committee has decided that the fittest monument will be a replica in bronze of the late Sir J. E. Boehm's seated statue on the Thames Embankment. This statue was done from the life in 1875, when Carlyle was in his eightieth year. The sanction of Boehm's trustees to proceed with the replica has been obtained. The work will be executed under the supervision of a Scottish sculptor. We believe that the idea of a replica originated with Lord Rosebery. In this connexion it may be mentioned that Mr. Thomas M'Kie, Advocate, has presented Woolner's bust of Carlyle—which he purchased from the trustees of the late Charles Jenner—to Edinburgh University.

SEVERAL gifts of antiquities have been made to St. Helen's museum during the past month, including specimens of Egyptian-Libyan, circa B.C. 3100, discovered at Negada, 30 miles north of Thebes, by Professor W. M. Flinders-Petrie, LL.D., from Mr. J. O. Swift. Mr. J. L. Hodgson has presented to the museum an old sword found at Larkhill, Preston, in 1830, during an excavation, when many other relics of war and human remains were discovered. The sword was supposed to have belonged to an officer of the rebel army which was defeated by Cromwell on the 17th August, 1648.

THE news that the next Winter Exhibition at the Royal Academy is to consist exclusively of the works of Sir John Millais is exceedingly welcome. Not only does it mean that we are to have a further respite from the now obsolete old master shows, but it also guarantees the presence at Burlington House of a collection of great Artistic importance and very wide interest. Now that the Academy has broken through the tradition that their galleries must be annually occupied by the pictures of painters of other centuries, it is to be hoped that some better scheme for the advancement of modern Art than the glorification of the work of the past may be devised during the interval available for reflection. It cannot be doubted that the inflation in the prices given for often unworthy pictures by long-deceased Artists, an inflation which has produced a corresponding depression in the modern market, is largely due to the annual exhibitions held by the Academy. It is scarcely the function of such a body to concern itself with the Art of yesterday.

SO many important events have lately occurred in Southern Africa that the progress of Mr. Rhodes's great scheme of an African Trans-Continental Telegraph has been almost ignored. Despite a temporary suspension of work, owing to the Rhodesian war, the projected connection has so far advanced that (with the exception of a few hundred miles between Mount Darwin and Tete) communication now exists from Capetown to Zomba, in the British Central African Protectorate. This represents a total distance of nearly 2,400 miles. Material for the line is lying all along the route from Mount Darwin to Matatima, and the wire is stretched on trees as far as Tete. Zomba is only some eighty miles from Fort Johnston, and the next stage will be from Karonga (north-west of Lake Nyassa) to Kituta (south-east of Lake Tanganyika), about 230 miles.

BY the election of Mr. J. S. Sargent to fill the vacancy caused by the retirement of Mr. G. F. Watts, the traditional tendency of the Academy to do what most people expected least has been once more exemplified. That Mr. Leader, who has lately narrowly missed promotion on more than one occasion, should be again passed over was certainly not anticipated, and hardly anyone outside Burlington House would have been disposed to fortell the advancement of an Associate whose actual admission within the Academy is of such recent date. Apart from the matter for regret in the continued neglect of the claims of the landscape painters, there is no fault to find with the choice of Mr. Sargent. He is one of the cleverest of living Artists, a worker to whom we may fairly look for great achievements, and the acknowledged leader of the modern school. His capacity as a portrait painter is quite remarkable; and as a decorative Artist he has proved himself to be original in ideas and skilful in method. The influence which he should be able to exercise upon the policy of the Academy can hardly fail to be valuable.

IN connection with Sunderland Workmen's Dwellings' competition there were fifty-eight sets of designs submitted, and Mr. J. Slater, of London, recommended that the first award be given to Messrs. Robert Angell and Martin B. Perry, Joint Architects, of Garrick Square, York Buildings, Adelphi, whose plan, under motto "Pro Artifice," shows accommodation for 468 people in sixteen blocks of dwellings, with separate entrances and staircases. Each tenement is completely isolated, and contains all the accommodation of an ordinary cottage dwelling. The total cost is estimated at £20,000. The second premium the assessor awarded to "Homes," submitted by Messrs. Jacob and Brand, of 34 and 36, Gresham Street, E.C., whose design is estimated to cost £23,351 in carrying out, and provides for 448 people. The third premium is taken by "Salis populi suprema lex," Messrs Houston and Houston, of 13, Furnival's Inn, E.C., with provision on plans for 402 persons, at an estimated cost of £20,000. The Corporation of Sunderland has confirmed the assessor's award.

THE antiquated panel, representing a view of Furness Abbey has been removed from the house at the corner of China Lane, Lancaster, formerly occupied by Mr. N. Molyneux, and is about to be placed in the Storey Institute. Another interesting painting on plaster, at the foot of the stairs, is said to be a portrait of the Countess of the seventh Earl of Derby, Charlotte de la Tremouille, the defender of Lathom House. Her husband was away in the Isle of Man, and the intrepid lady defended the house for months. Her husband was subsequently beheaded at Bolton, and his head now lies in a separate box in the Derby vault in Ormskirk Church. The portrait of the Countess, if the painting be that of the distinguished lady, is in the possesion of the Corporation, and will probably find a home in the local museum. It is satisfactory to know that these two interesting relics have been saved from destruction. To Mr. Cook, the borough surveyor, is due the credit of saving the last-named picture.

DR. VAN DER HEYDEN, of Yokohama, Japan, has built a "hygienic house" which deserves notice. The walls consist of parallel plates of ground glass several inches apart, with a concentrated solution of alum or salts of soda between them. These are fixed in metal frames, by which they are built together. The roof is not translucent, and is made of materials which are impervious to heat, thus keeping out the sunshine, and holding in the warmth of the rooms. The house is entered by at door underground, to which a stair leads. The air also enters underground, and passes through a microbe filter of cotton wool and glycerine. Is circulates through the rooms by means of gratings and escapes under the roof.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ADDRESS TO THE STUDENTS AT THE DISTRIBUTION OF PRIZES, BY PROFESSOR AITCHISON, ON MONDAY, JANUARY 18TH.

IT has been the custom for the President to say a few words to the students on these occasions. You have had from Mr. MacVicar Anderson, when he was President, some admirable remarks on planning, besides those on professional brotherhood, and most excellent advice from my learned predecessor, Mr. Penrose, who found out for us all, and the world, the optical refinements of Greek Architecture. He was trained in the reverent study of the antique from the actual remains of Greek and Roman structures, and is not less learned in those of the middle Italian Renaissance, which he has also measured, and we have heard from him that Palladio alone of the Renaissance Architects had learned the secret of the grand Roman style. However much I may be inferior to my predecessors in weight and eloquence, I think I may say that I cannot yield to them in my ardent desire for the improvement of our English Architecture, nor for giving all the advice and all the knowledge that can be imparted in a short speech to the students, in whom we see the future Architects of our country.

NO TEACHING WILL GIVE GENIUS

or parts to learners, but I think I may say, without fear of contradiction, that untiring diligence is an absolutely necessary qualification, and this has been so evident to those who possess genius, that Buffon defined it "as the Art of taking trouble," which we all know it is not; but diligence is so absolutely necessary for the development of genius that it is excusable to confuse the necessary servant with the master. I would call your attention to the works of Lord Leighton, now being exhibited at the Royal Academy, and also to the large collection of his studies at the Gallery of Fine Art in Bond Street. The studies there are but a portion of the innumerable ones he made, and you will see by these that the exquisite perfection he attained in his finished pictures and statuary resulted from the most careful and accurate study of nature; that there is not a form, an extremity, or a piece of drapery that was not perfectly studied before it was painted or modelled. Necessary as indefatigable diligence is, the longest life is only too short for the attainment of even a competent knowledge in the master Art we profess, which embraces so many various Arts, and requires a knowledge so wide and so various, and qualities of mind that are rarely found in one person. It is a great saving of time to have a map, a compass, and a knowledge of the streams and currents, of the reefs and sandbanks, before we embark, not only to prevent shipwreck, but also to avoid great deviation from our course, so that there may be no waste of labour, however strong and indefatigable we may be. Some of the wiseacres of the last century, during a dearth, employed labourers to dig holes in the ground and fill them up again, and although this kept the labourers' muscles in training and prevented the loss of habits of diligence, the crop that should have resulted and rewarded the labourers for their exertions was non-existent; nothing is more disheartening than useless labour. Many of my own early years were wasted in inking in drawings, and I could not help wishing at the time that I had been a shoemaker, for stitching shoes could not be more irksome, and would have prevented some people from getting their feet wet or worn. The creation of something useful would have mentally compensated me for the irksome labour, while no one was benefited by my inking in drawings. The wisest saying of the Delphic oracle was "Know thyself," and it can be as usefully applied to themselves by those who study Architecture as by others in the various exigencies of human life. It is obvious that if one knows one's self one can best choose the part of Architecture most fitted to one's aptitude, and one can map out those parts that are

ESSENTIAL TO BE LEARNT;

by this means not only is much useless labour saved, but that worst of all shipwrecks is averted, the having embraced a profession that is not congenial and for which one finds one's capacities are not fitted, and this, too, when it seems too late to throw up the profession. I recollect hearing of a pupil of Laing's—the Laing who built the Custom House—who found Architecture so uncongenial that he embraced the law, and became a Vice-Chancellor; as Alfieri, the barrister, became a celebrated Architect. It is within the knowledge of most men that many of those who have become distinguished have changed their profession; but these men have mostly had a natural aptitude for the subject they eventually embraced and excelled in. To those unfortunates who have embraced Architecture but have no aptitude for it—nor, as far as they know, for anything else—I can only recommend the behaviour of Scotchmen under the circumstances. I think I may say that Scotchmen are the only people of the United Kingdom who have a good education, and by this I mean a moral education; each man who finds himself in this position says to himself, "This is my only chance in life; I have no natural aptitude for it, but I must try by application and striving, in season and out of season, to make up for my lack of aptitude"; and you rarely find that they fail in whatever walk of life they have embraced, for they mostly gain a good position. Youth is naturally enthusiastic and ambitious, and would fain know everything connected with its occupation. Most students have probably read Bacon's programme of mastering all human knowledge; but we are not all Bacons, and had Bacon lived now, when the memory wanted for one small branch of science is greater than that given to most men, he would never have set out on so impossible a quest. A student, for example, has to see what a column or stanchion will safely bear, and so he wants to know the laws of flexure, and finds himself referred to Poisson; he gets Poisson's book, but finds that to understand it he must master the differential calculus; he gets a treatise on that, but finds that it would take him his whole life, if he could learn it then; yet, as the multiplication table is to arithmetic, so is the differential calculus to the higher branches of mathematics; he therefore comes to the old conclusion "that everybody cannot do everything." It is, perhaps,

A LAUDABLE AMBITION

to take one of the great Architectural geniuses as a pattern, but you should have common sense enough to calmly and dispassionately review your own powers and capacities before entering on a serious attempt at imitating his achievements. There is only one genius in several millions of people who is blessed with the capacities of the great Architects, who has the making of a Brunelleschi, an Alberti, a Peruzzi, a Bramante, a Leonardo, or a Wren, and I only wish more of those who find themselves incompetent would abandon the profession. The average capacity of mankind is not great, and yet each one wishes to be the bright particular star of the world. Each unit of mankind cannot endure the idea that his capacity is not equal to that of the greatest genius, but he will admit that he is deficient in industry, and in that judgment which guides a man to concentrate himself on the principal aim of his life. This shows us one of the weaknesses of humanity—to be ashamed of admitting that which is a pure accident, over which we have no control, and to admit, without blushing, our neglect of those things that are in our power. It is the fashion to encourage the belief that all men are born with equal capacities, as it is to suppose that every epoch is equal in mental and moral power, and that the difference depends on teaching, as if cutting and polishing a flintstone would turn it into a diamond. I recollect Roebuck talking this sort of nonsense at Sheffield, and after pointing out what John Stuart Mill could do at thirteen years of age, who had then mastered Greek, Latin, and mathematics, he says, "But if John Mill could do what he described, why may not John Brown do as much, or nearly as much?" The subjects that seem to me of the utmost importance are—firstly, the recognition by students and their teachers that

ARCHITECTURE IS A STRUCTURAL ART,

and that until this is realised and acted on no great improvement is likely to take place. All the materials we use have weight, and in their ultimate position have size too, and in the positions they are placed have, as well as downright pressure, cross and diagonal strains. All these strains occur in almost every building, and must balance one another, or else the building becomes deformed or ruined, or tumbles down. The theory of the strains that produce equilibrium is called statics. The Architect with the keenest observation, the strongest memory, and the greatest experience is a mere child compared with one who is a master of statics and the strength of materials; secondly, we all admit that without proportion buildings and their parts are unsightly, and we endeavour to train the eye to good proportions by studying classical buildings; their proportions, however, mainly give the statical results gained by experience at the time the buildings were erected; if these studies are pursued too long they are apt to make us fall in love with a state of knowledge inferior to that which they now possess. That friend of our youth, Mr. Ruskin, partially enlightened us on this subject, by pointing out the infinite variety of

PROPORTIONS IN NATURE,

most of which we find agreeable to the eye, and we now know that what might be called the fundamental proportions depend on the weight to be carried, the strength of the material, and its height and size. Statics allow us to go further, for, knowing the strains to be borne, and where they come, and the strength and peculiarities of the material, we may mould it into various forms, either by cutting away useless parts, or by adding to the bulk in certain directions. By statics we know where there is a change of function, and where various strains are concentrated, and these parts call for some expression, and the only way of expressing them Architecturally is by moulding. The proper arrangement of each chamber for the duties it has to perform, the collocation of the different chambers, and the access to them by means of halls or passages without unnecessary waste of room, is commonly denoted by the word "planning," and in reality it includes much more, as, for instance, their proper lighting, aëration, ventilation and warming; in fact, the enabling us to make the different portions fulfil their ends is the foundation of all good Architecture. But man wants more than this; he wants not only certain parts to be more striking than others, but to make the whole have such an external appearance that it tells us the use of the building and evokes the emotions proper to its use. All we have to deal with outside are walls and roofs, but we may want porticoes and porches, towers, lanterns, spires, and domes for certain uses and under certain circumstances. Inside we have much the same elements, but we have as well, floors, ceilings, and staircases, and although we always want floors to be flat, there are circumstances where steps are required to give elevation and dignity to certain parts, and there are also certain shapes which add beauty or dignity to the rooms, and if the ceiling is vaulting or domed we may want it made striking or beautiful. One particular point is usually missed in speaking of Architecture—the skill in combining the junctions between forms of diverse or opposed shapes, and of marking the different changes of function where they occur, or of marking the concentration of strains. These, as I mentioned before, are accomplished by moulding, and these mouldings are to give us varieties of light and shade, and to have a sort of logical sequence in their forms. The Greeks were the first and the

GREATEST MASTERS OF MOULDINGS,

which were, of course, shaped to be played on by brilliant sunshine and in a clear air. The Roman mouldings were only badly-designed Greek ones with infinitely less variation. The second masters of mouldings were the Gothic Architects, who designed them for the misty climates and feeble sunshine of the countries they lived in. They were as logical as the Greeks, though destitute of their refined Artistic sensibilities; and since then the study of profiling has been abandoned. I say nothing of sculpture, in which I include naturalistic as well as vegetable and animal forms, for this is another Art, but it must be exercised with due regard to the Architecture, and must neither be incongruous nor destroy the scale of the part, the chamber, nor the building. You cannot expect sculpture from Architects, as it takes the life-study of an Artist, and Architecture alone may be said to embrace the life-studies of many men, men of science, men of ingenuity, and men of Art. When, however, the Architect is so transcendent a genius that he can master his own Art and that of another Artist, he excites our

wonder and our admiration; but to be a bad Architect and an execrable sculptor too is not a combination to be admired, and still less to be proud of. It merely entitles the possessor to Martial's compliment, who called the amateur who did so many things nicely a great meddler. There are one or two more points that I must mention, but perhaps

THE INFLUENCE OF THE AGE,

is the most important; this in one direction is what we call the taste of the nation, and it inevitably modifies the individual taste of the Artist. The old proverb says, "The mind of man is greedy of novelty," and novelty in itself has, no doubt, a certain charm, but it should only be that difference from what has gone before which must inevitably follow from those thousands of things, circumstances, and temperaments that distinguish one age from another. It shows us, too, how ridiculous antiquarianism is when it takes the place of Architecture. We are not Greeks, Romans, or Byzantines; our age is not Romanesque, nor Gothic, nor Renaissance, and if the Architecture of the day is to charm the age it must discover and embody the desires of the age. The paraphrasing of deceased styles only charms us in so far as our civilisation approaches that of the date of the building paraphrased, and the building wants novelty too. We naturally do not admire Gothic paraphrases, as the desires of those times are so far removed from our own inclinations. The Gothic Architect's passion for geometry is very far from being ours. The nation, too, has

LOST ALL DESIRE FOR ART,

which is the embodiment of ideas, by which alone the bulk of the people can be taught; now a little scientific jargon, embodied in a newspaper paragraph, or an Act of Parliament, is expected to fulfil the function of Art, but any person of observation can see it does not. Art, which should proclaim to the most uneducated the various inestimable advantages obtained by being free, by having a voice in the election of its representatives, by belonging to a great nation with colonies, by free teaching, by free surgery and doctoring, by free lunatic asylums, by the free housing, clothing, and feeding of aged paupers, by free libraries, by public parks, gardens and baths, by free museums and free picture galleries, knows nothing of it, because it is not brought to their eyes by Art; in fact, so far is this from being the case that all these benefits, if not unknown, are unnoticed, because Art is suppressed in all the buildings which minister to the people's wants. Such buildings should be of the most impressive appearance, and adorned with sculpture expressive of their use. Splendid tombs and monuments in public places should perpetuate the memory of the great warriors and statesmen, the great inventors and industrial leaders, the great poets, the great writers, musical composers, painters, sculptors, and Architects, whose works will make the nation live in the memory of the world when its greatness and glory have departed. Architects can but slightly modify the desires of an age, as there are so many thousand things, conditions, and influences that combine to mould

PUBLIC TASTE.

All they can do is to have the attainable knowledge and skill required for their Art, and if invention in Architecture is extinct, we must try to recreate it. I hope it is not extinct, but if it be we still have the mountains, rocks, and peaks, the caverns and grottoes, the woods, the trees, and the plains, the rivers and seas, the clouds and the heavens to stimulate us to embody the lessons we can learn from these natural effects; not to speak of the lessons we can learn from the past Architectures of the world. I cannot help thinking that if the born Architect should arise and be single-eyed in his devotion to this grand Art, we might hope to see it again flourishing, as in the grand epochs of the past. Antiquarianism is not content with gnawing out the vitals of Architecture, but is destroying our faith in its being still alive. Another of the points that wants attending to is the study of the means employed by the great Architects of the world to evoke the emotions proper to the use of buildings, and particularly to those dedicated to the adoration of the Almighty. Students are naturally apt to seize upon features that they admire, and use them in the most incongruous way, as if the adornment of a temple or a palace were appropriate to a labourer's cottage, a coal store, or to a tailor's shop, whose owner makes the human form divine ludicrous and ignoble. Elegant simplicity of appearance should be the Architect's aim for most of his buildings, as his aim should be to produce horror and repulsion in a prison. Our great object now is to be sure that we have done our best to learn all that we ought to learn. How delightful would it be if we were as sure of our progress as were the Gothic Architects, and instead of being as careful of every scrap left by a semi-barbarous age as if it had come from heaven and were sacred, we could use with a light heart a good stone, as they did, for our own work, and build in their worked part we have surpassed. I may say this was not confined to Gothic days; the Greeks used the sculpture they had surpassed for filling in holes and trenches, and Mr. Purdon Clarke showed me a Saracen wood block that had once formed a door-head in a destroyed mosque, the back of which had been used for the work of the day, while the carved part, worked in a former age, had been built in. If the Institute wants to start this work of

FUNDAMENTAL IMPROVEMENT,

it will see that its examinations are not confined to students alone, but are to be passed by every one who joins it, and that everything that is not Architectural is excluded from the examinations, and that those things alone are included that every Architect ought to know to be worthy of the name. No one can say that the Arts of surgery and medicine have not enormously advanced since the surgeons and doctors had to pass a strict examination in the subjects of these Arts. No sane person can suppose that if Architects were required to show that their knowledge rested on a solid foundation of science and æsthetics Architecture would not rapidly progress.

At the close of the President's address a review of the designs and drawings submitted was given by Mr. William Milner Fawcett, M.A., Vice-President.

IT is in contemplation to form a local syndicate for the erection of a new Town Hall at Killarney.

THE ratepayers of Islington have rejected Mr. Passmore Edwards's offer of £10,000 towards the cost of erecting three public libraries in the parish.

THE Works Committee of Dundee Town Council has authorised contracts to be taken for paving High Street, Commercial Street, and Murraygate with granite setts.

A WINDOW, to the late Mr. Alexander Macmillan, publisher, and his son, the late Mr. Malcom Kingsley Macmillan, has been placed in the Parish Church at Bramshott.

HALES PARISH CHURCH is now in process of restoration. This picturesque little building has now been thoroughly overhauled, and it is expected that the Bishop will open it in a few months' time. It was necessary to spend a large amount of money on the roof and windows in order to make the Church waterproof.

COLONEL J. T. MARSH, R.E., Local Government Board Inspector, has held an inquiry at Truro into the application of the Town Council for sanction to borrow £690 for the purchase of a site in Union Place for the erection of a technical school and Art Gallery.

THE Queen's new yacht will be built entirely of steel, and will have a length of about 400 feet, and a beam of about 52 feet. She will have twin screws, and the steam to work her composite engines will be supplied by 18 or 20 water-tube (Belleville) boilers. The maximum speed is to be 23 knots per hour, but for all ordinary occasions the speed will not be more than 19 or 20 knots.

CONSIDERABLE alarm has been caused in the neighbourhood of the Whins, at the north-eastern boundary of Alloa, by the subsidence of the ground at several points between the Old Toll Road Bridge and Hilton Brickwork. The subsidences vary in length from 10 to 20 feet, and in depth from 5 to 25 feet, the largest being in the vicinity of Hilton. A house is in course of erection in close proximity to the fallen-in ground, and it has been found necessary to stop the operations. The cause of the subsidences is supposed to be the giving way of old underground workings, which stretch in all directions in this particular part of the Alloa estate.

Professional Items.

ABERDEEN.—The Aberdeen Town Council has agreed to send a deputation to wait upon the Postmaster-General and urge upon him that the sum of £20,000 he has already stipulated as the sum to be spent on procuring a site for the new Post Office for the city, is quite inadequate for a suitable and satisfactory site; and that a sum should be granted sufficient to have the new offices erected in Union Street.

BOOTLE.—At a special meeting of the School Board, to select a plan for the new Gray Street School, it was decided that, subject to the consent of the Education Department, the plan for the Gray Street school sent in under the *nom de plume* of "Left-hand Light" be adopted, and that the Architect be appointed Architect for the school upon the usual conditions. The cost of the new school, which will accommodate about 1,100 children, is estimated to be £7,297. The Architect called in by the Board to advise upon the plans was Mr. Paul Ogden, of Manchester. Fifteen sets of plans were sent in. The successful Architect is Mr. Cox, of the firm of Cox and Marmon, Liverpool and Bootle.

BRADFORD-ON-AVON.—A building for the purposes of a Technical Institute for Bradford-on-Avon and neighbourhood has just been completed in Junction Road. The total cost is about £3,900. The frontage is 75 feet to Junction Road, with a depth of 45 feet. The style is a form of English Renaissance. From the centre of the hall a wide staircase runs to the first floor, stairs beneath communicating with the heating chamber and store rooms. On the first floor is a chemical laboratory, and the lecture theatre is also on the first floor, in the centre of the building and adjoining the chemical laboratory, provision being made by specially ventilated fume closets for carrying off the gases emitted from chemical experiments. There is also on the first floor a large room to be used for teaching drawing, building construction, and other technical subjects.

BRIDGWATER.—The Town Council, on Thursday, considered an amended scheme for the improvement of the River Parrett navigation. The new scheme, prepared by the borough surveyor, provided for the cutting off of some of the awkward bends of the river, at an estimated cost of £45,000, the estimate for Mr. Wheeler's original scheme being £100,000. The Council adopted the amended scheme by fifteen votes to five.

BROADHEMPSTON.—The Broadhempston Church Restoration Committee has accepted the tender, at £590, of Mr. R. F. Yeo, of Torquay, for the restoration of the roofs. Mr. E. Sedding is the Architect. The work is to commence on Feb. 1st.

BURNTISLAND.—The Harbour Board met last week, when offers for the construction of a new deep-water dock were before the meeting. Mr. Carlow, chairman of the Board, presided. The committee's report on the tenders received from the selected contractors recommended that the offer of Sir John Jackson, Westminster, be accepted, and the meeting unanimously adopted the committee's recommendations. The estimate of Messrs. Meik and R. Henderson, engineers, as to the probable cost of the new works was £300,000, and the tender accepted, it is understood, is between £250,000 and £260,000. The new dock is to have a water area of fully ten acres, and a depth at spring tides of 29 feet. As the firm of Sir John Jackson are well forward with the dock extension works at Methil, it will be possible to enter on the new contract at Burntisland with little delay.

CAMBRIDGE.—A meeting was recently held in St. Barnabas' Schoolroom, for the purpose of discussing the erection of a new Parochial Institute. A site has been given by the Master and Fellows of Gonville and Caius College, but has not yet been conveyed. The Building Committee of the Corporation accepted the plans on December 8th. Plans have been drawn up by Mr. Fawcett, the Architect, and Mr. Saint estimates the cost at £1,400 or £1,500, and this, with the Architect's fee, brings the total up to nearly £1,600.

CLEVEDON.—Clevedon has just been provided with a commodius club for Lileral working men, from plans by Mr. H. G. Hewlett. The new building has been erected on the site of the former club in the Triangle, only a few yards from the railway station. The exterior has a neat and effective appearance, and it is proposed in the near future to extend the front to twice its present length, providing it with two additional bays and a corner tower. This contract was carried out by Mr. W. A. Green.

CRAIGIE, N.B.—At a special meeting of the Police Commission, held to consider the Works and Paving Committee's recommendation as to accepting offers for the construction of the outfall sewer for Craigie district, the Lord Provost stated that the Committee recommended that the offer of Mr. P. Girrity, contractor, to complete the work for £1,876 be accepted. A resolution was passed adopting the recommendation.

FARSLEY.—At a meeting of Farsley Liberals, last week, a plan of a proposed new club was submitted by Mr. W. D. Gill, Architect. The estimated outlay is £2,250.

LEITH.—At Leith Dean of Guild Court last week, the following warrants were granted: To Henry Ward, to erect 27 self-contained houses, two storeys high, at Newhaven and Dudley Gardens; to the Edinburgh Ropery and Sailcloth Company, Limited, Bath Street, to erect a spinning mill and engine-room, one storey in height; and to W. and J. Jenkinson, to make alterations on their premises at St. Andrew Street and Riddle's Close.

LONDON, N.W.—The Baths and Washhouses Committee of the St. Pancras Vestry, has selected Bower Cottage, Leighton Road, Kentish Town, as the most suitable site in the northern division of the parish on which to erect the baths and washhouses so greatly needed by the dense population, mostly working people, in North St. Pancras.

LOUGHBOROUGH.—At a meeting of the Town Council, held on the 4th inst., a letter was read from Joseph Griggs, J.P., offering to erect, and present to the town, public baths, at a cost of £3,000, to commemorate the completion of the 60th year of Her Majesty's reign, upon a site to be provided by the Corporation. The borough of Loughborough has previously benefited by the generosity of Mr. Griggs, who held the office of mayor for the first two years after the incorporation and the office of high sheriff of the county during 1895. Mr. George H. Barrowcliff, Architect, of Loughborough, has been intrusted with the work.

MANSFIELD.—With respect to the widening of Leeming Street, the chairman of the Roads and Buildings Committee of the Town Council and the borough surveyor have interviewed the owners of property in the street, and they have received the following offers:—Mr. J. Hudson, £1,500; Mr. R. Woods, £1,550; Simpsom's trustees, £4,000; Mr. A. J. Cursham (for fiontage in Leeming Street and Clumber Street, acd setting back premises), £1,250; Mrs. J. Wilson, £21 per yard. The committee has resolved that the offers of Mr. J. Hudson, Mr. R. Woods, Simpson's trustees, and Mr. A. J. Cursham be accepted, and the Deputy Town Clerk has been instructed to enter into a provisional agreement with Mrs. Wilson for the purchase of a piece of land in front of her house.

MONTROSE.—The Free St. George's Church, Montrose, after having undergone extensive alterations and improvements during the last three months, was reopened a few days ago. The principal structural alteration has been the erection of a porch facing George Street. On the façade of this porch, which forms the principal entrance, is carved the words "*Nec tamen consumebatur*," the motto of the Free Church, on a ground work representing the burning bush. A corridor runs round the back of the area, and from this corridor, which is partitioned off, access can be obtained to any part of the Church by means of five passages. The interior has been arranged in a semicircular amphitheatre style. The Church has been reseated, and the pews are constructed of pitch pine with all the most modern conveniences. The walls are painted in a warm tone of pink, with the dado lining in imitation of pitch pine. Above the dado runs a band of Lincrusta Walton, with the floral scroll-work picked out in colour. All the windows have been filled with Cathedral glass in an effective manner. Messrs. Matthew and M'Kenzie, Aberdeen, were the Architects, while the contractors were:—Masons, Messrs. Reed and Burnett; joiners, Messrs. J. and W. Craigie; glazier, Mr. Douglas; heating, Mr. Alexander Moug; plumbers, Messrs. Christie and Smith; and painter, Bailie Adamson.

NEWPORT.—The directors of the Newport and County Infirmary, as a result of the decision of the assessor, Mr. N. G. Pennington, of London, to whom the plans for the proposed new hospital at Newport were referred, have awarded the first premium of £100 to Mr. Richard J. Leirll, of 46, Victoria Street, London; and the second premium of £50 for the second best set of plans to Mr. J. T. Harnett Harrison, of North John Street, Liverpool.

PAISLEY.—Plans of a new Board School, to be erected in Carbrook Street, Paisley, at a cost of £8,000, and to accommodate 836 pupils, have been passed in Paisley Dean of Guild Court yesterday.

PERTH.—A new block of buildings is in course of erection at the corner of New Scott Street and South Street, Perth, for Bailie Wright, proprietor of the Perthshire Courier. The buildings are to be built of stone, with polished face and dressing, from Polmaise Quarries, Bannockburn, and will have two facades of 60 feet and 54 feet respectively to New Scott Street and South Street. The roofs will be covered with slates from Port Dinorwic Quarries. The cellar areas will be lighted by street pavement iron prism lens lights, made by the Hayward Bros. and Eckstein, and the ironwork is in the hands of Mr. Barker, engineer, New Row. The contractors for the whole works are:—Mason and brick work, Alexander Beveridge, builder, New Row, Perth; carpenter and joiner, Thomas D. Falconer, contractor, Shore, Perth; plaster and cement work, Daniel Campbell, Bridgend; slater, James Buchan, King Street, Perth; glazing, Edward M'Conocher, South Street, Perth; iron and steel contract, George Bailie, New Road, Perth. The plans, &c., have been executed by ex-Bailie Smart, Architect and Surveyor, Morgan's Buildings, New Scott Street, Perth.

ROTHERHAM.—At Rotherham, consideration is being given to a scheme for the restoration of the Parish Church. It was stated at a recent meeting that the worst thing was the choir seats, the only bit of seating in the Church that was not oak. The choir seats were a great eyesore. Behind the present choir seats there were two oak seats richly and beautifully carved, and it was suggested to brings these to the front in keeping with the rest of the Church, and provide oak seats sufficient for the choir. The cost of this improvement would be about £80 or £90. The proposal to erect a screen of solid wood with linen scroll or carving, and above the solid wood some open carved work, so as not to intercept the view of the chancel, the height not to exceed 5 ft. 3 in. The gas brackets and coronas also needed attention. It was further suggested that the chancel should be carpeted, and the rough stone at the sides of it covered with cloth. Plans from two local Architects had been obtained for the screen, which were submitted.

SUNDERLAND.—The following Architects have obtained the premiums offered by the Sunderland Town Council for the best designs for workmen's dwellings at the east end of the town:—(1) Messrs. M. B. Perry and R. Angell, Garrick House, London, W.C.; (2) Messrs. Jacob and Brand, Gresham Street, London, E.C.; (3) Messrs. Houston and Houston, Furnival's Inn, London, E.C.

SWANSEA.—Mr. G. E. T. Lawrence is the Architect for the new school of St. Thomas, at Swansea, which, when completed, will be one of the finest in the district. It will consist of three departments—the infants on the ground floor, girls on the next floor, and the boys on the top, the three departments being made to accommodate 1,200 children. Each department is planned with a large central hall, with class-rooms leading into it. The building will be of brick, with fireproof and wood-block floors throughout. It is estimated to cost £10,500. The builders are Messrs. J. and F. Weaver, Manselton.

TRIM, IRELAND.—The main building of the new Church of St. Patrick's, Trim, is now nearly completed, and the tower is far advanced. A considerable sum of money is yet required to complete the structure and to furnish and decorate its interior. Mr. Hague is the Architect, and Mr. Nolan, builder, the contractor.

WOLVERHAMPTON.—This Church, which has been closed for extensive alterations, was reopened last week. The structural changes which have taken place comprise the removal of three bays of each of the side galleries and the whole of the high-backed pews, and free benches on the ground floor, together with the upper galleries which had provided accommodation for about two hundred children. The choir has been extended one bay further into the nave, the altar has been elevated so as to render it visible from all parts of the Church, and the sanctuary has been enlarged by the addition of a curved step and altar-rail extending into the choir. A vestibule has been formed at the west entrance, with cloth-covered folding doors. The floor has been laid with oak blocks, and oak open seats provided. A new oak pulpit on a stone base replaces the former structure. The interior of the Church is being redecorated by Messrs. Lewis and Swindley, of Wolverhampton; and a new organ, constructed by Mr. Deal, Kent, will be in its place about March next. The works are being executed from designs by, and under the supervision of, Mr. Fred. T. Beck, Architect, Darlington Street, Wolverhampton.

In a report on the educational work of the Wolverhampton Town Council recently prepared, Mr. S. T. Mander suggests that the erection of a free library building in a more central and prominent position should be at once proceeded with. A sum of £15,000, it is estimated, would be sufficient for this purpose, including the interior fittings.

THE Chester Town Council has adopted a scheme for the erection of public baths in the city, at a cost of £8,000.

THE Baths Committee of the Hackney Vestry has decided to open the new public baths for the parish at an early date in February.

MR. JAMES CARSWELL, engineer-in-chief to the North British Railway, died on Wednesday morning last, at Edinburgh.

THE Herefordshire County Council has approved of the proposed enlargement of the County Lunatic Asylum, at a cost not exceeding £32,500.

MISS HELEN GOULD, the daughter of Mr. Jay Gould, has given £50,000 to the Presbyterians of Roxbury, for the purpose of building a new Church.

THE trustees of the David Lewis (Liverpool) Fund have decided to give another £20,000 towards the rebuilding of the Liverpool (Northern) Hospital, thus raising their gift to £80,000.

THE Treasury authorities have just received from the Chief Constable of Buckingham a collection of 28 coins which were recently discovered at the village of Whitchurch, through the falling in of the ceiling of an old house. They are all silver coins belonging entirely to the period covered by the reigns of Elizabeth, James I., and Charles I. The bulk of them are in a good state of preservation. The oldest date decipherable is 1565.

THE death is announced of Mr. J. W. Beck, of Michwood, Merton Park, who was for many years secretary of the Grosvenor Gallery, and subsequently of the New Gallery, 121, Regent Street. Mr. Beck was himself a capable water-colour Artist, and took charge of the British Fine Art collection sent to the Chicago Exhibition in 1893.

A LOCAL Government Board inquiry has been held at Wigan, regarding the application of the Corporation for a provisional order for power to obtain a supply of 200,000 gallons of water daily in perpetuity from the Manchester Corporation's supply at Lake Thirlmere. It was proposed to construct a line of pipes from the service reservoir at Wigan Lane to the aqueduct leading from Thirlmere to the city. The cost of the proposed work was estimated at about £12,000.

SHEFFIELD BUILDING.

A RECORD YEAR.

DURING 1896 the progress of Sheffield in the direction of the improvement of the city has been greater and more marked than in any previous year. The widening of High Street has been the most notable event, and the last obstructing building—that of the Capital and Labour Clothing Company—will be removed within the course of a few weeks. The south side of High Street will, during the coming year, if the lofty pile of Messrs. Foster and Sons and the buildings above it be any criterion, put on an Architectural dignity which has long been lacking. The buildings in High Street completed during 1896 have been described on various occasions. They include the London and Midland Bank at the corner of York Street, the lofty pile raised by Messrs. Foster and Sons, and the pretty terra-cotta building of the Grand Clothing Hall. The Café Company's premises consist of the original building set back to the prescribed line. The new premises of Messrs. F. E. and S. Smith were the first to appear behind the disappearing bricks and mortar, and now the Victoria Hotel is practically completed. As yet the new roadway is only temporarily laid, and the completion of the connecting link of the new sewer, which extends from the Monolith to the Church Gates, and from Change Abbey to the top of Commercial Street. This sewer replaces the ineffective drain which was in places simply carved out of the rock in its course. In Church Street the space above the Reform Club buildings so long unoccupied is now fully covered by the premises built for Messrs. Wm. Bush and Sons, auctioneers, and Messrs. H. and A. Maxfield, solicitors; and still further up Messrs. Webster and Styring are having an imposing corner block, which while it utilises what has been a miserable-looking stoneyard, will shut out the street view on one side of St. James's Church. The new Court House buildings in Waingate, of severe and imposing dignity, barren altogether of beauty although not opened, were virtually completed during 1896. The

NEW TOWN HALL,

which has been alluded to so many times, is apt to escape notice. The great gates are not to be rolled back until Her Majesty gives the signal. The officials of the Corporation were however, so badly housed that the earliest opportunity was seized of requisitioning the apartments in the city's building. The City Surveyor and his staff were the first to leave the unsuitable offices in Bower Spring and take up their new quarters. That was in February. The Medical Officer of Health, the City Accountant, and the Town Clerk were all fixed in their new home during the summer. The Water Department and the Council will shortly occupy the new hall, which has long been waiting for them. The completion of the new Town Hall has done a great deal to inspire building energy in that immediate neighbourhood. The Prudential Assurance Company's building—in the familiar style adopted by their Architect in nearly every town—as a structure is complete, and requires only interior work and fitting to be ready for occupation. Behind them brick and mortar will soon be rising on the space opposite to the Empire Palace. The shops on the Pinstone Street side complete the Architect's scheme in connection with the Empire. On the opposite side of the road a space which has long been an eyesore is that now filled by the buildings erected by Messrs. Laycock and Gibbs. The buildings already enumerated may fitly come under the general heading of city improvements, inasmuch as they fill up unsightly gaps in main streets, and lend an appearance of thoroughness and completeness which has been long wanting. The new arcade which Messrs. T. B. and W. Cockayne are building at the end of Watson Walk will be finished at an early date. An improved thoroughfare from Campo Lane to Broad Lane is much needed. This is in connection with the difficult problem of how to deal with

THE INSANITARY AREA,

—a question full of perplexity, and one not likely to be settled without enormous outlay. Mr. Wike's scheme provides for the much-needed widening of Townhead Street and Tenter Street, and gives more direct access from Campo Lane to Broad Lane by a good wide thoroughfare, beginning about the centre of the Crofts. Already the Corporation has secured a large number of the scheduled properties, and before the end of 1897 it is anticipated that satisfactory terms will have been arranged with all the property owners. Workmen's dwellings and improved thoroughfares are to be the outcome, but exactly in what form this will be accomplished, remains to be seen. However, the slum quarters are to be swept away. The work of the Corporation has been by no means restricted to the centre of the city. In many other parts of the thirty square miles area the City Surveyor's men have been at work, many of the improvements being of a minor character, but none the less acceptable to those in the vicinity of the alterations. Here and there, in much-frequented streets, houses standing much out of line rudely jostle the foot-passengers on to the roadway. Not one of these has been overlooked in the Bill with which the Corporation go to Parliament next session, in which it seeks powers to finish the widening of Westbar, Shalesmoor, and Infirmary Road, and other more distant roads. In the

CITY SURVEYOR'S DEPARTMENT

the baths at Upperthorpe were completed during the year, the Glossop Road Baths were entirely reconstructed and improved, and now the east end is to have its turn. The long-talked-of baths at Brightside have been planned by the City Surveyor's staff, and tenders will be asked for early in the year. An additional temporary ward has been built at Lodge Moor Hospital. The new "Destructor," which is being built on a site purchased from the Duke of Norfolk, near the canal at Attercliffe, is now nearly completed. The Surveyor's department during the year has practically finished all the work for which a loan of £54,000 was granted. Another loan of £42,000 has been applied for. This is for work spread over all the city. Twenty-nine miles of carriage road and carriage ways have been reconstructed, and about 17 miles of footpaths, flagging, and asphalting, at a cost of £70,000. Sewering to the extent of 4½ miles has been constructed. In this last work the biggest piece is the sewer from Nether Green, right through the newly-purchased Whiteley Woods, to Brookhouse Hill. It will be capable of draining the whole of the valley district, and assist greatly in the development of that quarter as a residential district. The official statistics show that buildings other than dwelling-houses have been erected in 1896 to the number of 287, against 253 in 1895, and that plans have been sanctioned for 533, against 432, in the preceding year. Additions have been made to the works of Messrs. Vickers, Sons, and Company at the Cyclops Works of Charles Cammell and Company, at the foundries of Messrs. Samuel Osborn and Company, and the Brightside Foundry Company. Messrs. Walker and Hall have made extensive additions to their works, Messrs. Mappin and Webb, and Messrs. Atkin Brothers have also been extending. Not much has been done in the way of school building, but the Bole Hill Board Schools were opened during the year, and various other schools belonging to the Board at Newhall and Tinsley Park have been enlarged. The Primitive Methodists have built a Chapel and mission-room at Heeley, and a small Chapel at Fulwood, and the Congregationalists at Cemetery Road have added a school to the Chapel. St. Matthew's Clergy House in Carver Street and a Mission Church at Grimesthorpe complete the tale of ecclesiastical work, though preparation has been made for the Chapel-of-ease, in connection with St. Mark's, at Brocco Bank.

THE Electricity Committee of St. Pancras Vestry has fixed the price for charging accumulators for electric motor vehicles, at either of the vestry's central stations, at 2*d*. per Board of Trade unit.

WE are informed by Mr. Thomas Elsley that his business has now been converted into a limited company. The shares are not offered to the public. We also have to announce that his business has been entirely removed to Great Titchfield Street (Nos. 20, 22, 26, 28, and 30), the premises occupying the site adjoining those in which his fireplace factory has been carried on for some years past.

SEWAGE IMPROVEMENTS AT BRADFORD.

AT the annual meeting of the Birmingham, Tame and Rea District Drainage Board, the Works Committee reported that in accordance with the proposal to apply for Parliamentary powers to acquire additional lands for sewage purposes, a bill had been deposited, and the preliminary formalities complied with. In pursuance of the instructions of the Board, the committee had caused to be included in the bill powers for the purchase, in addition to the 1,100 acres recommended in Mr. Hawksley's report of the 31st July, of the seventy-nine acres recommended by Mr. Till for avoiding severance and improving boundaries, of the freehold of 125 acres now held on short lease by the Board; and for obtaining the property rights and easements necessary for removing the weir and sluices at Forge Mills. These additions to the original proposals would add to the cost of carrying out the scheme, and after consultation with all their professional advisers, the committee decided that the sum of £400,000 should be inserted in the bill as the amount to be borrowed under its provisions. The committee had obtained an offer for the sale to the Board of about 34¾ acres of freehold land and two cottages situate at Wiggin's Hill, for £3,775. The property was part of the area of the extension scheme, and the committee recommended the Board to purchase it for the sum named. The following proposal had been made with reference to the method of dealing with the sewage of Castle Bromwich:—that the Board give up to Lord Newport its freehold land about six and three-quarters acres in extent, situated on the south side of the Midland Railway against the new racecourse, and that Lord Newport give up to the Board in exchange an equal area of freehold land, to be situated to the east of the footpath leading from Castle Bromwich, past Berwood Hall, to Minworth, the Board to lay out the same, and deal thereon with the sewage from Castle Bromwich. It was added that Lord Newport proposed to straighten the River Tame through the land he thus acquired, and further west as far as the point where the river entered on the Board's land at Stonehouse. The committee recommended that this arrangement be adopted, and the exchange of land effected under conditions to be approved by the committee. On the motion of Mr. Hughes, resolutions were passed giving effect to the committee's recommendations.

AT a meeting of the School Buildings Committee of Aberdeen School Board it was reported that building operations at Walker Road School are now sufficiently far advanced to render the opening of the school probable next month. It was resolved to have working drawings prepared for the new school at Kittybrewster, and to have the works specified with a view of their being contracted for at an early date.

A SHOCKING accident occurred at the Eiffel Tower which is in course of construction at New Brighton, near Liverpool, on the 13th inst. Three men in the employment of Mr. Handyside, of Derby, who is the contractor for the iron work of the tower, were working on a scaffold 35 feet from the ground, and were engaged in fixing one of the huge iron girders, when the hook and the crane used for lifting the iron gave way. The iron work, which was swinging from the crane, fell and in its descent struck the scaffold on which the men were working, entirely demolishing the structure. Two of the men were instantaneously killed, the third seriously injured.

A MEETING in furtherance of the proposed road over Sty Head Pass was recently held at Keswick. Mr. R. D. Marshall presided, and among those present were representatives of the Keswick Urban District Council, the Whitehaven Rural District Council, and representatives from Bowness and Windermere. A resolution was passed recognising the great importance to the Lake district of an easy means of communication between Borrowdale and Wasdale, and pledging the meeting to give hearty and active support to any well-considered plan for such a road. The estimated cost of the road is £10,000.

SOCIETY MEETINGS.

Devon and Exeter Architectural Society.—Mr. Edmund Sedding read a paper, on Thursday evening, at the Plymouth School of Art, the subject being "Local Gothic Architecture." He said that, situated as Plymouth was, amid scenery of considerable beauty, it was incumbent on those who designed in that town that they should design well. The Architectural status of a town or city depended on the character of its domestic buildings; if they were mean and of a second-rate order the Architectural character of that town would be so in comparison. Referring to the two great divisions of Architecture, Classic and Gothic, and after giving weighty reasons for the adoption of the latter, which he described as the natural Architecture, Mr. Sedding said the inhabitants of Plymouth had acted wisely in erecting their principal public buildings in the Gothic style, which was so adaptable to the climate and so much more suitable for constructional methods. With regard to the decoration of Architecture, which he described as the most important part of this fine Art, he remarked that it should be of Gothic character, in proper proportion to the distance at which it was placed from the eye—not as the Greeks placed it, on the top of their buildings, but as the Goths placed it, at the entrances to their buildings. There was very little stimulant in Plymouth for the Architectural student in the way of museums or old buildings. It was necessary to be in touch with old work in order to design well, and that could be done if only the trouble was taken. He advised that the Society should spend their afternoons in visiting old buildings, when the weather permitted.

Edinburgh Architectural Society.—A meeting of the Edinburgh Architectural Society was held on Thursday last—Mr. G. S. Aitken in the chair—when Mr. Alexander Drew, C.E., delivered the first of a series of lectures on "The practical designing of iron and steel roofing." We are pleased to state that we have arranged for the exclusive right to publish this series of lectures, which will commence early in the new volume.

Sheffield Society of Architects and Surveyors.—The monthly meeting of this Society was held on the 12th inst., at the School of Art, Arundel Street, Mr. C. Hadfield, F.R.I.B.A., the President, in the chair. A lecture was delivered by Mr. Beresford Pite, F.R.I.B.A., President of the Architectural Association, on "The Study of Architectural Design," illustrated by numerous drawings, photographs, and blackboard sketches. He stated that the modern Architect suffered from lack of Artistic motive. He sought it in Archæology and mere picturesque quaintness, there being now no traditional style or intuitive sense of beauty in Architecture. No doubt this was as characteristic of our age as if it were quite otherwise, but it was impossible that the Architectural student should be left without direction or serious intention in his study of design. Present purposes could perhaps best be served by seeking to excite enthusiasm from interest in detail work, and by understanding and analysing the beautiful qualities in the means employed in plans and working drawings, which were the instruments by which a beautiful building was obtained, and thus made up for the loss of genuine national Architectural style. An Architect's plans had a beauty of their own, and this was pointed out in some detail from many examples. This beauty was undiscernible in the building, and belonged to the embodiment in the drawings of the building. In the same way the sectional plans of buildings were examined, and the means illustrated from them of obtaining different Architectural effects by a carefully studied interest in the sections. Elevations were grouped in different classes dominated by general ideas, such as verticality or horizontality, concentration or distribution of ornament, a picturesque grouping of sky line, or dignified severity. These points were illustrated from photographs and sketches, as well as grandeur of line, simplicity of rhythm, luxuriousness, a simple line with a rich surface, or a rich line. The students were exhorted to thoughtfulness in detail as pre-eminently the road to good Architecture. In conclusion, Architecture was vindicated as a decorative Art, and as such the foundation of all Art other than imitative.

[We are pleased to state that we have arranged for the exclusive right to publish this lecture, which will appear in an early issue of the Architectural Review.]

Belfast Mechanical and Engineering Association.—The members of the above Association held their fifth annual meeting on the 16th inst. The report stated as follows:—"That the past year has been one of continued progress. During the year eighteen new members had been enrolled. During the summer, visits were paid to The Ulster Spinning Company and Messrs. Gunning and Campbell's; ss. Langton Grange; main drainage pumping stations; British Aluminium Company's Works at Larne Harbour; Corporation Gasworks. Two valuable papers were read during the present session—namely, that on 'The Construction of the New Albert Bridge,' by the Hon. President, Mr. J. C. Bretland, and 'Engineering Materials,' by Mr. James M'Clelland."

Society of Antiquaries of Scotland.—The monthly meeting of this Society was held in their library at the Museum, Queen Street, on the 11th inst., Mr. J. Balfour Paul, Lyon King of Arms, Vice-President, in the chair. In the first paper, Mr. Robert Brydale described a group of seven carved grave slabs in the churchyard at Dalmally which was anciently called Clachan Disert, and is stated in Dean Macgregor's Chronicle to have been the burying-place of the chiefs of Macgregor from 1390 to 1528. In the second paper, Mr. Thomas Wallace, F.S.A. Scot., gave some notes of antiquities in the districts of Loch Alsh and Kintail, first describing Castle Grugach, a round dry-built tower or broch, like those of Glenelg, which stands at the foot of a precipitous rock called Onag, on the south shore of the extreme east end of Loch Alsh. It was cleared out in 1889, but all that was found in it was a fragment of a quern. In structure it resembles others of its class, but the stones are large and well fitted together, and there is a huge triangular stone forming the upper lintel of the doorway. There is a vitrified fort of small size between the Glennan Burn and Loch Long, to the north of Bundalloch. The island on which Castle Donan stands at Dornie has been fortified by a vitrified wall on the land side. In the third paper, Mr. F. R. Coles gave a notice of the standing stones of Torhonskie, Wigtonshire, which seem to be the megaliths of a great cairn, although the accumulation of stones about them is really known to be recent, and the group of standing stones appears analogous to those at Glenquicken, Park of Tongland, and hills in the Stewartry; and in the fourth paper, Mr. R. Crawfurd Walker gave a notice of an interesting heraldic monument at Kilmany, Fifeshire, which is probably unique in Scotland.

The Institution of Civil Engineers.—An ordinary meeting was held on Tuesday, the 12th inst. Mr. John Wolfe-Barry, C.B., was in the chair, and the paper read was on "Superheated Steam Engine Trials," by Professor W. Ripper, M. Inst. C.E. The author showed that the heat expended in superheating reduced the amount of heat employed in evaporation of water, and that no important gain could be theoretically expected from superheating. When steam was superheated it was in a more stable condition than without superheat, and if the steam contained sufficient excess heat, the steam in the cylinder could be rendered dry at cut-off and at release, and thus the principal source of loss of heat in the cylinder, namely, water at release, was removed. The author considered superheating not as a means of obtaining a thermal efficiency in any way proportional to the temperatures used, but as a device for realizing as far as possible the full thermal efficiency of saturated steam, by rendering the cylinder practically non-conducting. Experience has shown that, with ordinary care as to purity of feed-water, superheater tubes after long periods of severe work showed no signs of burning, scaling, or injury of any kind. With the greatly improved quality of lubricating oils no trouble need arise with the lubrication of superheated steam engines. The point requiring chief consideration in the design of engines to work with superheated steam was the steam-admission arrangements. The steam-admission valve, being subjected to the maximum temperature, should be practically frictionless, so as to remove the necessity for its lubrication.

Correspondence.

EXETER CHURCH COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In an anonymous letter signed "Competitors" in your issue of the 13th inst., certain points call for comment. I take one of the sentences and alter the fourth word: "Everyone knows how elevations* can be, and are, made attractive to the eye, and every Architect knows how misleading they can be made"!

I observe that it is rare for an Architect to design in perspective, much less to model, and that a careful perspective is usually far more like the building than four elevations. This, to my mind, is shewn in the drawings illustrated, one side being very superior to the other—a point avoided by placing the Church as in my plan. The winning design is, presumably, the *only* one which will be seen in *actual* perspective. Hence, in the end, the fitness of things will be apparent. However, if "Competitors" care to send their elevations, I shall have pleasure in doing the same.

I am, yours faithfully,
PHILIP APPLEBY ROBSON.

* "Perspectives" in original.

ST. DAVID'S CHURCH. EXETER COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Happily this is a case of "All's well that ends well," and it may be interesting to know that after the very strong opposition from quarters where it should have been least expected, the award of the assessor, Mr. James Brooks, has been acted upon, and a tender of £11,960 accepted for the work according to Mr. W. Caroe's plans, to which he gave the premier position; and it has now been decided that the second premium of £50 be paid to Mr. Harbottle Reed, of Exeter, the author of the design placed second by Mr. Brooks.

Yours faithfully,
"FAIRPLAY."

19th January, 1897.

ALTHOUGH to the passer-by the extension of the Public Record Office, which is to be seen in Chancery Lane, looks well-nigh complete, the whole work is not expected by the authorities to be finished until early next year. No formal opening of this extension is contemplated, as the new buildings will be purely for official purposes, except the part intended as a museum for the exhibition of Domesday Book and other historical manuscripts preserved at this institution.

Announcements.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

Ourselves.—An Announcement. WITH this present issue is completed the fourth volume of THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD, and we have arranged, in opening the new volume, to take a certain decisive step which we have long had under consideration. Our Journal has become a fine grown child, now entering upon his third year, and parental solicitude and ingenuity have of late been exercised to meet his swelling proportions. From time to time since his birth his tucks have been let out, till their limits are now fully exhausted, and it has been decided on the advice of his nurse, the Editor, to give him a new rig-out, which shall better befit his size and dignity, and shall enable him to acquit himself in a wider sphere, and rival with equal pretensions the big fifth form boys. The scheme of THE BUILDERS' JOURNAL, as our readers may know, was devised on the conviction that it would be possible to produce for a penny a weekly paper, the pages of which, though necessarily less voluminous than those of the more expensive papers, should yet take a position equally beside them. Although many periodicals and magazines in this day able to burst forth with a blast, and achieve their highest success with their first issues, this can never be the case with a paper whose original vital principles are economic principles. In such circumstances time alone can bring assurance of success, and the continued and growing popularity of this Journal, and the acknowledged position it has achieved among the professional publications of the day, has at this, the opening of our fifth volume, found us with a decision to yet further enlarge its pages and its scope, and to extend its interest in directions whence the circumstances of our one-penny limit has hitherto held us from venturing. The first necessity in a paper for Builders and Architects is a complete epitome and summary of professional news, and, in particular, of *intimate* professional news. This we have always made the backbone of our Journal, and we have been able to give week by week, since our foundation, a more complete record of building contracts, tenders and matters relating thereto, than we believe, is to be found at all elsewhere, without limit of cost. In our enlargement, therefore, we feel there is little more to be done in that direction, though the increased size of the paper will enable us to give items of building news with more extension of detail than has yet been possible. It is to the second, and, in a certain sense, subsidiary interest of the Journal that we propose to give our particular attention. Besides the popular "Men Who Build" series, the accounts of notable Artists and their work, we have continually published original and refined articles by writers and Architects of distinction, and editorials on matters foremost in Architectural interest. It is to this department of our paper, then, that we have decided to yet further add to and develop, and it is to this Architectural and Artistic interest in particular that the increased dimensions and the widened scope of the forthcoming volumes of the Journal will be especially dedicated. We intend also to pay some further attention than hitherto to Art workers and decorative Sculptors and Painters, and to secure a continued series of interesting original signed articles. It has many times been suggested to us, by Architects of experience, that the title of our Journal, in its direct emphatic assertion as being primarily a "Builder's Journal," tends somewhat to check its circulation in those directions where an Architectural interest is looked for, and that also, in view of the attention given to Architectural matters in the paper, the term is misleading, and tends to detract from the identification of the Journal with the Architectural profession. This, however, is entirely wrong; the greater part of our circulation—probably so large a proportion as 70 per cent.—is among Architects and Surveyors. In order, however, to further strengthen the practical side of our columns, we have decided from time to time to give Sanitary and Surveying Supplements, and other features of great interest professionally, which we feel sure will be appreciated. In instituting THE BUILDERS' JOURNAL we attempted more than had ever been done before, and in making these additions we are but continuing

HERALDRY IN ARCHITECTURE: ARMS OF ERSKINE, EARL OF MAR. FROM MAR'S WORK, STIRLING.

our consistent policy of development and enterprise. A recognised position has been fought for and obtained, and it is not by any means our intention of resting upon our laurels.

MR. ALBERT GILBERT, R.A., AT THE INSTITUTE.

SCULPTORS' ARCHITECTURE OF THE RENAISSANCE.

IN reading a paper on "Sculptors' Architecture of the Renaissance" before the members of the Royal Institute of British Architects, on Monday night, Mr. Albert Gilbert, R.A., said he felt it presumption on his part to attempt an address which suggests so much, and upon which, alas! he was so incompetent to descant. They must forgive him, however, if his remarks conveyed merely suggestions for their own enquiry. Could those great men, whose names would presently be mentioned, hear all that might be said at that meeting, they would be filled with wonder and amusement at the pains they had inspired in us, to reduce to theory the origin of their aims, and though possibly grateful to us for our appreciation of their realization, there might be yet some concern at the thought that their most cherished gifts to us had been made out, explained, and proclaimed to the world. In the days when these great men lived, Art was young in her re-birth. Man, though as old as his age, was yet unborn, as knowing or professing more than his personal knowledge. It was an age of assertion, of endeavour, yet not tentative, but as decided as the handwriting on the wall, and every bit as misty. And, therefore, it held us, it enchanted us, it allured us to inquiry. They were met that evening to discuss the work of Sculptors of a past age. Surely it was because they recognised in certain work which delighted us, the distinct work of a class of individuals who, though cunning with their tools, were yet not too friendly with the tee-square and the set-square of modern days, and it was doubtless the apparent innocence on their part of that which we had grown to regard as indispensable which astonished them. That the results of their inspirations and labours under such conditions should prove so splendid as to create in us a desire to study their methods was refreshing, not to say restful, in these days of hurry. He was one of those who was anxious to plead

THE CAUSE OF HIS REVERED PREDECESSORS

in such a manner that their exampless might be followed by his living brothers and those to come after them. Sculptor-Architects! Architect-Sculptors! Where was the difference? And yet what a difference there was! Add the magic words "Renaissance," and the query was almost immediately answered. The Sculptor-Architect of that period still survived, but the Architect-Sculptor — well, his existence was not really matter for our enquiry. He probably did exist, despite the fact that his efforts form less of a phenomenon than those of his brother craftsman. And the question arose: How came this so-formed Sculptor-Architect into existence? At this period, despite a desire to create a National Architecture, there seemed to have been little attempt on the part of Architects to realize anything beyond a free revival, or imitation, or adaptation of classic models. Examples were not lacking. The Sculptors, imbued with the same spirit, had fewer examples. Indeed the best they had were the Greek or Roman productions. Sources of inspiration were open to them, however, in the study of nature in all her suggestiveness. At this time, the Architects were hard at work as students of antiquity, striving to resuscitate, whilst Sculptors were yearning, burning, in fact, to create, and to give to future generations a true impress of their own lives and time. Was it to be wondered at, under such conditions, that the Sculptor of the period should long for license and liberty, and a greater field for his invention, and that he should venture on the accompaniment of his own Architecture. And thus, greatly enlightened, he was led by his ambition to attempt the creation of the very forms he had been called upon to decorate — in short, to govern instead of being governed. This, to his mind, constituted the real origin of the most remarkable phase of the history of the Renaissance, and since its inception, spreading as it did throughout Europe, and inspiring such works as were to be found in all the great centres of Architecture, its good influence had been so manifest that he ventured to think that, if greater attention could be paid to the study of this subject, if it could be brought into the ordinary training of both the Architect and the Sculptor, much good would accrue, and there would be some hope of the Architect and Sculptor placing themselves in the position of those whom we admire and were inclined to imitate. It was not to be wondered at that, in an age of sumptuousness and magnificence, such as was that of the Renaissance, that

THE STRIVING TO EXCEL

should have become a passion, the ambition to build palaces to adorn, should have taken the place of the former contentment to ornament palaces already built, in fact, that the Sculptor should seek so much to combine his own Art with that of the Architect that he placed himself above the standard of decoration to the Master Adaptor. Formerly, the Architect had been more confined to his own profession, to the spirit and traditions of the Art of his predecessors, strengthened by that intense craving to create for himself. Thus far he had endeavoured to trace the possible existence of the phenomenal Sculptor-Architect in order that they might more readily follow him in his remarks as to his work. He was by no means prepared to claim for it a striking pre-eminence as directed simply on the erection of edifices. It was rather in the treatment of ornaments that combine with purely Architectural forms, that he would feel inclined to favour the Sculptor in his dual capacity. He had been used to design and execute ornaments of buildings in which he had had no hand and with which doubtless he oftentimes entertained no sympathy. He could realize that his ornament meant to his employer so much decoration, while to him it was an expression of an idea. This knowledge thus fitted the Sculptor for the task he was about to undertake, and which from the best examples he had proved himself to have mastered. Another qualification was his, and one which they must not overlook, for it was very marked in the productions of the Renaissance and the period immediately following. It was a training they usually received in the Art of the goldsmith. To this, no doubt, must be attributed the extreme freedom, and accuracy and delicacy of execution, to say nothing of the sense of colour and light and shade, and due appreciation of proportions which characterised their work. He was quite aware that, strictly speaking, the subject of his paper would appear to promise a critical review of the Sculptor-Architect's work, but it seemed to him fit that this should rather be invited through discussion than given as pronouncements from himself. He also felt that

REFERENCE TO SPECIAL WORK,

or particular Architects, was more likely to serve the object for which those gatherings were held if it were made in the discussion. But he wished to add a few words, emphasizing a remark he had made earlier in the paper, and that was with regard to the desirability of the study by young Architects and Sculptors alike of the particular phase of the Art of the Renaissance which was under consideration. Such a study could not fail to impress them with the grandest lesson to be learnt—that it was a duty every Architect owes to himself, to his Art, and to his generation, that he should endeavour to place himself beyond the charge that he was merely an imitator of masters and styles of a past age, but rather he should go to the root of the flowers and learn to create on the stem, flowers as beautiful as the originals. It was the spirit of the age, not the letter of the age, with which he should commune. He should worship it, and by bending himself to the application of its great influences, endeavour to pass on to posterity a rich legacy, further enriched by the print of his own time and individual adornment. Art was a very old republican. To-day it had been given the grand secret—the elixir of life—that secret which had for ever been denied to man. Art was as young to-day as it was centuries ago. Its existence was a curious thing, at once retrospective and progressive. Its every movement forward was a reflection sent back from the Mirror of the Past. Its life was a constant reflection backwards and forwards in the Mirror of Ages. Its every act was a mere reflection. Its future was written in the magic word "tradition," a word which with its mighty significance would ever remain to assist Art in its onward movement. It was in the spirit of the past that we might grasp the inspiration with which, with our own individuality, we can hope to hand on the important legacy we had inherited from men who were far more than mere specialists.—Discussion followed. It was opened by Mr. Alma Tadema, who, in proposing a vote of thanks to Mr. Gilbert, said, he had been a most attentive listener to what he considered a most interesting paper, full of suggestions which had made him dream of

THE BEAUTIES OF THE RENAISSANCE,

and of the revival of the antique, without giving anything positive to disturb their general admiration of the beautiful things in the light of which they were daily feasting, and from which they were daily provided in their Art. To be brought to admire a thing worth admiring was always a reason for gratitude. He would like to see more of the Renaissance in the modern productions of buildings. He would also like to see the various branches of Art in greater union—the Architect a little more beholden to the Sculptor, and the Sculptor and Painter a little more beholden to the Architect. He had pleasure in proposing the vote of thanks. It was seconded by Mr. J. M. Bryden, who, in a rather lengthy speech, entered into a critical review of the work of the Renaissance, specially that of Michael Angelo and Sansovino. Michael Angelo had looked upon Architecture from the Sculptor's point of view, and they would find in examining his work that latterly the decorative side had obtained over the constructive side. He hoped, with Mr. Tadema, that a greater union between the Sculptor and the Architect would again exist.—Mr. Beresford Pite said the Architect and Sculptor were in need of each others' ideas. The two suffered distinctly and apart from different complaints, and a conjunction of the two might produce a healthy state of design. The Architect was fettered by a large number of facts, by lines, by orders, by plans and so on, and, on the other hand, the Sculptor suffered from the lack of these restrictions. His mission was to create an object out of nothing, to create a statue out of an abstract idea, and if they could have a little of the Sculptor's blood infused into Architects, they might produce "a mongrel Sculptor-Architecture of a distinctly strong breed." The debate was continued by Mr. H. H. Statham, Lieut.-Col Lennox Prendergast, Mr. H. J. Florence, Mr. Owen Fleming, Mr. G. A. T. Middleton, and the Chairman. The latter thought it would probably be much better if the Sculptor and the Architect combined in cases where their joint Artistic efforts could be brought to bear on any monumental work. Mr. Gilbert replied to the discussion at some length. Referring to the difference in the training of a Sculptor to that of an Architect, he pointed out that whereas the latter was guided by rules and so on, the Sculptor had no law-books. Answering a question by Mr. Fleming, Mr. Gilbert disclaimed any intention of seeking to convey the idea that building should be necessarily work of one hand. What he wished to infer was, that it would not be unbeneficial, if those who were learning their respective Arts also paid attention to the study of other Arts, so that in building they might know when to seek assistance from a brother Artist engaged in another branch of Art.

MR. BRUCE JOY'S bust of the late Archbishop Benson has been temporarily placed in the saloon of the Mansion House.

THE new baths which the vestry of Hackney have erected at Clapton Square, will be opened on Saturday, February 13th, by Lord Russell.

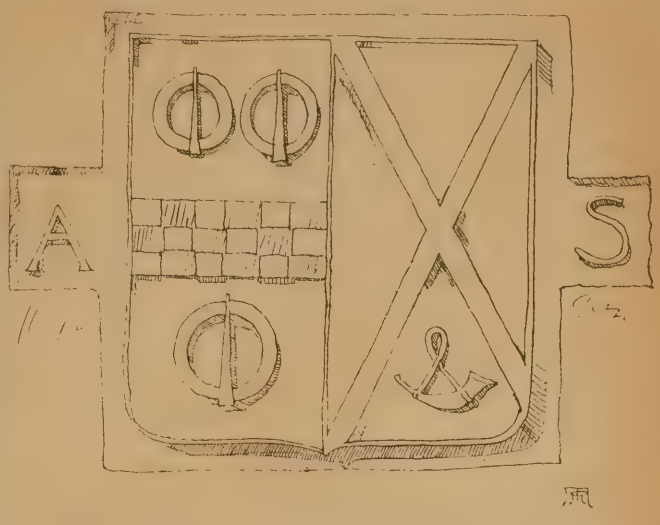
THE loftiest tunnel of Europe is the Colle del Marcello Tunnel on the line of railway from Naples to Sulmona, which was recently opened. This tunnel on the mountain side is, at its highest point, where it debouches, 4,593 ft., but the journey is nevertheless performed without gear. A most interesting feature of this tunnel is a natural gas spring, which supplies a permanent light.

THE BUILDERS' AND ARCHITECTURAL JOURNAL RECORD

Heraldry in Architecture.*

BY RAMSAY TRAQUAIR.

I DO not think that I can begin this paper better than by a quotation from a well-known writer on Art matters, a quotation which is a striking example of the interest of heraldic decoration in Architecture, not only to antiquaries and Architects, but to all who take an interest in Art.



"In a Florentine street, through which I pass most days, is a house standing a little back, the sight of which lends to that sordid street of stained palace backs, stables, and dingy little shops, a certain charm and significance in virtue solely of three roses carved on a shield over a door. The house is a humble one of the sixteenth century, and its three roses have just sufficient resemblance to roses, with their pincushion heads and straight little leaves, for us to know them as such. Yet that rude piece of heraldic carving is sufficient, as I say, to give a certain pleasurableness to the otherwise unpleasurable street."

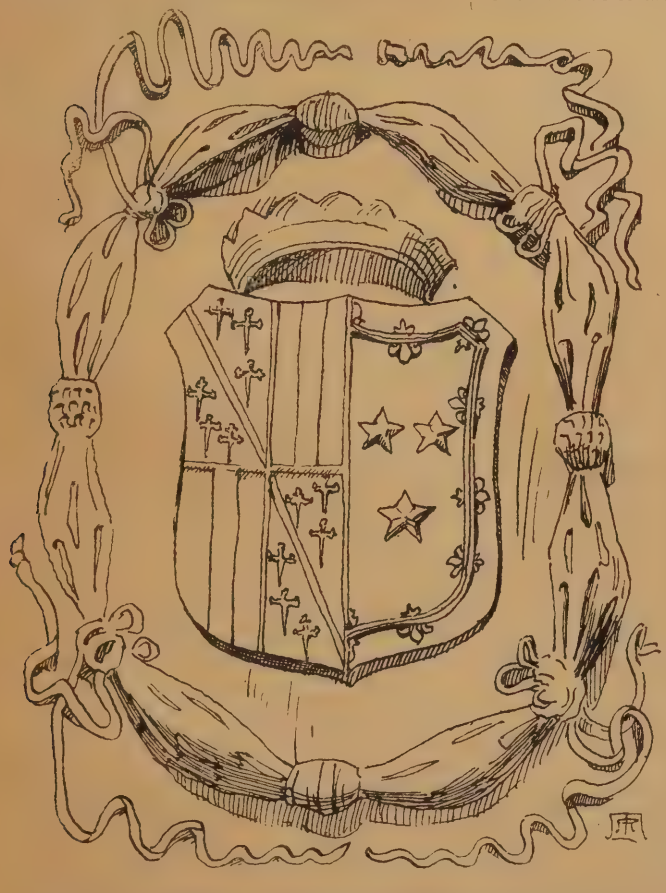
The technical execution has here nothing to do with the pleasurableness of the decoration, it may be well carved, it may be badly carved, its interest lies solely in its being heraldic, and this testimony to the interest of heraldic decoration as such is doubly valuable as coming from a writer unbiassed by any antiquarian tendency.

This special value of heraldry lies, I think, in a certain individuality thus given to a building, or, indeed, to any article decorated with coats-of-arms. It sets a house apart as the possession, the home, of a certain family, and invests it with all the historic interest and dignity of that family.

In public buildings it often fulfils an additional function in directing attention to persons connected with the building at the time of its erection, or in giving a clue to the identity of statues or figures, carved or painted. Thus in mediæval frescoes we often see little shields placed above or beside the principal figures, and blazoned with their arms, to identify them, a method surely much more beautiful than that of writing their names underneath.

These considerations should make us very careful in the use of heraldry in Architecture, every coat used should serve some purpose, should not merely show that the Architect fancied a row of rampant lions along the front of his building; we should also be careful not to use false or incorrect heraldry, decorating our buildings with coats which never existed, or which perhaps belong to some person having no earthly connection with the building on which it is placed.

PAISLEY ABBEY. ARMS FROM NORTH TRANSEPT. STEWART IMPALING MAXWELL.



Before using heraldry in decoration, a slight knowledge of the principles by which the descent of arms and the combination of different coats are ruled is very necessary, and this knowledge is also useful in considering the arms we may find on old buildings.

A coat-of-arms is essentially a personal possession, it descends from the father to his eldest son; younger sons even do not bear their father's arms, but must get some slight alteration made in the paternal arms, which, when thus "differenced," become a possession in their branch of the family, and descend thus differenced to their eldest sons.

Slightly different rules apply to daughters; these, however, will appear when we consider the case of combinations by marriage.

When a man marries, he combines his own and his wife's arms within one shield. This is done, in ordinary cases, by dividing the shield down the middle, placing the husband's arms on the right or dexter side of the shield, and the wife's on the left or sinister. The wife here uses her father's arms without difference, the addition of her husband's being sufficient distinction. On her death, her arms disappear altogether from the shield, and her sons bear only their paternal arms. I have illustrated several examples of this practice, technically called "impaling," from various buildings in Scotland. When, however, the wife is an heiress, that is to say, when she has no brothers to whom the paternal arms may be handed down intact, the modern custom is to place her arms on a small shield in the centre of her husband's, "in pretence," as it is called. Her son then combines his father's and mother's coats by "quartering." The shield is divided into four parts, the paternal arms are placed in two diagonally opposite quarters, and the maternal in the remaining two. This combined coat then becomes the hereditary bearing of the family, and is treated in exactly the same way as a simple coat.

The ancient practice, in the case of an heiress, seems to have been for the husband to quarter his wife's arms at once, instead of placing them in pretence; but, wherever you find an old quartered coat, it is a sign that the head of the family at some time married an heiress.

MAR'S WORK, STIRLING. MAR IMPALING MURRAY OF TULLIBARDINE.

The Earl of Mar's coat from Mar's Work, Stirling, is an example of this. From it we see that the last "Earl de Mar" had a daughter but no sons. His eldest daughter married an Erskine and thus made him Earl of Mar. He now hands down the arms of the extinct family "de Mar," combined with his own paternal arms of Erskine.

A very common way of using the impaled arms in a scheme of decoration, was to place the husband's arms alone on one side of the doorway, and his wife's, that is, the impaled arms, on the other. Thus, at Mar's Work, we have Erskine, Earl of Mar, on the right, and Mar, impaling Murray of Tullibardine, on the left of the entrance, the Countess of Mar being a daughter of that house.

This last coat also shows a quartered coat impaling a simple one.

We are now ready to consider this coat from Paisley Abbey; but, before looking into it, I may say that in the case of a family marrying more than one heiress, the whole coat is not quartered each time, but the heiress' arms are placed in a separate division. Thus the second heiress would place her arms in the 3rd quarter, the third would go into the 4th quarter, and any after that would go into similar divisions, also called quarters, no matter how numerous they may be.

Now, as this Paisley coat consists of eight divisions, you might suppose that the family of the happy owner had married no less than seven heiresses in former time. A truly appalling record!

On examination, however, you will find that the coats are not all different, and that they are arranged on a certain principle. The first corresponds to the 6th, the second to the 5th, the third to the 8th, and the fourth to the 7th.

The whole is in fact a coat formed by impaling two quartered coats—Hamilton, Earl of Arran and Lord Seaton.

The principle of impaling arms was also used in other connections: thus, a bishop impales the arms of his see with his own, placing his on the sinister side as "maritus ecclesiae."

I would now like to say a few words regarding the various accessions to a coat-of-arms: the crest, helmet, mantling, and supporters.

The crest was a badge, often taken from some bearing on the coat-of-arms, placed on the warrior's helmet to distinguish him in battle. It was fastened to the helmet by a twisted band of two colours in the case of a commoner; in the case of a peer it rose from the coronet.

The crest did not descend as regularly as the shield, and is hence not so useful in identifying buildings. Indeed, I am sure you must all have noticed the extraordinary frequency of such crests as an arm holding a dagger. This crest must, I am sure, be borne by hundreds of people, whereas a coat-of-arms can only be borne by one man, and by no other during his lifetime.

The helmet is usually placed above the shield and supports the crest. It is of various shapes, and is often an exceedingly important part of the design.

From underneath the coronet or wreath issues the mantling. Various conjectures have been made as to the origin of this extremely picturesque

* A paper read before the Edinburgh Architectural Society

PAISLEY ABBEY. ARMS IN ASOUNDING ISLE.

adjunct. It has been supposed it was the cloth in which the shield and helmet were wrapped when not in use. In support of this, it is pointed out that the mantling is often supplied with cords terminating in tassels, which may have been used to tie up the whole. It may also have been a lady's favour, worn attached to the helmet, and which would thus naturally get slashed and cut in battle into picturesque forms. I, myself, am convinced that it was simply a puggaree, and that its use was to protect the knight from the heat of the sun, which, striking on his polished armour, must have been very trying.

In the earliest periods the mantling was exceedingly simple: the example here given from the Percy Shrine, Beverley, shows it in its simplest form, here appearing as a mere edge on each side of the head. In the later periods it was very luxuriant and took leaflike forms, though often preserving the now meaningless tassels of its earlier existence.

As examples of mantling, I cannot do better than refer you to Duren's drawings. Here we have mantling at its fullest development and taking a most prominent part in the design.

Supporters are borne only by peers, and, I believe, by Highland chiefs. They may be either animals or men, and stand one on each side of the shield, holding it up. Occasionally only one is used. They may have originated in the grotesque disguises assumed by the squires in tourneys.

I have till now purposely refrained from saying anything about the Artistic treatment of heraldry, and have confined myself to indicating the materials which the heraldic decorator has to hand. The Artistic use of these materials is far too large a subject for the tale end of a paper, and would require almost a series of papers to itself, but I have here two shields which I can not refrain from showing you as examples of how it can be done.

The first is from Paisley Abbey. Here the Artist had a lion rampant surmounting a fesse checquy. He has accordingly lengthened out the body to almost a line, and disposed the feet above and below, so as not to interfere with the fesse.

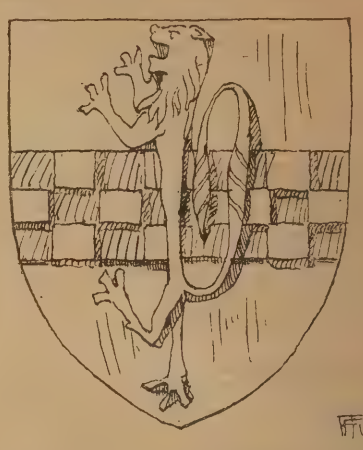
The second is the coat from Beverley Minster, to which I have already referred, and which is, I think, the finest example of heraldic decoration I have ever come across. It is an example of spirited treatment and Artistic feeling which yet never strays from the straight path of heraldic virtue.

As you see, it shows the King of France and England fully armed, bearing his shield across his breast. In one hand he holds a spear, in the other his sword, of which the scabbard shows under the shield. The vizor of his helmet is raised, and the mantling is indicated on each side, falling from the coronet.

The shield itself is a splendid specimen of heraldic Art, the bearings are, as you see, quarterly — France and England. France at this time bore a shield "semée of fleur-de-lys," that is spotted with an indefinite number of fleur-de-lys. Accordingly the sculptor has placed five good big fleurs in the first quarter, but only three in the fourth and smaller quarter. England wore then, as now, three lions "passant guardant." Here he had to deal with an invariable number, he accordingly adapted their size. The second quarter shows three equal-sized lions, the legs of the lowest straying curiously in amongst the fleur-de-lys in the fourth quarter, but in the third, where the breadth decreases as it approaches the base of the shield, the lions decrease also, till the last lion is quite microscopic, and seems to have curled up in his corner.

The whole of the bearings are raised fully three quarters of an inch above the field, which latter is completely covered by a large square diaper.

The whole forms, I think, as beautiful a piece of decoration as we can hope to find, and exhibits all the qualities which we should aim at in designing heraldic decoration.

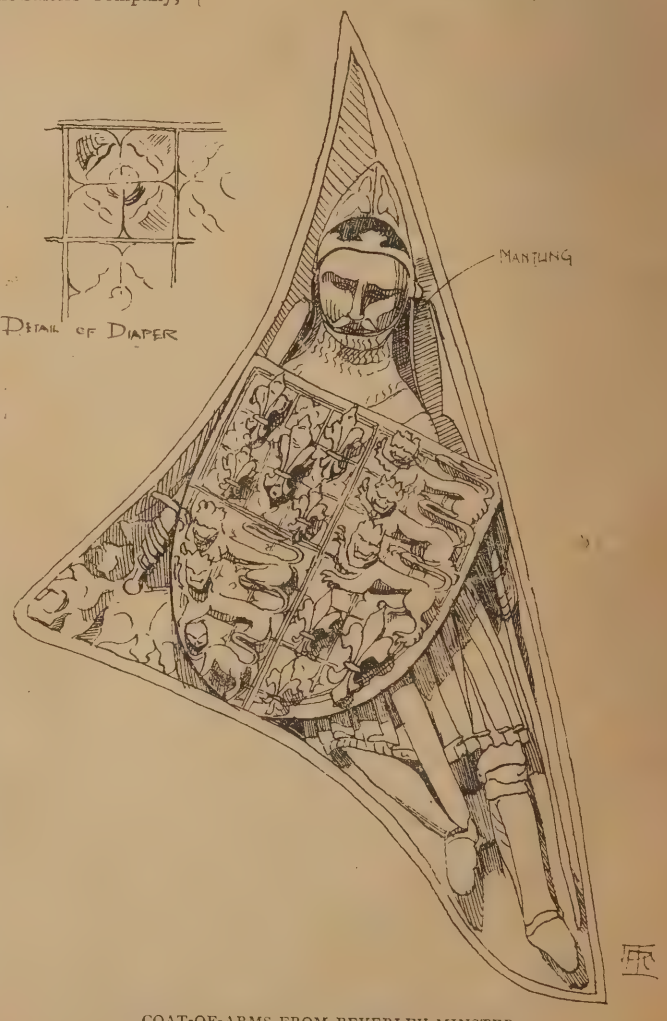


PRINCE and Princess Christian will open the new General Hospital at Birmingham, in June next, on behalf of the Queen. The precise date of the ceremony has not yet been fixed. The building is estimated to cost £200,000.

SIR E. J. POYNTER will shortly be presented with the honorary freedom of the Salters' Company, and entertained at a banquet at the Company's hall. The Painters' Company will also, in April, make the President an honorary freeman of the Company.

ARRANGEMENTS have been made for rebuilding Bolsover Parish Church at once, and the Duke of Portland has given £1,000 as a first instalment. In the meantime, however, it is intended to procure a large iron building to accommodate about 600 people.

AT Smethwick, the most suitable way of celebrating Her Majesty's long reign has been decided to be the building of a technical school. At a recent meeting it was stated that a properly equipped school would cost £7,500 or £8,000, of which between £2,000 and £3,000 would have to be obtained from voluntary contributions. With a good technical school they would have no fear of German or other continental competition.



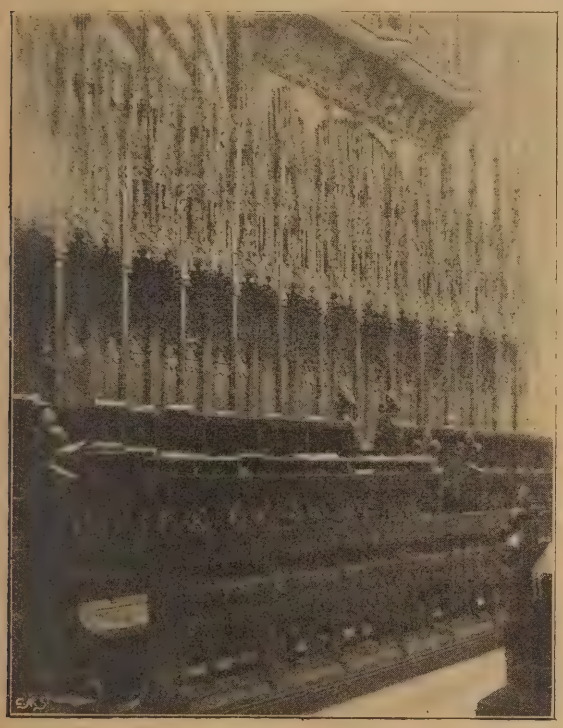
THE deepest bore-hole in the world is one of 6,571 feet below the surface of the soil, made at Paruschowitz, near Rybrick, Upper Silesia. The previous record for depth was the 5,733 feet hole drilled some years ago at Schladebach, near Leipzig. The later bore was made in search for coal measures, and 83 separate seams, some of considerable thickness, were penetrated. Though steel was used at a depth of 6,560 feet, the total weight of the tools reached 30,155 lb.

PAISLEY ABBEY. COAT-OF-ARMS FROM TOMB IN SOUNDING AISLE.

LISKEARD CHURCH TOWER COMPETITION.

LISKEARD Church Tower Committee, on the 25th of last month, received a report from Mr. E. Sedding, of Plymouth, as to the two best designs for the proposed new tower of the Parish Church, illustrations of which we gave in our issue of December 23rd. Twenty-five designs, under *nom de plume* or motto, were examined by him, and the plans of Mr. J. Sansom, of Liskeard, and Mr. H. P. Burke Downing, Great College Street, Westminster, S.W., have been respectively awarded the first and second premiums of 50 guineas and 25 guineas. The whole of the designs were exhibited in the Public Hall last week.

COAT-OF-ARMS FROM BEVERLEY MINSTER.



DURHAM AND ITS CATHEDRAL.*

(With Special Illustrations.)

By A. LINDSAY MILLER.

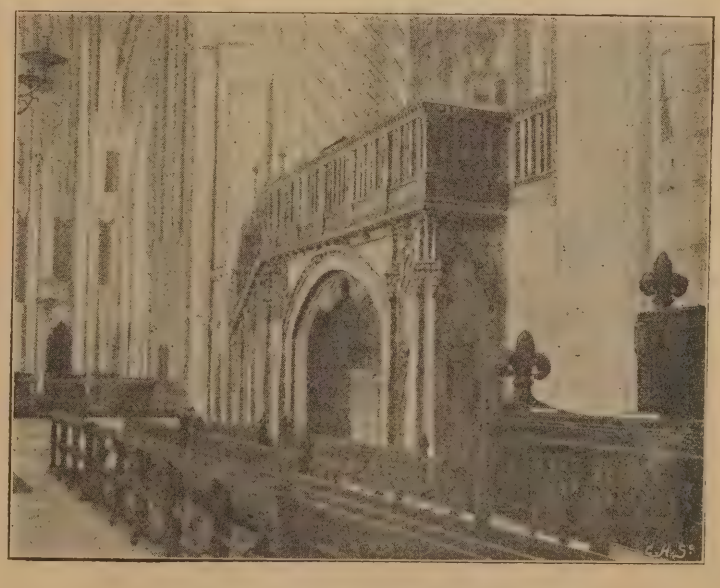
(Continued from page 377.)

ST. CUTHBERT, for some cause or other, had a great dislike to the ladies, and ordered that none should be admitted to his Church at Lindisfarne, which system was continued at Durham; but the story goes that one of the bridesmaids of Queen Maud of Scotland (1130) putting on a monk's dress entered the Church in defiance of the Saint; upon this St. Cuthbert spoke out from his tomb to the sacrist and commanded him to lose no time in driving out the wench, which was done. Other attempts at different times were made by ladies to enter, but the Saint was too much for them. We have noticed that Bishop Pudsey, being more of a polite man, started the erection of a Chapel for them at the east end, but the Saint could not rest with the prospect of the hated ones coming so near him and shook the new Chapel about the ears of the builders, so the Bishop had to satisfy himself with erecting one at the west end, (now known as the Galillee), for their benefit. They seem, however, to have been allowed to occupy a small portion of the west end of the nave as a line of marble between the second piers marked the limit of their approach. Be that as it may, the Galillee was erected ostensibly as a ladies' Chapel, and it is a beautiful specimen of the twelfth-century work. In fact we can hardly imagine how the Architect, under the influence of the massive work in the Cathedral, could erect a structure so elegant, so delicate in its proportions; so light indeed is it that it hardly looks strong enough to carry itself.

THE STALLS.

In form it is oblong, divided into five aisles, each with four arches. The centre aisle is higher than the rest. The arches, decorated with a deeply cut ziz-zag ornament, are supported on two slender shafts of marble; later, two additional columns were added, making a cluster of four columns. The earlier columns are in one stone, whilst the later ones are in courses.

The Galillee was entered by the north door, which has been restored (it is however an exact copy of the original). The present windows belong to the fifteenth century, and take doubtless the place of the original Norman windows; and the Tudor terminations of the walls on the three fronts indicate the lack of feeling for the older work in which restorations were made. In fact, if it were not for the beauty of its interior and the interest we have in it as the work of the period, its removal would be a considerable gain to the west elevation of the Cathedral. In the arched recess, on the north side of the altar, are the remains of some of the original fresco paintings, and considered of the same period as the building, and they are the only specimens of fresco decoration left in the Cathedral. It is probable that the whole interior of the Galillee was originally richly decorated, as is indicated by small portions yet left. In Cardinal Langley's time, 1406-1437, the Galillee was in a ruinous condition; he re-roofed it, put in three windows in the middle of the west wall, blocked up the door to the Church, making two new ones, one on each side of it, and added the two extra columns to the coupled pillars.



In 1796, the Galillee narrowly escaped destruction, when, under the advice of Mr. Wyatt, it was doomed and the lead actually stripped off the roof, and it was only saved through the intervention of Mr. John Carter, a draughtsman who engraved the series of English Cathedrals issued by the Society of Antiquaries in 1801. He, at a meeting of the Society, drew attention to the matter, and so much indignation was expressed that the Dean became alarmed and stopped it. At the same time it was intended that the Bishop's throne and altar screen be taken down, mixed together and fitted up as a new screen against the eastern wall of the Chapel of Nine Altars, the floor of which was to be raised to the level of the choir.

Before leaving the interior, we might note a few of the alterations made in the original structure from time to time. The following may be mentioned:—the original great windows at the ends of nave and transepts of Norman construction were removed at a very early period, and larger ones with tracery peculiar to their dates inserted for the purpose of gaining light. This was the case with all the windows in the aisles of the choir, and when the Norman windows were not enlarged, mullions and tracery were inserted. The windows of the south aisle of the choir were inserted by Prior Forcer, 1341–1374, and those in the south aisle of the nave by Prior Messington, 1416–1446. The windows of the Chapel of Nine Altars were all single lights till Messington's time, when they were filled with tracery and stained glass.

Passing through the south-east door in the nave, which is an interesting example of Norman work and in good preservation (being under cover), we pay a visit to the cloisters. They occupy a considerable space, but present nothing extraordinary from an Architectural point of view. On the east, west, and south sides of it were the buildings connected with the domestic and political life and the household economy of the monastery. In the refectory and dormitory they ate and slept, studied in the library, and washed themselves in the lavatory in the centre. In the west alley the novices had their school, taught by their master—one of the oldest monks that was learned. There probably was a cloister at an early period in the history of the Cathedral, very likely a temporary cover of wood. The present cloister owes much to Bishop Skirlaw, 1388–1405, and Cardinal Langley continued the work. Such considerable alterations have, however, been made on it from time to time that, except the oak ceiling, little has been left. Looking at the south transept from the cloisters we see the start of the great central tower and the junction of the parlour and chapter house. The original chapter house was taken down by Wyatt (at the same time that the Galillee was threatened), and in spite of Carter's efforts to save, and it was rebuilt as a memorial to the late Bishop Lightfoot. The fourteenth century windows in the apse have not been reproduced, but the following description of its original condition would indicate a careful effort at restoration:—"The ribs of the vaulting were decorated with zig-zag mouldings. The wall arcade of semi-circular intersecting arches ran round the building except at the west end. Beneath the arcade was a stone seat raised on two steps, on which the monks sat in chapter. The floor was covered with monumental slabs of the bishops buried beneath it, and by separate doors access could be had to the south transept or to the cloisters.

Leaving the interior, the finest view of the Cathedral is obtained from the river; the grouping towers, the outline of the castle adjoining it, the deep wooded bank of the river, all combine to make a picture of great beauty, and indeed in the matter of situation, I don't remember a finer one.

We have no record of the central tower, of how much of it was built by Bishop Carilef. The first record we have is of its destruction by lightning, in 1429. The tower as it stands at present, was erected, judging from the style (perpendicular), in the fifteenth century. When Wyatt was at the restoration, one of his ideas was to finish it with a spire; I fear such an addition would have spoiled the dignity of the tower as at present. The lower parts of the western towers belong to the twelfth century, and they were completed about 1220. The Gothic pinnacles and parapets with Italian mouldings were added by Wyatt, and we are led to believe that at one time they were surmounted by spires covered with lead; these were removed about 1657. Near the western towers is the sanctuary door. This door was much altered by Wyatt. Over the door there originally existed two chambers, occupied by the men who admitted suppliants to the sanctuary;

THE BISHOP'S THRONE.

* A paper read at the meeting of Glasgow Philosophical Society, Architectural Section, on January 18th.

these rooms have been removed, the gable and pinnacles put up, and so much has it been altered that Greenwell considers it is difficult to speak with absolute certainty as to the exact time of its original construction. The innermost moulding appears to remain in its original state, and much resembles the corresponding one in the arch of the outer doorway of the castle; this would give the date about 1140. The pillars with their enriched capitals are very much weathered and wasted. Billings notes that the sandstone of the whole building is of a very bad quality, having so much iron in its composition that it literary rusts away. In many parts of the south side of the nave decay is so deep that jackdaws build their nests in the holes. The building so prominent in south elevation is the kitchen, erected in 1368–1370 by Prior Forcer, and is an octagon 36 feet 8½ inches in diameter. Crossing the palace yard, we have on our left the old library buildings with the new portion adjoining them, and on our right we see the octagon keep of the castle in the distance. The upper part and the external casing are the work of Bishop Barrington, 1791–1826; the doorway, however, is twelfth-century work, by Bishop Pudsey, who built the north side of the castle, and also, as we have noted, the Galillee of the Cathedral. Originally the site of a Saxon castle, which would consist of earthwork with ditches and palisades, the interior being of wood, the Normans erected on this site a shell keep of stone. These keeps, as in this case, were of stone, either circular or polygonal in shape, to suit the site, erected on a natural or artificial mound of earth.

THE GALILEE CHAPEL.

This castle was erected by William the Conquerer, in 1072, and, as noticed beforehand, so as to protect the Cathedral on its open side, the river being sufficient on the other side.

The castle was originally the residence of the Prince Bishop of Durham, but it is now held on trust for the benefit of the University, and, since 1837, the castle has been the residence of the members of the College.

ARCADING IN CHAPEL OF NINE ALTARS.

A HANDSOME brass eagle lectern has just been presented to Whippingham Church. The lectern was made by Messrs. Jones and Willis, of 43, Great Russell Street, London, and Birmingham.

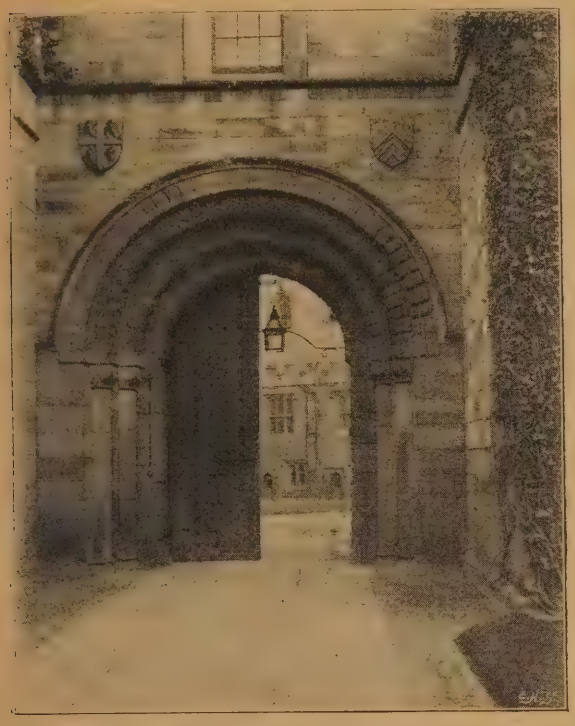
ISLINGTON has achieved a distinct financial success with its installation of the electric light. The accounts for the year show indeed a profit of no less a sum than £1,503, and a balance of £818 is declared after the interest payable on the capital outlay has been taken into consideration.

WE learn that Lincoln Cathedral organ, admittedly the worst Cathedral organ in the country, is about to be rebuilt and enlarged, at a cost of £4,000.

THE Improvement Committee of the Gloucester City Council last week considered the plans of the new theatre, to cost about £15,000, which a London Syndicate proposes to erect opposite the municipal schools in Brunswick Road. The plans were passed, subject to the city surveyor's approval of the sanitary arrangements.

THE ADVANCEMENT OF ARCHITECTURE, WITH SOME REMARKS ON THE STUDY OF GOTHIC.

THE FIRST OF THE ROYAL ACADEMY LECTURES, BY PROFESSOR AITCHISON, ON MONDAY, JANUARY 25TH.



IT is now 129 years ago since the Royal Academy of Arts was founded by His Majesty, George III. It was founded at the request of Sir W. Chambers, his Architect, and in the charter granted by His Majesty, and dated the 10th December, 1768, it was provided that there shall be "A Professor of Architecture who shall read annually six public lectures, calculated to form the taste of the students, to instruct them in the laws and principles of composition, to point out to them the beauties or faults of celebrated productions, to fit them for an unprejudiced study of books, and for a critical examination of structures." At that time the tide of the Italian Renaissance was still flowing, although there were slight signs of reflux in the growing admiration for Gothic. Horace Walpole altered Strawberry Hill in the Gothic taste in 1750, while, in the very year of the Royal Academy's foundation, Milizia published his Lives of the Architects, in which the works of Palladio were held up as the standard of taste. The Dilettanti Society, in 1762, published the first volume of Stewart's Antquities of Athens, and subsequently the Antiquities of Attica and Ionia, and is, I believe, still publishing works on Greek Architecture. At any rate the researches of Pullan on the Temples of Apollo Sinintheus, of Bacchus at Teos, and Minerva Polias at Priene, or one at least was published in the year 1881. Wilkins published his Antiquities of Magna

NORTH FRONT OF GALILEE CHAPEL.

Græcia in 1807; Inwood, The Erectheum at Athens in 1827; Penrose, The Parthenon, in 1847, 1851, 1888. Sir C. Fellows published his works on Lycia, Caria, and Lydia, in 1839–1847; J. Pennethorne, The Geometry and Optics of Ancient Architecture, in 1878; Sir C. Newton and Pullan on the Discoveries at Halicarnassus, Cnidus, and Branchidæ in 1862–1863; Cockerell and Donaldson, their supplements to Stewart's Athens in 1830; and Cockerell his Temple of Jupiter Panbellenius and Apollo Epicurus in 1860; and in the same year Falkener published his Classical Museum, not to speak of foreign publications; I need hardly speak of Hittorff's Restoration of the Temple of Empedocles at Selenius, 1851, nor of Abel Blouet's scientific expedition to the Morea and to Macedonia, 1831–1838. There is no task more difficult than that of unravelling

the causes of certain movements among mankind, and this is even more difficult when it is a purely intellectual movement. We speak of the Renaissance as if it were a change of taste that could be as precisely dated as a revolution or a battle, while it had been led up to for centuries, and we can only be certain of its existence and preponderance long after it had begun. In this case of the Greek movement, one prime factor in it was

DURHAM CASTLE, ENTRANCE.

the enthusiasm of Winckelmann, who began to write on Greek sculpture when he was at Dresden, and afterwards published his History of Ancient Art about the middle of the last century, and he found sympathishers who had come to much the same conclusions before he wrote. From attention being called to the perfection of Greek Architecture in 1762, and subsequently, a wave of Greek taste swept over most of the countries of Europe. The Elgin marbles were purchased by the British Government, and placed in the British Museum in 1816; even children who saw them were struck by the beauty of the Panathenaic frieze, and doubtless this revelation of beauty to the public prolonged the call for imitation Greek Architecture. The admiration, however, of

GOTHIC INCREASED IN ENGLAND,

partly owing to Sir Walter Scott's novels, and partly to the efforts of such men as John Bratton, Rickman, the second Pagin, the Ecclesiological Society, and others. This admiration became so prevalent as to strongly influence public opinion, so that in 1840 it was determined that the Gothic style should be adopted in the new Houses of Parliament. Even before this, the very champions of classic Architecture were so affected by the increasing admiration for Gothic, that the great Wilkins himself dabbled in it, and Sir James Pennethorne and Professor Donaldson tried their hands at it. Decimus Burton, once a well-known classic Architect, who persisted in his creed, was so far forgotten that, when he died a few years ago, his name and works were almost unknown. A passion for the study of Gothic spread largely in society; antiquaries, clergymen, undergraduates, heads of houses, and other amateurs, as well as Architects, employed their spare time and holidays in making notes on Gothic buildings in England and abroad, measured and drew out the mouldings of different dates, and a few of the more learned endeavoured to solve the mysteries of Gothic construction. In 1841, Professor Willis read an admirable paper at the Royal Institute of British Architects, called "The construction of the vaults of the Middle Ages," really a treatise on Gothic stone cutting, greatly admired abroad, and still studied by Architects in this country, while the Gothic flame was still burning, fanned by Mr. Ruskin. In 1854-68, was published by that Cuvier of Gothic Architecture, Viollet le Duc, his Dictionary of Architecture, now of world-wide celebrity; which may be said to have completed the Gothic conquest. Casts of figures and foliage from the Gothic Cathedrals and Churches were collected at the Architectural museum, and masons were encouraged to copy them; while during the professorships of Scott and Street at the Royal Academy, Gothic was pronounced to be the only true Architecture in the world, and that eccentric genius, W. Burges, was never tired of advocating its universal adoption. Casts of Gothic figures and foliage were collected at the South Kensington Museum, and even at the Royal Academy. There was a long struggle between those who were getting their living by paraphrasing Classic and Renaissance buildings, and by those paraphrasing Gothic buildings; hard words were bandied about, and "Pagan" and "Papist" were affixed by their opponents to the rival practitioners. A truce was at length concluded, and a practitioner was allowed to paraphrase Classic or Gothic, or both, without having an offensive epithet bestowed on him. Students were allowed to compete for prizes at the Royal Academy, and at the R.I.B.A., in either style, much to the disgust of those brought up in the belief that Renaissance was the

ONLY ADMISSIBLE STYLE.

Owing to the large increase of travelling, the publication of Architectural works, and the multiplication of photographs, the desire for novelty, and the absence of any proper teaching, all phases of Architecture from Greek days downwards, if we except the Egyptian Hall and Angelo's School of Arms, were in turn adopted. This produced two results: the first was this, that the public looked on Architects as persons keeping an Architectural costumier's shop, at which colourable imitations of every past style could be procured; the public still believes that Gothic has a stronger ecclesiastical flavour than any other style, and that Renaissance is more adapted for municipal buildings; so it has a Gothic Architect for its Churches, and a Renaissance one for its other buildings. The wealthy occasionally desire the rooms of their mansions to form an Architectural pattern book, each room being of a different style, or phase of a style, a Gothic Chapel, a Græco-Roman hall, an Elizabethan dining room, a Louis XIV drawing room, a Louis XV boudoir, an early French Renaissance morning room, a Roman library, and a Moorish smoking room, with perhaps a Chinese, Indian, and Japanese room thrown in. The other result was, that thinking men interested in Architecture began to ask themselves what Architecture was, beyond designing habitations or shelters for men and animals, factories for making goods, warehouses for storing them, and shops for selling them; why the buildings of certain countries, and at certain epochs had always been admired; why the shapes and details of buildings at successive epochs were so different from one another, and why at so brilliant a period as this of the nineteenth century, when men's minds are so active, and so restless, nothing but paraphrases of bygone styles were to be met with, even in important buildings. They soon saw that some of the differences in past styles were brought about by the greater number of men's wants, and by the greater complexity of society; that some were owing to an increased knowledge of materials, and of their powers, and to advancement in the Art of building. A good many thought that when every part of a building exactly answered its purpose, and when every redundance had been pared away, and each part took its shape according to the work it had to do, an Architecture would arise of itself without further trouble, more wonderful, more perfect, and one that caused more exalted emotions than any that the world had seen; but it became apparent that this was a wrong hypothesis. The wonderful iron structures of our engineers have surpassed all that was done before in the world in a scientific direction, without regard to anything but cheapness and utility, but nearly all their works are unsightly, and

MANY OF THEM ARE HIDEOUS.

It is just possible that if this hypothesis could have been perfectly carried out, it might have given the true solution; for we believe Nature makes her organisms in the best way, and with the least possible material, while most of her works are beautiful; but we have not got her materials, her knowledge, nor her skill, and we are not sure either that she does not aim at beauty; still, I think that most of our minor problems point to a solution in this direction; but the major problem seems to me to wholly depend on man, for it is not the purely necessary problems that are alone to be solved, but the proper emotions that should be excited by the sight of the building. Solemnity, adoration, and thankfulness should be evoked by a temple; majesty by a building for legislation; awe and apprehension by law courts; dignity by buildings for public offices, great officers of state and magistrates; magnificence in the mansions of merchant princes and great manufacturers; grace and delightfulness in theatres, concert, and fine Art exhibition rooms; comfort and comeliness in the houses for ordinary citizens; while the grimness of a prison should excite repulsion and terror; but, beyond these master emotions, we want each part to exhibit the æsthetic

QUADRANGLE OF DURHAM CASTLE.

cultivation of the day, and show not only the mastery of the Architect, but the knowledge, the care, and the

SKILL OF THE WORKMEN.

The lessons of how these various emotions are to be raised must be learnt from those buildings of former times, which show how cognate emotions were excited. The rest depends on the genius of the Architect and the cultivation and aspirations of the best of the public. A perfect Architectural monument has much more human interest given it by Sculpture, and by figure painting, than by pure Architecture, while fine monumental colouring is another source of delight. Sculpture and figure painting have for their highest models the most physically perfect human beings; if the figures created by these Artists will not harmonize with the Architecture, the Architect must look to it, for his Art is then below that of his brother Artists, and the completed monument is patchwork. The serenity of high ideal sculpture or painting will not harmonize with coarse Romanesque nor with tormented Gothic; so you see that it does not depend on the will of the Architect to adopt any past style he chooses, but the style is evolved from the necessities of the case. The rude figures of the Solomon Islanders would be as much out of place in the pediment of the Parthenon as the Panathenaic frieze would be in a Norman Cathedral. I do not address you as persons anxious to get your living, and naturally the best one possible, by the exercise of a respectable calling, but as

POETS IN STRUCTURE,

who not only hope but desire that the monuments you erect will call forth admiration and delight in the cultivated, hundreds or thousands of years hence, and who spare no study and no pains to ensure this result. What Milton says of fame is true, it is "that last infirmity of noble mind." If you feel the divine power within you, that will enable you to delight millions yet unborn, you feel that fame is but an unimportant accident. You must, however, not only "scorn delights and live laborious days," but you must study as the poets have studied, and see how your predecessors learned to evoke the emotions that now delight you. As I have addressed you as poets in structure, it will not be amiss to see how the poets in words, inspired with the divine afflatus, have learned the elements of their Art. Take Dante, or Milton, or Tennyson, and see how they studied all the best poetry of the past and of the present, how they mixed among mankind and studied the emotions of those around them, how they translated or paraphrased the poems of other times, and of other tongues, to get their hand in and to learn their Art. Some of you may object that such transcendent poets as Shakespeare and Burns had but little learning, you may be sure that both of them deplored it, and endeavoured to make up for their deficiences by learning all they could from ancient story, from ancient poetry, and from contemporary work, and by constant and piercing observation of the persons and things around them, and by repeated efforts to make their works immortal. In our own Art we see Brunelleschi, who was to become the great Architect of his day, working as a journeyman goldsmith at Rome, so that he might measure and study the Roman ruins, and obtain from them constructive and æsthetic knowledge. In our own day, we have seen Alfred Stevens getting his living by designing grates, tiles, and fire-irons, while he was learning to be a great Sculptor, a Painter, and something of an Architect. Remember that above all things

ARCHITECTURE IS A CONSTRUCTIVE ART,

and that all that you can do is to build; by that you must show your knowledge, your skill, and your aspirations, your manners and your morals, and as an Architect, by that alone. You can, of course, avoid the study of statics by getting examples of what has been done before, and keeping well within the old lines, but this is not what the Roman, the Byzantine, or the Gothic Architects did; their aim was to outstrip their predecessors. It is not the method our engineers have adopted whose works are the wonder of the world; they learnt as much as was necessary for their purpose of that part of science that underlies their practical work, and taking iron as their material, have immeasurably surpassed all that was done before them in construction. They never would have done this if they had merely feebly copied the engineering works of the Romans. In Art, however, there is a very different story to tell. The Arts may be said to appeal to the emotions through the eye and the ear, and the accumulated knowledge of them does not help us beyond a very limited distance. When accurate modelling has been attained, there is little more to be learnt, except how to create ideals that are, in certain respects, more perfect than the average human being; in drawing, when form can be exactly copied, and when that knowledge of perspective, called fore-shortening, is attained, there is but the composition of line and grouping to be added: the rest depends on the imagination of the Artist, whether it be to create allegorical figures, or scenes from the past.

IN COLOUR

there is the harmonising and contrasting of the different tints and tones to be attained, and the choice of those most appropriate to the subject of the picture, and the imitation of such subtlety of mixed colouring as is found in the nude human form. We have no reason to believe that after the Greeks had cultivated gymnastics the human form has improved. Landscape painting may have improved, as the forms and laws of inanimate nature are better known and observed, but we have no reason to believe that the beauty of inanimate nature has increased. Ordinary emotions have become more complex, but this can hardly be the case with the grand ones, such as ecstatic joy, heartrending grief, terror, and despair. Is eloquence, wit, humour, or pathos more common or more forcible than in the best ages of Greece? I think almost the emotions being now more complex than of yore have become more difficult to pourtray, so that if the modern Artists pourtray them with an effect equal to that attained by the great classic artists they must be greater men. It would be amusing if it were not so melancholy to see with what a light heart the Architectural students treat the master Art they follow, every one of whose three or four branches is transcendental, each one of which may take the whole life of a man to master, and which requires genius as well, to enable any one to surpass the ancient masterpieces—I mean planning, construction, proper emotional excellence and healthfulness—yet, after three years passed in an Architect's office, each student feels himself competent to practise if his friends can get him work. Sir John Soane's retort to a young Architect is apposite; the young Architect said, "I ought to understand Architecture, for I was articled to it for seven years;" "The time it takes to make a cheesemonger" was the reply. When I see the long hours and the long years devoted by Artists to drawing or modelling a human figure and to the study of anatomy, and know that even then he has but the elements of his Art and may want the divine gifts that are required to make an Artist, I am almost in despair at the prospects of Architecture; still there is hope for the future in the fact of Architectural students having their eyes opened to their own ignorance, which, through the teaching at the Architectural Association, they are trying to dispel. I was pleased to see a young Architect working out models of masonry at the Schools of the Associated Guilds in Titchfield Street. I am doing my best to dispel from the students' minds the notion that the paraphrasing of dead styles is Architecture, that it is more than the means of learning how to express themselves Architecturally. Sketching in perspective is no doubt a

CHARMING ACCOMPLISHMENT,

and the young men of the present day have progressed wonderfully in this Art, and though it is not without its value as a means of cultivation, still it can never teach them Architecture. When I look at the sketch book of Willars de Honecourt, the French Architect of the thirteenth century, I see that he could sketch but poorly, at whose efforts an accomplished draughtsman of the present day would laugh, but Willars could design a Cathedral, and see it properly carried out, and he could do this so well that he was sent for to Hungary to build one there. The Art of sketching is like making a coloured sketch of the painted decoration on the soffit of a vault, useful enough as a memorandum of the excellent effect produced, but affording no information as to how the effect is obtained; to get that information the student wants a scaffold to see the actual colours used and the methods of using them to produce the desired effect, one or two hundred feet from the eye. Although Greek Architecture is

THE MOST PERFECT

the world has yet seen, in which everything is studied with endless labour, and treated with supreme ability, so that a whole building and each part answers as perfectly to the intention of the Architect as the strings of a fiddle respond to the hand of the musician, it is absolutely without effect in this dull and misty climate, at least for the greater part of the year, and our brightest sunshine never produces the results obtained in its native country. In Greece the sunshine plays endless symphonies on it from daylight to dark. It is doubtful if we can ever again have such complete simplicity, owing to the number of modern wants, and the complexity of modern society; still, let us study it deeply, and take to heart the lessons it so strongly enforces, of aiming at simplicity if we hope to attain the sublime. Every Architect feels that he could design the Parthenon if it had not been done before, though in this respect he is absolutely mistaken, for to obtain elegant simplicity is the most difficult as well as the highest achievement of Art. To make Architecture simple and expressive and lovely, when loveliness is wanted, is the aim of most Architects, and should be

THE AIM OF ALL,

but for the Architect to find out how to attain this in his particular work, is the greatest difficulty, involving as it does the greatest efforts, as well as supreme genius. In comparing Greek with modern Architecture, it may be said—

"We shift, and bedeck and bedrape us,
Thou art noble, and nude and antique."

Some pessimists say we can do nothing but paraphrase, until the present civilization of the world is submerged by a flood of savages; yet, surely this is not a necessary consequence. We see that the Romans, when almost effete, when cruelty and corruption seemed hardly able to go further, managed to develop a style that equalled, if it did not surpass, the best work done in the Gold and Silver Ages of the Empire. This fact alone ought to banish despair. Let us all combine our efforts to set Architecture on its feet again, and if we can do this, I think we may be sure that the new phase of Architecture that results, will be a credit to our age and to our country. We should recollect that we are still, in the main, a courageous, honest, industrious, and enterprising people, and I hope we are also beginning to be a tasteful people, and may hereafter make the boast of Pericles, that "we love the beautiful." Wealth is the result of the virtues I have enumerated, and we should neither decry nor abuse this wealth, but learn how to use it properly for the instruction and delight of the world, and for the honour of our country. I have touched, in former lectures, on the merits and peculiarities of Greek, Roman, Byzantine, Saracenic and Romanesque Architecture, and I now propose to give you some remarks on Gothic, not as Mr. Ruskin once said, "to put into a storehouse for use, but into a gallery for study." I think it will not be amiss now to show you some master-pieces of Romanesque and Gothic after the Parthenon, for all subsequent Architecture is a lineal descendant from the Greek. I think nowadays, few will deny that though Gothic is very far from having attained the perfection of Greek Architecture, even if it attained to the dignity of Roman, it has been able to raise emotions of perhaps a loftier sort than those raised by any other monuments; it has given us

LESSONS IN COMPOSITION,

that, at least, are different from those to be learnt from any other Architecture, and has shown to what perfection construction in stone may be carried. One of the æsthetic triumphs of late Gothic is the effect produced by pierced work in stone, which is certainly different from any thing west of India; and it made another stride in the logic of building. The Greeks, and the Greeks alone, studied how to gain the utmost effect in their buildings from brilliant sunshine in a clear air; every moulding was adapted to that end, with a perfection that indicates the most profound study, corrected by experience and failure. The Gothic Architect had neither the clear air, nor the brilliant sunshine; as a rule the atmosphere in which they built was always more or less misty, and their sunshine, where they had any, was

feeble; so they set themselves to work in the most logical way, to see how effects might be obtained in the mist, by deepening shade, by strongly accentuating the parts that took the light, and by perfecting outlines to be seen against the sky.

THAT SEVERE RESTRAINT

that the Greeks imposed upon themselves, the Gothic Architects were not cultivated to practise; even supposing that they were sensible of the matchless beauty of Greek Architecture. which is most improbable, for apart from their professional knowledge and skill, the bulk of them were probably ignorant and uncultivated men. As late as the fourteenth century the French Architects, the Bons, the desigders of the Porta della Carta and the Ca d'Oro at Venice, were merely designated as stone-cutters (Taglia de pietra). It is scarcely likely that these Gothic Architects, who had at their fingers' ends a new development of Architecture, who had surpassed the Romans in the height of their buildings, and had nearly equalled them in the spans of their vaults, and were revelling in intricate geometrical forms, should have been captivated by the massiveness and simplicity of Greek Architecture; they probably despised the constructive ignorance of the Greeks and their lack of ornamental geometry, and what they looked on as the absence of interesting detail. The Gothic mouldings were, in all probability, the result of the Architects' efforts to gain the effect they wanted in their own climate. If you exclude square mouldings, such as the fillet and fascia, the Greek mouldings were the bead and torus, the quarter round, the ogee, and the hollow, and in late work the cyma recta; each one infinitely varied, as the case required, but rarely departing from the generic form, and in their best Doric work a very few even of this restricted number of mouldings were used; while in Gothic there were hundreds, if not thousands, of mouldings used in a great Abbey Church or a Cathedral; it was therefore impossible to bestow much time on their elaboration. I may here say, that I use the word Gothic in its common signification, as the laymen's Art that sprang up at the end of the Romanesque period of clerical Art, about the middle of the twelfth century, which for easier recollection we call the Art of the thirteenth century, to its extinction in the early part of the seventeenth century. I may also say, that I do not propose to investigate Gothic archæologically or philosophically, though both sorts of investigations are

PROFOUNDLY INTERESTING.

I am going to treat it practically, that is, to see what lessons we may learn from it for present use. Many get their living by being able to copy or paraphrase Gothic, and though the desire of getting one's living is very praiseworthy, it will scarcely help us directly in advancing the Art of Architecture, which is the one thing to be most earnestly desired and sought after. I hope I may enlist you in this quest, for surely nothing should be more desired by Architects than to see Architecture again a flourishing and progressive Art, expressing all the main characteristics of the wonderful epoch in which we live, and meeting the desires and raising the admiration of the most cultivated people of this epoch. When the public realises what Architecture does for a nation, even for a town, it will be treated with greater respect, and the Architects will be more cherished, admired, and honoured, and will thus be stimulated to make greater exertions. It must be borne in mind that it is an obtrusive Art. In a town it meets you at every step, and cannot be hid away like a book, a picture, a statue, or a musical instrument. If it be real Architecture, and produces the right emotions that the building should excite, it makes that building at once deeply interesting. It proclaims, even in an ordinary street, the relative dignity and taste, the occupation or the liking of the owner, that is, supposing he had it built for himself, while, if it be a public building, it bespeaks a higher or more important office, and in both cases causes admiration for the care, thought, and invention bestowed upon it; at the same time it shows the character and condition of the nation at the time it was erected, and is a permanent memorial of the cultivation of the people. No reflective person can see any kind of Architectural monument without it giving him a notion of the people at the time it was built; its gables, pediments, domes, spires, towers, lanterns, and pinnacles diversify the skyline, and give interest to it; it tells of an expenditure of wealth and labour,

OF SKILL AND INVENTION,

and gives us a sort of epitome of what the people once admired. It is full of lessons of the most important sort that we can hardly miss, while many buildings fill us with delight from their beauty. We know little of mediæval times, and we should know much less of them were it not that mediæval buildings are dotted all over the country. Architectural monuments may be ruined or pulled down, but, except in the case of the very small ones, they cannot be moved; and if they are beautiful, lovely, sublime or frowning, they attract persons from all parts of the world to see them, or as students to study them; and when at last, in the vicissitude of ages, the nation that built them becomes insignificant, or is swept away, they still remain as landmarks to show how rich, powerful, scientific, and tasteful it once was. How little should we know of Egypt, of Babylon or Nineveh, of Mexico and Peru, and how much less should we think of their former power and greatness, if all their colossal buildings had been destroyed. Should not this reflection appeal to the patriotism of nations, and induce them to foster Architecture and to honour the Architects, and should not the same reflection stimulate the Architects to hand down to remote posterity, in enduring monuments, the greatness and cultivation of their time?

NEWCASTLE SOCIETY OF ANTIQUARIES, ANNUAL MEETING.

THE annual meeting of the Newcastle Society of Antiquaries was held last week in the Library of the Old Castle, Newcastle. The annual report was submitted, and stated that the membership of the Society has been well maintained, the numbers now amounting to 345. The Excavation Committee regrets that partly owing to the unfavourable character of the weather during the past autumn no progress has been made with the excavations at Great Chesters (Aesica). The members of the Society have heard with deep regret that one of the few remaining mediæval towers on the walls of Newcastle is threatened with demolition. It is earnestly hoped that the Corporation may be able to intervene to prevent such an act of barbarism and to preserve the Herber Tower (as the structure is called), and the fine stretch of the walls adjoining, as a slight memorial for the citizens of Newcastle of the more stormy, but also more picturesque age in which these works of defence were reared by their ancestors. With respect to those portions of the town wall of Newcastle which the ravages of time have spared, an effort should be made, and that speedily, to prevent further destruction. Mr. W. H. Knowles, one of the Council of this Society, has attended a meeting of the Parks Committee of the Corporation, and repeated the suggestions made by him ln a paper which he read at the November meeting for the preservation of the interesting thirteenth-century ruin, in Heaton Park, known as King John's Palace; it is hoped that the Corporation will undertake the slight but necessary work for its protection. It has been reported to the Council that a portion of the south wall of Doddington Pele, an interesting though late tower, has fallen down. The Earl of Tankerville is the owner. Mr. R. G. Bolam, his agent, is taking steps to prevent further damage, and it is intended to remove the farm buildings which abut on the tower, so that there may be a clear space all round. The financial statement showed that the total revenue from all sources was £535 16*s.* 3*d.*, and the total expenditure was £593 19*s.* 2*d.* The castle showed an excess of receipts over expenditure of £29 8*s.* 4*d.* The black gate, for the first time, had met its outlay, there been a credit belance of a few shillings.

AT Tokenhouse Yard, last week, the Esplanade Pier at Shanklin, was offered for sale by order of the directors, with the concurrence of the mortgagee. The pier is 1,100 feet long and 30 feet wide, and is constructed of wood and iron. The amount expended on its erection is said to have been £18,000. Biddings ranged from £5,000 to £6,950, after which the property was bought in at £7,500.

FORD MADOX BROWN'S WORKS AT THE GRAFTON GALLERIES.

BROUGHT together at the Grafton Galleries the very representative collection of works by the late Ford Madox Brown will come upon you as something of a surprise. For, in the matter of colour, Madox Brown's works is very—even aggressively—startling; and then, beyond that again, it is very decidedly puzzling. To discover that an Artist has *no* sense of colour, or no very particular and acute one, or even that he has a negative or perverted sense about it, is, usually, a very simple matter; for in any of such cases the question of colour may be left at once out of the reckoning. But this is impossible in the case of Madox Brown. He never in any but his youthful work, done under Belgian influence, evaded the employment of colour—nay, very frequently he seems to be challenging attention as a colourist, and a colourist essentially and chiefly. And frequently the only conclusion that one can come to about his colour is that it is very bad—about as bad as anything can be. And yet by no means always, nor always in like measure. Nor, even when it is most trying to the æsthetic sense, is it devoid of the suggestion that it is aiming, though quite unsuccessfully, at something that is rather fine and failing of it—not for ignoble reasons. In colour as in breadth of effect, in intensity and in expression, Madox Brown frequently fell short because he attempted too much. The colouration of the born decorator cannot be combined with equal portions of that of the unflinching realist; it is possible, nay easy, by aiming at both to achieve neither. Madox Brown's life-work is summed up with considerable completeness in the present exhibition; the wall paintings, whose execution occupied so large a portion of his later time and energies, being represented by sketches in colour, cartoons, and replicas that give a very adequate suggestion of the original works in the Town Hall at Manchester. The chief easel pictures of his most characteristic periods are here: so are many of the works of his youth, when his *technique* was Belgian and Rembrandt his inspiring divinity; so are cartoons of various inspirations, from that of the Westminster Hall competition to that of the mystical phase of Pre-Raphaelitism; so also are studies, sketches, woodcuts—even pottery—executed from his designs. No. 12, "The Romans Building Manchester"—a preparatory painting for one of the large wall pictures—is a favourable example of Madox Brown's later style: the mingled workers, Britons and Roman legionaries, the incompleted masses of brick building, and the casual disposition of things in general, give to it a certain air of naturalness that is partly convincing. There is, too, a distinct effort at open-air effect upon the helmets and other arms of the Romans, and the chart of the new city and the cloaks of its founders are blown about as they would be upon the top of the ramparts of a city in an exposed position.

WE understand that the name of Mr. T. W. Barry, of Buckingham Street, Strand, should have been associated with that of Mr. Tarring in the design submitted for the Exeter Church Competition which we published in our last issue.

AT Oxford, the hall which has been acquired as a memorial to Bishop Hannington was formally opened last week. In 1895 part of the site of New Inn Hall was purchased from Balliol College for the sum of £3,500, and the old building formerly occupied by the undergraduates of New Inn Hall has been converted into a hall, with a gallery capable of holding from 250 to 300 persons. The ground floor is set apart for a missionary library, the only one in the University.

THE Belgian Consul-General, M. Edouard Seve, has received instructions from his Government to intimate that a public adjudication upon tenders, open to international competition, for the construction of 2,000 metres (2,161 yards) of quay upon the river Scheldt, south of Antwerp, will take place in that city on the 30th April next. British engineers and contractors are specially invited to tender, but it is stated that the work will not be entrusted to any but firms of recognised competence. Detailed information may be obtained in the proper quarter. It has already been announced that a large extension of the dock and quay accommodation of Antwerp has been resolved upon.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
February 3rd, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate: and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gildea ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

LORD ROWTON'S third model lodging-house—or, rather, the third house set up by the company of which Lord Rowton is the chairman—has attained nearly its full height, and will, it is expected, be opened some time this year. It is situated at Newington Butts. In its main features it will not differ much from the two that have already proved so successful, one at Vauxhall and the other at King's Cross. It will be considerably larger than either of them, and it will accommodate somewhere about 800 inmates.

OUR Gloucester correspondent states that, in connection with the alleged vandalism at Gloucester Cathedral, Mr. Fred Waller (Architect to the Dean and Chapter), who has charge of the restoration of the Lady Chapel, has written to the secretary of the Society of Antiquaries, stating that for sanitary reasons it has been found absolutely necessary to remove part of the lovely old floor of the chapel in order that unwholesome soil and vaults and graves might be filled with concrete. It will, however, be carefully replaced after the necessary work has been done. Mr. Waller emphatically denies that the reredos is being restored, and, in fact, it has never been touched since the havoc committed during the Commonwealth.

IN an arbitration which took place recently, respecting the purchase of two houses in Beresford Street, Walworth, by the School Board, a surveyor asserted that property in Walworth was as sound as Consols, and that recently no less than ten millions sterling had changed hands for bricks and mortar. The owner, Mr. Kidman, who paid £610 for the two houses five years ago, regarded them as now worth from £900 to £1,000, and thought the School Board should pay him the last-mentioned sum for their compulsory acquisition. Sir William Marriott, Q.C., contended on behalf of the School Board that £650 was quite sufficient, but ultimately the jury assessed the price at £755.

AT the Royal Society of Painters in Water-colours may be seen a special exhibition of works by the lately deceased members—Lord Leighton, P.R.A., A. W. Hunt, G. A. Fripp, A. D. Fripp, E. K. Johnson, Richard Beavis, and George Du Maurier. In many ways the most interesting works shown here are the examples of George Du Maurier's water-colour painting. These are interesting in themselves as specimens of execution in a little-accustomed *technique* from a man of varied abilities who specially excelled in another line; interesting also as showing to which of his pen designs Du Maurier attached such importance as to wish to rehandle them in something like picture form. This gifted Artist's work in colour should not be quite so hastily dismissed as the superficial critic may incline to suggest. Let it be granted over and over again that the specialist in black-and-white is in a position of particular and embarrassing difficulty when he occasionally attempts to deal with colour. One-half of his *technique* is absolutely familiar to him as a matter of constant and every-day practice, the other technical half is far less ready, and the disproportion between the several facilities, too, is in itself a fertile source of difficulty. The sense of line is more than prompt to state accurately, definitely, and emphatically; the sense of colour would linger, fearful of error, and frequently betrayable into mis-statements should it mend its speed. That the occasional work in colour of Artists in black-and-white is seldom wholly satisfactory may sometimes be accounted for by the theory that a certain conscious lack of the colour-sense led the Artist into that particular branch of his Art, but this was not the case with Du Maurier.

THE huge pile of buildings for the extension of the Post Office Savings Bank, in Queen Victoria Street, which was to have been ready for occupation at Christmas, is not yet out of the hands of the contractors, and probably will not be for another five or six weeks, some difficulty with workmen having, it is said, delayed operations. The new building lies at the back of the old one, the two being connected by bridges across Knightrider Street, and thus practically forming one gigantic establishment. When the Department takes possession of its new quarters, the Savings Bank Comptroller will have about him a staff of upwards of 2,000.

AN action is about to come before the local County Court to recover compensation from the War Office for damage inflicted upon the Parish Church of Grayne, near Rochester. "Whatever its results, it is," says Truth, "a monstrous thing that the vicar and his parishioners, or, for the matter of that, any private parties, should be put to expense and trouble of this kind by the War Office. The fort by which this damage has been done was built in 1862, and in those days the firing from it did not inflict any damage on the Church. But with the development of artillery the matter has become very serious, two of the guns in the fort being among the largest in use. The Church, which dates from the eleventh century, was so much shaken structurally that it had to be restored some two years ago. The War Office then contributed the paltry sum of £50 towards the £1,000 which had to be spent; and this chiefly, no doubt, for the reason that the troops use the Church and that the War Office are the principal landowners. Since then both the east and south-east windows have been smashed by the firing, and the War Office, when applied to for compensation, cooly repudiate all liability."

ONE of the dining rooms in the Hôtel Victoria has just been entirely redecorated. The chief object in carrying out the alterations was to make the interior as bright and light as possible, and this result has been achieved in a high degree. Much assistance in this direction was afforded by Mr. John Fulleylove, R.I., and the scheme of colour resolved itself into a selection of white and gold. The bases of the white columns supporting the body of the hall have been brilliantly relieved by the use of metal castings, which tend greatly to throw up the light, and the effect is enhanced by filleted mirrors, after the Venetian style, which adorn the walls in the place of the dark and subdued paintings which formerly hung there. White marble also plays a prominent part in the decoration of the hall.

THE Great Western Railway Company has decided to build, at a cost of £60,000, a new station at Windsor. One special feature will be a group of buildings for the personal use and convenience of Her Majesty and her guests and visitors; and it is intended that this portion of the new work shall be available for use before the commencement of the anticipated festivities of next summer. The Company had hoped to get the new station ready in its entirety for the coming season; but delay has been caused by an unexpected difficulty, now overcome, in connection with some of the land that was required.

THE destruction of St. Anna at Pelago, in Tuscany, by an earthquake, has caused much misery in the neighbourhood of that picturesque ittle I alian town. Built principally in the early part of the seventeenth century, St. Anna is situated on a mountain side some three thousand feet above the level of the sea. The first tremors of an earthquake were felt early in the evening of the 21st December. There were several severe shocks, which caused widespread ruin, old castles and Churches, old houses and modern villas being destroyed impartially. A beautiful little roadside Chapel, called the Saint Antonio Oratory, was laid in ruins, notwithstanding its solid seventeenth-century walls. The great tower and the fine old Church were not spared, nothing but a small part of the Church being left.

CROSSGATES has grown rapidly in recent years. A large proportion of the residents are in business in Leeds; about five hundred travel daily to and from the city, and the number increases rather than diminishes. As indicating the rapidity of the growth, it may be mentioned that during the last two years more than a hundred dwelling-houses have been erected on the land lying between Manston Lane and the railway, and building operations are still going on there. In Church Lane, and at New Manston and Stanks, a number of new houses have also been built, but development in this direction is retarded, owing to there being no suitable land in the market. On the Whitkirk side, the Hollyshaw House estate, situated on the right-hand side of the lane leading to Whitkirk Church, has recently been laid out for building purposes by Mr. Percy Robinson, Architect, Leeds. His plans provide for the erection of between seventy and eighty houses in blocks facing east and west, each residence with garden back and front.

THE Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, at its monthly meeting at the Society House, 7, Dean's Yard, Westminster Abbey, S.W., made the following grants of money, namely:—Building new Churches at Ealing, St. Saviour, Middlesex, £300; and Mitcham, St. Mark, Surrey, £120. Re-building the Churches at Dolphinholme, St. Mark, near Lancaster, £50; and Newton-in-Makerfield, St. Peter, Lancashire, £50; and towards enlarging or otherwise improving the accommodation in the Churches at Edstone, St. Michael, near Kirby-moorside, Yorks, £15; Hove, All Saints', Sussex, £190; Oving, All Saints', near Aylesbury, Bucks, £5; Willesden, St. Andrew, Middlesex, £125; and Yiewsley, St. Matthew, near Uxbridge, Middlesex, £100. The following grants were also paid for work completed:—Hull, St. Augustine, £80; Wall, St. George, near Wall-on-Tyne, £50 on account of a grant of £60; Streatham, All Saints', Surrey, £100, on account of a grant of £120; Carlton Miniott, St. Lawrence, near Thirsk, Yorks, £40; and Gateshead, St. Patrick, £25. In addition to this the sum of £672 was paid towards the repairs of 17 Churches.

AT Bradford, recently, Mr. W. E. Preston read a paper to the Bradford Scientific Society dealing with the antiquities to be found on Rombalds Moor. In the course of his paper, Mr. Preston referred to the great destruction of barrows and early stone monuments which had been the result of the enclosures of the last and the early part of the present centuries, and described especially a tumulus which existed until a few years ago on Baildon Moor. This was at one time, within the memory of living persons, from five to seven feet high, and was composed of earth and stones, protected on the north and east sides by a ditch and bank forming a right angle. This had now been entirely destroyed, and the stone used for making the road between Eldwick and Baildon. Four years ago, when the reservoir for the Baildon waterworks was in process of construction, a circle of thirty upright stones was discovered during the clearing of the surface of heather and peat. The height of the upright stones varied from two to four feet, and they were set at unequal distances from each other, the diameter of the circle being eighty feet. The ground in the centre of the circle showed evidences of fire, the sandy soil being burned to the depth of a foot. Until the clearing operations took place, the circle, which was perhaps the only perfect example to be found locally, had escaped notice. After describing generally the various classes of antiquities of prehistoric date to be found on the moors, the reader of the paper alluded to a nearly obliterated circle which he noticed in 1892 on Rivvock Edge, overlooking Keighley. The diameter was about sixty yards, and the wall of the circle was composed of loose stones and earth. In the centre was a large rock covered with peat and heather. On examination of a small portion which was exposed, this rock proved to be inscribed with a number of small and rather indistinct cup and ring marks. This aroused curiosity, and on removing the peat the whole surface of the rock

Proved to be covered with such markings. This was perhaps the only case in which an inscribed rock had been found enclosed within a circle on the Yorkshire moors.

THE practice of affixing commemorative mural tablets to the walls of houses in which historic personages have resided, or historic events have happened, has only been adopted of recent years in Edinburgh, but good progress has already been made with this pious work, and the New Zealander who visits the modern Athens, may read as he runs where Burns put up on the occasion of his historic visit to the capital, where Scott and the Opium Eater dwelt, where David Hume died, and where Lord Brougham, the joy of the caricaturist, first saw the light. For the latest addition to these mural records, the citizens of Edinburgh are indebted to the zeal and public spirit of the local Pen-and-Pencil Club, which has just marked No. 18, Buccleuch Place, as the birthplace of the Edinburgh Review. For it was in that house that Francis Jeffrey lived in the earliest years of the century, and gathered about him one day in 1802 that historic assemblage of young Whigs so graphically described by Sydney Smith. As the leading journal of the other great Scottish city remarks, one can never look without respect on a periodical which has given the world the criticism of Jeffrey, the wit of Sydney Smith, and the essays of Macaulay.

A SUB-COMMITTEE of the Leeds Corporation was recently appointed to confer with Alderman Scarr, with reference to the site of the fountain which he proposed to erect in City Square, and present to the city. The following report was afterwards presented to the Corporate Property Committee. "That in the opinion of this sub-committee the proposal of Alderman Scarr for a fountain for City Square is as yet in too indefinite a form for the committee to judge fully of its suitability for the position opposite the post-office, where, in their opinion, a fountain should be of appropriate design, and not over 10 feet high; but the sub-committee think it advisable that a decision upon the matter should be deferred until the scheme already authorised by the Council has been carried out." The report was adopted.

AT a general meeting of the Society of English Artists, held at the Regent Gallery, Regent Street, the following resolution was passed respecting the title of the Society, to which the Royal Society of British Artists had raised an objection: "That there is no legal obligation on the part of the Society of English Artists to change the name as suggested in the letter received from the Secretary of the Royal Society of British Artists, as there is no infringement of title, as alleged; at the same time there is a feeling that the similarity of the names is objectionable, and therefore, we, as a young society, are desirous of meeting the wishes of the older body, and with this view it be resolved to alter the name to the Society of English Painters."

A COMMITTEE has been appointed by the Corporation to deal with the condition of Cardiff streets, which are said to be in a very disgraceful state. The Corporation has obtained sanction for the expenditure of about £34,000 upon the principal roads in the town, but it is very questionable whether the thing will prove complete when it is done. There is an old and well-known adage to the effect that that which is worth doing at all is worth doing well, and it does not seem at all likely that the Cardiff Municipal Governors are going to do this work well. We will take Queen Street first. With the excellent pavements that have already been laid, and roadway laid with wood, this would make one of the finest in the West. At the approach to the Taff Vale Station the wood terminates, and there immediately follows a spot which is the noisiest spot in the town. Above are two railway bridges, over which there passes an enormous amount of traffic, and beneath is a road laid with granite setts, upon which there is a continual stream of traffic. Why cannot the wood road be continued to the University College? Noisy this end of Queen Street must always remain, but with wood paving it would be materially improved. It would certainly improve one of the most unpleasant roads in Cardiff, and be worth the extra expenditure. It is to be hoped that the Cardiff Corporation will decide to extend the work in this direction so far as the University College. Again, while St. Mary Street and High Street are to be improved, the almost equally important road—Castle Street—is not to be touched, and here the existing difficulty of mud will remain and be carried by the traffic on to Duke Street. Further still, Bute Road is to be laid with granite setts as far as the Taff Vale Station, where wood is to succeed it. Now Bute Road of late years has become one of the most important entrances to the town. The steamboat traffic has enormously increased, and there are many important offices situated there. Surely, under these considerations, wood is the proper thing to be laid.

THE Estimates for Class I. of Civil Services—that for Public Works and Buildings—for the year ending 31st March, 1898, were issued on Thursday night, and they show a net decrease of £35,972 compared with those of the current financial year. The total amounts to £1,861,810. The following are proposed increases: Admiralty, extension of buildings, £15,000; public buildings in Great Britain, £26,000; rates on Government property, £24,514; and surveys, £7,151. The Votes which show decreases are:—Revenue Department buildings, £63,400; harbours and lighthouses, £5,800; royal parks and pleasure gardens, £6,000; royal palaces and Marlborough House, £5,000; and diplomatic and consular buildings, £5,800.

IN his second lecture of the Cantor Series, now in course of delivery at the Society of Arts, John Street, Adelphi, on "Material and Design in Pottery," Mr. William Burton spoke of the splendidly decorated fine earthenwares of Persia and of Italy, and pointed out that the differences between the two colour schemes adopted by them could be completely explained by the differences of the components of the white facing of the earthenwares in one case and the other. The white grounds used in both instances were equally favourable to the development in their fullest richness and brilliancy of blues and greens; hence in Oriental and Italian pottery these colours are profusely and happily employed. But the element of tin used in the Italian ground was destructive to reds, so that in that class of work we find reds suggested by tints tending to pink or brown; while in the Oriental ware, with its facing of siliceous slip, reds could be developed to their utmost—as is superbly shown in much Rhodian work. Conversely, the Oriental ground was quite destructive to yellows, and these we never find in Persian or similar ware successfully attempted; while the clearness, brilliancy, and perfection of the yellows (developed upon a tin basis) is a most striking feature in some of the masterpieces of the Urbino ware.

EXTENSIVE additions are proposed to the Central Police Station, Parliament Street, Hull, and plans have been sent showing the proposals to the Home Office. The Committee has received a communication from the Home Office asking that the plans be reconsidered, and stating that Sir Matthew Ridley is advised that the existing buildings are incapable of being converted into a more suitable police station, and that if such a station is to be provided on the present site the only course is to pull the buildings down and re-erect them in conformity with modern requirements. The Chairman, at a recent meeting, said the sub-committee felt that in view of the very great alteration which would take place in the Old Town by the purchase of the Kingston Gas Company's undertaking and the projected street improvements, it was desirable not to spend money in rebuilding the police station, but to wait and see how matters developed. It was therefore decided to postpone the consideration of the project for a time.

MR. SKIDMORE, the Bradford stipendiary magistrate, has just come into possession of a small block of wood, part of the old drawbridge formerly spanning the lake at Walton Hall, Wakefield. The relic is of historic interest, as being associated, though somewhat indirectly, with the siege of the original Walton Hall during the Civil Wars, it is said, under Cromwell's personal direction. It is a well-attested fact that while the troops of the Parliamentary forces were encamped at Sandal Castle, near Wakefield, a reconnoitring party was detached to Walton Hall to search the premises. The drawbridge, however, was let down, and the search party were unable to cross the lake to the hall. Doubtless the drawbridge would remain until about the middle of last century, when the late Squire Waterton's father rebuilt the hall and enlarged the lake. The castellated gateway, with central tower and flanking turrets, is still standing by the side of the lake. The gate is of thick oak planking, studded with heavy-headed nails, and is pierced with loopholes for musketry. Evidences of the Cromwellian siege exist in marks of the bullets which were fired at the loopholes from the opposite side of the lake. One ball is still embedded in the woodwork, and is almost buried. During the time that Walton Hall was occupied by the late Mr. Edward Hailstone, Mr. George Field found a quantity of timber in an outhouse at Walton, with dove-tailed cuts, which had formed part of the old drawbridge, and from which Mr. Skidmore's block has been cut.

A BIG scheme for Church work was brought forward at the annual meeting of the Birmingham Church Extension Society last week. An appeal was made for £211,250, and, in addition, a yearly subscription list of £11,700. It was proposed to erect new Churches and mission rooms to accommodate 15,100 persons, at £7 10s. per sitting, and give room for one in eight of the population. A total of £113,250, besides £98,000, was asked for for the Bishopric scheme.

MR. PERCY WOOD is exhibiting at his studio, 25A, Queen Anne Street, W., the finished model for the statue of the Saviour, to be produced in bronze, and erected at Lady Henry Somerset's Temperance Colony, at Duxhurst. The figure is of life size, and designed with unaffected grace and dignity. The type of face which the sculptor has evolved is based rather upon the accepted ideals of Christ than upon new or eccentric experiment. It is noteworthy that this is stated to be the only statue of the Saviour designed for public erection in England since the time of the Reformation.

A REMARKABLE demand for old arms and armour was clearly shown at Christie's, when the sale of the important collection formed by Herr Richard Zschille, of Grossenham, was commenced. A Swiss dagger, with scabbard of copper-gilt, chased in relief with William Tell shooting the apple from the head of his son, fetched £110; while a rapier of the sixteenth century sold for £370. A tournament helmet went for £300; a close helmet for £115; and a demi-suit of armour, from the Meyrick collection, for £105. Amongst other items were a curious sword and wheel-lock pistol combined, circa. 1560, £100; a saddle, composed of polished deer-horn plates, carved in relief, circa. 1400, £480; a crossbow, with ebony stock, richly inlaid with engraved ivory, and with the coat-of-arms of the Elector Augustus I. of Saxony, £270; an arbalist, supposed to have belonged to Duke Julius Henry of Brunswick, from the Londesborough collection, £215; a circular shield, or rondache, of blued steel, and damascened with ornaments in gold and silver, £70; and a wheel-lock sporting gun, £190.

ST. SAVIOUR'S, Southwark, in which a window will shortly be dedicated to Fletcher, may be said to pay a special tribute to the bravery of the old English reformers and to the fame of literary men. Memorial windows have been or will be placed to render permanent the names of Massinger and Beaumont, Fletcher's companions. Shakespeare will monopolise three panes close at hand, whilst Chaucer, Bunyan, Johnson, and Goldsmith will, amongst others, be allowed this "transparent" honour. Nor must be forgotten the tomb of John Gower, the father of English poets, who died in 1402. Among the heroes of religion is recorded the memory of Roland Taylor, Dr. Hooper, John Rogers, and Philpott, Archdeacon of Winchester. In fact, Winchester seems to have been closely connected with the parish, for the tomb of Launcelot Andrewes, Bishop of that diocese, lies in the Lady Chapel.

TO further the movement in favour of the National Registration of Plumbers, a meeting was recently held at Truro, under the auspices of the Council for Devon and Cornwall of the Worshipful Company of Plumbers, London. Mr. W. J. Addiscott said the object of the Company was to educate the public to the value of good plumbing.

They did not recognize trade organizations either of masters or operators. But as the apprenticeship system had to a great extent been done away with, the Company established examinations, both theoretical and practical, in order to give those who did not serve their time an opportunity of showing their knowledge of the trade, and they were willing to hold examinations in various centres throughout the country. Already there had been examinations at Penzance, Exeter, and Torquay, and, if sufficient candidates were forthcoming, they would hold them at Truro, as their object was to bring the movement to the very doors of the plumbing craft. In consequence of the opposition from ironmongers and other sections of the trade who sought to foist themselves on the public as plumbers, the Bill for the Registration of Plumbers had never got beyond second reading. That opposition had now been done away with, and it was the intention of the company to first introduce the Bill in the House of Lords.—Mr. S. Trevail was pleased to know that the Company confined itself strictly to the qualification of the handicraft, and did not attempt to interfere with the commercial side. They would have his cordial sympathy and support while they confined themselves to the education and improvement of plumbers. He should be equally ready to support a proper qualification for stonemasons. In the plans for the Central Technical Schools to be built at Truro, he had made proper provision for the instruction of plumbers, and he asked for the support of the Company in that matter. If they sent a lecturer or demonstrator, doubtless students would come from various parts of Cornwall.

Two interesting objects have just been placed on review in the exhibition galleries of the British Museum, one in the Department of Egyptian Antiquities, the other in the Ethnographical Section. The first of these is a stone object in the shape of a cartouche or royal escutcheon, and dedicated by Rameses II. to his wife Tui. Traces of vermillion colouring are still visible on the edge; it is probable that the whole thing was originally covered with it. The inscription, which occupies the top and bottom portion of the cartouche, reads:—"The King of the North and South, Lord of the two lands Ra-usar-ma-setep en Ra (prenomen of Rameses II.), giver of life for ever. The hereditary great princess, Royal wife Tui." The other object is a sacrificial stool, presented by Sir Gilbert Carter, K.C.M.G. It was obtained at Ife, in the Yorub country. This object is made of quartz, and stands about 3 ft. high, with a table-like top of 6 ft. in circumference.

It is understood at Mandalay that it is settled to construct an iron bridge across the Irrawaddy, from the Amarapura shore to Sagaing, for trains and foot-passengers, who would pay a small toll. The traffic at that point of the river has been increasing, and the obstruction to the transport of goods wagons over the river through the formation of the sand-bank at the shore has, it is said, caused the management of the railway to recognise the advisability of incurring the enormous expense of a bridge, the construction of which, presenting no extraordinary engineering difficulties, would be completed in a couple of years or so from the date of starting the work.

If it were as easy to supply a deficiency as it is possible to point out its existence some of the gaps in the collection in the National Gallery would be very promptly filled up. Some recrimination, which is unfortunately quite justifiable, has just been indulged in by papers on both sides of the Channel, concerning the admittedly inadequate representation of the British School in the Louvre and Luxembourg, and of the French School in Trafalgar Square. To do our neighbours justice it cannot be denied that the French Government has lately made some real attempts to secure fully representative examples of several of our more distinguished painters, living and dead, and it cannot be doubted that as opportunities occur these hopeful first-beginnings will lead to more sustained efforts. The old idea that no good thing in Art could come out of the British Isles has at last given way, and a sincere appreciation of what is best in our painting is becoming more evident in French Artistic circles.

BUILDING TRADE EXCHANGE FOR EDINBURGH.

A STRONG desire has for some time existed among parties connected with the building trades throughout Edinburgh and district that an exchange should be instituted on somewhat similar lines to the Glasgow one, and a meeting was recently held in Dowell's Rooms, George Street, Edinburgh, when about 200 of those interested were present. After some possibility remarks from the chairman, Colonel Bennett, Glasgow, who was largely instrumental in inaugurating the exchange there, gave his experiences of that institution, and also of those in America, which he had visited. He said they in Glasgow had found it advisable to take a lesson from their brethren in America. What they had done in Glasgow had proved the possibility of the existence of these exchanges in this country. The general principle was a simple one. The builders believed that a more intimate social relation and acquaintance with each other would tend to check the bitterness of rivalry and keep the eagerness of competition within reasonable limits. Further, it was believed that the skill and knowledge of each member would be secured by all, and their usefulness to the community increased. Such exchanges had been instituted in nearly every one of the larger cities of the United States, and their utility demonstrated. In America the builders were nearly fifty years in advance of those in Britain. The principles of the exchange were adhered to in the offices of

THE LEADING ARCHITECTS

and surveyors. An exchange based upon proper lines, and which was strong and associated for the common good of all, would mean that the competent man would come to the front and the laggard would go to the wall. The exchange would also mean the putting an end to shoddy work and shoddy prices. In Glasgow, during the last two years, they had formed themselves into a limited liability company, and they were perfectly solvent. They had found favour with many of the Architects and surveyors. In fact, they found benefits daily. In Glasgow, they had pointed out the fallacies of the new City Improvement Bill. Mr. Cook, secretary of the Glasgow Building Trades Exchange, also addressed the meeting, explaining the inner working of his institution. Their membership in Glasgow was about 300. They had found a firm footing, and were now in a really prosperous condition. In reply to a question, he stated that at the close of the first year, the Glasgow Exchange had a surplus of £50, and at the close of the second year £200. Councillor Yooll, Leith, moved that a Building Exchange be formed for Edinburgh and Leith. Mr. Peter White, in seconding the motion, said the members of the building trade desired to protect themselves in a proper business fashion. They did not want the Town Council or any other body to teach them. In Edinburgh, the builders were just cutting each others' throats, whereas, in Glasgow, they had succeeded in abolishing a great deal of unnecessary competition. The motion was unanimously adopted, and a committee appointed to forward the formation of the exchange.

CONSIDERABLE damage was caused by fire last week at Trinity Church, Birchfield. The whole of the contents of the vestry were destroyed, including the registers. The roof was much damaged.

MR. F. H. TULLOCH, M.Inst. C.E., an inspector of the Local Government Board, held an inquiry at West Bridgford on Wednesday last, into applications of the Urban District Council for sanction to borrow £13,275 for works of private street improvement, and £1,504 for public works of sewerage and street improvement. No opposition was forthcoming.

THE magnificent Japanese bronze, which Mr. E. W. Beckett, M.P., has purchased for the museum in the Leeds Art Gallery, represents a goddess who, according to a Japanese legend, was the creator of that country. She is figured standing on a dragon that she has charmed by her song, accompanying her theme on the viol or lute. There is an exquisite finish about the work that will make it a valuable and attractive addition to the public collection.

NEW TOWN HALL FOR CARLISLE.

EIGHT months ago the Carlisle Town Council appointed a committee to consider and report upon the proposal to erect a new Town Hall for the city. They have now had a meeting, and have interested themselves in discussing sites. No fewer than six are suggested. One is an area which includes the site of the present Town Hall; another means the demolition of the ancient hall of the Trade Guilds, which dates back to the time of Richard II., and is known as Redness Hall; a third would involve the destruction of a large block of property adjacent to and including the Crown and Mitre Hotel—the old Coffee House, reminiscent of some of the best stories of the coaching days and old Carlisle; another site would account for property of almost equal note, in the shape of the Grapes Hotel, belonging to the Corporation, which did away with the licence some years ago, and is now looking for the old sign—a gilded bunch of grapes—to place in the Museum. Her Majesty's Prison is suggested as a site. In a similar way a few years ago it was suggested as a site for the new Public Markets. The sixth and last site suggested is the vacant ground upon which the Church Congress Hall was erected. As a matter of fact, although there are many leading citizens who would like to see a new Town Hall, the subject is not yet ripe, and it must be years, in face of water, sewerage, lighting, and other large questions, before it can come to a head. The present Town Hall, which was built in the reign of Queen Elizabeth, has been altered and improved many times, judging by the numerous legends which are inscribed over its doors and windows. It has been much modernised, but has become altogether inadequate for the business transacted there. Old pictures represent it with diamond windows and swing shutters, with ledges overhanging the shops below, and an extensive semicircular flight of steps in the centre. These have gone, as also has the "muckle toun bell"—from an ancient foundry—which was cracked in a fire that occurred at the Town Hall some years ago. It was anciently called the Guild Hall, and Chancellor Ferguson—to whose eminent services as historian and antiquary Carlisle owes much—says, "The name long survived as the designation, and the proper one, too, of the building now commonly called the Town Hall, but whose name in the Corporation records is always the Guild Hall or Moot Hall."

MR. J. PIERPOINT MORGAN, of New York, has undertaken to erect, at his own expense, a building to cost about $1,000,000 for the New York Lying-in Hospital.

THE Prince of Wales has expressed a desire that the fountain in memory of the late General Sir C. Fraser, V.C., should be erected in Sloane Street, at a point opposite the house where the General used to reside.

ON Saturday afternoon seven memorial stones were laid in connection with the erection of the Salvation Army Barracks in Chapel Street, Harrogate. The building has frontages to three streets, and the cost, including land, is about £8,000, the lower portion of the premises being utilised for shop purposes.

ONE of the largest fires that has occurred in Bristol for some years broke out on Wednesbay morning at the immense factory of Messrs. Todd and Co., at Temple Gate, resulting in the destruction of the building and contents, and a loss estimated at nearly £40,000.

THE Town Council of Windsor has been engaged in committee discussing propositions for the commemoration of the Queen's reign. The most favoured proposal is one to build a new infirmary, in the place of the present Windsor Royal Infirmary, to be built on a portion of the Bachelor's Acre.

THE total cost of the proposed Hull and South Yorkshire Extension Railway undertaking is put down at £149,700, of which the main line will cost £135,100. The main line will be 8 miles 5 furlongs in length, and will commence by a junction with the Hull and Barnsley Railway at South Kirkby, and will terminate in the township of Wath-upon-Dearne. The line will be constructed as a single line throughout its whole distance.

Professional Items.

BOSTON.—The Primitive Methodist Chapel at Boston, Lincs., was on Thursday afternoon almost entirely destroyed by fire. The Chapel was built in 1886, and accommodated 720 worshippers. The fire is supposed to have been caused by the heating apparatus.

BRAMLEY.—Sir John Barran, Bart., opened the Bramley Zion Baptist New Sunday Schools recently. The ground floor is divided into eight class-rooms, with a meeting-room capable of seating 150 persons. On the first floor is an assembly-room, capable of accommodating 500 persons, and four class-rooms. The total cost of the building, which is in the English Renaissance style of Architecture, and is erected from the designs of Mr. W. Hobson, of Leeds, is about £2,500.

BRISTOL.—The re-opening of the Church of St. Mary's-on-the-Quay, Bristol, took place a few days ago. The building has recently undergone renovation and decoration at a cost of upwards of £300. The chancel has been painted and decorated in oil, and in a style in keeping with the Architecture of the building. The east end beyond the pillars has been enclosed within a broad border carrying medallions of the sacred monograms of our Lord and the Blessed Virgin, broken up with scroll ornaments, and on the side walls a unique effect is produced in the treatment of the panels, while other details of the decoration harmonise effectively. The altar has been repainted with solid panels of gold, bearing suitable enrichment, and the stone reredos cleaned and restored, the altar of the Lady Chapel being similarly dealt with. The recess over the Lady Chapel has received additional decoration.

CARDIFF.—A new font has been erected in St. Francis Church, East Moors, as a memorial of the Rev. H. S. Nicholson. The bowl of the font is of Portland stone, in one piece, with carved lip and scrolls, and rests upon green Irish marble columns, having moulded Portland stone capitals and bases, the whole standing upon two massive stone steps. The cover is of polished oak. The bowl is lined with lead and furnished with a drain. The font has been erected by Messrs. A. J. Howell and Co., Queen Street, from the designs of Mr. H. H. Turner (of Messrs. Habershon and Fawckner, Architects).

DEVONPORT.—Mr. H. G. Luff, of Chapel Street, Devonport, is the Architect for the new Conservative Club premises at 7, Fore Street, opposite the Public Hall. The premises include a large and lofty billiard room, 48 feet by 18 feet, with pitch-pine roof and dado, and a lantern light extending the entire length. The first floor, which is reached by an easy staircase with mahogany hand-rail and pitch-pine balustrade, is devoted to the reading room. The secretary's room is on the half-landing and the card and smoking room on the second floor, where there will also be a room set apart for deputations and transacting matters connected with the organisation of the party. The caretaker's apartments will be on the top floor.

DUMFRIES. — Dumfries School Board has resolved to erect a new elementary school. The new building will supersede the Greensands School, and the Board agreed to purchase a site in George Street, from the representatives of the late Mr. M'Lean, auctioneer, and the late Mr. Grierson, builder, at the price of £1,800.

EDINBURCH.—St. Margaret's Church, Juniper Green, which has just been completed from plans by Councillor R. M. Cameron, Architect, Edinburgh, was dedicated last week. The Church, which has cost £5,000, is seated for six hundred people. At present the only part of the Church unfinished is the tower, the completion of which will require another £800. The fabric is a handsome Gothic structure, crucifix in form, with side aisles, a centre nave, north and south transepts, chancel, and apse. The nave is separated from the side aisles by five pointed arches, while the transepts and chancel are spanned in single arches from the large piers of the central square tower which rises above the building. A barrel-shaped timber roof runs along the whole length of the building, and is divided into bays by moulded ribs springing from carved stone corbels placed immediately over the pillars in the nave, and thus neatly separating the clerestory windows. A stone arched organ chamber is placed near the chancel and south transept, and large windows with fine tracery are placed in the east and west ends of the Church.

EXMOUTH. — Memorial stones of the new Church and school being erected at an estimated cost of about £6,000 were laid. Centrally situated, the new buildings will be visible from the Strand, Rolle Street, and Chapel Hill. With seating accommodation for nearly seven hundred persons, the principal building will consist of nave, transepts, and chancel, with a gallery over the vestibule. To the right of the chancel will be the organ chamber, the minister's vestry being on the left. The main entrance will be from Rolle Street. The schoolroom, immediately in the rear of the Church, will accommodate nearly four hundred children, there being also six class-rooms and a ladies' parlour.

GLASGOW.—The fourth monthly visit of the High School Building Construction Classes took place on Saturday, when Mr. Dobson's students were shown over Mount Florida School, which is in course of erection for the Cathcart School Board. The style the Architect has adopted for the building is a free treatment of Classic. The planning has been carried out in an admirable manner. The basement contains the necessary fresh air ducts warmed by high pressure pipes. It also contains the janitor's house and other rooms, while upstairs, on the ground floor, the central hall is situated, 44 by 38 feet, surrounded by nine large class rooms. On the upper floor a similar mode of division takes place, but a cooking centre has been placed here The Plemin system has been adopted, the propeller being situated in the basement, the warm fresh air being discharged well above the heads of the scholars, and taken away by shafts either at floor or ceiling, depending on the condition of the atmosphere outside. The building will ultimately accommodate about 1,200 scholars, and is built of Locharbriggs stone. The cost is expected to be about £2,000. Mr. David Barclay is the Architect, and Mr. John Sim, at the close, was courteously thanked for his services to the students in showing them over the building.

GREAT BADDOW.—After having been closed six months for repairs the Parish Church has been re-opened. The Church dates back to about the fourteenth century, and some portions of it to an even earlier period. The work of restoration, for that is what it practically amounts to, has been carried out by Messrs. Choat & Son, of Chelmsford. The side galleries have been removed, and a great improvement has thereby been effected in the interior of the Church, and a still greater improvement would be obtained if the organ gallery at the western end was also taken down. The chancel roof has been stripped and relaid, and the inside of the chancel roof, where there was formerly but a plaster ceiling, has been lined with oak panelling, with moulded ribs and carved bosses. The two dormer windows on the north side of the chancel have been taken down and rebuilt, so as to exactly correspond with the old ones. The side walls of the chancel have been scraped, and three monuments removed from the chancel end to other parts of the edifice. The roof over the aisles has been re-leaded on the outside, and inside the plaster ceiling has been substituted by oak boarding, while the exterior roof of the nave has been re-slated. All the stone work in the Church has been re-dressed, and the two large windows have been cleaned and re-pointed. The two arcades have also been re-pointed. The total cost of these renovations is about £1,000.

HAMILTON.—The Parish Church of Hamilton, which has been closed since the beginning of October for renovation and the introduction of an organ, has been re-opened. The work of renovating and redecorating has been carried out under the direction of Mr. A. Cullen, Architect. The organ, which has been placed in the Duke's Aisle, has been erected by Messrs. Ingram & Co., Edinburgh and Hereford. Its action is tubular-pneumatic, of the latest type, and the instrument is enclosed in a neat oak case, designed to correspond with the oak panelling of the gallery of the Church.

HEMSWORTH.—Mr. F. H. Tulloch, M.I.C.E., Inspector to the Local Government Board, recently held an inquiry in respect to the application of the Rural District Council to borrow the sum of £15,500 for purposes of water supply to the contributory places of Hemsworth, Brierley, Shafton, South Kirkby, South Emsall, and South Hiendley. The clerk (Mr. Joshua Scholefield) explained that the area of the entire district involved was 12,647 acres, the rateable value £48,472, and the present population 9,255. An agreement has been made with the Barnsley Corporation for a supply under their new Bill, and it was estimated that the cost of the scheme will be £15,000, which was apportioned upon the contributory districts as follows: Brierley, £1,306; Hemsworth, £5,284; Shafton, £915; South Elmsall, £1,488; South Hiendley, £2,045; and South Kirkby, £4,062. There was no opposition.

HOLBECK.—At a meeting of the Leeds Building Clauses Committee, it was reported that Mr. Hainsworth (the Building Inspector), together with two or three members of the committee, had had an interview with Mr. Rhodes, the Architect who has prepared plans for the erection of a new theatre, and that the latter had agreed to make additional entrances, and to improve the access to the gallery. The committee expresses itself satisfied with the plans as amended.

LEEDS.—A special sub-committee of the Leeds Corporation recently met at the Town Hall, for the purpose of considering the question of providing more adequate stabling accommodation for the horses used by the Sanitary Department. Three months ago the Highways Committee took over the site on which the old stables stood at Crown Point for the purpose of erecting thereon an electrical generating station for the Roundhay and Kirkstall electrical tramways. Since that time the 130 horses belonging to the Sanitary Department have had temporary accommodation found for them in private stables. This system has entailed considerable expense, and the committee is anxious that the Corporation should as early as possible possess its own stables. The question is not so much whether the Corporation should provide such accommodation, but whether the stables are to be built upon one site or on land adjoining the four refuse destructors of the city. The city engineer (Mr. Hewson) was instructed to prepare plans for the erection of three blocks of stables, capable of accommodating 166 horses, on the site recently acquired by the Corporation in Dock Street. It will be remembered that £14,000 was paid for this land, which covers an area of about 11,000 square yards. On this property also it is proposed to erect workshops and offices—in fact, to convert the place into the central sanitary depôt of the city.

LOUGHBOROUGH.—On Wednesday the new recreation room erected at the Loughborough Girls' High School was opened. The plans were prepared by Mr. G. H. Barrowcliff, and the contract for £477 was placed in the hands of Mr. A. Faulks. The new room is attached to the main building, and is practically an elongation of it on the Burton Street side. It has therefore been erected in a similar style of Architecture and material, of red brick and tile, with facings of Derbyshire stone.

LOW FELL.—Erected by the Gateshead School Board at Kell's Lane, Low Fell, a new school was opened last week. It has been built from the designs by Messrs. Oliver and Leeson, Architects, Newcastle, and provides accommodation for 880 children. It is designed on the "central hall" principle. Each of the two floors has six class-rooms, in addition to the usual teachers' rooms, cloak rooms, &c. The school is so planned that it may be worked either as a separate boys' school and separate girls' school, or on the "mixed" principle, with one headmaster over the whole. Particular attention has been paid to the lighting and ventilation of the rooms. It is built of Pewlaw bricks, with stone dressings. The whole of the work has been carried out by Mr. Joseph Elliott, contractor, of North Shields; Mr. W. Edington having been the clerk of the works. The slating was done by Mr. Wylie, of South Shields; Messrs. Dinning and Cooke supplied the heating apparatus, and the lavatories and sanitary fittings generally were supplied by Messrs. Twyford and Co.

NEWCASTLE. — The branch establishment, erected by the Newcastle Savings Bank at Gateshead, was opened on Saturday by the Mayor of Gateshead. The new premises are situated at the corner of West Street and Bensham Road. The style adopted is English Renaissance. The building has a massive Peterhead granite plinth and doorway. Above the plinth and up to the first floor level the facing is of Kenton stone, varied with red stone from Dumfries. Above the first floor level, the facing is of Normandy red brick, relieved with stone bands and dressings. The roof is covered with green slates, and the dome at the angle is of copper. The banking room is lighted on three sides, and is entered the angle through an inner porch. The board room is on the first floor, and above are rooms for the caretaker. Messrs. Haswell and Waugh, of Gateshead, were the contractors, and Mr. G. B. Burnett has acted as clerk of works. The slating has been executed by Mr. J. Hewitson, Newcastle; the plumbing by Mr. Corking, Gateshead; the plastering by Mr. Rule, Gateshead; and the painting and glazing by Mr. Moreton, Gateshead. The granite, marble work, tiles, stoves, and gas fittings, have bean supplied by Messrs. Emley and Sons, the counter and other furnishings by Messrs. Sopwith and Co., and the lead glazing by the Gateshead Stained Glass Company. The contract for the whole of the work was £3,615, and it has been carried out under the supervision of the Architect, Mr. Stephen Piper, County Chambers, Newcastle.

PAISLEY.—The new Board School in Carbrook Street, plans of which were recently passed, will be two stories in height, with accommodation for 836 pupils. The estimated cost is £8,000.

PUDSEY.—A new school has just been erected by the Wesleyans at Valley Road, Pudsey. The school, which has been much needed, contains a large tea-room in the basement, a large school-room on the first floor capable of seating 450 persons, and six large and two small class-rooms, the Architects being Messrs. Hodgson and Farrer, Pudsey. The cost is £1,200.

ROCHDALE.—An effort is now being made to complete the Church of St. Luke, Deeplish, Rochdale, by the building of the nave. The present nave is entirely of a temporary character, and the chancel, designed by Mr. R. Knill Freeman, cost £2,700. Further plans have been prepared by the same Architect, which will require about £3,300 to carry out. In addition to the promises already made, some £1,700 is needed.

WOLVERHAMPTON. — St. George's Church, which has been closed for some time to allow of extensive alterations and repairs, has been re-opened. The alterations include the removal of three bays from each of the side galleries, the whole of the old high-backed pews, and the upper galleries, which gave accommodation for about 200 children. The floor has been relaid with wood blocks, and the whole of the pews now consist of plain oak. The choir has been extended, and the old high pulpit has been replaced by one of oak on a stone base. The chancel and choir have been treated in a most imposing manner, and a massive rood-screen divides the nave and choir.

AT the St. Paul's Churchyard end of Cannon Street, on Thursday morning, a water main burst breaking up the wood pavement for several yards.

MR. ALBERT E. PRIDMORE, C.C., of 2, Broad Street Buildings, is the Architect engaged in erecting Hampstead Hill Mansions, Downshire Hill, for Mr. Alfred Hackworth.

THE Kingston Town Council has authorised an application to the Local Government Board for sanction to the borrowing of a further sum of £20,000 for extensions of the electric light within the borough.

AT a meeting of the Glasgow Harbour Tunnel Company, the Bill to ask powers to raise capital to the extent of £130,000 to equip and finish the undertaking was approved.

THE traditions of Mabille have been suddenly effaced by the demolition and sale of the flimsy structure which made up the Jardin de Paris. The clearance was necessary for the buildings to be annexed to the new Palais de l'Industrie.

SOCIETY MEETINGS.

York Architectural Society. — At the annual dinner of the members of the York Architectural Society, Mr. Henry Perkin, F.R.I.B A., the President, occupied the chair. Mr. A. W. Turner, in proposing "The Royal Institute of British Architects and Kindred Institutions," said, Architecture was a profession taken up by men of great intelligence, and the Architect should possess qualities that are diametrically opposite to those of the practical worker. He had to exhibit Artistic feeling in what he did, and must be a man of imagination. We lived in an age of progress and invention, and this and kindred institutions were taking active parts in the onward march. He advised youthful aspirants in the profession to pull with the times in educational matters, and to cultivate the thinking and reasoning faculties. Mr. W. Watson, in responding, remarked that lately the Royal Institute had done better work for the profession generally than was the case ten or fifteen years ago. Formerly it was sadly too exclusive. He thought the time had come when Architects should be registered as one of the learned professions, and if such a result could be achieved during the present memorable year it would be a matter for great satisfaction. Mr. J. W. Knowles proposed "Success to the York Architectural Society," which, he said, was progressing, and had been in existence about 15 years. The President made response. He called attention to the syllabus and papers for the 15th session, and stated that Mr. Godfrey Bingley, of Leeds, the Dean, Canon Argles, and Mr. A. J. Penty would read papers, and that in March there will be an exhibition of the prize competition drawings of the Royal Institute of British Architects. He remarked that the Society fairly held its own in an increased membership, but there were several leading Architects in York whom he would like to see amongst them. He spoke of the advantage of being allied with the Royal Institute, and of benefits which members of the profession hoped to reap. He thought the Institute had shown a disposition to treat them fairly.

The Northern Architectural Association.—The Students' Sketching Club, in connection with this Association, held their seventh annual smoking concert and exhibition of drawings and sketches in the Grand Assembly Rooms, Newcastle, on Tuesday evening the 26th January, when about 100 members and friends were present. The President (Mr. A. M. Dunn) having sent a letter to say he was too unwell to come, the Vice-president, Mr. Joseph Oswald, F.R.I.B.A., occupied the chair and opened the concert. Those present, included the Hon. Sec. Mr. A. B. Plummer, and Messrs. J. T. Cackett, W. S. Hicks, H. C. Charlewood, W. L. Newcombe, W. Glover, J. A Morton, C. S. Arington, S. Piper, &c. The musical programme, which included an orchestra of nearly 20, was a great success, owing to the indefatigable zeal with which Mr. E. Fenwicke and Mr. Harold Oswald had arranged it. The usual votes of thanks terminated the proceedings.

Midland Institute, Archæological Section.—The Committee, in their annual report, state that there has been a further falling-off of eight in the number of members of the section, which was 208 at the end of the year 1895, and now stands at 200. This decrease has not, however, materially affected the financial position of the section, but it is, nevertheless, unsatisfactory to observe a steady, though small, annual reduction in the list of members, which in 1892 numbered as many as 228. The usual number of papers dealing with antiquarian matters had been read on Wednesday evenings, and, with one exception, had been of peculiar interest to the Midland Counties. The attendance at the summer excursions, which last year fell considerably below the average, has greatly improved. The value of the library of the section has been enhanced by the addition of several volumes, plans, rubbings of brasses, &c., and a supplementary catalogue of the property has again been included, with the volume of the transactions for the year 1895. Steps are being taken to avert the possible destruction of the old "Strafford House" at Camp Hill.

The Builders' Merchants' Association of London.—The third annual dinner, preceded by the annual general meeting, over which the President for 1896 (Mr. W. Sankey) presided, was held at the Midland Grand Hotel, St. Pancras, on Thursday, the 21st January, 1897. The proceedings following the dinner were opened by the President for 1897, M. Clement Braby (who presided) proposing the health of "the Queen and the Royal Family." Following this came the toast of the late President, Mr. W. Sankey, of Hammersmith, which was ably given by Mr. Erith, who commented upon the able manner in which the retiring President had carried out the arduous duties of that office. The late President replied to the toast, thanking those present for the hearty manner in which they had received it, and stated that in his endeavours to further the interest of the Association he had received much benefit and pleasure. The toast of "the President for 1897, Mr. Clement Braby," was entrusted to the care of Mr. E. Montague Edwards, of Messrs. Young and Marten, Stratford, who remarked that an Association of this character needed in its President an experienced, determined, and yet diplomatic individual, to ensure its successful working. It had prospered under the Presidency of Messrs. Hughes, Broad, and Sankey, and he felt, in proposing the toast of the present chairman that the Association possessed in him the qualities necessary for such an important position. He would like to see the good points of the four Presidents rolled into one, in order that the Association might materially benefit by the combined wisdom, energy, and tact; but, as this would be impossible, the next best course to pursue would be for the Presidents to act conjointly as one. Mr. Braby, in replying, said he appreciated the toast, and further said the very fact of the Association existing, and of these annual dinners being held, had done, and is still doing, a great deal to further the interests of the trade generally. This Association had, during the past year, been working in a quiet way, but he felt sure that a very great deal more good work had been carried through than could be represented in black and white on the minute-book. The next toast was that of the Builders' Merchants' Association and kindred Associations, coupled with the names of Messrs. Hughes and Wragge, proposed by Mr. Dobson (of Messrs. Godson and Dobson), who, in the course of a well-delivered speech, said, "Since I have been in this building, and have had the pleasure of listening to your annual report, and to the remarks that have been made concerning the work of your Association during the past year, I am filled with wonder and astonishment that you could go on so long without some one thinking of starting the Association years before you did. I believe you have done very good work indeed in the past, but I also believe there is far more to be done in the future. If only we can be brought together more often as we have opportunities, for, being in an Association like this, I feel sure the result will be most beneficial to all." Mr. Wragge (of Messrs. Eastwood and Co.) rose, amid cheers, to reply on behalf of himself and the kindred Associations, and said, "There may be many Associations kindred to your Association, but the two with which I am personally most concerned are the Brick Masters' Association, and the newly-formed Lime Merchants' Association. With regard to the Brick Masters' Association, it is pursuing the even tenor of its way. I hear that several merchants belonging to your Association are thinking of going into the brick trade, but I may tell them this: it is not such a flourishing business as it is made out to be. I can assure those present that there is no antagonism between the brick masters and merchants; what the former have done they have had to do in self-defence, and I think it is for the merchants to support them in it. It has been said by one speaker to night that he hoped I should one day preside over this Association as I preside over the Lime Merchants' Association. I beg to say I do not preside over the Lime Merchants' Association, but am identified as its Hon. Secretary. I am entirely in sympathy with the Builders' Merchants' Association, and give it my support because it has been the means of my becoming acquainted with many merchants whom I only knew before by reputation. I quite agree with Mr. Dobson, that the more we are brought together the better it will be for us. With reference to the Lime Merchants' Association, I think it will succeed, because it is now so strong that

no lime merchant or burner can place himself against it." Mr. Hughes, in replying for the Builders' Merchants' Association, said, "With perseverance and pluck, I believe we shall prove a great success. I dare say some of us remember the Midland Pipe Manufacturers' Association—the pipe manufacturers are now united as a body, and I do not see why we cannot get into touch with them, and, as they are now more consolidated, I think we are in a better position to approach them; all they ask for is a *quid pro quo*. It has been a great pleasure to me to listen to Mr. Wragge's remarks; we have heard his words, and I think they will have their effect upon all. If we only stick to our guns, by the end of this year I believe we shall be united in association for our mutual benefit, and I hope that when that does come our friend, Mr. Wragge, will 'boss.'" The toast of "the Visitors" was proposed by Colonel Sankey, who is one of, if not the oldest, merchants in the lime trade in London, and Mr. Joseph Cook (of Messrs. Freund and Co.) suitably responded.

Liverpool Engineering Society.—The annual dinner of the Liverpool Engineering Society was held at the Adelphi Hotel last week. Mr. S. B. Cottrell, the President, occupied the chair, and was supported by the Lord Mayor. Mr. J. Wolfe Barry, President of the Institution of Civil Engineers; Mr. J. Brancker, Chairman of the Dock Board; Professor Hele-Shaw, Mr. A. L. Jones, Mr. J. T. Wood, Mr. F. C. Danson, Chairman of the Liverpool Chamber of Commerce; Principal Rendall, Mr. A. Holt, Mr. A. G. Lyster, Engineer, Dock Board; Mr. A. T. Squarey, Dock Board Solicitor; Mr W. H. Preece, Director of Postal Telegraphs; Mr. H. P. Boulnois, Mr. A. Ross, Mr. F. Gregory, President of the Incorporated Law Society; and Mr. G. Farren.

Institution of Electrical Engineers.—An ordinary general meeting of the Institution of Electrical Engineers took place last week at the Institution of Civil Engineers, Great George Street, Westminster, S.W. In his inaugural address the President, Sir Henry Mance, said that there were in existence to-day more than 1,300 submarine cables, the aggregate length of which could not be less than 162,000 nautical miles. They represented a total expenditure of about £40,000,000. Up to quite recently nearly every telegraph cable of importance had been manufactured in this country, but England could no longer boast of a monopoly in that business. The deeper the water the better the bottom and the safer the cable. In shallow water the cable became encrusted with shell fish, and it swayed with each turn of the tide. Marine monsters, such as sawfish, considered it their larder, and, while raking off the marine life, either ruptured the cable or penetrated the core with one of their formidable teeth. Lightning, earthquakes, landslips, and submarine volcanoes had all to be reckoned with, and the leviathan of the deep had more than once been responsible for an interruption. But probably the most dangerous enemy was the teredo, to ward off whose attacks the plan had been resorted to of covering the core with thin brass. In order to effect repairs a fleet of 41 telegraph shtps was maintained. The work of the telegraph engineer was in one respect incomplete; it still remained for him to established a girdie round the earth. He (the President) did not attach too much importance to the possibility of the telegraphic isolation of England in the event of war.

The Yorkshire Archæological Society.—The report for last year states that the cash sheet shows that the society is in a prosperous condition, a sum of over £90 remaining in the bank to its credit, although a large amount has been spent on the new rooms in Leeds. The capital account has been increased from £1,213 to £1,321 during the year, chiefly due to the legacy of £100 received from the executors of the late Mr. Stanhope Smart, for many years the hon. auditor of the society. The number of members is slightly less than last year, 607 as against 615, but even this is to some extent counterbalanced by there being only 53 members in arrear with their subscriptions, as against 85 at the date of the last annual meeting. The chief event of the year, and it may almost be said in the annals of the Society, has been the taking of a permanent home. Some months ago Colonel Wilson reported to the Council that he had the offer of the Old Medical School, 10, Park Street, Leeds, as a head-quarters for the Society. It was decided that a sub-committee of the Council should confer with a sub-committee of the Thoresby Society with a view to jointly taking the rooms. Several meetings were held, and ultimately the two Societies entered into an agreement with the Yorkshire College to rent the rooms for a period of five years, with the option of purchase at the end of that period. These rooms have been thoroughly renovated and made comfortable, the books belonging to the Society have been removed from Huddersfield, and any member can now obtain them on application to the Hon. Librarian, The Yorkshire Archæological Society, 10, Park Square, Leeds.

Sanitary Inspectors' Association.—A meeting of the Yorkshire Branch of the Sanitary Inspectors' Association was held at the Town Hall, Bradford, on Saturday afternoon. Mr. T. Pridgin Teale, presided. Mr. William Ackroyd, public analyst to the borough of Halifax, read a paper on "The Scientific Aspects of the Sewage Question." With respect to effluents, he said that, as there was no legal standard of purity, it would lead to precision of ideas if those interested in the matter referred to the standards recommended by the Rivers Inspection Committee in 1872, after four years of investigation. At some future time it would be necessary to have a legal standard for all sewage, trade as well as domestic. The effluents from manufactories would always be a trouble to local authorities. The grosser forms of pollution had only to be found out to be stopped. In going through certain sewage works he had seen a large heap of logwood chips which had been removed from one of the tanks. On another occasion, at a dye-works, he had noticed two workmem at the subsidence beds attached to the works coolly raking blue-black silt into the beck. He had known of a secret opening in a boiler-house, down which the fireman shovelled his ashes, to be carried away by the next flood. These and other abuses of water carriage could only be stopped by rigid inspection. An ideal system of sewage purification would probably admit of many modifications to suit the special requirements of its neighbourhood. But with regard to oils, if a high degree of purity were required, beyond mere clarification, the microbes had to be considered, and there must be the requisite conditions for cultivating them up to a certain point.—A debate afterwards took place upon a paper read by Mr. A. W. Stanley, of Hull, at the last meeting of the Association, in which he advocated that much greater care should be taken in laying the drains of houses, and that greater power should be given to sanitary inspectors in supervising such work.

Shrewsbury and District Master Builders' Association.—At the fifth annual dinner in connection with the above Association, Mr. T. S. Harris proposed "the town and trade of Shrewsbury," and said that he did not think they were likely to rise to the level of a large manufacturing community, but at the same time it was possible for them to rise to a very much greater height than they had done up to the present time. They had amongst them not only the opportunities but also the ability to attract and conduct larger business than they had done hitherto. He thought they had shown that they were capable of manufacturing the best class of goods, and that they could not only supply their own town and neighbourhood but could also go further afield and compete with towns more favourably situated. With a little more encouragement they might be able yet to make the town a centre not altogether insignificant in the manufacturing world. This, of coure, rested with thsmselves, and he hoped that the spirit of enterprise would carry them further than they had been able to reach at present. As to contemplated improvements, he thought they might congratulate themselves that at last they were within measurable distance of an improved railway station. He had heard that evening of the placing of an order for something like four million bricks, which of course meant the circulation of a considerable sum of money. Other things were looming in the distance which must add to the trade of the town.

Royal Institute of British Architects.—Mr. Alexander Graham, F.S.A., presided over a meeting of the Institute on Monday, reported on another page. He announced that the Council propose to recommend that, subject to Her Majesty's most gracious sanction, the Royal gold medal for the present year be presented to P. J. H. Crypers, of Amsterdam, for his executed works as an Architect. It was the opinion of the Council that the gold medal might this year be awarded to a foreign practising Architect, and Mr. Crypers was, as many of them knew, the leader amongst Architects in Holland. During the 50 years of his career, he had embraced his craft most thoroughly. He had built Churches in every direction, and to such an extent, that they wondered any other Architect in Holland had found anything at all to do.—The Chairman further announced that a visit to Peterborough Cathedral will be paid on Saturday, the 6th instant, under the auspices of the Institute. The party was limited to 30, and 21 members of the Council and others had already signified their intention of accompanying the trip. The Committee, at a meeting held on the 18th ultimo, had passed the following resolution:—"That the Council having fully considered the matter of the restoration of the west front of Peterboorugh Cathedral are of opinion that it would be inexpedient for the Institute to take any public action therein." At the next ordinary general meeting of the Institute, Mr. H. E. Milner will read a paper on "The garden in relation to the house."

KEYSTONES.

IT is proposed to restore the ancient Parish Church of Ryther.

A NEW Conservative club building is to be erected in Loughborough, at a cost of £6,000.

THE annual "James Watt" dinner of the Institution of Engineers and Shipbuilders of Scotland took place last week in the Windsor Hotel. Sir William Arrol presided.

MR. S. TREVAIL, of Truro, has been appointed Architect for the new County Asylum buildings at Bodmin, which are likely to cost between £30,000 and £40,000.

THE plate glass of the roof light of the Northwich County Court fell in one day last week, Mr. Rhodes and Mr. Overend Evans, barristers, of Manchester, had marvellous escapes, and Mr. Lawrence, a solicitor's clerk, sustained a wound to his head, requiring his removal to a surgery.

THE Hon. Walter Rothschild has consented to lay the foundation stone of the South Hackney Synagogue and Class Rooms, which are being erected from the designs of Mr. Delissa Joseph, F.R.I.B.A. Feb. 14 has been selected for the ceremony.

THE condition of the old bridge at Perry Barr was under discussion at a recent meeting of the Perry Barr District Council. It was unanimously decided to petition the County Council to widen the bridge, which at present is only 9 feet wide, and protected by a very low parapet.

THE Sanitary Committee of the Leeds Corporation has resolved to recommend the Council to give an invitation to the Sanitary Institute to hold its annual Congress in the city during the month of September next. Last year the Congress took place at Newcastle.

THE proposed expenditure of Ayr Town Council for 1897 embraces £10,000 on sewerage, £6,000 on iron bridge near station, £8,000 on extension of the water works, £1,000 on underground conveniences, and £10,000 on extension of electric lighting plant.

WE understand that the Caisse de la Dette has granted the Egyptian Government £(E.)250,000 from the general reserve fund for drainage works, on condition that the entire sum is expended this year. This will confer a great benefit on cultivation, as owing to the extended irrigation much land is becoming waterlogged. The Cairo tramways, which were constructed and are worked by a Belgian company, will shortly be extended to the Gizeh Pyramids

IT has been reported in Wolverhampton that large orders have been given out by some sheet-iron and wire-rod and other ironmasters for American steel, which is now actually arriving in the form of tin bars and billets. The price which the Americans quote for bars for sheet rolling, 30 feet long by 9 to 9½ inches wide, is £4 5*s.* delivered, or 7*s.* 6*d.* to 10*s.* below English prices. Steel billets they are delivering into Lancashire ports at £3 17*s.* 6*d.*

Trade and Craft.

LEGAL INTELLIGENCE.

The claim brought by the trustees and creditors of Mr. Wm. Brooks, against the St. Pancras Guardians, which has long occupied the attention of the Official Referee, Mr. Edward Ridley, Q.C., was resumed on the 22nd inst. It will be remembered that the plaintiffs, who are builders' merchants, sue as trustees of creditors of Mr. Wm. Brooks, of Folkestone, builder, against the Guardians of the Poor of St. Pancras and their Architects, Messrs. A. and C. Harston, for a balance of £24,226, or, alternatively, £24,262 alleged to be due on a contract for the completion of the St. Pancras Workhouse. The plaintiffs' case was that some years ago the Guardians resolved to reconstruct the workhouse in King's Road, and appointed Messrs. Harston as their Architects. The contract for the work was first taken by Messrs. Kirk and Randall, of Woolwich, but disputes arose, and, in 1892, that firm requested to be relieved of further work under the contract. Fresh tenders were invited for the unfinished work, and that of Mr. Wm. Brooks was accepted for £50,861. The work was to occupy fifteen months from May, 1892, but delays arose, and in November, 1894, the work was stopped. Messrs. Drew-Bear, Perks and Co., of Queen Victoria Street, who supplied the iron work; Mr. H. Tolputt, of Folkestone, who supplied the timber; and Mr. J. Brown, of Cannon Street, who supplied bricks, sued on behalf of creditors for the balance alleged to be due to Mr. Brooks. The net cost of the work executed was stated to be on the first claim £65,479, plus ten per cent. profit, £6,547, making £72,026, of which £47,800 had been received under the Architects' certificates, leaving a balance of £24,226. In the alternative claim the net cost of the work executed was estimated at £65,479, as before, but the ten per cent. profit was reckoned on the contract price of £50,861, which, with other amounts claimed, brought the alternative claim to £24,262. The plaintiffs alleged that Brooks was hindered from continuing and completing the contract by the action of Mr. George Poole, the clerk of the works, who interfered without sufficient cause, and condemned materials supplied wholesale. It was also further alleged that the Architects were seldom on the works, and that the interference of the clerk of the works caused needlessly a net loss to Mr. Brooks of £2,526, in addition to £193, the value of the materials left by Messrs. Kirk and Randall, and not permitted to be used. The defendants generally denied the charges against the clerk of the works, and alleged that Brooks had not carried out his undertaking to complete the work left unfinished by Kirk and Randall. The Guardians further relied on the Public Authorities Protection Act, 1893, as being a defence, inasmuch as the matters referred to in the action occurred more than six months before the action was brought. The defendants, Messrs. Harston, pleaded that they were not liable, and said that they had received no complaints from Poole with respect to the manner in which the works were being carried out by Mr. Brooks. Reports of the former proceedings have appeared in the issues of the Builder for November 21st and 28th, December 5th, and the 23rd ult. Mr. Reginald Bray and Mr. A. A. Hudson appeared as counsel for the plaintiffs; Mr. English Harrison and Mr. W. Moyses for the Guardians; and Mr. MacIntyre and Mr. R. W. Turner for Messrs. Harston. Mr. Harrison concluded his speech on behalf of the defendants, after which additional evidence was taken. George Poole, clerk of works, was the first witness called for the Board of Guardians. He said that he had been fifty years engaged in the building trade, the last twenty of which he had acted as clerk of works under Messrs. Harston. He was now in the service of the St. Pancras Guardians. He had heard the evidence given by the witness Fearon in the case. He had not spoken disrespectfully of Messrs. Drew-Bear and Co., when he heard that they were going to take the iron-work. Drew-Bear and Co. knew what was required, and they could do good work if they liked. They had done a large job for Messrs. Harston before, and knew their style of work. It was not true that witness had said to Fearon that he always made a practice of condemning the first parcel of goods received, for by that plan he got people to send better. Witness was clerk of works during the whole time that Kirk and Randall held the contract. On June 1st or 2nd, 1892, Mr. Millward, the clerk to the Guardians, sent for witness to his office, respecting the erection of temporary buildings. Witness was directed to show Brook and Fearon the ground plan, and to explain the way to conduct the job. He in no way interfered with the clearing of the site, but they could not get at the particular point they wanted to work at. It was absolutely false that he told Fearon not to get on the hoarding. It was a huge job, five acres of ground being enclosed, and they did not want all the hoarding at that time. It was totally untrue that the first lot of Thames ballast was condemned on July 14th, 1892. His diary for that date said, "a quantity of satisfactory Thames sand came this day." On February 14th, 1893, Brooks certainly came up about a complaint witness made, and it was untrue to say that these complaints began in July, 1892. There was not a new brick put into the foundations anywhere. Cross-examined as to the girders supplied by Messrs. Drew-Bear and Co., one of which was objected to by witness as being 2 lbs. per foot too light and the other as too heavy, the witness said that he did not know that any margin was allowed as to weight in girders. Of the two girders weighed, each 17 ft. 2 in. long, one was 19 lbs. under, and the other 29 lbs. over weight in the aggregate. Mr. Harston did write saying that the deficiency in that one girder was trifling and not worth notice. Five days afterwards Mr. Harston rejected the girders. He rejected six of the cast-iron columns because the brackets were wrong. There were two defects; the first being that the bracket was out of the upright, and, secondly, that the bracket was not at right angles to the cap. Some of them were as much as an inch out of the upright. He did not say that their being out of the upright diminished the strength. It would affect the look of them, however. At first Fearon had no one on the works who could take the levels, and on his recommendation Fearon employed, from July, 1892, witness's son, Alfred, a surveyor, who took the levels for five or six weeks. Then Mr. Harston wanted Alfred Poole for other work, and Fearon engaged another of witness's sons for the work. Alfred Poole was not more competent than witness was to take levels. He had never intended to say that they had never had a competent person to take the levels. He would not swear that he never marked more than one brick at a time. It was absolutely untrue, as George Brown had sworn, that he (witness) got into a temper and marked the bricks without noticing whether they were good or not. He only once marked the bricks with a carbon, most of them were done with a pencil, and the scratch would remain even though Mr. Harston overruled witness. He had no power of condemnation. The examination of the witness continued, he stating in answer to further questions that he had had no communication with Nash, of Slough, about the job in question, but he had not used his bricks for twenty years. Witness always described the brick he required in writing a specification, because the names of bricks differed in various yards. It was not impossible to comply with his specification. The red bricks were more chipped than those of Brown's usually were, but otherwise they were of good quality. Examined as to the timber, the witness said that it was generally inferior in character. He had always endeavoured to exercise his authority in a conscientious manner. The hearing of the case was then further adjourned till March 1st.

A NEW WOOD-SAWING MACHINE.

Messrs. George Gordon and Co., timber merchants, have now added to their plant at their works in Blaikie's Quay, a horizontal board-sawing machine, which is the only machine of the kind in Scotland. The feature of the machine is that it has two horizontal parallel saws. Machines are already in use in Aberdeen with a single horizontal saw, but none with two saws. The effect of having two saws is, that the machine cuts a log into boards in half the time that a single-saw machine can. The log or tree to be divided into boards is placed by means of a crane on a massive iron table, 30 feet long, and about five tons in weight. It is fixed firmly to the table by means of dogs, and the table is then run up, along rails, to the sawing machine, by means of a revolving screw working on a rack. The end of the log is thus fed against the saws, one of which projects a little in front of the other. The saws are, as regards height, one above the other, placed a distance apart equal to the thickness of the boards which are desired to be cut. The saw-frames in which the saws are fixed are driven from side to side by connecting rods off a two-throw crank with opposite centres, so that the motion of the one balances that of the other and prevents vibration. The crank makes 200 revolutions a minute, each saw, therefore, making double that number of journeys across the machine in a minute. The machine can saw boards up to 48 inches in width, and its cut is found to be very clean. The makers were Messrs. Robinson and Son, Rochdale.

WAGES IN THE ENGINEERING TRADE.

The concession of a fifty-three hours' week to the men engaged in the engineering trade and in boiler-making in the Spen Valley has served to revive the agitation among the similar industries in Leeds for a like reduction of hours. The fact is some of the engineers are almost inclined to regard the success of the Spen Valley workmen as an indirect reflection on the bulk of their trade in Leeds, where, it is said, the organisation is in anything but a satisfactory condition, and where, at the conference held on the subject in December last, when a variety of branches were represented, the engineers were reported to be the least determined in the effort to obtain a reduction of hours. Further, the wages in the Spen Valley district average 32s. per week, which is at least a couple of shillings more than is paid in Leeds. The boiler-makers in Leeds are said to be in receipt of lower wages than in any other of the great towns of the country. It is difficult, at present, to say whether throughout these two trades, as well as among the labourers connected therewith, any joint step will be taken to improve their position, the reason being the inefficient organization, especially in the engineering trade. There is, however, a strong feeling among a section of the men that something should be done.

MESSRS. F. WALTON & CO.

Mr. Hine, the manager of "Lincrusta-Walton," forwards us a copy of a new trade circular which shows undoubted novelty in its method. The average circular is ever with us, and a sigh of relief usually accompanies its safe delivery to the paper basket. Here, however, we have something unusual, an application of "sweetest Shakespeare-fancy's child" to the uses of natural Art. Certainly it smacks of irreverence to mix Shakespeare with advertising, but this is an iconoclastic age, and the thing has been well done in the present case, though as to whether it be "fitly done" we will not attempt to dogmatise.

Announcements.

Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, Eighteenpence.

Three Insertions for the price of Two.

Prepayment in the above Advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements.

Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.
